**LOGI—NORI**

***London : The Educational Book Co., Ltd.***

**Logia** (Gr., sayings). The name given to an ancient collection of the discourses of Our Lord. According to Papias, probably a disciple of S. John, "Matthew composed the logia of the Lord in the Hebrew tongue." Hence the name is sometimes given to the supposed document, consisting largely of discourses, drawn upon, through a Greek translation, by the writers of the Gospels according to S. Matthew and S. Luke, and designated Q. (See Gospels.)

The name logia is also given to several fragmentary collections, professing to be sayings of Jesus, on 3rd cent. papyri, found in Egypt by Grenfell and Hunt in 1897 and 1903. They have been published as Sayings of Our Lord from an Early Greek Papyrus, 1897, and New Sayings of Jesus and Fragment of a Lost Gospel, 1904. Whether authentic or not, they preserve an early tradition.

**Logic** (Gr. *logos*, word). The science of reasoning. Logic deals systematically with the principles which regulate valid thought, that is, thought of which the conclusions are justified by the facts given. Logic does not itself provide new knowledge, as, say, chemistry may do, but furnishes a set of rules that help a man to gain new knowledge, to judge whether any given evidence is sufficient to prove a given statement, and to perceive what additional statements can justifiably be inferred from any given statements. For this reason logic has also been called the science of proof and the study of the general conditions of valid inference.

A knowledge of logic will not prevent anyone from coming to wrong conclusions, any more than a knowledge of hygiene will prevent the formation of unhealthy habits; but it does furnish a means of testing conclusions on any matter and the processes of argument by which they have been derived. Practice in logical analysis should enable anyone to perceive more easily fallacies hidden in the arguments and conclusions of others. The study of logic should assist correct thinking, as the study of grammar should assist correct speech. There were clear thinkers before there were logicians—otherwise the rules of logic could not have been formulated; but everyone should be a better thinker and a better judge of the conclusions of others if he is practised in logical analysis. A knowledge of logic cannot confer infallibility—it should not be forgotten that the greatest logicians of an-

# Volume 7

cient and medieval times believed and could "prove," for example, that the sun moved round the earth and that the earth was flat. But logic can provide an instrument for checking conclusions, and can focus attention on the various sources of error, so that the logician has really no excuse for believing that he is infallible.

The subject-matter of logic is usually presented in two parts, formal logic and inductive logic or scientific method. The first of these is concerned primarily with deductive reasoning, which assumes the truth of certain statements (or premises, that is, things placed before), and deduces conclusions from them, that is, uses them to formulate other statements implied by them. Inductive reasoning, on the other hand, starts with observed facts and tries to discover what general principles (or laws) underlie and explain them. A lawyer interpreting a statute and applying it to a particular case uses the deductive method; a scientist observing an experiment and interpreting the results uses principally the inductive method. In most forms of practical thinking induction and deduction are combined freely. In the study of logic it is convenient to treat them separately.

**FORMAL LOGIC.** This analyses the different types of proposition and the various ways in which inferences can be validly made from them. Every proposition has a subject and a predicate. Thus in "The furniture in this room is worth £150," the subject is "the furniture in this room": the predicate is "(something) worth £150." The subject and the predicate are called the terms of the proposition. A statement may be made concerning one thing or one group of things; e.g., *This cup of tea is strong*; *The furniture in this room is insured*. The proposition is then said to be singular. Or a statement may relate to any and every object of a certain class; e.g., *Armchairs are comfortable*:

*No man is infallible*. Such propositions are called general. The subject term is said to be distributed. A third type of proposition uses the subject indefinitely; e.g., *Some houses have been rebuilt*. These propositions are called particular.

Using S to denote the subject-term and P to denote the predicate term, we can classify the simplest forms of proposition as (1) All or every S is P; (2) Some S is P; (3) All and every S is not P; (4) Some S is not P. Of these four types, the first two *Affirm* something of the subject; the second two *deny* (Latin *nEgo*) something of the subject; the four types are therefore commonly referred to respectively as A, I, E, O propositions. Much of formal logic deals with the limitations on the use of these four types of proposition. They are commonly denoted by the symbols SaP, SiP, SeP, SoP.

Two assumptions essential to consistent thinking are known as the law of contradiction and the law of the excluded middle. According to the first, the same predicate cannot be both affirmed and denied of the same subject (S cannot be both P and not P). According to the second, a given predicate must be either affirmed or denied of a given subject (S must be either P or not P; there is no middle course).

Different immediate inferences are implied in the A, I, E, O propositions. Thus: SaP implies SiP but denies SeP and SoP; that is, if every S is P, some S must be P, and it is false to say that no S is P or some S is not P. On the other hand, SiP does not itself imply SaP, although SaP may also be true; and SiP excludes SeP but it neither affirms nor denies SoP. These relationships of the four types of proposition are systematically summarised in the traditional square of opposition. A proposition may imply also (a) its converse or (b) its obverse. Thus: the proposition, *The greatest side of a triangle is opposite to the greatest angle* has the converse, *The greatest angle of a triangle is opposite to the greatest side*, and the obverse, *The greatest side of a triangle is not opposite to the least angle*.

**SYLLOGISM** Mediate inference involves the use of two propositions containing a common term to derive a new proposition, the truth of which follows as a necessary consequence. Thus:

Educated people are tolerant;  
He is educated;  
Therefore, he is tolerant.

Such an inference is usually called a syllogism. The derived proposition is called the conclusion. The predicate of the conclusion (denoted by P) is called the major term. The subject of the conclusion (S) is called the minor term. The term appearing in both premises but not in the conclusion is called the middle term (M). Thus in the example we have: Major term, *tolerant (persons)*; minor term, *he*; middle term, *educated people*. The syllogism could be symbolised thus:

(Major Premise) MaP;

(Minor Premise) SaM;

(Conclusion) SaP.

The A, I, E, O propositions can be combined to yield nineteen different types or moods of valid syllogism. The scholastic logicians of medieval times concerned themselves principally with these forms of syllogism and devised elaborate rules and mnemonics regarding the different moods. The following two general rules of the syllogism are important: (1) The middle term must be distributed at least once in the premises. (2) No term may be distributed in the conclusion if it is not distributed in its premise. A fallacy is an invalid inference; e.g., Educated people are tolerant; he is tolerant; therefore he is educated. This is an example of the fallacy of the undistributed middle term. The word *tolerant* in neither premise denotes all and every tolerant person.

#### Chains of Reasoning

A chain of reasoning consists of syllogisms so linked that the conclusion of one is used as the premise of another. For example: Educated people are tolerant; he is educated; therefore, he is tolerant. Tolerant persons are good workmates; he is tolerant; therefore, he is a good workmate. No good workmate would tell tales of his fellows; he is a good workmate; therefore, he would not tell tales. Such syllogistic chains of reasoning have usually to be disentangled by analysis of the words used. Thus, that just given might have been expressed as follows: He would not tell tales, for like all educated people he is tolerant, and therefore a good workmate, and hence incapable of tale-bearing. The chief function of formal logic is to analyse chains of reasoning in order to decide whether the syllogisms are valid and to express the premises fully so that they can be adequately considered.

**SCIENTIFIC METHOD.** Inductive logic deals with the methods by which new knowledge can be gained.

Observation and experiment provide the raw materials of facts. These can be critically examined, analysed, classified, and grouped, described, compared, contrasted, and considered imaginatively in order to discern common factors, similarities, differences, or causal relationships; suppositions or hypotheses can be formulated to explain tentatively what has been observed; these suppositions can be checked by seeing if they apply equally to other observations of the same kind; they can be corrected and re-checked; eventually a generalisation or scientific law can be formulated that fits the evidence beyond all doubt.

#### The Place of Statistical Analysis

During this century remarkable progress has been made in the technique of accurate observation, in the design and conduct of experiment, and in the analysis of the results of observation and experiment. The analysis is usually mathematical and statistical in character, whether the observations concern, say, astronomy, physics, agriculture, sociology, engineering, or dietetics. But the mastery of statistical method is no substitute for the constructive imagination that can perceive that a problem exists, determine the kind of observation or experiment that may provide the requisite evidence, and then recognize the significance of the results secured, either with or without the aid of statistical analysis.

H. WATSON

Buckley, 1876; Manual of Logic, J. Walton, 2 vols., 1891; Textbook of Logic, A. Wolf, 1930; Thinking to Some Purpose, L. S. Stebbing, 1940; Industrial Experimentation, K. A. Brownlee, 1946.

**Logistics.** Military term, originally coined to denote the art of moving and quartering armed forces. The French term *logistique*, of which it is a rendering, was first used by the military writer Jomini, and is derived from *loger*, to lodge. The word is now obsolete in Great Britain and on the Continent, but is still current in the U.S. army, covering roughly those aspects of the duties of "Q" branch, supplies, transport, and quartering, which are concerned with keeping an army mobile and ready to fight. Thus, a force unable to send forward enough ammunition for its artillery would be described as "logistically unsound." See Staff.

**Logogram** (Gr. *logos*, word; *gramma*, letter). A symbol or type sign used to represent a word or the termination of a word, for the sake of brevity and speed in writing, e.g. / for "the." Logogram is also the name given to a puzzle in verse. A word is chosen, and from its constituent letters words are made, synonyms of which are introduced into the verse, and from these the original word has to be guessed. Thus, if the word exhaustion were chosen, from which the words haste, heat, stone, etc., can be made, synonyms such as speed, warmth, pebble, would be introduced into the lines, giving clues from which the word exhaustion could be discovered.

**Logone.** A river and native state of Africa. The river rises in French Cameroons, and forms the boundary between that colony and French Equatorial Africa. It runs N.N.W. from the neighbourhood of Bakassi to its confluence with the Shari, just below Fort Lamby. The Logone is navigable for launches as far as Ham, whence there is portage and water communication with the Benue.

Formerly a vassal state of Bornu, the state of Logone now forms part of Cameroons. The country is swampy. The native capital is at Birni Logone, but the administrative centre is Küsseri, a few miles above the confluence of the Logone and the Shari.

**Logos** (Gr., word). Greek term much used in philosophy and theology. In philosophy it implies either reason or reason as expressed in speech; in the Jewish and Christian religions, the Word or medium of divine revelation. Heraclitus, Plato, and the Stoic philosophers attributed the rational order of the world to a divine Logos, Reason, or Mind. The Hebrew-speaking Jews used the word Memra in the sense that the Greeks used Logos, and in the Targums, or Aramaic paraphrases of the O.T., speak not of Jehovah, but of His Memra as manifested to Abraham, Hagar, Jacob, and Moses.

Combining Greek philosophy with Jewish thought and tradition, St. John, in the beginning of his Gospel, defines a Christian doctrine of the Logos, referring to Christ as (1) the inward Word of God, i.e. as much one with God the Father as reason is one with reasoning man; and (2) as God's outward Word, because he explains and reveals to the world what God is, and, by becoming flesh, and living a sinless human life, showed man how to become like God. In the

words of S. Augustine "the Son is called the Word of God because the Father made known His Will by Him, as a man makes known his mind by words."

**Bibliography.** History of Dogma, vol. ii, A. Harnack, 1894; Evolution of Theology in the Greek Philosophers, E. Caird, 1904; Personal Idealism and Mysticism, W. R. Inge, 1907; The Fourth Gospel, E. C. Hoskyns, 1940.

**Logotype.** In printing, two or more letters, a word, or a phrase cast as one piece of type, e.g. er, of, in, on, ed, the, tion. It should be distinguished from a ligature, which consists of two or more connected letters, like ff or æ. Logotypes have not been used extensively except by John Walter, founder of The Times, and early in the 19th century by Earl Stanhope. They are used in the setting up of work involving numerous repetitions of the same sequence of letters, as in directories and dictionaries. Logotypes reduce the number of hand movements to be made by the operator in picking up type or depressing keys. On the other hand, they increase the number of compartments in a case of type or keys on a keyboard to be memorised by the compositor. Also damage to any one character of a logotype necessitates replacement of the whole combination.

**Logroño.** Small inland province of N. Spain. It is bounded N. by the river Ebro, and lies mostly within its basin. To the S.W. lie the Sierra de la Demanda, alt. 7,562 ft., and the Pico de Urbión, 7,388 ft. The fertile region S. of the Ebro, known as La Rioja, is famous for its red wines. Logroño also produces cereals, olive oil, fruit, flax, honey, and silk. There are some minerals, including silver, copper, and lead. Area, 1,946 sq. m. Pop. 231,335.

**Logroño.** A town of Spain, capital of the prov. of Logroño. It crowns a hill 1,200 ft. above the fertile plain of the river Ebro, 61 m. E. of Burgos, on the Saragossa-Miranda de Ebro rly. The Ebro is here spanned by two bridges—one built of stone in 1138, the other modern. The town is walled, and its church is said to have been founded by Constantine. The centre of La Rioja district, Logroño has a large trade in wine and fruit. Named by the Romans Julia Briga and afterwards Lucronia, it was besieged by the French in 1521 and occupied by them 1808-13. Pop. est. 54,365.

**Logwood.** The heart wood of a tree, *Haematoxylon campech-*

*ianum*, a native of the warmer parts of S. America and the W. Indies. It was first imported to Europe by the Spaniards in the 16th century; about 1715 trade was developed with Jamaica, whence some of the best grades now come. Its value depends

Logwood. Foliage and flowers of this American evergreen tree

upon the presence of a colouring principle, haematoxylin, which is readily oxidised to a red dye, haematein. This is extracted and used in large quantities for dyeing wool and silk, generally with a chromium or an iron mordant. Leather, rayon, and other materials are also dyed with logwood. The extract is prepared near the plantations in Jamaica, where the wood is reduced to chips and extracted with hot water. *Consult* Natural Organic Colouring Matters, A. G. Perkin and A. E. Everest, 1918.

**Loharu.** Former state of India, now merged in Punjab. It was ruled by a nawab who traced his descent from a Mokhara Mogul serving under the emperor Ahmad Shah. Lord Lake granted a perpetual estate to the nawab, but trouble occurred in the latter's relations with the East India Company and in his own family. In 1874 the British government revived the title of nawab in favour of Ala-ud-din Ahmad Khan. Though the ruler was a Muslim, 86 p.c. of the pop. of 30,000 were Hindus. The capital was Loharu. Area, 226 sq. m.

**Lohengrin** (i.e. Garin of Lorraine). In medieval German romance, one of the heroes of the Grail cycle. He is the subject of a High German poem, composed c. 1300, in continuation of Wolfram's Parsifal. The son of Parsifal, and a knight of the Holy Grail, he is conveyed by a swan through the air at King Arthur's command to rescue Elsa, daughter of the duke of Brabant. Overcoming her enemy, he marries Elsa, who is not to inquire of him as to his

origin. She persists in doing so, and when he is persuaded to tell her the swan carries him away again to the Grail. Wagner took this legend as theme for his opera, Lohengrin, 1848. *See* Wagner.

**Lohmann, GEORGE ALFRED** (1865-1901). English cricketer. Born June 2, 1865, he became at 20 one of the most successful bowlers of the day, and a mainstay of the Surrey team. During 1885-90 he was indispensable to any representative English eleven. He took over 200 wickets in first-class matches in each season, 1888-90, his averages being 10-90, 13-43, and 13-62 runs. He played in nine test matches against Australia, securing his wickets at an average cost of 13-01 runs apiece. Lohmann died Dec. 1, 1901.

**Löhr, HERMANN** (1871-1943). A British song writer. Born at Plymouth, son of a theatrical conductor, he studied at the Royal Academy of Music, where he gained the Charles Lucas medal for composition. He wrote more than 200 songs and ballads, the best known being *My Little Grey Home in the West*, popular with the troops and much parodied by them during the First Great War; and *Where my Caravan has Rested*, of which a million copies were sold. He died Dec. 6, 1943.

**Löhr, MARIE** (b. 1890). Australian actress. Born at Sydney, July 28, 1890, she first appeared on the London stage in Shock-Headed Peter, 1901. Engaged by the Kendals in 1907, she made her reputation in the comedy, *My Wife, at the Haymarket Theatre*. Then she appeared with Tree at His Majesty's, and in 1911 with Hare. Manager of the Globe Theatre, 1918-25, she produced and acted in such successes as *Nurse Benson*; *The Laughing Lady*; *Aren't We All?* Later came *The Breadwinner*, 1931; *Call it a Day*, 1935; *Quiet Wedding*, 1938; *Playbill*, 1948. In films from 1932, she displayed adroit sophisticated humour.

Marie Löhr, Australian actress

**Loir.** River of France. It rises in the dept. of Eure-et-Loir and flows generally S.W. to fall into the Sarthe near Angers. Its length is about 180 m.

**Loire.** River of France. It rises in the dept. of Eure-et-Loir and flows generally S.W. to fall into the Sarthe near Angers. Its length is about 180 m.

W. into the Atlantic, which it enters at St. Nazaire. The longest river in France, it flows some 610 m. through much picturesque scenery, and on its banks are Orléans, Blois, Tours, Angers, and Nantes. On the S. or left bank its chief tributaries are the Allier, Cher, Indre, and Vienne; on the right they include the Maine. The river drains nearly 50,000 sq. m.

The Loire is not a great commercial highway, as its flow is much too irregular, rising at times with great rapidity and flooding the country. For small vessels it is at times navigable for a great part of its course, but for safety there are a number of canals. Some of these have been cut parallel to the river, which they rejoin; others, like the Canal du Centre, connect the Loire with other rivers. Attempts have been made to lessen the destructive Loire floods. Dykes and embankments have been built, and there are several dams, notably the great one near Roanne.

On June 14, 1940, German troops occupied Paris and, advancing S., reached the Loire S. of Avallon two days later. On June 17 Orléans was captured by the Germans, who crossed the river. In 1944 U.S. armoured columns reached the Loire at Nantes and Angers on Aug. 9, and turning E. advanced on Paris. American patrols crossed the Loire on Aug. 11.

**Loire.** Department of France. It is in the E. centre of the country, and takes its name from the above river. It is largely a hilly district, containing part of the Cévennes range, although it also contains the plains of Forez and Roanne. Its chief rivers, besides the Loire, are the Lignon du Nord, the Gier, the Aix, and the Ondaine, while the Rhône just touches it. In the N. it is an agricultural district, cattle being reared, and wheat and rye grown. In the S. is a large coalfield, on which are the manufacturing towns, of which St. Étienne is centre. St. Étienne is the capital and the head of one of the three arrondissements; Roanne and Montbrison of the two others. Before the Revolution the department was included in the province of Lyonnais. Area 1,852 sq. m. Pop. 631,594.

**Loire Inférieure.** Department of France. It is in the W. of the country, the Bay of Biscay forming its W. boundary. It is a generally flat and marshy district, subject to floods and drained by the Loire and its tributaries, the Erdre,

the Sèvre, and others. A number of canals flow through it. This is a fine agricultural region and yields heavy crops of cereals, while horses and cattle are reared, and dairy farming is carried on. Salt is extracted from the marshes, granite is quarried, and there are fisheries off the coast. The department is divided into five arrondissements. Nantes is the capital; other large towns are St. Nazaire and Châteaubriant. Guérande, Clisson, and Paimboeuf are interesting towns. In the S. is the large lake of Grand-lieu. Until the Revolution the department was in the province of Brittany. Area, 2,693 sq. m. Pop. 665,064.

**Loiret.** Department of France. In the centre of the country, it takes its name from a small tributary of the Loire. The Loire itself flows through this dept., as do the Essonne and the Loing. The dept. is mainly plain or plateau. It contains part of the wheat growing district called the Beauce, the Gâtinais, and a section of the infertile plain known as the Sologne. Cattle, sheep, and other livestock are abundant, and corn is grown; the vine is cultivated, and a large area is covered by forest. Orléans is the capital, and there are four arrondissements—Orléans, Gien, Montargis, and Pithiviers. Most of Loiret was formerly included in the province of Orléanais. Area, 2,629 sq. m. Pop. 346,918.

Loja, Ecuador. Main street of the town of Loja, capital of the province

**Loir-et-Cher.** Department of France. It takes its name from two rivers that flow through it. The Loire also flows across it, while other streams are the Sauldre and the Beuvron. The dept. is mainly plain or plateau. It contains part

of the Sologne, and the Beauce, and the district known as the Perche. Wheat and oats are grown, cattle and sheep are reared, and the vine is cultivated. There are also considerable forests. Blois is the capital and the head of an arrondissement; the other two are those of Romorantin and Vendôme. Before the Revolution the dept. was mainly included in Orléanais. Area, 2,478 sq. m. Pop. 242,419.

**Loisy, ALFRED FIRMIN** (1857–1940). French theologian. Born in Lorraine, Feb. 28, 1857, he was ordained priest 1879, and became professor of Biblical exegesis in Paris, 1881; chaplain of the Dominican College at Neuilly, 1894; and director of classics at the Sorbonne, 1900, resigning 1903 upon adverse criticism from Rome. Loisy helped to forward the modernist movement in the R.C. Church, urging that the Church could fulfil its mission in the world by accepting higher criticism and the comparative study of religions. His *Évangiles Synoptiques*, 1907, suggesting that the Gospels failed to give an historical record, brought about his excommunication. Yet he was appointed to a chair in ecclesiastical history at the Collège de France, 1909–32. He wrote *L'Évangile et l'Église*, 1902; *La Religion d'Israël*, 1908; *La Morale Humaine*, 1923. He died June 1, 1940. A study by M. D. Petre appeared in 1944.

A. F. Loisy, French theologian

**Loja.** Southernmost province of Ecuador, S. America. It is bounded S., E., and W., by Peru, and is traversed by the Andes. Rich in minerals, it also has extensive forests of cinchona, the bark of which is largely exported. Area, est. 3,705 sq. m. Population est. 198,100.

Loja, the capital, situated at an alt. of 6,850 ft., and served by rly., has a pleasant climate. Founded in 1546, it possesses a cathedral and a law school. Woollens are made, cereals, sugar, cotton, and tobacco are produced, and cattle are raised. In the neighbourhood are gold, silver, and copper mines. Pop. est. 19,000.

**Loja.** Town of Spain, in the prov. of Granada. It stands on the river Genil, 32 m. by rly. W. of Granada. Picturesquely placed at the foot of hills overlooking the

Genil, it has a ruined Moorish citadel, two 16th century churches, and a palace of the dukes of Valencia. It manufactures coarse woollens, leather, paper, and silk, and carries on a thriving trade in cattle and cereals. With Alhama, it formed one of the "two Keys of Granada." It was wrested from the Moors by Ferdinand III, in 1226, but was soon abandoned, to be recaptured by Ferdinand and Isabella, May 28, 1486, through the help of English bowmen under Lord Rivers. Pop. 20,493.

**Lokeren.** Town of Belgium, in E. Flanders. It is a manufacturing town in the densely peopled and highly productive district of Waesland, and is a rly. junction between Ghent and Antwerp, about 12 m. E.N.E. of the former. The church of S. Lawrence has a famous pulpit by Verhaeghen. Pop. 25,602.

**Loki.** A giant in Scandinavian mythology, of a race that reigned before the gods, the personification of fire as a destructive agent. He is beautiful, but cunning and malignant, and swears friendship with the gods in order to ruin them and the world. Through his guile Balder (*q.v.*) was slain. In some myths Loki is chained to a rock, while a serpent drops poison on him. His children are the wolf Fenrir, the earth-serpent, and Hel (*q.v.*).

**Lokman** (Arab., devourer). The traditional author of certain Arabic fables, which are of Greek origin. He is called the son of Baura, a relative of Job, and is said to have lived for several centuries, and to have known David. Described as a deformed Ethiop slave, Lokman has been identified with the Greek Aesop. One of the chapters of the Koran, in which reference is made to the wisdom of the fable-teller, is entitled Lokman.

**Lolland.** Alternative spelling of the Danish island more commonly spelt Laaland (*q.v.*).

**Lollards.** Name given in England in the 14th and 15th centuries to the followers of John Wycliffe (*q.v.*). It is derived from the Middle Dutch *lollen*, to sing in an undertone, the name *Lollard* having been applied to the members of an association for burying the dead, founded at Antwerp c. 1300, which, like a similar body, the Beghards, came to be persecuted for suspected heresy. Hence the term was extended in England to those who, under a religious guise, concealed turbulent motives. Some well-known Lollards were more or less independent of Wycliffe's influence; others were simply men who

sought their own salvation in an individualistic way, regardless of the Church, and were sometimes communistic in their ideas. They attacked ecclesiastical endowments, the hierarchy, clerical celibacy, the Mass, and prayers for the dead; charged the clergy with immorality; and denounced capital punishment.

The first English statute against heresy, in the reign of Richard II, was passed by the lords and directed against the Lollards. In 1388 both lords and commons petitioned the king against them, and royal letters urging repression were sent to the archbishops and their suffragans. In 1395 the Lollards themselves presented their case to parliament. In 1401 the statute *De haeretico comburendo* was passed, and whereas excommunication and imprisonment had been the worst forms of punishment for heresy, the civil authorities were now empowered to inflict death by burning upon all offenders handed over to them by the ecclesiastical courts. A prominent victim was Sir John Oldcastle (*q.v.*) in 1417.

Between 1401 and 1532 forty-seven Lollards suffered the extreme penalty. As it developed, Lollardy assumed a social and political character, and was used by courtiers opposed to the political power of the prelates. Generally the Lollards were a poor and unlettered people. Though repressed in both England (especially in London) and Scotland (Ayrshire) by Church and state, they prepared the way to some extent for the Reformation (*q.v.*).

**Bibliography.** Wycliffe and the Movement for Reform, R. L. Poole, 1889; *The Peasants' Rising and the Lollards*, ed. E. Powell and G. M. Trevelyan, 1899; *Constitutional History of England*, W. Stubbs, 5th ed. 1896; *England in the Age of Wycliffe*, G. M. Trevelyan, 3rd ed., 1908; Lollardy and the Reformation in England, J. Gairdner, 1908; and a novel, *He Rides in Triumph*, P. Lindsay, 1945.

**Lollards' Tower.** Place of imprisonment attached to episcopal palaces for those accused of heresy. The tower at Lambeth Palace (*q.v.*), popularly known since the 18th century as the Lollards'

Lollards' Tower. Interior of the prison room in Lollards' Tower, Lambeth Palace, London

Tower, owes this name to a confusion between the archbishop's prison and that of the bishop of London at Old S. Paul's, which is definitely called the Lollards' Tower by Stow. Consult Chapters in the History of Old S. Paul's, W. S. Simpson, 1881.

**Löllingite.** In mineralogy, essentially iron diarsenide ( $\text{FeAs}_2$ ), occurring as steel-white metallic grains in mineral veins formed at moderate temperatures. It resembles arsenopyrite, but contains a much higher proportion of arsenic and is a richer ore-mineral of that element.

**Lolo.** Chinese collective name for aboriginal peoples, mostly in Szechwan, Kweichow, and Yunnan. Calling themselves Nosu, they include the Man and Hsifan tribes. Tall, fair, level-eyed, straight-nosed, wavy-haired, hardy hill-men, they comprise the noble Hai (black-bones) and the plebeian Pai (white-bones). Their Tibeto-Burman speech is shared by Lisu, Lahu, and other tribes. They may number 60,000 in Burma and several thousands in Tongking.

**Lomami.** River of the Belgian Congo, a southern tributary of the Congo. It runs nearly parallel with the Lualaba-Congo, and enters the main stream at Isangi, about 65 m. below Stanleyville. It has not received the attention of explorers and traders, and flows through an unknown section of the country. Lomami is the name of a dist. containing the upper courses of the Lomami and Sankuru.

**Lombard, CAROLE** (1909-42). American film actress. Jane Peters was born at Fort Wayne, Ind., Oct. 6, 1909, and appeared on the screen from 1926, at first in Mack Sennett comedies. Then she played the blonde adventuress type of part, but in 1936 made a success in "crazy" comedy with *My Man Godfrey*. Later films

included *Nothing Sacred*, 1938; *They Knew What They Wanted*, 1941. She was killed, during a war bond selling tour, in an air crash near Las Vegas, Nevada, Jan. 16, 1942. She married (1) William Powell; (2) Clark Gable.

**Lombard, PETER** (c. 1100-60). Italian schoolman. Born at Novara, then in Lombardy, he was educated at Bologna and Reims, where he was befriended by Bernard of Clairvaux, and at Paris, where he was a pupil of Abelard. He became a teacher of

Peter Lombard,  
Italian schoolman

theology, canon of the convent of S. Victor, and, in 1159, bishop of Paris. He is said to have been the first to obtain the title of doctor of theology in the university of Paris. He is called *Magister Sententiarum* (master of sentences) from his theological manual, *Libri quatuor sententiarum*, *Four Books of Sentences*, collated from the Scriptures and the works of the early Fathers, and designed to explain the whole system of Catholic theology and ethics. Upon this work, which served for a long time as the basis of all theological literature in Europe, more than 4,000 theologians are said to have written commentaries.

The first book treats of God, and brought the author before the Lateran council in 1139 on a charge of heresy, of which he was acquitted; the second, created things; the third, the incarnation, redemption, and human virtues; the fourth, eschatology and the sacraments. He maintained that, until the day of judgement, the inhabitants of heaven and hell will continually see one another, but that in the succeeding eternity the inhabitants of heaven alone will see those of the opposite world. Two other works, a *Commentary on the Psalms and Commentaries upon all the Pauline epistles*, are attributed to Lombard, who died in Paris, July 20, 1160. *Consult Life* (in French), F. Protois, 1881.

**Lombards.** Ancient people of Europe. The Lombards or Langobardi, whose name perhaps means the men of the long axes, were among the last of the Teutonic tribes who forced their way into that part of Europe which had been Latinised by the Roman empire. They lived on the lower Elbe in the 1st century of the Christian

era, but are found four centuries later in Moravia, where they became Arians. They revolted from the Heruli, and subsequently overthrew them in 493.

In the middle of the 6th century, aided by the Tartar Avars (*q.v.*), they extirpated the kindred German race of the Gepidae on the middle and upper Danube, and then, under their king Alboin, burst into N. Italy, 568, and made themselves masters of the whole plain of the Po, making Pavia their capital. Hence the region which they acquired received its permanent name of Lombardy. After Alboin (d. 572) the Lombards were ruled according to ancient tribal customs by many captains or chiefs, who extended their conquests over half Italy as far as the southern duchy of Benevento; a merely nominal sovereignty was enjoyed by an elected king. Catholicism replaced Arianism about 600 through the influence of Queen Theodolinda. There were periods of comparative progress in the time of Agilulf (591-615) and Rothari (636-652), who issued the code of Lombard laws.

From the middle of the 7th cent. till the middle of the 8th cent. Lombard dukes and kings were a perpetual menace to the papacy. The establishment of a real Lombard kingdom of Italy seemed close at hand in the reign of Liutprand (712-43). He established a real authority over the Lombard dukes. A quarrel between Liutprand and Pope Gregory III, and an attack upon Rome, caused the pope to appeal to the Frank Charles Martel against the Lombards, but it was not till after Liutprand's death that Pepin, the son of Charles, answered the papal appeal and set about the subjugation of the Lombards, which was actually completed in 774 by his son, Charlemagne.

The crown of Lombardy became the symbol of the imperial supremacy in Italy, and the Lombard kingdom itself soon disappeared. In the later Middle Ages the name of the Lombards, still preserved in Lombard Street, was given to the Italians who took the place of the expelled Jews in providing the crown with financial support. *Consult Italy and her Invaders*, T. Hodgkin, 2nd ed. 1892-96.

**Lombard Street.** A London thoroughfare, running from the Bank of England to Gracechurch Street, across which it is continued by Fenchurch Street. It contains the Wren church of S. Edmund—another of his. All Hallows, has

been removed under a replanning scheme—and S. Mary Woolnoth, built by Hawksmoor. Off Lombard Street are George Yard and Plough Court, where a tablet records that Pope was born. The street obtains its name from the Lombards who settled here as early perhaps as the 12th century. They were money-lenders, and this association has been kept up, many of the great British and foreign banks having their offices here. Lombard Street is often used as a synonym for the London money market. It is also the title of a classic work by Bagehot, 1873.

**Lombardy.** Territorial division, called a region, of N. Italy. It borders the Swiss cantons Grisons and Ticino, and contains the valley of the Po from the Rhaetian Alps in the N., between Piedmont and Venetia, to Emilia in the S. It embraces the provs. of Bergamo, Brescia, Como, Cremona, Mantua, Milan, Pavia, Sondrio, and Varese. Except in the N., where it is mountainous, the surface is virtually a fertile and well-cultivated plain. The division is well watered by the rivers Po, Adda, Oglio, Ticino, etc., and is well canalised and irrigated. Lake Maggiore is on the W. boundary and Lake Garda lies on the E. frontier. The beautiful lakes of Como and Iseo are wholly within Lombardy. The climate is very hot in summer and cold in winter. The chief productions are iron, copper, zinc, marble, granite, and alabaster.

Silk is largely manufactured, and the mulberry tree cultivated, while rice, maize, flax, hemp, wine, fruit, and nuts are grown. The chief town is Milan.

Lombardy was named after the Lombards (*q.v.*), who wrested it 568, from the E. Roman empire. Conquered by the Romans 222 B.C., it had been part of Gallia Cisalpina or Transpadana. The Lombard cities, which grew rich by industry and trade, formed small republics and joined the Lombard league, which successfully stood out against the emperors. By the close of the Middle Ages Lombardy came under the rule of the dukes of Milan. It later fell under the sway of Spain, and then of Austria. It was taken from the latter in 1859 and made part of the kingdom of Sardinia, and two years later was incorporated in the new kingdom of Italy. Area, 9,183 sq. m. Pop. 6,190,361. *See Italy*; *History*.

**Lombardy Poplar** (*Populus italica*). Tall-growing tree much used for ornamental purposes. It is of hybrid origin, one of the parents

Lombardy Poplar in winter, showing vertical direction of branch growth

being the black poplar (*P. nigra*). Rapidly growing in the form of a spire, it attains a height of from 100 to 150 ft. Male and female flowers are borne on different trees, and it is the male which is commonly grown, propagation being made by suckers and cuttings. See Branching illus.; Poplar.

**Lombok.** Island of the United States of Indonesia. A mountainous volcanic island of the Sunda group, it is separated from Sumbawa on the E. by the strait of Alas and on the W. from Bali by the strait of Lombok. Two mountain chains extend along the S. and N. coasts, in the latter of which is a volcanic peak, Mt. Lombok, 12,379 ft. high. Between the mountains is a fertile valley in which rice, maize, and coffee are grown, and cattle and horses raised. The capital is Mataram and the principal port Ampanam, on the W. coast. The island exports cattle, horses, tobacco, and indigo. Lombok came under Dutch control in 1894, and was governed by a rajah through the Dutch resident of Bali and Lombok. The native ruling class are Brahmins, but the mass of the people are Malays and Mahomedans. Occupied by the Japanese in the Second Great War, the island was liberated by British troops in Sept., 1945. It is now part of East Indonesia. Area 2,000 sq. m. See Bali; Wallace, A. R.

**Lombroso, CESARE** (1836-1909). Italian criminologist. Born Nov. 18, 1836, he became an army surgeon, 1859; professor of mental diseases at Pavia university, 1862; later professor of forensic medicine and psychiatry at Turin. In 1875

Cesare Lombroso, Italian criminologist

he published his monumental work *L'Uomo Delinquente* (The Criminal), in which he promulgated the theory that there was a definite criminal type which could be distinguished from the

normal type both anatomically and psychologically. Other books include *The Man of Genius* (Eng. trans. 1891); *Crime, its Causes and Remedies* (Eng. trans. 1911). He died Oct. 19, 1909. See Criminology; consult Life, H. Kurella, Eng. trans. 1911.

**Lome.** Seaport of French Togoland. Under the German administration before the First Great War, it was the capital of the country. Situated in the extreme W. of the colony, on the right of Benue, it is connected with Atakpame by rly., and also by rly. along the coast with Aného. The port has a wharf which can take a daily traffic of 600 tons. Lome was captured from the Germans by a British force on Aug. 7, 1914. Pop. 27,908.

**Lomond.** Scottish loch or lake. It covers 27 sq. m., but has a length of 23 m., the breadth being mostly one mile and only at one point 5 m. The largest inland loch in Scotland, it is often called the most beautiful. Its extreme length is between Ardlui and Balloch. It lies between Stirlingshire and Dumbartonshire, amid

Lomond. At Inversnaid coaches from the Trossachs connect with the steamers on the lake. The romantic associations of the district inspired a celebrated song. Around Balloch its shore has been industrialised; at Inveruglas, on the western shore of the lake, a power station of the N. of Scotland hydro-electric board's Loch Sloy scheme came into operation in March, 1950. See Ben Lomond.

Lome, West Africa. European quarter of this seaport town of French Togoland

**Lomza.** Town of Bialystok, Poland. In the 16th cent. it had a trade with Prussia and Lithuania. In 1795 it came under the dominion of Prussia, and after the peace of Tilsit (1807) it was under Russian rule until 1918. It lay in Russian-occupied Poland after the partition of 1939, was overrun by the Germans in 1941,

Loch Lomond, Scotland. View of the loch looking eastward from Luss

mountain and other scenery of great beauty. In the lake are a number of wooded islands. It receives the Endrick, Luss, Arklet, and other streams, and its waters pass by the Leven and the Clyde to the sea. On the E. side is Ben

and recaptured by the Russians after bitter fighting, Sept. 13, 1944. It stands on the Narew, a tributary of the Bug, 80 m. N.E. of Warsaw, on a branch of the Leningrad-Warsaw rly. Trade is carried on in corn, timber, and tar.

# LONDON: THE WORLD'S LARGEST CAPITAL

W. ERIC JACKSON, Assistant Clerk to the London County Council

*Here is an account of the history and activities of the capital of Great Britain, including particulars of the effect on that city of the air: aids it suffered during the Second Great War. Elsewhere in this work are hundreds of articles concerned with the boroughs, districts, parks, squares, buildings, monuments, etc., of the metropolis, e.g. Bankside; Lambeth; Kensington; Westminster; Hyde Park; Trafalgar Square; Guildhall; Law Courts; Tower, The, etc. See also Great Fire and biographies of eminent Londoners: Defoe; Dickens; Hogarth; Milton; Pepys, etc.*

The name London has many meanings. In the popular sense it includes the vast inhabited area

City of London  
arms

which stretches from Kew to Barking, from Surbiton to Enfield, and even beyond. When the registrar-general, for statistical purposes, first devised the term "Greater London" he took the metropolitan police and city police districts which together form an area more or less within a radius of 15 m. from Charing Cross. That term has since become popular and expresses a recognition that this great area is, in many senses, one unit. Greater London, in fact, comprises the whole of Middlesex and parts of the cos. of Essex, Kent, Surrey, and Hertford, has an area of 693 sq. m., and a pop. (1946) of 8,033,640. The built-up sprawl into which the original London has expanded has not ceased at the boundary of "Greater London" so defined. The Greater London Plan issued by the govt. in 1944 includes an even wider area.

The present City is the original London dating from Roman times. A square mile in area, it lay within the city wall, with the Ludgate

County of London  
arms

in the W., Aldgate in the E., Aldersgate in the N., and the Thames as its S. boundary. In contemporary speech the name London is more appropriately applied to the administrative co. of London, formed in 1889. This contains about 118 sq. m., with a pop. (1946), of 3,207,270, and includes the city. Outside the city, the co. is divided into 28 met. bors.

The London postal area is larger than the co., although it does not contain some small parts of Woolwich and Lewisham. It is divided into eight districts, which in turn are divided into a total of 118 separate delivery areas. For the purpose of main drainage, electricity supply, and water supply other special areas have been defined, each differing from the others and each larger than the co.

**GEOLOGY AND GEOGRAPHY.** The primary factor which has determined the importance of London is its position at the head of the Thames estuary, the main gateway into Britain from the Continent. Medieval chroniclers attribute the foundation of London to legendary heroes of prehistoric ages, but from archaeological and historical evidence there is little doubt that before the first cent. A.D. the site of London was a marshy tract merging on the higher ground into primeval forest, and that the main crossing of the Thames used by the Romans was at or near the site of London bridge.

S. of the river most of the land

in the London area is low-lying. Because of its marshiness it was little built on until the 19th cent. N. of the river the ground rises fairly sharply, excepting where streams ran down from the Hampstead heights. The Westbourne flowed through what is now Hyde park to its outlet at Chelsea; the Tyburn ran a little to the west of Bond St., across Green Park, and into the Thames by two branches at Westminster; the course of the Holbourne was by King's Cross, along the line of Farringdon St. under what is now Holborn viaduct, the lower reaches being called the Fleet. To the E. the river Lea still empties itself by many mouths into the Thames.

London lies within the chalk basin which extends from S. Herts. to the North Downs of Surrey and Kent. The basin is overlaid by a deposit of London clay which, in its turn, has been covered in part by local deposits of river gravels. These gravels form a clean, dry metalling eminently suitable for habitation.

**EARLY HISTORY** London is in origin two cities, the City of London, from its foundation in Roman times a trading centre, and the city of Westminster, which grew up slowly round the royal palace of Westminster. Both "cities" grew until their buildings joined, but throughout the cents. their main characteristics have been retained. The City of London is the centre of commerce, Westminster, "the west end," is the main shopping and entertainments quarter and the seat of govt.

Tacitus tells us that Londinium was already a flourishing community when in A.D. 60 it was destroyed by Boadicea and her tribesmen. It was soon rebuilt by the Romans and was defended against further attack by a wall, portions of which still remain to mark the bounds of the Roman city, e.g. in the Tower, in the churchyard of S. Giles, Cripplegate, and in the street now called London Wall. After the withdrawal of the Romans in A.D. 410, Britain was subjected to waves of invasion by Germanic tribes who knew nothing of urban civilization. Life ebbed from London

London. Plan of the Roman walled city, showing gates (some with their present names), and the roads or ways which radiated to all parts of Britain

and its buildings fell into decay. For over a century it was deserted, but some kind of occupation must have been resumed by the beginning of the 7th cent., for in 604 Mellitus was consecrated bishop of London.

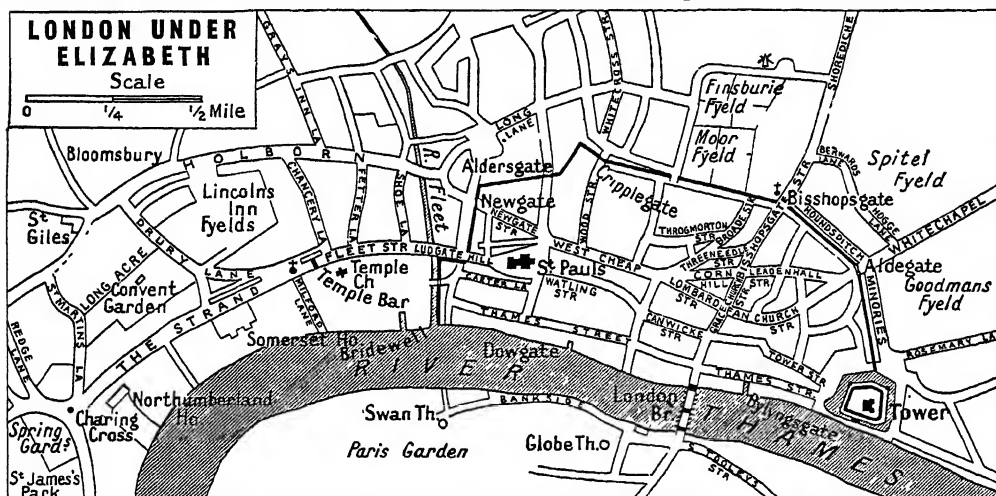

During the wars against the Danes, London, once more a trading centre, was a bone of contention. It seems to have been the centre of govt. when Canute became king of England. The abbey of Westminster, founded probably in the 8th cent. on the Isle of Thorney well outside London, was rebuilt by King Edward the Confessor, who also built a palace for himself close by. His successor, William the Conqueror, realizing the strategic importance of the

had secured a firm hold over commercial matters and over the administration of City govt. They developed into the livery companies, many of which survive. Sir Richard Whittington typifies the wealthy City merchant of the 14th-15th cent.

Westminster increased in importance after the establishment of the law courts there under Henry II. Gradually the great offices of state, the Exchequer, and the Chancery, and their offshoots, became centred there, and in the later Middle Ages when parliament was increasing in importance it too made Westminster its normal meeting place. By the end of the 15th cent. a collection of buildings had sprung up round Westminster

dome by S. Bartholomew priory and Bermondsey abbey.

ELIZABETHAN AND STUART LONDON. The outburst of energy which followed the Renaissance, the popularity of Elizabeth, and the brilliance of her court brought renewed vigour to England's capital. Noblemen, who previously held their town residences in the City, built houses at Westminster where they were nearer the royal court and had more room than in the crowded City streets. The wealthier merchants began to follow their example, and the sovereign became alarmed at the spread of buildings. The growth of a large town was a new phenomenon which might have serious political consequences, and it pro-

London. Plan showing main thoroughfares in the late 16th century, based on maps by Stow and Aggas

conjunction of Westminster and London, had himself crowned in the abbey, and made Westminster palace his chief residence. William built the White tower, the core of the present tower of London, to overawe the citizens, but in some degree reconciled them to his mastery by granting them a charter of liberties.

MEDIEVAL TIMES. During the Middle Ages London grew in wealth and importance and overflowed beyond the ancient walls so that some of its wards lay without the City gates, and new bars or gates were built to mark their limits. Temple Bar and Holborn Bar marked the W. boundary and the citizens tried to assert their rights over the growing community at the S. end of London bridge in Southwark. As in other towns, merchant and trade guilds were formed. By the 14th cent. they

palace. These housed govt. officials and clerks and provided lodgings for courtiers and M.P.s.

Henry VIII and Cardinal Wolsey did much to change the face of London. They built Whitehall, St. James's, and Greenwich palaces, and to them Hyde park and St. James's park owe their origin. They dissolved the numerous religious houses existing in London. Some of the buildings were destroyed, but some were adapted for secular, parochial, or charitable uses. The priory church of S. Mary Overy became the parish church of S. Saviour's, Southwark (now Southwark cathedral). Schools were founded at Westminster, S. Paul's Greyfriars (Christ's Hospital), and elsewhere; while the hospitals of S. Bartholomew and S. Thomas were founded in the reign of Edward VI as a part replacement of the charitable work

duced many difficulties in the provision of sufficient food and water and sanitation. Elizabeth and James I issued edicts against further building, but they were powerless to stem the tide. London's pop. was growing, and it had to be housed. Nevertheless, the first authentic map of London made about 1570 shows the churches of S. Martin and S. Giles still "in the fields." It was not until the middle of the 17th cent. that Leicester Sq. and the neighbouring streets were laid out by the earl of Leicester on the site of Leicester house, and that the piazza was built in Covent (or Convent) Garden by the earl of Bedford. John Stow in his Survey of London, first ed. 1598, gives a detailed and vivid description of London in a period of rapid change and development. The citizens of London opposed the demands of Charles I for loans

and taxes and supported parliament against him in the Civil War. Soon after the restoration they suffered two severe calamities—the Great Plague and the Great Fire. The result was an impetus to the spread of London. Many people fled from the tainted air of the City to the surrounding villages in 1665, and, although Sir Christopher Wren's spacious rebuilding scheme for London after the fire was not adopted, many of the congested alleys were cleared, and the new houses were less tightly packed than the old, the displaced population finding accommodation outside the City.

#### A City of Spires

Wren made London a city of spires, many of which have fortunately survived both "improvers" and enemy attacks. His greatest monument is St. Paul's cathedral, which, though damaged by enemy bombs during the Second Great War, still supports the great dome, to many people a symbol of London's greatness.

17TH, 18TH, and 19TH CENTURIES. The discovery of the new world and the opening of routes to the East meant a great increase of trade in London. The new trading companies—the merchant adventurers, the Muscovy co., the E. India co., the Hudson's Bay co., etc.—had their h.q. there. The river quays grew busier, but it was not until 1800 that the first dock, the W. India dock in the Isle of Dogs, was built.

The guilds and livery companies, originally democratic in character, tended to become more exclusive and oligarchical as they grew richer. Poor craftsmen were often forced to leave the City, either because of the high cost of living or because of the restrictions imposed by the guilds. They plied their trades in the suburbs and sold their wares to the City shopkeepers. They were joined by craftsmen from other parts of England and, particularly in the 16th and 17th cents., by refugees from persecution on the Continent. French silk-weavers settled in Spitalfields and Shoreditch, feltmakers from Rouen and hop-dealers from Flanders settled in Southwark, tanners in Bermondsey.

The poorer workers who made their abode outside the City either crowded into existing houses or put up makeshift sheds and hovels. Simultaneously a more orderly growth of London was taking place. Landowners were "developing" their estates W. of the City with the aid of the speculative

builder, and streets and squares of houses were being built to accommodate the nobility, the City merchants, and the new professional classes. Many of these flat-fronted brick Georgian terrace houses still survive, particularly in Westminster and Bloomsbury.

The London bridge, built at the beginning of the 13th cent. by Peter de Colechurch, survived, though with many repairs and alterations, until 1831 when the present bridge was opened. No other bridge was built over the Thames in the London area until the first Westminster bridge of 1750. The first Blackfriars bridge was completed in 1769. Approach roads to these two bridges were formed on the S. side of the river, converging at St. George's Circus, but little building took place between them except along their immediate frontages. The area between Blackfriars Rd. (formerly Great Surrey St.) and the Borough was, however, almost all built over by the end of the century.

In the years following the industrial revolution London, like the rest of the country, had a rapidly increasing pop., though from 1785 onwards hundreds of London pauper children were sent N. to work in the factories. The speculative builder was busy both building round the central area and developing the villages surrounding London—Islington, Hackney, Poplar, Greenwich, Camberwell, etc.—until they converged into the urban agglomeration now called London. Even marshy land like that in Pimlico and Lambeth, previously considered unfit for building, was drained and built on. Street upon street of uniform semi-basement houses was built to accommodate the large families and plentiful domestic servants of Victorian London, the London of extremes of wealth and poverty, of bustle and confusion, ill-drained, and often fog-bound, but full of vitality, admirably portrayed in the novels of Charles Dickens.

#### Outbreaks of Cholera

The public health conditions in London were, as were those of other great cities at this time, deplorable. The tainted and inadequate water supply, the slums and cesspools, and the festering graveyards resulted in outbreaks of cholera in 1832-33, 1848-49, and 1853-54, which spread from the poorer to the richer quarters of the town.

The social conscience was awakened. The reforming zeal

engendered throughout the country in the latter part of the 19th cent. had an impressive impact upon London's local govt. Twice at least in that half-cent. the organization of local administration in London was drastically overhauled.

THE CITY CORPORATION. Of the authorities sharing the local govt. of London, the City of London corporation is the most ancient. The earliest London officials recorded are the bishop and the portreeve, mentioned in the charter given to the City by William the Conqueror. The portreeve was apparently the representative of the civil authorities. His office appears to have been abolished and his place taken by the sheriff or shire-reeve, appointed by the king. Londoners were, however, granted by Henry I the unusual privilege of appointing the sheriffs of London and Middlesex (in which co. London then was). This privilege was forfeited in the reigns of Henry II and Richard I, but restored by John in 1199.

#### History of the Mayoralty

At a somewhat earlier date a new official appears to have been created—the mayor. His office dates certainly from 1191 and probably from some years earlier. John, during the absence of his brother Richard I, granted to the citizens of London the right to elect their own mayor. The conferment of this right was the price of the citizens' support of John against the justiciar Longchamp. John swore to recognize the London commune, a form of town govt. borrowed from Rouen. Under this system the local governing body was the mayor and 12 *échevins* (aldermen) with whom were associated *alii probi homines* (other worthy men), also to the number of twelve. Thenceforward the mayor was the head of London's local govt.

Somewhere about 1540, without any official grant of the title, the mayor became the lord mayor. The *échevins* and the "other worthy men" were forerunners of the present common council. Aldermen had already, from an early date, presided over the 25 wards into which the City was divided. Their earliest appearance as a court of aldermen was in the 13th cent. From the 14th cent. onwards the City corporation thus included the chief magistrate (mayor), a court of aldermen, and a court of common council. The annual election of aldermen was formally ordered in 1377. The common

London. Map of Greater London, showing the vast area it had attained by 1943

councilmen were originally elected by the wards, but by the close of the Middle Ages their election was made by the livery companies. Both aldermen and common councilmen are now popularly elected on a franchise similar to that for other local govt. elections. In 1683 Charles II in his attempt to obtain autocratic power deprived the City of its civic liberties, but they were restored in 1698.

The court of common hall consisted originally of all freemen of the City. Later it became representative of the wards. It consists today of those freemen of the livery companies who are entitled to the "livery" of their companies; it elects the two City sheriffs and certain other officers, and nominates two aldermen for the office of lord mayor from among those who have been sheriffs. The court of the 25 aldermen now elected for life, one for each ward, acts as a court of justice for minor offences (each alderman being a J.P.) and has the control of the City of London police force. The court of common council is composed of the aldermen and 206 common councilmen elected annually. This court is virtually the

local govt. authority for the City and carries out duties relating to public health, housing, open spaces, streets, and bridges.

The lord mayor presides over all three courts of which the corporation is composed. He is the chief magistrate, has the title of admiral of the port of London, has certain duties in connexion with the royal coronation, and has a number of other functions and privileges. After his election he is presented to the sovereign by the lord chancellor for the royal approval, and is then sworn in by the judges of the high court. This is the occasion for one of London's most popular events, the procession to the law courts, known as the lord mayor's show, held on or about Nov. 9 each year, usually in the form of a display of pageantry illustrative of some aspect of London life or some theme of current public interest. The City of London corporation, largely medieval in form, is a unique local governing body.

Apart from income from rates, the corporation has substantial private property, the funds from which are used for charitable and educational purposes, ceremonies and the entertainment of distin-

guished visitors, and the official salary of the lord mayor. The corporation officials, besides including normal local govt. appointments such as M.O., engineer, surveyor, and solicitor, include also the recorder, appointed for life by the lord chancellor on the nomination of the City. The recorder acts as one of the judges of the central criminal court. The common serjeant is a somewhat similar appointment. The town clerk is elected annually. The chamberlain is by ancient custom the treasurer of the City. The remembrancer has duties connected with official hospitality and the maintenance of relations between parliament and the City. The secondary keeps the register of electors.

The sheriffs of the City lost their jurisdiction over the co. of Middlesex when in 1889 the co. of London was created.

**THE COUNTY OF LONDON.** Before the middle of the 19th cent., in the area surrounding the City, local govt. was partly in the hands of the quarter sessions of the various cos. Each parish had either an annual vestry composed of all the local inhabitants, or a select vestry set up, under the Vestries

Act, 1831, as representing the inhabitants. These vestries had very limited powers. Accordingly, in order to deal with such matters as sewerage, street maintenance, and paving, special bodies were set up under acts of parliament to provide these necessary services in defined localities. By 1855 there were some 300 of these small bodies in the met. area. Numbers of them were in no way responsible to the local ratepayers. The Metropolis Management Act, 1855, defined an area to be known as the metropolis, and in that area abolished these small local bodies and set up administrative vestries elected by the local ratepayers. Some of the smaller parishes were grouped together under elected district boards. These vestries and district boards were given the functions of street management, sewerage, drainage, and the like. For the metropolis as a whole, a met. board of works was set up, not directly elected by the people, but appointed by the local vestries and boards. The met. board had certain general functions over the whole area, such as the management of the London fire brigade, main drainage, the Thames embankments, and the administration of the London building laws.

#### London Made a County

The met. board of works proved unpopular, chiefly because of its indirect election. Complaints of maladministration and corruption were made. A royal commission was appointed to make inquiry. By the Local Government Act, 1888, which set up C.C.s throughout England and Wales, the "metropolis" was made a co. by itself, and the London county council was created. The co. has its own sheriff and lord lieutenant. For local govt. purposes the City of London is part of the administrative co. of London. For judicial purposes the City remains a separate co. with its own sheriffs.

By 1899 the vestries and district boards were supplanted by the met. bor. councils, 28 in number, of which one (Westminster) has the title of city council. Each of these has a mayor, aldermen, and councillors. The councillors are publicly elected by the local residents every three years. Aldermen are, in number, one sixth of the councillors, and are elected by the councillors every six years. The total membership of a met. bor. council may not exceed 71.

The L.C.C. consists of 20 co. aldermen and 124 councillors. The latter are elected for three years; aldermen are appointed by the

councillors and sit for six years. There is a chairman, a vice-chairman, and a deputy chairman. The council is responsible for certain main services, such as public education, main drainage, major housing schemes, town-planning, the London fire brigade, and a number of large parks and open spaces. The City corporation and the met. bor. councils administer local services such as public libraries, baths, cemeteries, refuse collection, minor housing schemes, public gardens, food sampling, and street maintenance.

#### Authority Managing the Port

The management of the port is in the hands of the port of London authority, which is partly appointed by the govt. and local authorities, and partly elected by users of the port. Water supply in and around London is managed by a special water authority, and police services outside the City and within an area extending some 15 m. from Charing Cross are under the control of a commissioner of police for the metropolis, who in turn is subject to the supervision of the Home office.

**TRADE AND INDUSTRIES.** Besides being a national and imperial capital and a governmental and administrative centre, London is a hub of commerce and an area of very considerable industry. The greatness of London has, indeed, been founded upon commercial activity. The livery companies developed out of guilds which were chiefly concerned with crafts and local trade, but they soon became divided into those which catered for local demand and those which undertook international trade. Of the latter class the mercers were the most prominent, and from their co. the great merchant adventurers co. evolved, the first of the many important trading companies which assisted in the development of the resources of the new world. The first royal exchange was built in the reign of Elizabeth, and provided a tangible sign of the growing importance of London trade. Until then merchants had been obliged to meet in the streets to transact their business or (at a later stage) to make use of the converted nave of S. Paul's as a sort of general meeting place.

The great increase in the number of banks during the 17th cent. illustrated the growing prosperity and commercial activity of London. These banks were in the hands of the goldsmiths, who, in the 16th cent. had taken the place of the Lombard and other foreign bankers

of the Middle Ages. The great event which marks the beginning of the era of London's modern trade, however, was the foundation of the bank of England in 1694. From this time onward London tended to become a world centre for trade. The 18th cent. saw terrible financial crises, the worst of which was the bursting of the South Sea Bubble in 1720. These were, however, temporary checks in a steady development.

The Crystal Palace exhibition of 1851 marked one of the peak periods of London's prosperity. The exhibition was held in Hyde park, the building being subsequently moved to Sydenham. It survived until 1936 when it was destroyed by fire. None of the subsequent "great exhibitions" at Earl's Court (1894), the White City (1908-10), and Wembley (1924-25) aroused quite the same enthusiasm.

#### Industrial Development

At the beginning of the 20th cent. London had a world-wide importance not only in commerce but also in industry. Within the co. of London in 1938 approx. three-quarters of a million persons were engaged in productive industry. Some 37,000 factories and workshops were in operation. The principal industries were (in order of size) engineering, clothing, food (including tobacco and drink), furniture, printing and paper, and chemicals, besides a large number of miscellaneous trades. Engineering and clothing in 1938 accounted for some 55 p.c. of London's industrial employment, and 60 p.c. of its factories and workshops. The Second Great War (1939-45) with its air-raid damage did not greatly alter this balance. There is a tendency for industry to decentralise from the congested inner areas to the outer belt, a process encouraged by the various town-planning proposals. This, however, may be regarded as a spreading of London rather than as a diminution.

The average number of workers per factory, except for a few relatively large ones, is less than 20. Industry is for the most part small-scale and very scattered, although engineering works of no small importance are to be found on both sides of the river. The royal arsenal at Woolwich is a particular example. In the same bor. and in Greenwich, Deptford, Poplar, and Battersea heavy engineering is organized in large units undertaking the manufacture of cranes, boilers, cables, marine engineering, and ship repairs. There

is a certain amount of shipbuilding of smaller craft. Medium and light engineering, including the production of printing machinery, electrical and household equipment, pressed metal work and scientific instruments, is distributed throughout the co.

#### The Clothing Trade

Clothing manufacture and tailoring is chiefly grouped in two areas, the west end (the centre of fashion) and the east end (the main centre of wholesale, warehouse, and mass-produced trade). Much of the "tailoring-out" work for the high class west end tailors is done in Soho, some of it in the east end. The centre of the west end dress-making trade is Regent St., Bond St., and Brook St., while Oxford St. is the shopping centre for the less expensive retail drapery and women's clothing. In Hanover Square and Soho Square is the wholesale dressmaking business. The east end wholesale trade is linked with the City warehouses, but some high quality specialised work is also carried out. The boot and shoe industry lies chiefly in Hackney. The fur trade is located in Stepney, Bethnal Green, and Hackney in association with the fur warehouses of the City.

Food manufacture and allied processes, such as bacon curing, butter blending, sugar refining, tobacco processing, and brewing, form a very substantial part of London's industry. The furniture making trade is located chiefly in the east end, as an overspill from the City, and is carried on in both small and large workshops. A trade in repair work is developing in the west end mainly in association with the big shopping centres and the antique furniture trade.

The printing industry continually expands. An important section of this trade is the production of daily newspapers and other periodicals and the subsidiary trades, such as process work, ink making, and general stationery.

The heavy chemical industry in and around London is largely outside the boundary of the co., but there are in the co. substantial factories concerned with oil refining, paint, soap, glue, and gas manufacture. A great development has taken place in the light chemical industry concerned with cosmetics, tooth-paste, surgical requisites, and the like.

In the period between the First and Second Great Wars industry, particularly light industries, tended to gravitate towards London. The Town and Country

Planning Act, 1947, and other acts, and town-planning schemes made under them, had as one of their objects the establishment of satellite towns, with an appropriate amount of industry, some 20 to 50 m. out from London, in order to relieve the congestion of London and provide better living conditions there.

The backbone of London's industry is the port of London with the majestic easy-flowing Thames leading right into the heart of the city, and London's long pre-eminence as a port is likely to continue. The port has a tremendous entrepôt trade and is a supply centre for London region.

Of the wholesale markets Covent Garden, where fruit, vegetables, and flowers are sold, is perhaps the most famous. Smithfield is the principal market for meat, Billingsgate for fish.

The London stock exchange is the leading exchange of its kind in the country. Lloyd's is the centre for world marine insurance. The Fleet St. area contains many newspaper and publishing offices.

**AMENITIES AND SOCIAL LIFE.** Since the days of Shakespeare and the theatres on Bankside, London has been the mecca of British actors. Most of the theatres are in the neighbourhood of Charing Cross Rd. and Shaftesbury Ave. Cinemas are numerous and vary in size from the super cinema (some of which were specially built and some converted from former theatres) to the small news theatre of which examples are found at main line rly. termini. Important films are usually shown in central London before being generally released. Queen's Hall, home of the promenade concert, was destroyed, and the Old Vic, resort of lovers of Shakespearian and other classical drama, was damaged by air raids in 1941; the "proms" found a home in the Royal Albert Hall. Schemes for developing the S. bank of the Thames in connexion with the 1951 Festival of Britain included a concert hall and a national theatre.

#### Art Collections and Libraries

The chief picture galleries are the National and the National Portrait galleries in Trafalgar Square, the Tate gallery (mainly 19th and 20th cent. paintings) on Millbank, and the Wallace collection in Manchester Square. The Victoria and Albert and the British museums contain large collections of drawings and etchings. S. Kensington is the museum centre of London. The London

museum (*q.v.*) was housed at Kensington Palace from 1948.

The British museum library, one of the three copyright libraries, contains over 5 million books and a large collection of manuscripts; the newspaper section was moved to Colindale, 1932. It attracts many students, as does the public record office. Other fine libraries are the science library in the Imperial Institute, the law libraries in the Temple, the library of the London school of economics and political science, and the libraries of London university and its colleges. Many learned societies have their h.q. in London.

#### London's Open Spaces

The royal parks, Green park, Hyde park, and Kensington gardens, form a continuous stretch of open space over two m. long. The rose garden, the lake, and the open-air theatre attract many visitors to Regent's park. The parks at Dulwich, Battersea, and Finsbury Park are among the most attractive of those maintained by the L.C.C. Open-air entertainments and bands are provided in the summer months. Epping forest, Hampstead heath, Richmond park, and Wimbledon common are large open spaces where natural conditions have been retained. Transport to the open countryside is available by bus, motor coach, and rly. The local authorities have done much to preserve "London's country" by buying up tracts of land round the built-up area to form a green belt round London.

Thousands of people visit London every year to see cricket at Lord's and the Oval, tennis at Wimbledon, Rugby football at Twickenham, and Association football at Wembley. Other important sporting events take place at Wembley stadium, the White City, and in the Crystal Palace grounds.

The fashionable shopping centre is the neighbourhood of Regent St., Piccadilly, Bond St., and Oxford St., though Knightsbridge and Kensington High St. attract many shoppers, and none of the bors. is without its local shopping centre. Certain trades and types of shop tend to collect in certain streets, *e.g.*, Charing Cross Rd. is noted for its bookshops, Great Portland St. for motor salerooms. Street markets flourish in The Cut in Lambeth, Middlesex St. (formerly Petticoat lane) in Stepney, Berwick market, Soho, and many other parts.

Westminster abbey, S. Paul's cathedral, and Southwark cathe-

dral attract visitors. S. Martin-in-the-Fields is perhaps the best known of London's parish churches. Westminster cathedral, off Victoria St., and Brompton oratory are the centres of Roman Catholicism. Many churches and chapels were destroyed or badly damaged by enemy air attack in 1940-41 and 1944-45, but the Central Hall, opposite Westminster Abbey, the Memorial Hall in Farringdon St., and Friends' House, Euston Rd., remained as the central meeting places of the Methodists, the Congregationalists, and the Society of Friends. The Salvation Army h.q. in Queen Victoria St. was destroyed.

**PHYSICAL DEVELOPMENT.** London has evolved, as have many other large urban centres, out of a series of ancient villages which have grown into one another by common expansion. The community structure of the former villages can still be traced, overlaid by the general development. In e.g., Blackheath, Dulwich, Chelsea, Lee, the old world atmosphere of the former village can still be sensed. Some of the former centres have become focal points and prominent local shopping centres; Brixton, Lewisham, Peckham are examples.

#### Transport Facilities

When rlys. first came to London in the middle of the 19th cent., the termini at Euston, St. Pancras, and Victoria were on the outskirts of the town. London is now covered by a network of rlys., including surface, underground (at basement level), and "tube" lines. Buses or trams cover every district, and numerous taxi-cabs ply for hire. All the great trunk lines terminate in London.

London's transport has developed without co-ordination and, particularly in the matter of roads, has tended to lag behind need. As London has grown, the transport problem has been intensified. Road widening and extension, improvements in underground and surface rlys. have had constantly to be undertaken; circular roads around London to divert traffic that would otherwise pass through the centre are under construction or in project. Cross-river traffic is a perennial problem. The Thames is, within the co. of London, crossed by ten road bridges under the control of the L.C.C., as well as by four bridges controlled by the City corporation. There are six rly. bridges, two pedestrian tunnels (at Greenwich and Woolwich), two vehicular

tunnels (Rotherhithe and Blackwall), and a free ferry for vehicles and pedestrians at Woolwich. Further bridges and tunnels are under construction or planned.

#### Architectural Styles

Its architecture has made London the butt of criticism of town-planners and a source of endearment to those to whom variety appeals. It includes a few medieval buildings, churches and public buildings often of Portland stone, a mixture of flat, brick-built houses of the 18th cent. and semi-base-ment brick and stone residences of the 19th, interspersed with examples of Victorian Gothic, all darkened with the grime of years, and huge dept. stores, super-cinemas, blocks of flats, and offices in reinforced concrete of the latest design. Large areas of 20th cent. red brick housing of terrace and villa types fill the outer suburbs.

The ever-moving tide of social change has had, and will doubtless continue to have, its effects. Neighbourhoods alter with the trends of fashion and habit. Districts that were once, like Belgravia and Mayfair, exclusively residential are invaded by commercial and professional business; districts that once were high-class grow depressed and workaday. The large town house goes out of fashion, and flats become the vogue.

The air-raids of 1940-1945 scarred London badly, making some localities unrecognizable. The broad outlines, however, remain. S. Paul's continues to dominate the City, the west end remains the centre of culture, fashion, and entertainment, the east end the main area of working-class life. The City is the commercial centre of office, bank, and counting house.

London lost some of her architectural glories—notably, many of Wren's churches in the City—but her citizens won the battle honours of patience and steadfastness under trial. The pop. of the co. fell from over 4 millions to just over 2 millions. With the end of hostilities London filled again, the pop. rising to 3½ millions by the end of 1945; there was acute shortage of housing and business accommodation.

#### Plans for Reconstruction

London, however, like her Cockney inhabitants, is irrepressible. Great plans for reconstruction were prepared by the public authorities during the Second Great War. The County of London Plan 1943, issued by the L.C.C.,

the City of London Plan, 1944, prepared by the City, and the Greater London Plan, 1944, issued by the govt., laid down the broad lines of post-war re-development. Projects for ring roads for fast traffic, increased open space and amenity, new schools, and the decongestion of pop. and industry are among schemes to be implemented before the end of the 20th century.

London of the days of Sherlock Holmes and R. L. Stevenson has disappeared. The horse-bus and the hansom cab are seen no more. The old-time "London particular" fog, yellow as pea soup, offspring of coal smoke, survives but, under the beneficent influence of smoke abatement laws and electrification, only as an occasional pale mist.

The movement towards planned reconstruction has brought consciousness of the value of the old. Buildings of architectural and historic merit are not to be ruthlessly swept away; while the opportunity presented by the enemy's clearance of many sites in the city was used to study Roman and other archaeological remains normally buried under bricks and mortar. London will retain continuity with her great past and continue to be an embodiment of the pride, the achievement, and the affection of the whole British people.

**Bibliography.** The Guildhall and the L.C.C. libraries, and the London museum all contain good collections of books, maps, and views relating to London.

**GENERAL HISTORY AND TOPOGRAPHY.** London Past and Present, 3 vols., P. Cunningham and H. B. Wheatley, 1891; Survey of London, 10 vols., Sir W. Besant, 1902-09; Dictionary of London, H. A. Harben, 1918; London Rebuilt, H. Clunn, 1897-1927; Geography of London River, L. R. Jones, 1931; Famous London Churches, C. B. Mortlock, 1935; London: Heart of the Empire, A. Mee, 1937; Encyclopedia of London, W. Kent, 1937; Under London, F. L. Stevens, 1939.

W. Eric Jackson

THE SECOND GREAT WAR. Preparations to meet aerial attack on London started at the time of the Munich crisis, Sept., 1938. Distribution of gas masks and the organization of a civil defence force began, and plans (put partially into practice at that time) were drawn up for evacuation of sections of the pop. and of govt. depts. Steel outdoor (Anderson) shelters were distributed free in Feb., 1939, to families who lived in houses and whose income was below £250.

During Sept. 1-3, 1939, 300,000 official "evacuees"—school children, expectant mothers, and aged and blind persons—were sent out of London; and parties continued to leave at intervals until Nov. 10, 1943; official evacuation was reopened July 1-Sept. 7, 1944, to counter the danger from flying bombs.

#### First Air Raid Warnings

The London sirens sounded their first air raid warning—a false alarm—as the prime minister finished broadcasting the announcement on Sunday, Sept. 3, that the country was at war. The blackout of all artificial lighting which was to last until Sept. 17, 1944, had begun on Sept. 1. Notices announcing AIR RAID SHELTERS appeared overnight above basements, some of them reinforced; signs in every street pointed to wardens' and first aid posts, and gas cleansing and fire stations. Zig-zag shelter trenches were dug in many of the parks and squares, to be later roofed in with steel. Statues and monuments in the streets were either removed to a place of safety or bricked up. Barrage balloons went up, and around London A.A. guns were sited, the outermost about 13 m. away.

Sirens sounded again on the night of June 24-25, 1940; and "spotters," whose task after the air raid warning had been sounded was to notify approaching enemy aeroplanes, were thereafter placed on the top of many buildings. The first air attack in the London area came on Aug. 16, when 30-40 bombs were dropped in a S.W. suburb; the first all-night raid on central London was on Aug. 24. The battle of London began on Sat., Sept. 7, with a day and night attack on the docks by more than 600 raiders coming in in waves. Raids continued nightly until Nov. 3, when there was no alert; few nights to the end of Dec passed without an attack. The opening months of 1941 brought

occasional raids, but after May 10-11 there were no further severe attacks until early 1944.

Blast walls of brickwork were put up outside the doorways of office buildings; many ground floor window openings were sand-bagged, many upper windows were bricked up, and when window glass was blown out it was replaced by wood or cardboard. Surface shelters of brick and reinforced concrete were built in every road and open space. It had been intended to keep the tube rly. stations (used as air raid shelters during the First Great War) clear during alerts; but when severe night raids started people carrying blankets and their treasures in suitcases bought 1½d. tickets and took possession, sleeping on platforms and stairways until in Nov. 79 stations were fitted with 7,600 three-tier bunks for which season tickets were issued. When the shelter facilities in these stations were ended May 6, 1945, London Transport added up the nightly numbers of those who had slept in these bunks and made the total forty millions. At the time of the worst raids, however, at least two-thirds of Londoners remained in their homes: the city's sprawl was an aid to safety. The windows of omnibuses, trams, and trains of London Transport, which ran throughout the raids, were covered with protective netting to reduce the danger of their splintering. Indoor steel table (Morrison) shelters were issued in Feb., 1941.

#### Narrow Escape of S. Paul's Cathedral

A one-ton delayed action bomb that penetrated the roadway in front of S. Paul's cathedral on Sept. 11, 1940, was dug out and carted away to be exploded in Hackney marshes, where in the course of time many others joined it, together with hundreds of tons of rubble from shattered buildings. In Oct. a bomb penetrated the roof of S. Paul's, and it was hit again the following April; but though the cathedral was damaged the devotion of the special band of watchers who volunteered to care for it saved it from destruction; its survival was an important contribution to Londoners' morale. Buckingham Palace was hit on Sept. 10, 1940; but the king and queen remained in London throughout the war.

A fire-raising raid on the night of Dec. 29-30 started some 1,500 fires and destroyed acres of buildings in the narrow streets and alleys of the oldest part of the

City; many water mains were damaged, the Thames was at low-tide, and the firefighters could not get water. Only towards the end of 1941 was completed the system of large surface pipes laid along the chief roads and fed by pumps from the river which, with many new water tanks built on cleared sites, would have provided adequate water in the event of another fire attack. Between Sept. 1, 1940, and July 31, 1941, fifty thousand H.E. and countless incendiary bombs fell on London.

#### Effects of Air Raids

Information kiosks set up by London Transport directed people whose normal bus or tram route or rly. station was out of action through the presence of unexploded bombs or road blocks due to bomb cavities or heaps of rubble. Broken gas and water mains, telephone and electric cables were repaired during raids and with remarkable expedition. A temporary bridge was thrown across a crater in Charing Cross road; a crater in Lancaster place caused the closing of (the pre-war temporary) Waterloo bridge, but work continued on the new bridge, which was opened to traffic Aug. 11, 1942. The approaches to a number of Thames road bridges were hit, and there were many near misses close to the innumerable rly. bridges in S. London, but only Hungerford footbridge was cut, by a flying bomb; a wood-and-steel emergency bridge between Westminster and Charing Cross was used by pedestrians until Hungerford bridge was repaired; a second emergency bridge, between Lambeth and Vauxhall, and a third, between Chelsea and Albert bridges, were never used. All the main line rly termini were damaged by blast; Paddington, Liverpool Street, Victoria, and S. Pancras received direct hits. Bombs fell all round Clapham Junction, largest rly. junction in the world, but rarely put it out of action. The enemy's onslaught on the dock area, however, reduced the activity of the port, dockers, barges, and grain elevators from which were transferred to a temporary port at Gareloch in the Clyde.

When in June, 1940, France was defeated and invasion of England seemed imminent, all public buildings were barricaded with barbed wire and with defensive netting. Camouflaged concrete blockhouses were built at strategic points—one of the most conspicuous in Parliament square so well disguised as a

bookstall that hundreds of people passed it every day without realizing that it was a fake. An anti-tank ditch was constructed all round London some 12 m. from the centre.

The removal of iron railings from parks, private gardens, and squares during 1942, which gave public access to squares (e.g. St. James's, Russell, Berkeley) never open before except to occupiers of the surrounding houses, produced about 135,000 tons of scrap iron.

Many business firms, banks, and societies evacuated part or the whole of their organization to the country. Some govt. depts. and parts of others moved out; but the govt. itself and depts. dealing with the conduct of the war remained in the capital. The commons met in their own house until it was destroyed by fire during an air raid on May 10–11, 1941; thereafter they met first at Church House and later in the chamber of the upper house, the lords then meeting in Church House. Seventy feet below Whitehall was the cabinet h.q., construction of which began shortly after Munich; Winston Churchill's wartime broadcasts were made from his private room there. The Admiralty built a bomb-proof citadel behind its pre-war building.

After the German occupation of Europe in 1940, London became throughout the war the seat of the exiled govts. of Poland, Norway, Belgium, the Netherlands, and Czecho-Slovakia, and h.q. of the Free (later Fighting) French until 1943; the exiled govts. of Yugoslavia and Greece were in London, 1941–43. From 1942 the U.S. army and military police uniforms were a familiar sight.

#### Headquarters for European Invasion

In Aug., 1943, preparations for the invasion of Europe began under Lt.-Gen. F. E. Morgan at Norfolk House, St. James's Square, which became Gen. Eisenhower's h.q., Jan.–March, 1944, when he moved to Bushey park, Middlesex, on the outskirts of London.

The "little blitz" on London followed Eisenhower's arrival. Enemy bombers, on most of the 20 attacks during Jan.–March, 1944, about 100 in number, were met by a barrage of intense violence. On the night of Feb. 23–24 they damaged the London library and Chat-ham house in St. James's Square.

Caissons for the Mulberry harbours were made in the Thames estuary, and London was a mounting port for landing craft taking part in the invasion of France on

June 6, for some days before and after which military convoys travelled almost continuously through London on their way to their assembly points. On June 13 the flying-bomb (*g.v.*) attack began; during June 13–Sept. 4 more than 2,300 flying-bombs fell on London; one on June 18 destroyed the Guards chapel at Wellington barracks; another on June 30 fell just outside the Air ministry's office in Aldwych. No London borough escaped damage; Wandsworth was the most severely hit. The bombardment went on through the 24 hours; but Londoners continued by day to go about their life and work, pausing to take shelter only when they heard the sound of an approaching missile. At night, some of them used the eight deep shelters which, started in 1941, were opened during July, 1944. A hundred ft. below ground, these were bomb-proof, gas-proof, and water-proof; each could sleep 8,500, and in emergency shelter 35,000. The first rocket bomb (*see* Rocket) to reach London fell at Chiswick on Sept. 8; more than 500 fell in London. One, on a Sat. morning in Nov., killed 160 in New Cross.

The worst "incident" of the war connected with air attack on the U.K. occurred at Bethnal Green, March 3, 1943, when 173 were killed as crowds entering a shelter lost their self-control through the firing of A.A. rockets.

#### Total War Casualties

A total of 29,890 citizens of London were killed by enemy action, 50,497 injured and detained in hospital; 1,400,245 houses were destroyed or damaged by bombs—many slightly, but enough were uninhabitable to make the housing shortage serious when evacuated Londoners were, on May 2, 1945, officially invited, if their homes were habitable, to return. The first temporary prefabricated houses which helped to remedy this shortage were erected in Poplar, 1943.

The lantern in the clock tower at Westminster was relit April 24, 1945; and from 10, Downing Street, Churchill broadcast the announcement of the end of the war in Europe on May 8, Clement Attlee that of the war with Japan at midnight, Aug. 14–15.

LONDON: MAIN LINE RAILWAYS WITH THEIR TERMINI, AND THE NETWORK OF THE LONDON TRANSPORT SYSTEM OF TUBES AND OTHER ELECTRIC RAILWAYS

LONDON: CENTRAL DISTRICT FROM S. PAUL'S CATHEDRAL (EAST) TO OXFORD CIRCUS (WEST), INDICATING CHURCHES, PUBLIC BUILDINGS, Etc.

**London.** City and port of entry of Ontario, Canada. In Middlesex co., it stands on the Thames, 105 m. S.W. of Toronto. It is served by the C.N.R., C.P.R., also by the Pere Marquette and Michigan Central lines. It has electric tramways which also run to Port Stanley on Lake Erie. The seat of the university of W. Ontario and of R.C. and Anglican bishops, it has for chief buildings the two cathedrals and other churches, hospitals, etc. Industries include the manufacture of agricultural implements and machinery, chemicals, furniture, leather, etc., and here are petroleum refineries and shops of the C.N.R. Electric power is obtained from Niagara falls. London was founded in 1825. Pop. 79,277.

**London, CRIES OF.** Calls of street vendors and others. All but obsolete today, they ranged from the cries of watchmen and watermen, bellmen and boatmen, shopkeepers and apprentices, to those of the hundreds of itinerant traders, balladmongers, etc., who plied their wares or callings in the city streets. Of the trade cries the earliest mention is in Lydgate's 15th century ballad, *London Lyckpenny* (Lackpenny), which throws an interesting light on the life of his time. Many of the cries, like *Sweet Lavender*, were harmonised, and were illustrated by drawings of the criers by T. and J. Bewick, Rowlandson, Cruikshank, Crowhall, and Hogarth (*The Enraged Musician*); they are referred to by the old dramatists (Jonson's *Silent Woman* and *Bartholomew Fair*); by Addison in *The Spectator* (No. 251); and in the *Roxburghe ballads*.

Illustrative drawings by Marcellus Laroon or Lauron (1653-1702) were popularised by the engravings by Pierce Tempest (1653-1717), and, like the series by Francis Wheatley, R.A. (1747-1801), engraved by Schiavonetti (1765-1810) and others, are valued by collectors. The cries of Bologna

have been described by Annibale Caracci (1560-1609), and those of Paris by Victor Fournel in *Les Cries de Paris, Types et Physionomies d'Autrefois*, 1887. Consult *History of the Cries of London, Ancient and Modern*, C. Hindley, 1884; *Old London Street Cries*, A. W. Tuer, 1885.

**London, DECLARATION OF.** International agreement about naval prize law. In 1908-09 an international naval conference was held in London, on the invitation of the British government, to consider and define naval prize law. It did not legislate; it merely codified. Ten great powers, including the U.S.A. and Japan, were represented by 37 jurists, who drew up a code to be observed in every prize court in every country. This code was called the declaration of London, 1909. It consisted of 71

not been ratified by the powers. In Great Britain, the house of lords refused to pass a bill to render it the law of the land. During the war it was found impossible for the Allies to observe the declaration. The provisions relating to blockade were never formally dissented from; but the Allies established a blockade of a new kind, and based their right to do so on the right to exact reprisals for Germany's submarine campaign. The Central Powers paid no attention to international naval law. As a result, on the first test the declaration broke down. See *Blockade*; *International Law*.

**London, PORT OF.** For an account of this body see *Port of London Authority*.

**London, TREATY OF.** Name given to several treaties signed in the English capital, the most important of which are the following: (1) Treaty between England and France made in 1359; its provisions were not kept, and it was replaced by the treaty of Brétigny (q.v.). (2) Treaty signed Jan. 14, 1814, and incorporated in the general settlement made by the congress of Vienna (q.v.). This established the kingdom of the Netherlands, with the prince of Orange as king, but the kingdom was not a success.

(3) In 1831 a treaty was signed in London by Great Britain, Austria, France, Prussia, and Russia. It declared that Belgium, now separated from Holland, should become an independent and neutral state. (4) In 1839, a treaty, also of London, signed by the same powers, confirmed the earlier arrangement, declared Belgium neutral, and forbade that country to make war save in self-defence. This was the agreement violated by Germany in 1914. (See *Belgium*: *History*).

Meanwhile by a treaty signed in London in July, 1827, the European powers decided to intervene in Greece, and drive the Turks, under Ibrahim Pasha, therefrom. This led to the battle of Navarino.

In 1852 a conference of London dealt with the succession to the duchies of Slesvig and Holstein. The protocol signed by the five great powers, also by Norway and Sweden, on May 8, 1852, declared that these duchies must be an integral part of Denmark, and that to them, as to the Dutch crown itself, Christian of Glücksburg, afterwards Christian IX, should succeed on the death of Frederick VII. As it asserted that the German rights in Holstein must

London Cries. "Two bunches a penny, primroses, two bunches a penny." The first of F. Wheatley's series, 1793

articles, in which were embodied international law relating to naval warfare, as then understood in most countries. It dealt with blockade in time of war; contraband of war; the liability of neutrals to capture and condemnation for unneutral service; the destruction of neutral prizes; transfer of an enemy's ship to a neutral flag after a declaration of war; what ships could be termed of enemy character; convoy and resistance to search.

When the First Great War broke out in 1914, the declaration had

remain, it was pleasing to neither party. (See Slesvig-Holstein Question.) Treaties were also signed in London in 1871 and 1883, which dealt with the navigation and control of the Danube and the Black Sea.

On May 30, 1913, a treaty was signed at S. James's Palace to end the war between Turkey on the one side and Bulgaria, Serbia, Greece, and Montenegro on the other. The first meetings, at the end of 1912, had been suspended, and the war renewed. In March, however, Turkey agreed to mediation, as did her foes in April. The representatives met again, and the treaty provided that Turkey should give up Crete to Greece, and should be confined in Europe to a line drawn from Enos to Midia. The Balkan states, however, failed to agree upon a division of this ceded territory, and the second Balkan War began. The treaty was thus never operative. (See Balkan Wars.)

The term treaty of London is given to the secret agreement signed April 28, 1915, between Great Britain, France, and Russia on the one hand, and Italy on the other. Italy agreed to enter the war on the side of the Allies, and the treaty stated the conditions of such assistance. Among these were undertakings that by the treaty of peace she should receive Trentino, part of Tirol, Trieste, and other lands, including some islands belonging to Austria. Other articles dealt with Italy's interests in the Mediterranean, Africa, and elsewhere, and also provided for a loan to her.

The London naval treaty between Great Britain, the U.S.A., and France was signed March 25, 1936. It was divided into five parts, and its outstanding points were definitions of capital ships, aircraft carriers, light surface and auxiliary vessels, and small craft; placing limitations upon the maximum displacement and the size of the heavy armament in battle-ships, aircraft carriers, and submarines; and prohibition of the construction of capital ships or light surface vessels, other than aircraft carriers between 8,000 and 17,500 tons, before Jan. 1, 1943. The treaty also provided for an annual interchange of information about naval construction programmes. In the event of any of the contracting powers becoming engaged in war, liberty was given to suspend the provisions of the treaty, which was to remain in force until Dec. 31, 1943.

**London, JACK** (1876-1916). American novelist. John Griffith London, born at San Francisco,

*Jack London*

Jan. 12, 1876, adventured for a time as an oyster pirate, then formed a fish patrol. Next, shipping as a sailor, in 1892-93 he visited China and Japan and hunted seals in Bering Sea. He then tramped through the U.S.A. and Canada. During the Russo-Japanese war of 1904-05 he was a war correspondent. He died in California, Nov. 22, 1916. Of his many stirring books of adventure the best known are *The Call of the Wild*, 1903; *The Sea Wolf*, 1904; *White Fang*, 1907; *Burning Daylight*, 1910. His short stories were masterly; he also made contributions to socialist literature; e.g. *The Iron Heel*, 1907.

**London Airport.** The official name for the international commercial airport opened by the British ministry of Civil Aviation, 1946. It is in the district formerly known as Heathrow, situated in Middlesex, 14 m. W. of the centre of London, between the Bath and Great South West roads; the nearest towns are Feltham and Hounslow (Heston and Isleworth borough). In its final form, with nine runways all capable of taking the heaviest of land aircraft, the airport is planned to absorb a large area north of the Bath road, the terminal and control buildings to be sited in the centre of the landing area. See Airport.

**London and North Eastern Railway.** British railway group which existed from 1923 to 1947. It comprised the earlier Great Northern, Great Eastern, Great Central, North Eastern, Hull and Barnsley, North British, and Great North of Scotland rlys. The London termini were King's Cross, Marylebone, and Liverpool Street, and among the main line stations were Waverley (Edinburgh), York, Newcastle-on-Tyne, Norwich, Nottingham, and Sheffield. The company owned the locomotive works at Doncaster, Darlington, Gorton (Manchester), Stratford (London), Cowlands (Glasgow), and Inverurie (Aberdeenshire). Locomotives were coloured green and coaches brown, but the engines drawing stream-lined trains were blue. The L.N.E.R. was the first British rly. to introduce a stream-

lined train (Silver Jubilee, 1935), and to build cinema cars for showing news programmes. The company operated nearly 17,000 m. of track. On Jan. 1, 1948, it was incorporated in British Railways. See Railways.

**London Basin.** Geological and geographical term used for the roughly triangular area lying between the chalk ridges of the N. Downs and Chiltern Hills, and containing the valleys of the Kennet and lower Thames. The general geological structure is that of a broad trough (syncline) which is pitching gently to the E. The chalk, underlain by the impervious gault clay (see Cretaceous system) forms the outside of the basin, and passes below London from one side to the other. It is overlain by Tertiary sands and clays which form an impervious layer above the chalk. The chalk is much fissured, and receives water draining from the N. Downs and Chilterns. This water, trapped between the two impervious beds above and below, flows down under London and has been extensively tapped by artesian wells.

The general shape of the London basin is the result of folding earth movements. At the close of the Cretaceous period the chalk was up-arched over the Weald and down-folded to N. and S., so forming the London and Hampshire basins on either side. Tertiary deposits — Thanet sand, Reading beds, London clay, and Bagshot sands, all of Eocene age — were then deposited in the down-warped areas. Further earth movements during the Tertiary period then further accentuated the earlier folding.

The area is still slowly moving and tilting S.E. It has been established by geodetic levelling that, since 1860, there has been a lowering of the ground surface at Harwich of about 2 ft. The various deposits in the basin give rise to variety in scenery. To the N. and S. are rounded chalk hills with open fields and beech woods. In the Aldershot area the Bagshot sands form heath-lands with conifers, heather, and gorse; the London clay and Reading beds produce heavy soils suitable for arable land, oak, and elm. The clays are used locally for brick making. Extensive flat terraces on either side of the Thames carry roads and rlys. Their gravel beds have been exploited for building material, and where their surface is silt or clay they carry market

gardens or farms. See Cretaceous System; London Clay; Tertiary System. **Gilbert Wilson, Ph.D.**

**London Bridge.** Chief of the Thames bridges. Designed by John Rennie (d. 1821), whose two sons supervised the work, it extends from Adelaide Place and King William Street, E.C., to Borough High Street, Southwark, S.E. The first pile was driven March 15, 1824, and William IV opened the bridge, Aug. 1, 1831. It is built of granite, is supported by five semi-elliptical arches, the central arch having a span of 152½ ft., and is 928 ft. long and 63 ft. wide, the original width of 54 ft. having been increased by corbelling out in 1903-04. The total cost, including approaches and widening, was £2,566,268.

Its immediate predecessor, also of stone, was built on the site of a wooden bridge, believed to have been built by the Romans. Peter

stroyed in 1832, and the piles were pulled up, many thousands of Roman coins and medallions, with examples of Roman pottery and tiles, were discovered. Beneath old London bridge, in 1582, Peter Morris, a Hollander, erected waterworks, which existed until 1822. London bridge rly. station is on the S. side, and on the N. side of the river are Fishmongers' Hall, west, and Adelaide House, east. *Consult* Chronicles of London Bridge, by An Antiquary, 1862.

**London Clay.** A stiff blue clay of Lower Tertiary (Eocene) age which occurs in the London and Hampshire basins of S.E. England. It varies from about 600 ft. thickness in Essex to 50 ft. at Newbury and thins out altogether farther W. The thick clay bed acts as an impervious covering to the chalk, which is the artesian water-bearing formation underlying London.

The physical characters of the clay allow it to be easily tunnelled, which has permitted the development of tubular railways. See London Basin; Tertiary System.

**London County Council.** Administrative body set up in 1888 to manage the affairs of the newly created county of London. It replaced the Metropolitan Board of Works. It consisted of 19 aldermen, elected for six years, and 118 councillors, elected every three years, in the first week of March. In 1918 the number was raised to 124 elected and 20 aldermen.

The council as a whole meets every fortnight, but it does most of its work through committees. It has a chairman, a vice-chairman, and a deputy chairman, and a large staff of paid officials. Lord Rosebery was its first chairman. The offices were in Spring Gardens; Victoria Embankment; and elsewhere, until the London County Hall was erected on the right bank of the river, nearly opposite the houses of parliament.

General elections for councillors are held every three years. For electoral purposes the parl. constituencies form multiple-member council constituencies. Elections are usually fought on political party lines, as in national elections. From 1889 to 1907, with the exception of the years 1895-98, the Progressives (Liberals) had a large majority and controlled the council, but from 1907 to 1934 the position was reversed and the Municipal Reformers (Conservatives) were in power. Then came a Labour-Socialist majority, maintained at elections in 1937, 1946, and 1949 (there were no elections during the Second Great War).

of Colechurch began it in 1176. Completed in 1209 by a Frenchman named Isambert, this bridge stood E. of the existing structure, in a line with Fish Street Hill. It had 19 arches built upon piles of elm, surrounded by wooden stielings. On fortified gates at each end heads of traitors were exposed on spikes. Wooden houses on each side were removed in 1758. Between the 13th and 14th piers from the city side was a drawbridge. In the centre was a chapel, dedicated to S. Thomas of Canterbury. Peter of Colechurch was buried in this chapel. N. of the drawbridge stood the famous Non-such House (q.v.).

Old London bridge, as it is called, was the only bridge over the Thames until 1739-50, when the first Westminster bridge was constructed; and when it was de-

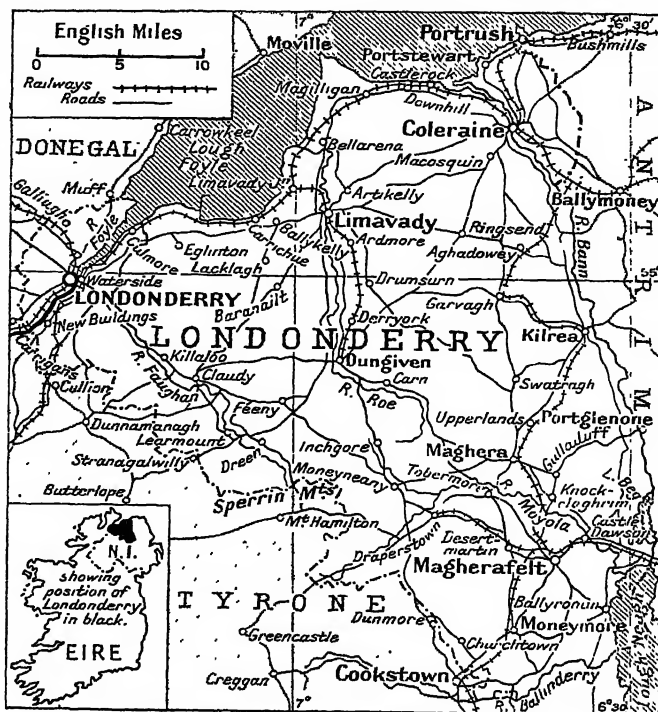

London Bridge from the south-east. On its right is Adelaide House, above which can be seen the tops of the Monument and S. Magnus; on left is Fishmongers' Hall. Top, left, from an old engraving, the bridge as it appeared about 1616. Five arches across was the drawbridge. On the gate are seen the heads of men condemned as traitors

The council is responsible throughout the whole administrative co. (including the city of London) for education (primary, secondary, and adult); town-planning and the regulation of buildings; maternity and child welfare and ambulance services; the Londoners' meals service (civic restaurants); main drainage and Thames embankment walls; licensing places of entertainment; the provision of homes for the aged and infirm, and the welfare services for handicapped persons.

Outside the city it looks after Thames bridges, and inspects shops, weights, and measures. The council in common with the City corporation and the metropolitan borough councils has power to provide open spaces and housing, but its powers are much wider in that they relate to the whole administrative co. It may, moreover, provide open spaces and housing outside the co.

Annual expenditure of the council is of the order of £40 millions, of which nearly half is spent on education. The aggregate capital expenditure up to 1947 was nearly £200 millions, and net debt outstanding at March 31, 1947, was nearly £80 millions.

**Londonderry.** County of N. Ireland. With a coast-line on the N., it has an area of 804 sq. m. The chief rivers are the Roe, Bann, Foyle, Moyola, and Faughan. The surface is level near the coast, rising to considerable heights in the S., where are the Sperrin Mts. (1,200 ft.). Lough Neagh is on its S.E. border and Lough Foyle on the N.W. Londonderry, or Derry, is the chief town; other places are Coleraine, Limavady, Dungiven, Moneymore, and Magherafelt. On the coast are the watering-places of Portstewart, Castlerock, and Downhill. The county took the

Londonderry, N. Ireland. Map of the county on the north coast of Ulster

prefix of London when in 1609 much of the land, taken from the O'Neills, was made over to the corporation of the City. Later much land vested in the Irish Society of London and London livery companies was sold. Londonderry elects an M.P. to the British house of commons and four to the N. Ireland parliament. There are castles at Dungiven and elsewhere; Dungiven had also an abbey. Pop. 142,736.

**Londonderry.** City, county borough, and seaport of co. Londonderry, N. Ireland, also the county town. Known locally as Derry, it stands on a hill near where the Foyle falls into Lough Foyle, 95 m. N.W. of Belfast, being on the west, or Donegal, side of the river. It is well served by rlys. The city is still surrounded by walls with gates.

The chief buildings are the cathedrals. S. Columba's, Protestant,

dates from the 17th century, but was restored and enlarged in the 19th. The R.C. cathedral of S. Eugenius is modern. There is a guildhall. Foyle College dates from 1617, and there are other colleges and schools. A monument commemorates the siege (v.i.) of 1689. The chief industries are flour milling, distilling, shipbuilding, tanning, and bacon curing; another important one is making linen clothes. The port has quays on both banks of the river, and good accommodation for vessels. Trade is mainly in agricultural produce, and there is steamer communication with Glasgow, Liverpool, and Belfast. One member is elected to the parliament of N. Ireland.

At Derry, a corruption of the Irish *Doire*, meaning the place of oaks, S. Columba founded a monastery in the 6th century. It became the seat of a bishop, who in the 12th century built a magnificent church, pulled down in 1600. The bishopric is known as that of Derry and Raphoe. The industrial prosperity of the town did not begin until it had become the prop-

Londonderry arms

Londonderry, Northern Ireland. Carlisle Bridge over the river Foyle, with S. Columba's Cathedral in the background

erty of the Irish Society of London. In 1689 it was besieged by the troops of James II as a Protestant stronghold. Its present inhabitants are almost equally divided between Protestants and Roman Catholics, and affrays between them have been frequent. There was serious rioting in 1920. The U.S. government constructed here during the Second Great War one of the best equipped naval bases in Europe; it cost several million pounds and was completed in six months, being put into commission on Feb. 5, 1942. From Londonderry U.S. destroyers and corvettes escorted convoys across the Atlantic in cooperation with the Royal Navy. Pop. 47,813.

**Londonderry, SIEGE OF.** Enterprize of James II and the Irish Jacobites in 1689. From the town, the chief stronghold of N. Irish Protestantism, James's garrison had been withdrawn, and 13 apprentices defied him by closing the gates, Dec. 7, 1688. James advanced in April with a large force, and Robert Lundy, the military governor, fled after advising capitulation, but a cry of no surrender became the watchword of the city. A clergyman, George Walker, was chosen governor, and siege operations began on April 19. William III's government had on March 30 planned relief, but mismanagement caused much delay; meanwhile famine and disease reduced Derry to the utmost straits. In mid-June a fleet entered Lough Foyle with provisions and four regiments under Maj.-Gen. Kirke, but they waited six weeks outside the harbour. Ordered at last to attack, the ships broke the boom, July 30, and raised the siege, which had lasted 15 weeks.

**Londonderry, MARQUESS OF.** British title borne by the family of Vane-Tempest-Stewart. There was an earl of Londonderry from 1623, the title being given to Thomas Ridgeway, a Devon man, who had secured land in Ulster. The title became extinct when his descendant Robert, the 4th earl, died in 1714. In 1726 the earl's son-in-law, Thomas Pitt, was made earl of Londonderry, but the title again lapsed in 1765.

In 1789 Robert Stewart, M.P. (1739-1821), of Mount Stewart, co. Down, was made Baron Londonderry, being raised in 1796 to earl and in 1816 to marquess. His son was prominent under the courtesy title of Viscount Castlereagh (*q.v.*). The latter's half-brother, Charles William, the 3rd marquess (1778-1854), was a soldier and a diplo-

matist. He married the heiress of the families of Vane and Tempest, and obtained rich estates, including collieries, in Durham. He was made a peer of the U.K. as Baron Stewart in 1814 and in 1823 Earl Vane, a title that passed to his son by a second marriage.

In 1884 the title came to Charles, 6th marquess (1852-1915). Born July 16, 1852, and educated at Eton and Christ Church, Oxford, he was Conservative M.P. for Down from 1878 until he inherited the title. He was lord-lieutenant of Ireland, 1886-89; postmaster-general, 1900-02; and president of the board of education, 1902-05, also lord president of the council from 1903. He died Feb. 8, 1915.

His son Charles Stewart Henry (1878-1949) became 7th marquess. Born May 13, 1878, he went to Eton and Sandhurst, and was Conservative M.P. for Maidstone, 1906-15. Under-secretary for air, 1920-21, he took office in the first government of N. Ireland as minister of education and leader of the senate. Returning to Westminster, he became first commissioner of works, 1928-29, and again in 1931; secretary for air, 1931-35; lord privy seal and leader of the house of lords, 1935. He wrote *Ourselves and Germany*, 1938; *Wings of Destiny*, 1943. He was also known for his receptions at Londonderry House, Park Lane, on the occasions of the opening of parliament. Dying Feb. 11, 1949, he was succeeded by his son Edward (b. 1902), 8th marquess. The family seats of the marquess are Wynyard Park, Durham, and Mount Stewart, Down. An eldest son is known as Viscount Castlereagh.

**Londonderry Air, THE.** Irish folk tune first published 1855, in a collection made by George Petrie (*q.v.*), Irish antiquary. Its beautiful phrasing and haunting melody gave it immediate popularity, and many lyrics have been written to the tune, notably by A. P. Graves and F. E. Weatherly. It has also been adopted as a hymn-tune, and Stanford introduced it into his 1st Irish Rhapsody.

**London Gazette, THE.** Official organ of the British government and the appointed medium for state proclamations, orders in council, and diplomatic, colonial, services, civil, and ecclesiastical appointments. It is also the medium for advertisements required by statute. Published Tuesdays and Fridays, the ordinary issues may be augmented by supplements. This is a continuation of

the Oxford Gazette which appeared Nov. 14, 1665, during the Great Plague, the present title beginning with No. 24 of Feb. 5, 1666, on the return of Charles II to London. Sir Richard Steele was an editor. Down to 1696 an edition in French was issued. Published for many years at ls., the gazette has cost 2s. since 1920. Similar publications for Scotland and N. Ireland appear as *The Edinburgh Gazette* and *The Belfast Gazette*.

**London Group.** Body of British artists. Owing its origin to the amalgamation of several small groups of painters including the Camden Town group and the Allied Artists' Association, just before the First Great War, it held its first exhibition at the Goupil Gallery, London, in March, 1914. Van Gogh and Gauguin were exerting a predominating influence on English painters, though Sickert had asserted an impressionism derived from Manet and Degas in his Camden Town interiors and music-hall scenes. The London Group became the focus of progressive work, regular exhibitors including Sickert, Spencer Gore, Charles Ginner, Paul and John Nash, C. R. W. Nevinson, and Mark Gertler. Wyndham Lewis and Jacob Epstein joined the group, which continued to hold annual exhibitions at various London galleries. At a retrospective exhibition at the Leicester Galleries, 1928, a remarkable collection of paintings and sculpture was shown. In 1943 the group organized its fifth wartime exhibition at Burlington House, when younger artists whose work attracted attention were John Tunnard, Eileen Agar, and Victor Pasmore. See New English Art Club.

**London Hippodrome.** Playhouse at the corner of Cranbourn St. and Charing Cross Road, London, W.C. It was opened Jan. 15, 1900, as a variety theatre, and was long a centre of circus and aquatic entertainment. Remodelled and enlarged, it became well known for revues and musical comedies, *e.g.* *Hello, Ragtime!* 1912; *Brighter London*, 1923; *Hit the Deck*, 1927; a series starring Bobby Howes; another with Vic Oliver; *The Lisbon Story*, 1943; *Perchance to Dream*, 1945. The theatre seats 1,340.

**London Hospital.** Institution founded as a charity in 1740, situated in Whitechapel Road. Ministering to the needs of the vast industrial population of the E. half of the capital, it is the largest general hospital in the U.K. It maintains 638 beds with 269 beds

London Hospital. Main buildings in Whitechapel Road

at an annexe. Accident and urgent cases are admitted at all times. Special departments exist for aural, cardiac, dental, dermatological, gynaecological, neurological, neurosurgical, ophthalmic, orthopaedic, paediatric, psychiatric, and thoracic surgery. There are training schools for nursing and midwifery, physiotherapy and radiography. The London Hospital medical college is a medical school of the university of London. Attached to the hospital is an organization with a staff of nurses all trained there and available for private cases at moderate fees. In 1946, 12,605 in-patients were treated and out-patients made 443,575 attendances.

**London Irish Rifles.** Territorial regiment of the British army. Formed in 1859 as a volunteer unit, the regiment first saw active service in the S. African War of 1899-1902. When the volunteers were organized into the Territorial Force in 1907, the London Irish Rifles became the 18th battalion of the London Regiment and served in France and Flanders. They earned distinction in 1915 at Festubert and at Loos, where they went into the attack kicking a football. Two battalions served in the Second Great War with the 56th div. in Africa, Sicily, and Italy. When the Territorial Army was reformed in 1947, the London Irish became a motorised infantry regiment of the 56th (London) armoured div.

**London Library.** Subscription library opened at 40, Pall Mall, London, S.W., May 3, 1841, with a collection of about 3,000 volumes. It originated in an agitation set afoot by Carlyle and strongly supported by eminent men, with the object of acquiring good books in all departments of knowledge which would be available to members at their own homes.

premises in Duke Street, was purchased in 1880. The premises were rebuilt in 1896 and extensions were added in 1913 and 1934, though some of the latter work was destroyed by a German bomb in 1944.

By 1946 the number of books available had increased to over 475,000. The library, which is under distinguished patronage and is governed by a committee consisting of a president, five vice-presidents, and 24 other members, rendered considerable assistance to government departments in quest of information during both Great Wars. C. J. Purnell was appointed secretary and librarian in 1940 in succession to Sir C. T. Hagberg Wright.

**London, Midland, and Scottish Railway.** British railway group which existed from 1923 to 1947. It comprised the former London and North Western, Midland, Lancashire and Yorkshire, Caledonian, North Stafford, Furness, and several smaller rlys. The London termini were Euston, Fenchurch St., and St. Pancras, and the company's principal locomotive works were at Crewe and Derby. Locomotives and passenger coaches were painted a maroon colour. With 20,000 track miles, this was Great Britain's largest

On May 15, 1843, a reading room was opened for the use of members. In 1845 the library was removed to what was formerly known as Beauchamp House, St. James's Square; the freehold of which, with that of adjacent pre-

railway system before nationalisation and served such widely separated towns as Bournemouth, Southend-on-Sea, Gloucester, Liverpool, Holyhead, Manchester, Carlisle, Stranraer, Edinburgh, Dundee, and Thurso. Between Dalwhinnie, Inverness-shire, and Dalnaspital, Perthshire, the line runs 1,484 ft. above sea level, the highest point on any main line in Great Britain. On Jan. 1, 1948, the L.M.S. was incorporated in British Railways. See Railways.

**London Museum.** Institution founded on the lines of the museum in the Hotel Carnavalet, Paris, to serve as an object lesson in the history of the English metropolis. It was founded in 1911 to commemorate the coronation of George V. Sir Guy F. Laking was director, 1911 to 1919. When the London county council refused to provide a home for the museum in their new county hall, King George, in addition to being a contributor, made over a set of apartments at Kensington Palace as a temporary home for the nucleus of the collection, and formally opened it in person, March 21, 1912.

Lancaster House (*q.v.*), presented to the nation in 1912 by Sir W. H. Lever (later Lord Leverhulme), was taken over by the government in 1913, and the exhibits having been removed here, the museum was reopened in 1914, but was closed during the First Great War. One of the early collections acquired by the trustees was that known as the Hilton Price collection of London antiquities, and this, having been supplemented by other purchases, gifts, and bequests, illustrates London and London life from prehistory. The museum was closed at the outbreak of the Second Great War, but some exhibits were on view in 1942. It was closed again in 1944 owing to flying bomb attacks. In 1948 a temporary home was again found at Kensington Palace.

**London Opera House.** Theatre in Kingsway, London. It was designed by Bertie Crewe and erected by Oscar Hammerstein (1847-1919) for the production of grand opera. He opened it on Nov. 13, 1911, with Jean Nougue's opera. Quo Vadis?, but his efforts were not crowned with success and the building was closed in 1913, to be reopened in 1914 as a theatre of varieties. It was later taken over by Sir Oswald Stoll and renamed The Stoll Picture Theatre, providing cinema entertainments. For its subsequent history, see Stoll Theatre.

London Irish Rifles badge

London Library. The building at the north-west corner of St. James's Square

**London Passenger Transport Board.** Organization formed in 1933 to coordinate the passenger services of London. On Jan. 1, 1948, it became part of the nationalised transport system under the title London Transport Executive. See London Transport.

London Pride.  
Spray of flowers

**London Pride** (*Saxifraga umbrosa*). Perennial evergreen herb of the family Saxifragaceae. It is a native of N. Spain, Portugal, Corsica, and Ireland. The leathery, broad, oval leaves grow in a rosette, from which the branched, leafless flowering stem arises. The flowers have reddish sepals and white petals dotted with red. It is also called

None-so-pretty and S. Patrick's cabbage.

**London Regiment.** Former Territorial regiment of the British army. It dated from 1908, when all London Territorial battalions were united into one regiment of 26 battalions. To maintain the old connexion of the Royal Fusiliers with London, the first four battalions were affiliated to that regiment, and retained the name fusilier in their title, e.g. 1st London (Royal Fusiliers), or officially 1st (City of London) battalion the London Regiment (Royal Fusiliers). The remaining battalions were designated County of London, e.g. 9th (County of London), or Queen Victoria's Rifles.

The 1st London was raised in 1859, being then known as the 19th Middlesex; the 2nd battalion, also raised in that year as the 46th Middlesex, became the 23rd Middlesex in 1880, and soon afterwards the 2nd (volunteer) bn., Royal Fusiliers. The 3rd bn. was raised in 1859, and the 4th originated from the Tower Hamlets regiment of the London train bands. The 5th bn., or London Rifle Brigade (*q.v.*), dated from 1859, also the 6th Rifles (formerly Surrey). The 7th and 8th, known as the Post Office Rifles, both served in Egypt, 1882, and in S. Africa; the 9th was the Queen Victoria's Rifles (*q.v.*); the 10th the Hackney; the 11th the Finsbury Rifles; the 12th the Rangers; the 13th the Princess

Louise's Kensingtons; the 14th the London Scottish (*q.v.*); the 15th the Civil Service Rifles; the 16th the Queen's Westminster Rifles. The 17th, formerly the 2nd Tower Hamlets Volunteer rifle corps, became the Poplar and Stepney Rifles. The 18th were the London Irish Rifles, raised in 1859; the 19th originated in the St. Pancras volunteers; the 20th (Blackheath and Woolwich) originated in the Royal Greenwich Fencibles. The 21st bn. became the 1st Surrey Rifles; the 22nd, The Queen's. The 23rd fought in the S. African War, as did the 24th, the Queen's. The 25th battalion the Cyclists, the 28th the Artists Rifles (*q.v.*).

The regiment had a brilliant record in the First Great War. On the W. front the 47th, 56th, and 58th divisions, mainly composed of London battalions, won lasting renown. Other battalions fought in Gallipoli and Palestine. Memorials in front of the Royal Exchange and in High Holborn commemorate the men who fell. In 1935 the regiment was disbanded as a separate formation, the units being attached to various regiments, though some retain their former badges.

**London Rifle Brigade.** Territorial unit of the British army. Raised in 1859 as The Prince Consort's Own Volunteers (London Rifle Brigade), it served in the S. African War of 1899-1902, and on the formation of the Territorial Force in 1907 became the 5th City of

London Rifle  
Brigade badge

London Regiment. In the First Great War battalions served in France and Flanders, taking part in the engagements around Ypres, 1915; the third battle of Ypres, 1917; and the defence of Amiens, 1918. From the storming of the Hindenburg Line, it had a distinguished share in the final battles of 1918. After the outbreak of the Second Great War, the 1st and 2nd battalions of the London Rifle Brigade became the 7th and 8th of the Rifle Brigade. The former served as motorised infantry with the 8th armoured div. in Africa and the 6th armoured div. in Italy; the latter fought in a similar way with the 11th armoured div. in France, Holland, and Germany. The London Rifle Brigade was reformed in 1947 as a motorised infantry battalion of the T.A. and affiliated to the Rifle Brigade.

*Consult History, 1921; The Rifle Brigade, 1939-45, 2 vols., 1946.*

**London School of Economics** School of the university of London. Founded 1895 through the initiative of Sidney Webb (Lord Passfield), an original member of the Fabian Society (*q.v.*), for the study of economics and related subjects, it became part of the university of London in 1900. Open equally to men and women, to matriculated students it grants degrees in economics and political science, laws, and arts (history, geography, sociology, anthropology). Non-matriculated students can study for certain diplomas and certificates, and may also under certain conditions attend classes and lectures (day and evening) without necessarily taking examinations. The school's library covering political and economic science, international law, and comparative legislation is open, by permission of the director, to any person desiring to read there. Webb was professor of public administration here 1912-27. Sir W. (later Lord) Beveridge was director 1919-37. Other members of the staff have included B. Malinowski, E. Cammaerts, R. H. Tawney, Eileen Power, A. J. Toynbee, H. J. Laski, C. K. Webster, H. B. Lees-Smith. The school is in Houghton Street, Aldwych, London, W.C.2.

**London Scottish.** Territorial regiment of the British army. Formed in 1859 as the London Scottish Rifle Volunteers, it is recruited in London, in normal times solely from men able to prove Scottish nationality by birth, descent, or property ownership. Its first active service was in the S. African War, when a company was attached to the Gordon Highlanders and a detachment served with the City Imperial Volunteers. When the Territorial Force was formed in 1907, the London Scottish became the 14th battalion of the London Regt.

London Scottish  
badge

Three battalions were raised for service in the First Great War, the first battalion being the Territorial infantry that went earliest into action against the Germans, at Messines, Oct. 31, 1914. The second battalion served in France, the Balkans, and Palestine. In 1920 the regiment was reformed as a single battalion, but in 1938 a second

infantry and a heavy A.A. battalion were raised.

In the Second Great War the 1st battalion served in Persia, N. Africa, Sicily, and Italy, while the 3rd (A.A.) was in Egypt and Italy. The 2nd battalion became a reserve and draft producing unit, most of the personnel passing through its ranks going to the 51st Highland div. Nearly 10,000 men joined the regt. In 1947 the London Scottish became a single-battalion regiment of the T.A., affiliated to the Gordon Highlanders. Its hodden grey kilt is the tweed of the Elcho family, Lord Elcho, later earl of Wemyss, having been its first colonel.

**London Society.** THE. Organization established in London in 1912 "to unite all Londoners who see the necessity for stimulating a wider concern for the beauty of the capital city, for the preservation of its old charms, and the careful consideration of its new development." Offices, 82, Pall Mall, S.W.1.

**London Stone.** London relic. A solid block of oolite, such as that used by the Romans in their

of the set composed in London by Haydn, was first performed in 1795. The thematic material of the final movement is based on the Westminster chime. (2) Symphony by Vaughan Williams, first performed at Queen's Hall, London, 1914. It suggests various aspects of the capital in moods ranging from sombre to gay, from the peace of old squares to the swirl of crowds and traffic.

**London Transport.** Organization responsible for the running of the passenger services of London, its full title being London Transport Executive. It is the name taken by the London Passenger Transport Board when that body became on Jan. 1, 1948, part of the nationalised transport system. The L.P.T.B. was formed by Act of parliament in 1933 under the chairmanship of Lord Ashfield to coordinate the underground rlys., tramways, trolley bus, omnibus, and coach services running within a radius of roughly 30 m. of Charing Cross, previously operated by 162 companies and local authorities. The principal objects in the formation of the board were to eliminate wasteful competitive services, and to improve passenger transport facilities in the area under its authority. The amalgamation included the London General Omnibus Co., the Metropolitan and Metropolitan District rlys., the London Electric rlys., and the L.C.C. tramways.

During the Second Great War the L.P.T.B. services ran through bombs, flying bombs, and rockets; 181 members of the staff were killed on duty, 1,867 were injured. Vehicles of the board were damaged on nearly 9,000 occasions.

The head office of London Transport is at 55, Broadway, London, S.W.1. See Bus; Green Line; Motor Coach; Underground Railway, etc.

**London University.** British educational body. It is today the largest university in the world. In the session 1947-48, over 50,000 students were studying for its degrees and diplomas, or were taking courses under its teachers. It was founded in 1836 for the purpose of examining and conferring degrees only, and was un-

London University. The William Beveridge room, in the great building in Bloomsbury. In this hall degrees are conferred. See also frontispiece to Vol. 6

sectarian. The intention was to make University College, founded in 1825, the university, but there was much opposition, and the two were kept distinct, though University College taught for the degrees of London university. It became incorporated in 1900.

In 1854 the right to confer medical degrees was granted to the university. In 1858 its degrees, previously confined to members of colleges affiliated to it, were thrown open to all. From that time dates their great popularity. In 1868 the university began to

London University arms

send a member to parliament; in 1880 it gave women access to its degree examinations; and in 1900 it was reconstituted as a teaching body also, under an Act of 1898.

A royal commission, appointed to inquire into the provision of university education in London, recommended in its report (1913) drastic changes leading to the closer association of all the capital's institutions for higher education. The question of a building for the university as a whole was also considered. The govt. in 1920 offered on conditions a site in Bloomsbury, which was accepted by the university. The foundation stone of the great new administrative building was laid by George V in 1935, the main part of the building, with the vast central tower housing the university library, being completed in 1938. The site was also planned to accommodate the School of Oriental and African Studies, Birkbeck College, the Institute of Historical Research, and the Institute of Advanced Legal Studies, together with the university extension department.

London university now consists of incorporated colleges and departments, schools of the uni-

London Stone, Cannon Street. The old stone, reputed to be a Roman milestone, seen behind the grille

buildings, it is set in a large stone case, protected by an iron grille, and let into the S. wall of S. Swithin's church, Cannon Street, E.C. It originally stood on the S. side of the street, opposite to its present position, which it has occupied since 1798. According to Camden, it was a milliarium or milestone from which the British high roads radiated, and their mileage was reckoned, similar to one in the Forum at Rome.

**London Symphony.** Name of two orchestral compositions. (1) Symphony No. 104 in F, the 7th

versity, central activities such as the research institutes, and institutions having recognized teachers. Incorporated colleges are University and King's. Schools of the university, a feature dating from 1900, include the Imperial College of Science and Technology, the School of Oriental and African Studies, Queen Mary (formerly East London) College, Goldsmith's College, Birkbeck College, London School of Economics, and South-Eastern Agricultural College, and three colleges for women only—Bedford, Royal Holloway, and Westfield. There are theological colleges, medical schools attached to the great London hospitals, and other institutions, including the Lister Institute of Preventive Medicine. Several polytechnics and the Trinity and Guildhall Schools of Music have recognized teachers. There are halls where students can reside and the ultimate aim is to surround the university with a number of hostels for students, thereby making it predominantly residential.

The university faculties are theology, arts, law, music, medicine, science, engineering, and economics, the last-named including commerce and industry, as well as political and social science. The university is governed by a senate and convocation, and the work of the senate is delegated to three councils—academic, external, and extension. The colleges of the University are noticed separately.

**London Wall.** London thoroughfare. Once called Currier Row, it runs W. from Old Broad St. to the N. of Wood St., E.C., crossing Moorgate at its junction with Finsbury Pavement. Part of the old City wall once formed its N. side, where the original church of S. Alphege was founded in the 11th century, being rebuilt on the S. side in 1777. The church was demolished in 1923, only the porch remaining. Close to Old Broad St. is the church of All Hallows-on-the-Wall, founded in the 13th century and rebuilt in 1767. It suffered slight damage in aerial attacks on London during the Second Great War.

The Roman fortification also known as London Wall was built in the 2nd century A.D., restored more than once in the Middle Ages, and was in existence in the middle of the 18th century. Remains may be seen in London Wall, the churchyard of S. Giles's, Cripplegate (destroyed by bombs), Tower Hill, and behind Stationers' Hall and Amen Court. Damage done by

bombing to various layers of buildings superimposed on London Wall afforded fresh opportunity for its exploration. In 1947 digging was begun on the western wall from the angle bastion where the wall turns S. near S. Giles's, Cripplegate, and runs S.S.W. towards Falcon Sq. Excavations were also made near Birchin Lane and in Gutter Lane, Cheapside, behind the wrecked Saddlers' Hall.

**London Wall.** Comedy by John van Druten. Produced at the Duke of York's Theatre, London, May 1, 1931, this play was notable for its characterisation, and was set in a solicitor's office in the City of London. It ran for 170 performances, Frank Lawton and Marie Ney taking the chief parts.

**Loch.** Loch of Scotland. An arm of the firth of Clyde, it extends for 17 m. in a N.N.E. direction between Argyllshire and Dumbartonshire. Its extreme breadth is about 2 m. A rly. runs N. from Garelochhead along its E. shore. past Arrochar at the head. During the Second Great War Loch Long was a training base for submarine crews. Commandos were also trained there in combined operations, and rehearsals for the abortive Dakar landing were carried out on the water.

**Long, WALTER HUME LONG, 1st Viscount (1854-1924).** British politician. He was born at Bath, July 13, 1854, of an old Wiltshire family, and was educated at Harrow and Christ Church, Oxford. He entered the house of commons in 1880 as Conservative M.P. for N. Wilts;

from 1885 he represented Devizes; from 1892 the W. Derby div. of Liverpool; from 1900 S. Bristol; from 1910 the Strand; and during 1918-21 St. George's, Westminster.

Long's first ministerial appointment was as parliamentary secretary to the local government board in 1886. He was president of the board of agriculture, 1895-1900, and of the local government board, 1900-05; then he became chief secretary for Ireland, but his party lost power. President of the local government board in the 1915 coalition, he was transferred to the colonial office on Asquith's retirement in 1916. He was first lord of the admiralty 1919-21, and then received a viscountcy. He published *Memories*, 1923.

1st Viscount Long,  
British statesman  
Russell

His eldest son, Walter, was killed in Greece in the First Great War; so at Lord Long's death, Sept. 26, 1924, he was succeeded by his grandson, Walter Francis David Long (1911-44). Educated at Eton and Sandhurst, the 2nd viscount joined the Grenadier Guards, and was A.D.C. to the governor-general of New Zealand. Retiring to become chairman of the Ocean Trust Co., he rejoined in the Second Great War, and was killed in action, Sept., 1944, the title passing to his uncle, Richard (b. Aug. 22, 1892).

**Long, GEORGE (1800-79).** An English scholar. Born at Poulton, Lancs, Nov. 4, 1800, he was professor of Greek, 1828-31, and of Latin, 1842-46, at University College, London, and classical lecturer at Brighton College, 1849-71. Long was one of the founders of the Royal Geographical Society, edited the *Penny Cyclopaedia*, 1833-46, and started the *Bibliotheca Classica*. Among his publications are *Two Discourses on Roman Law*, 1847, translations of *The Meditations of Marcus Aurelius*, 1862, and the *Discourses of Epictetus*, 1877. He died on Aug. 10, 1879.

**Long, HUEY PIERCE (1893-1935).** U.S. politician. Born at Winnfield, La., Aug. 30, 1893, he became a travelling salesman at 16. Later a lawyer, he was a member of the U.S. senate from 1924. Elected governor of Louisiana in 1928, he gained virtual control of that state. In 1934 the legislature passed 44 bills through all stages in 2 hrs. 20 mins.

A sinister instrument was the state bureau of criminal investigation, used by Long for political espionage. He brought under his personal control the legal system, militia, police, fire, and educational departments. To many classes he brought material benefits, but these were invariably bribes; and, although he thus increased the state debt to \$35,000,000, he aroused little opposition, as he had relieved 70 p.c. of the pop. from taxation. In 1935 an association formed to overthrow his regime was disposed of by means of machine-guns.

Long decided to stand for the presidency, and started a "share the wealth" agitation which organized clubs in every state. These planned to limit personal fortunes to £200,000 and to guarantee £1,000 to "every deserving family." Becoming a bitter opponent of Roosevelt, he once spoke for 15½ hrs. in the

senate in an attempt to talk out the bill for continuing the national industrial recovery act. Due to be called before congress to answer charges that Louisiana was no longer administered by republican forms, he was, before the inquiry could begin, shot in the state house at Baton Rouge on Sept. 9, 1935, by Carl Weiss, a young physician, and died next day. Known by his nickname of "The Kingfish," Long was an astute politician, and possessed personal magnetism, but politically was little better than a gangster in office.

**Long Acre.** London thoroughfare. Running N.W. from Cranbourn Street to Drury Lane, W.C., and crossing Endell Street and Bow Street, it was first called The Elms and then Seven Acres. Coachmakers began to settle here in the 17th, and motor car makers in the 19th centuries. A large building at the S.E. corner of Endell Street, now a printing house, was originally built in 1847 as S. Martin's Hall, for John Hullah's chamber concerts; burnt in 1860, it was reconstructed in 1862; known 1867-75 as the Queen's Theatre; next became a gymnasium; and was then converted into business premises. On Jan. 28, 1918, the building, then occupied by Messrs. Odhams, was bombed during a night attack by German aeroplanes, 28 persons being killed and many injured. Cromwell, Nicholas Stone the sculptor, and John Dryden lived in Long Acre; Samuel Butler died in Rose Street at the S.W. end of this thoroughfare; and Taylor the Water Poet kept an alehouse in Hanover Court, formerly Phoenix Alley. The Covent Garden underground rly. station is situated in Long Acre.

**Longan.** Evergreen tree closely allied to the litchi (*q.v.*).

**Long Beach.** A city of California, U.S.A., in Los Angeles Co. Situated on the Pacific Ocean, 28 m. S. of Los Angeles, it is served by the Southern and Union Pacific rlys. and an airport. It was first settled in 1840, became a city in 1897, and is now the fifth largest city of California. An excellent harbour on San Pedro Bay which is protected by three breakwaters forms part of Los Angeles harbour and with it is the home port of the U.S. Pacific fleet. Deep-sea fishing and yachting are favourite sports here, and the tourist trade flourishes. Within the city limits is the Signal Hill oilfield, discovery of which in 1921 tarted the industry largely resp on-

sible for the city's growth. Natural gas is also produced. Motor car, lorry, and aeroplane plants are also prominent among the city's industries. An earthquake in 1933 killed 120 persons and did to property damage estimated at £10,000,000. The pop., 2,252 in 1900, is now 164,271.

**Longbenton** OR BENTON. Urban district of Northumberland, England. It is virtually a suburb of Newcastle-on-Tyne, lying 4 m. N.E. of it and connected by rly. The chief occupations are at collieries and stone quarries. Pop. 14,072.

**Longboat.** Heavily built rowing boat; the largest carried by a ship. It was also fitted with mast and sails, and was used for conveying heavy cargo in seas unsuited to smaller boats. The term is now almost obsolete.

**Longbow.** A military weapon, first employed on a large scale by Edward I. It retained its supremacy on the battlefield until the introduction of firearms. Adopted from the Welsh, it became the national weapon of the English and appears to have got its name from its size, approximately the same as that of the bowman, while the ordinary bow, which was discarded soon after the introduction of the longbow, was only 4-5 ft. long. The longbow, made generally of yew or ash, shot an arrow which was slightly lighter but far longer than the quarrel of the crossbow. It could be fired three times as fast as a crossbow, and the shafts could penetrate an oak door 4 ins. thick. *See* Archery; Arms; Arrow; Bow.

**Long Branch.** City of New Jersey, U.S.A., in Monmouth co. Situated on the South Shrewsbury river and on the Atlantic coast, it is 45 m. S. of New York, and is served by the Pennsylvania and the Central of New Jersey rlys. Long

Branch began to develop as a watering-place towards the end of the 18th century, and was chartered as a city in 1904. Four presidents of the U.S.A. have made Long Branch their summer capital. Pop. 17,408.

**Longchamps** OR LONGCHAMP French racecourse and review ground. It is in the Bois de Boulogne (*q.v.*), just outside the fortifications W. of Paris. The meetings,

Longchamps. View of the stands at the French racecourse just outside Paris in the Bois de Boulogne

which include that of the Grand Prix (*q.v.*), are notable for the display of fashions they attract. Near by are the remains of the abbey of Longchamps, founded by Isabelle of France in 1256, and notorious in the 18th century for the fashionable concerts which took place within its precincts in Holy Week. The abbey was suppressed in 1792. *See* Paris.

**Longchamps, WILLIAM DE** (d. 1197). English chancellor. He was born in Normandy, the son of Hugh de Longchamps, and entered the service of Prince Richard, afterwards Richard I, on whose accession he was appointed bishop of Ely and chancellor of England. His haughty contempt for everything English and his quarrelsome disposition aroused popular hatred against him, but he was an able man and loyal to the king. When Richard left England he made Longchamps custodian of the Tower and joint chief justiciar. Longchamps soon ousted his fellow justiciar, and by his appointment in 1190 as papal legate became supreme in the Church as well as the state. He arrested the archbishop of York and defied Prince John, but was himself arrested and imprisoned. Escaping to France, 1191, he joined Richard in his German captivity and was sent back to England, where he continued his obnoxious behaviour. Richard engaged him in further negotiations, finally sending him

Longbow drawn ready for shooting

on a mission to the pope, but he died on the way at Poitiers, Jan. 31, 1197.

**Longcloth.** Plain white calico of the best quality, and woven in pieces of exceptional length. It was first made in India, and sold in England as early as 1550. In 1700 the jealousy of English makers of linen and wool caused the import of longcloth and other calicoes to be prohibited; but the prohibition did not last long, and to the end of the 19th century it was the most popular substitute for linen in the making of underwear. It is now generally replaced by softer, thinner materials.

**Long Eaton.** Urban dist. and market town of Derbyshire, England. It is 7 m. S.E. of Derby and 7 m. S.W. of Nottingham, with rly. stations, Trent being the main one. The church of S. Lawrence is partly Norman. The chief industries are the manufacture of lace, elastic webbing and braiding, upholstery, hosiery, electric cable and wiring, metal tubing, and railway carriages. Long Eaton was a village until late in the 19th century, when some Nottingham lace manufacturers transferred their businesses here. It votes in South East Derbyshire. Market day, Fri. or Sat. Pop. 26,700. Little Eaton is a village  $2\frac{1}{2}$  m. from Derby, with a rly. station.

**Longevity** (Lat. *longævus*, aged). Long duration of life. It is difficult to place a limit to the length of life of many species of plants and animals, and even in man the three score years and ten is frequently exceeded, reputed cases of individuals living to double that age being on record, e.g. Thomas Parr, a labouring man of Shropshire, who died Nov. 15, 1635, in his 153rd year; and Henry Jenkins of Yorkshire, who died in 1670, aged 169.

The longevity of man is insignificant beside that of many plants

and animals. The baobab tree is known to have lived from four to five thousand years; the *Sequoia gigantea* of California to a similar period; the giant tortoise of the Galapagos Islands has a span of life of 200 years or more, etc. The duration of life, however, of most animals is less than that of man. Attempts to rejuvenate the old were made by S. Voronoff (*q.v.*), who grafted sexual glands of higher apes in man.

The factors which influence longevity are a matter of dispute. There is little doubt, however, that environment, especially in plants, has a great influence on the span of life, and in man environment and heredity. The average mean duration of life in man rose in the 19th century by over five years in most civilized countries. In France the increase has been more marked, the average duration of life at the beginning of the 19th century being only 29 years, while it is now over 40. The study of old age (gerontology) includes the scientific and social aspects. See Age; Old Age; Life.

**Longfellow, HENRY WADSWORTH** (1807–82). American poet. Born at Falmouth, now Portland, Maine, Feb. 27, 1807, of early New England stock, he was educated at Bowdoin College, Brunswick, Maine. After studying law in his father's office, he

became professor of foreign languages at Bowdoin, 1829–34; and professor of belles-lettres at Harvard, 1836–54. He visited Europe, 1826–29; 1835–36; 1842 and 1868–69, when Oxford and Cambridge conferred honorary degrees upon him. He was twice married, in Sept., 1831, to Mary Storer Potter, who died at Rotterdam, Nov. 29, 1835; and in July, 1843, to Frances Elizabeth Appleton, the heroine of his *Hyperion*, who was burnt to death July 9, 1861, her dress having caught fire while she was sealing some packages of her little daughter's curls. Longfellow's 75th birth-

day was observed, especially in the public schools, throughout the U.S.A. He died at Craigie House, Cambridge, Mass., on March 24, 1882, and was buried at Mount Auburn. Emerson, then within a month of his own passing, looked on the face of the dead poet and said, "That gentleman was a sweet, beautiful soul, but I have entirely forgotten his name." A bust of Longfellow was placed in Westminster Abbey in 1884.

Longfellow's work was many-sided and voluminous. It included the writing of text-books, and was marked throughout by a deep sense of his mission as a teacher. His lyrical gift is remembered best by such poems as *Hymn to Night*, *A Psalm of Life*, *The Wreck of the Hesperus*, *The Village Blacksmith*, *Excelsior*, *The Belfry of Bruges*, *Resignation*, *The Children*, and *Moriturus Salutamus* (We who are about to die salute you). His skill in narrative verse is seen in *Paul Revere's Ride*, *King Robert of Sicily*, and *The Courtship of Miles Standish*.

Of his longer works the more notable are *Evangeline*: a Tale of Acadie; and *The Song of Hiawatha*, an epic of the red man, which was set to music by Coleridge-Taylor. His dramatic works include *The Spanish Student*. *The Golden Legend* is the best part of the long dramatic poem *Christus*: a Mystery. His translations include a metrical version of Dante's *Divina Commedia*. Always influenced by boyish memories, he is also a poet of the sea.

A scholar, devoted from boyhood to study, his chief characteristic is his simplicity. He is a poet of feeling and sentiment rather than of thought and reason. His phrases are felicitous rather than profound. But he had the gift of imagery, and none has excelled him in narrative power. No poet was ever better beloved by his own people, and his circle of friends was wide and representative. His relations with the young are beautifully commemorated in Whittier's *The Poet and The Children*.

W. F. Aitken

**Bibliography.** Works, Riverside Edition, 11 vols., 1886–90; Lives, S. Longfellow, 1886, new ed. 3 vols., 1891; E. S. Robertson, 1887; G. R. Carpenter, 1901; T. W. Higginson, 1902; H. Hawthorne, 1936; L. Thompson, 1939; *Evangeline*: the Place, the Story, and the Poem, Porter, 1882. Poets of America, E. C. Stedman, 1885.

**Longford.** Co. of Eire, in the prov. of Leinster. Wholly inland, its land area is 403 sq. m. The sur-

Longfellow. The house in Portland, Maine, where the poet passed his early years

face is level, save in the N.W., but there is much bog land. The chief rivers are the Shannon, on the W. boundary, Inny, and Camlin. Longford has many lakes, including Lough Ree, on the border, and Gowna. The soil is mainly under grass, being used for rearing horses and cattle, but there are dairy farms. Longford is the county town; Granard and Ballymahon are other places. The co. is served by the Eire state rlys., and the Royal Canal. Since 1935 the co. has been united with Athlone for electoral purposes, the combined area returning 3 members to the Dáil. Pop. 37,107.

Longford county arms

**Longford.** Market town and urban dist. of co. Longford, Eire, also the county town. It stands on the Camlin, 76 m. W.N.W. of Dublin, with a station on the Eire state rlys. The chief building is the R.C. cathedral of S. Mel, a fine modern edifice;

Longford arms

others are barracks, a market house, etc. The industries include a trade in agricultural produce, tanneries, and corn mills. Longford is the seat of the bishop of Ardagh. S. Idus founded a monastery here, and in 1400 a Dominican house was established. Longford became a town in the 17th century and sent two members to the Irish parliament. Pop. 4,019.

**Longford.** Village of Wiltshire, England. On the Avon,  $3\frac{1}{2}$  m. S.E. of Salisbury, it contains a castle, seat of the earl of Radnor, built in 1591 and restored in the 19th century. This mansion contains a magnificent collection of pictures.

**Longford, EARL OF.** Irish title borne since 1785 by the family of Pakenham. Thomas Pakenham (1713-76), an Irish M.P., was made a baron in 1756. In 1785 his widow was made a countess and was succeeded in 1794 by her grandson Thomas. He was made a peer of the U.K. as Baron Silchester in 1821, and his titles passed to his descendants. Thomas, the 5th earl, was killed in action at the Dardanelles, 1915. Edward, the 6th earl (b. Dec. 29, 1902), wrote plays produced in Dublin and London. The earl's seat is Pakenham Hall, Westmeath, and his heir is Lord Pakenham (q.v.).

**Longhorn.** Breed of British cattle, distinguished by the great length of the widely branching, drooping horns. Before the development of the shorthorn, this was the principal British breed, but it is now largely supplanted by its more fashionable rival. Its great value is for the production of cheese, as its milk is richer in curd than that of most dairy breeds. Apart from its great horns, it closely resembles the shorthorn in general build and colour, a white line down the back being another distinguishing point. Being of great size and weight, the longhorn yields much beef, and being of hardy constitution it is an easy animal to rear. See Cattle, colour plate.

**Longicorn, OR LONG-HORNED BEETLE.** Name given to a large group of beetles belonging chiefly to the family Ceraurycidae and found wherever trees are abundant. Their antennae are usually much longer than the body, hence the name, and their bodies linear, often brightly coloured. Among them are some of the largest of all insects. The larvae feed by burrowing into the wood of trees, often causing much damage. About 60 kinds occur in Great Britain. Consult Insects of British Woodlands, R. N. Chrystal, 1937.

Longicorn. Specimen of *Leprodora fimbriata*

**Longinus, DIONYSIUS CASSIUS** (d. A.D. 273). Greek rhetorician and philosopher. Born at Athens,

Longford, Wils. The castle, restored in the 19th cent. seat of the Earl of Radnor

or Emesa in Syria, he became a pupil of Ammonius Saccas (q.v.) at Alexandria. In opposition to Plotinus, he maintained that ideas had a separate existence apart from the divine Nous or intelligence. Visiting the East, he became the intimate friend and adviser of Zenobia, the queen of Palmyra, after whose defeat and

capture he was executed by the emperor Aurelian. A man of immense learning, he was the author of works on various subjects, only fragments of which remain. The famous treatise *On Elevation or Impressiveness of Style*, generally translated incorrectly *On the Sublime*, commonly attributed to him, is probably the work of an unknown writer of the 1st century of the Christian era.

**Long Island.** One of the Bahama Islands, in the N. Atlantic Ocean. It is 70 m. in length and very narrow, scarcely exceeding 3 m. in breadth. It lies between Watling Island and Exuma Island, in about lat.  $41^{\circ} 30' N$ . The chief settlement is Clarence Town. Pop. 4,564.

**Long Island.** A long, narrow island of the U.S.A., forming the S.E. extremity of New York state. Long Island Sound separates it from Conn. It is 118 m. long by 13 m. to 23 m. broad, and covers an area of 1,682 sq. m. Its surface is generally level except for a range of hills along the N. shore, which is indented by several bays, the largest being Smithtown Bay towards the centre. The inner S. shore is marked by Jamaica Bay, near the W. end, and the long, narrow Great South Bay, formed by an outer shore of beach ridges. The E. end of the island comprises two ragged peninsulas.

Long Island is divided into four counties. King's, Queen's, Nassau, and Suffolk, and at its W. extremity is the borough of Brooklyn and Long Island City, separated from Manhattan Island by the East river, only about  $\frac{1}{2}$  m. across. It is largely a residential district for New York business people and is served by the Long Island rly., which carries more season ticket holders than any other U.S. rly. Jones Beach, most frequented of many recreational areas developed in the neighbourhood, has in recent years usurped the popularity of the old time resorts, Coney Island and Rockaway Beach, and Sheepshead Bay is noted for its racecourse. In Queen's are the New York municipal airport, LaGuardia Field, which has the heaviest commercial airline operations in the world; and Flushing Meadow Park, site of the New York World's Fair of 1939 and

Long Island. Map of the island, forming part of New York State, and a residential district of New York City

of early meetings of the United Nations general assembly. Farther out, at Lake Success, the U.N. secretariat was established pending erection of permanent headquarters on Manhattan.

Long Island was first settled in 1623. On Aug. 27, 1776, the British defeated the Americans in the battle fought at the W. end of the island. Pop. 4,600,022.

**Long Island City.** Part of the borough of Queen's, N.Y.C., U.S.A. A separate city until 1893, it stands at the W. end of Long Island, on East River and Long Island Sound, and is the E. terminus of the Long Island rly. An increasingly important commercial and industrial centre, it has a river frontage of 10 m. Within an area of a few sq. m., 1,400 factories are grouped, their products ranging from bread to cut stone and marble. Settled in 1640, the city was created in 1870 by the consolidation of several villages.

**Long Island Sound.** Channel separating Long Island from the N.Y. mainland and Conn., U.S.A. It communicates with the Atlantic through a strait called the Race, and at the W. end is connected with New York Bay by Hell Gate and East River. About 110 m. long, it has an extreme breadth of 24 m. and a greatest depth of 200 ft. Rivers flowing into the Sound from the N. include the Connecticut, Housatonic, and Thames. See Hell Gate.

**Longitude.** The number of degrees from the zero or prime meridian, measured along any parallel of latitude. The prime meridian is by international agreement that of Greenwich, so that places E. of that meridian are in E. longitude and places W. are in W. longitude. E. and W. longitudes meet at the meridian 180°. The rotation of the earth from W. to E. gives to places E. of Greenwich an earlier noon than to places W. Since the earth rotates through 360° in 24 hrs., a

difference of 1° long. corresponds to a difference of 4 mins. of time. See Latitude.

**Longleat.** Seat of the marquess of Bath, 3 m. from Warminster in Wiltshire. The house, on the site of the monastery of S. Radegunde, was built 1567-80 at the cost of Sir John Thynne

and after designs by John of Padua. Later Wren added something to it. Capability Brown remodelled the grounds, and in the 19th century it was "improved" by Sir Jeffry Wyatville. Built in the Italian style, it has a front 220 ft. long, and contains a massive hall and large portrait gallery. It has a collection of portraits by Holbein, Reynolds, Lely, Kneller, Van Dyck, and others. Around it is a park. 15 m. in circumference, through which the Frome flows.

Longleat, Wiltshire. South front of the mansion of the marquess of Bath

The Thynne family, who obtained the property at the dissolution of the monasteries, opened it to visitors in 1949. The name comes from the long leat or conduit that carried water to the monastery.

**Longley, CHARLES THOMAS** (1794-1868). British prelate. Born at Rochester, July 28, 1794, he was educated at Westminster School and Christ Church, Oxford. In 1818 he was ordained, and in 1823 was appointed vicar of Cowley, near Oxford. He remained at

Charles T. Longley, British prelate

Christ Church, being tutor and censor 1825-28, and for a time university reader in Greek. Longley was in 1829 made headmaster of Harrow, which he left in 1836 to become first bishop of Ripon, where he remained twenty years. Then he was translated to Dur-

ham; in 1860 became archbishop of York; and in 1862 archbishop of Canterbury. He presided over the first pan-Anglican conference. He died Oct. 27, 1868.

**Longmaid Process.** In metallurgy, a method of recovering copper and silver from copper-silver ores, devised by William Longmaid, English chemist, in 1848. The ore is first roasted with salt to convert the metals into chlorides, after which the latter are dissolved out by water and weak solutions of hydrochloric acid. From these solutions the copper is precipitated by scrap iron, and the silver by zinc iodide, which is regenerated during the process, and the zinc used again. See Copper; Silver.

**Longmans, Green and Co.** London publishing firm. It was founded 1724 by Thomas Longman, of Bristol. He purchased the business in 1726 at the signs of the Ship and the Black Swan, Paternoster Row, from William Taylor. In 1826 it acquired The Edinburgh Review; in 1882 it started Longman's Magazine, which ran until 1905; and in 1886 it established The English Historical Review. Premises and stock were destroyed in the great German fire-raid of Dec. 29-30, 1940. Until 1947 the firm was housed in a London suburb, but then it returned to Clifford Street, W.1. Southey, Coleridge, Wordsworth, Moore, Macaulay, Scott, Disraeli, Mill, Lecky, Morris, Spencer, Stevenson, Lang, Rider Haggard, Conan Doyle, Winston Churchill, and G. M. Trevelyan are among the prominent names in the Longmans catalogue.

**Long Melford.** A village of Suffolk, England. Situated 3 m. N. of Sudbury, it is a rly. junction for Haverhill and Cambridge. The church contains interesting monuments; the village is known from its association with Isopel Berners. George Borrow's heroine.

**Longmore, SIR ARTHUR MURRAY** (b. 1885). British Air Force

officer. After going through his training in H.M.S. Britannia, Longmore became a naval officer and in 1912 joined the naval wing of the R.F.C. He reverted to sea

Sir Arthur Longmore. British air officer

service in 1916 and was at Jutland, but returned to the R.N.A.S. the same year. In 1929 he was appointed A.O.C., R.A.F. College, Cranwell, and he commanded the coastal area 1934-36. Air chief marshal from Nov., 1939, he became A.O.C.-in-C., Middle East Command, in May, 1940, being succeeded by (Lord) Tedder in July, 1941. Longmore was then inspector-general of the R.A.F., retiring 1942. He was knighted 1935. In 1947 his book, *From Sea to Sky*, was published.

**Longmyndian.** In geology, the name given to a group of Pre-Cambrian sediments which form the Long Mynd near Church Stretton, Shropshire. The strata are subdivided into two groups, E. and W. The former is mainly shales and ashy grits, and rests on the Uriconian Volcanics which form Caer Caradoc, Wrekin. The W. group, largely grits and conglomerates, is considered by many to be much younger. See Pre-Cambrian.

**Long Parliament.** Name given to the English parliament which met on Nov. 3, 1640, sat almost continuously until 1653, and was revived in 1659. It met at a time of great excitement, when the country was thoroughly roused by the king's arbitrary acts. It secured the expulsion of bishops from the house of lords, passed an Act that it should not be dissolved without its own consent, and from 1642 to 1649 conducted the Civil War. In Dec., 1648, some of its members, 143 Presbyterians, were forcibly excluded, but the remainder, called in derision the Rump, continued in session. They set up the court for the trial of the king, abolished the house of lords, and carried on the government until April, 1653, when Cromwell turned them out.

In May, 1659, when there was no settled government in England, the Rump was restored; then the members were expelled, but soon restored again, this time with those kept out in 1653. On March 16, 1660, the parliament passed an Act declaring itself dissolved. From 1640 to 1653 its speaker was William Lenthall, while Pym, Hampden, Cromwell, and Hyde were prominent members of it. This parliament was, strictly speaking, an unconstitutional body after the outbreak of the Civil War, and its Acts from that date have no place on the statute book. See Cromwell.

**Longport.** Type of English porcelain. Earthenware was manufactured at Longport, near Burs-

Longport. Example from the Allen Collection, V. & A. Mus.

lem, Staffs, 1773. In 1793 Davenport produced a porcelain with hard, transparent body. His shapes and decorative treatment were good, and he produced many important royal table services, including the banqueting set for the coronation of William IV.

**Long Primer.** Name of an old printing type size, the modern equivalent of which is 10 point. It is a size larger than bourgeois and a size smaller than small pica, or about  $7\frac{1}{2}$  lines to an inch. Great primer, or 18 point, is three sizes larger. Long primer is known in France as petit-romain; in Germany as Korpus or Garmond, after the French type-founder, Claude Garamond (d. 1561); in Holland as Garmond; in Italy as Garamone; in Spain as Entredós. See Typography.

**Long Range Desert Group.** Reconnaissance and raiding unit organized by Brig. R. A. Bagnold to operate behind the enemy lines during the N. Africa campaigns of the Second Great War. Bagnold had led expeditions to explore the Libyan desert between 1925 and 1932 and written books about desert conditions. He went to the Middle East early in 1940 and, after some opposition, persuaded the War office to let him organize self-contained units to operate in the enemy's rear and gather information. At first a patrol consisted of two officers and thirty other ranks, accommodated in eleven 30-cwt. trucks. Armament comprised eleven Lewis guns, four Boys anti-tank rifles, and one 37-mm. gun, besides the crew's personal weapons. Later a patrol had one officer and 18 other ranks in five trucks, and the armament was altered to Browning, Vickers, and Breda guns.

The trucks were adapted to long desert journeys and equipped with spares and metal strips for negotiating loose sand. Each patrol was completely self-contained and carried sufficient food for an absence from base of three weeks and petrol for 1,100 miles. Further supplies of petrol, food, and ammunition were cached throughout the desert by a servicing unit. The first three patrols were manned by New Zealand divisional cavalry, but as the L.R.D.G. expanded

volunteers were accepted from other British and Imperial units, until 17 patrols were operating.

On Sept. 5, 1940, the first patrol set out, and from then until the fall of Tripoli early in 1943 the group travelled thousands of miles behind the Axis lines, collecting information and harassing lines of communication. Latterly it worked in cooperation with the Free French from Chad territory. *Consult* Born of the Desert, M. James, 1945; Long Range Desert Group, W. B. K. Shaw, 1945.

**Longreach.** Town of Queensland, Australia. It is 428 m. W. of Rockhampton on the Thomson river, which drains into Lake Eyre. Its artesian bore makes it the chief stock-watering centre of the Thomson and Barcoo dists. Pop. 3,683.

**Longridge.** Urban district of Lancashire, England. It stands on the N. bank of the Ribble, about 7 m. N.E. of Preston, with a rly. goods station. S. Lawrence is the parish church. Cotton and rayon manufacture are the chief industries. In the district are large waterworks belonging to Preston. A hill near is known as Longridge Fell. Pop. 4,158.

**Long Service and Good Conduct Medal.** Award to personnel of the British and certain dominion and colonial armed forces, and to a number of civilian services.

ARMY. The Good Conduct Medal was first instituted by William IV in 1830 and granted to soldiers who had served with irreproachable character for 21 years in the infantry or 20 years in the cavalry.

At one time each dominion and colony maintaining armed forces issued its own medal with distinctive ribbon. These were replaced by the present army L.S. and G.C.M. instituted by Edward VII in 1910 and made common to Great Britain and most dominions and colonies. Awarded to warrant officers, n.c.o.s, and men for 18 years' service with good conduct, it has on the obverse an effigy of the reigning sovereign in field marshal's uniform and on the reverse the words "For Long Service and Good Conduct." The medal is worn from a crimson ribbon with white edges. A title on the bar attached to the ribbon mount denotes the

Long Service and Good Conduct Medal. Reverse of army medal

force in which the recipient served. Duty in wartime or in certain overseas garrisons counts double time.

The Indian L.S. and G.C.M. is issued under similar conditions to native troops of the armies of India and Pakistan. It is identical in design, except that the reverse carries a wreath of lotus leaves encircling one of palms. The King's African Rifles L.S. and G.C.M. is the same as the British award, but with the inscription King's African Rifles on the reverse. The Royal West African Frontier Force L.S. and G.C.M. has similarly an appropriate inscription.

**NAVY.** The first L.S. and G.C.M. was instituted in 1831 by William IV; the present medal was authorised in 1848. It is granted to petty officers and men of the R.N. and to n.c.o.s and men of the R.M. who have served 15 years with good character, and carries a gratuity.

Long Service and Good Conduct Medal. Reverse of navy medal

Suspended from a blue ribbon edged with white, it has on the obverse the sovereign's effigy in naval uniform, and on the reverse a ship-of-the-line at anchor surrounded by a cable with the inscription "For Long Service and Good Conduct." Similar medals are awarded by the Australian and Canadian navies. Decorations go to petty officers and men of the Royal Fleet Reserve (ribbon: white, blue, white, the blue and white being separated by a red stripe); Royal Naval Reserve (ribbon: dark green with white edges and a central white stripe); and R.N.V.R. (ribbon: blue, red, green, blue).

**R.A.F.** The medal dates from 1919 and is awarded to n.c.o.s and men with 18 years' exemplary service. It is of silver and bears on the obverse the royal effigy and inscription, and on the reverse an eagle surmounted by a crown surrounded by the words "For Long Service and Good Conduct." The ribbon is dark blue and crimson with white edges.

**CIVIL.** Special constables who have served for nine years in peace or five years in wartime, and have performed 150 police duties, receive the Special Constabulary Long Service Medal. This is of bronze with the royal effigy on the obverse and the name of the recipient on the reverse. The ribbon

is red edged with one black and two white stripes. The London Salvage Corps gives a long service medal on completion of 15 years' unblemished service. The obverse has a kneeling fireman being crowned with laurel by a female figure, and the reverse the name of the recipient. The ribbon is maroon and light blue edged with white. The Colonial Police and Fire Brigades L.S. and G.C.M. was established in 1938, for award after 18 years. Its obverse shows the sovereign's effigy and the reverse a helmet and hatchet (firemen) or a wreathed truncheon (police). The ribbon of the police medal is blue, white, green, white, blue: that for firemen, blue, white, green, white, green, white, blue. The Coast Life Saving Corps L.S. and G.C.M. was instituted by the board of trade in 1911 for 20 years' service with a life-saving rocket crew. Obverse, royal effigy; reverse, recipient's name; ribbon, azure with scarlet edges. *See* Air Efficiency Award; Medals, colour plate: Territorial Efficiency Medal.

**Longships.** Number of rocks off Land's End, Cornwall, England. On one of them—Carn Brae—stands Longships lighthouse, with an occulting light visible for 16 m.

**Long's Peak.** Mt. in the U.S.A. Snow-capped peak in the Rocky Mts. in Colorado, 50 m. N.W. of Denver, it is near the sources of the N. Platte and Colorado (Grand) rivers. Its height is 14,271 ft.

**Longstop Hill.** Name given by British forces to a ridge N.W. of Medjez-el-Bab, Tunisia. It formed the right flank of the Axis troops holding Medjez-el-Bab in 1943, and was captured by the East Surreys and the Argyll and Sutherland Highlanders on April

the Mexicans. In 1861 he joined the confederate army, and was soon in command of a corps. He led this in the first and second battles of Bull Run, at Fredericksburg, Gettysburg, and Chickamauga: at the last named his generalship was chiefly responsible for the victory. In 1864 he

Longships, Cornwall. Carn Brae island and the Longships lighthouse, whose beam is visible for 16 miles

was again with Lee in Virginia, and was badly wounded. After the war he adjusted his differences with the northerners, becoming unpopular with the southerners. He held public appointments, among them that of minister to Turkey, and wrote accounts of his campaigns. Longstreet died Jan. 2, 1904.

**Long Tom.** Name given to a type of gun used by the Boers in the S. African War. These guns were 6-in. 94-pdrs., and originally intended for siege work. Adapted for field work, they were used against Ladysmith, Kimberley, and Mafeking. The range was 11,000 yds. *See* Ladysmith.

Long Tom. The Boer gun which bombarded Ladysmith during the siege, 1899-1900

26 after three days' hard fighting. *See* Tunisia, Battle of.

**Longstreet, JAMES (1821-1904).** An American soldier. Born in S. Carolina, Feb. 8, 1821, he was educated for the army at West Point, and first saw service against

ings, all modern, are the town hall and several churches; industries are the mining of coal and ironstone, and brewing and malting. Small until the introduction of the pottery industry in the 18th cent., Longton was made a borough in the

**Longton.** Dist. of the city of Stoke-on-Trent, formerly a separate borough and market town. It has a rly. station. Chief build-

19th. In 1910 it was incorporated in Stoke-on-Trent, its pop. being then 38,000. See Stoke-on-Trent.

**Longtown.** A market town of Cumberland, England. It stands on the Esk, 9 m. N. of Carlisle, with a rly. station. The chief building is the 17th cent. Gothic church, and the chief industry the making of bricks and tiles. Population 6,876.

**Longueville, ANNE GENEVIÈVE, DUCHESSE DE (1619-79).** French princess. Daughter of Henri, duc de Condé, she

Anne Geneviève,  
Duchesse de  
Longueville

was born at Vincennes, where her parents were political prisoners, Aug. 28, 1619. At 23 she married the duc de Longueville, and her beauty, together with

the military prowess of her brother, the great Condé, gained her influence. Her marriage proved a failure, and it was during a liaison with the duc de la Rochefoucauld that she entered politics. She took an active part in the organization of the second Fronde rising in 1653, persuading her brother and Turenne to side with her party. But wearying of her ambitions and jealous of her intimacy with the duke of Nemours, Rochefoucauld cast her off and, after the death of her husband, with whom she had been reconciled, in 1663 the duchess retired to a Carmelite convent. A staunch friend of the Jansenists to the last, she continued to exert her considerable influence at court in their favour. She died April 15, 1679.

**Longview.** City of Washington state, U.S.A., and the co. seat of Cowlitz co. Situated at the confluence of the Cowlitz and Columbia, it was the earliest planned city in the Pacific N.W. and is now one of the world's greatest timber centres. Founded in 1922, Longview also processes, markets, and ships farm products. The Hudson's Bay co. built warehouses here in 1846-47 and in 1852 a convention met at the settlement of Monticello to divide Oregon territory in two. This settlement was washed away by floods in 1866-67. Longview bridge, constructed in 1930 to connect Washington and Oregon across the Columbia, has the largest span of any cantilever bridge in the U.S.A. Pop. 12,385.

Another Longview is a city of Texas, the co. seat of Gregg co.,

120 m. E. of Dallas. The principal industry is oil refining, through its proximity to the E. Texas oilfield, the world's largest. Population 17,358.

**Longwall Working.** One of the systems of working coal. By it coal is removed from the face continuously, leaving long walls, and the roof over the parts from which the coal has been removed is generally left to settle or fall in, haulage way only being maintained. See Coal; Mining.

**Longwood.**

Name of the residence at St. Helena where Napoleon lived. It obtained its name from the Longwood plains in the N.E. of the island. The house which was built thereon was prepared for Napoleon, and there he lived from soon after his arrival on the island in Oct., 1815 until his death, May 5, 1821. See Napoleon.

**Longwy.** Town of France. In the dept. of Meurthe-et-Moselle, it is 40 m. N.N.W. of Metz, on the

Longwy arms

Belgian frontier, and consists of an upper town on a steep rock, and a lower. In the latter various manufactures are carried on, and there are blast furnaces in the vicinity. Called by Louis XIV the iron gate of France, it commands the approach of the Chiers valley from Luxemburg. It stands on one of the routes which invaders from the N.E. have always taken, following the course of the Moselle trench to Luxemburg and thence into France. It is on a strategic rly., which the Germans seized at the outbreak of the First Great War, and possessed a fort, one of a chain of forts designed for the protection of the N.E. frontier of France.

In 1914 Longwy was garrisoned by two French battalions and a small force of artillery. The Germans attacked the town on Aug. 21, when the crown prince with the 5th army began his advance and opened the bombardment with heavy artillery. By Aug. 26 the Germans had put 36 out of 37 guns in the defences out of action, and the commander surrendered. Pop. 12,150.

**Longyearbyen.** Coal mining settlement on Spitsbergen (q.v.). The coal deposits were first developed under licence from the Norwegian govt. in 1909 by an American, John Longyear, after whom the settlement was named. A yearly average of 300,000 tons of coal is produced. The pop. of 600 consists almost entirely of miners and auxiliary workers, most of whom migrate regularly from Norway for the season. A governor has administrative and

Longwood, St. Helena. The house where Napoleon passed the last years of his life during exile on the island

From a print c. 1840

legal authority. The original settlement was destroyed by the Germans in the Second Great War, but was rebuilt and resumed coal exports in 1946.

**Lonsdale, EARL OF.** A British title borne with a short interval since 1784 by the Lowthers. The family dates back to the time of Edward I or earlier, and in Tudor times the Lowthers were important in Cumberland. In 1696 Sir John Lowther was made a viscount. He was a supporter of the Revolution of 1688, after which he was first lord of the treasury. The title became extinct when his younger son died in 1751.

The existing branch of the Lowthers is descended from Sir Christopher (d. 1617). Sir James (1736-1802) inherited the great wealth of Viscount Lonsdale and of other Lowthers, including another Sir James, enriched by the development of Whitehaven. He was made an earl in 1784, but the earldom died with him. A kinsman, Sir William, became Viscount Lowther, and was made earl of Lonsdale in 1807. He built Lowther Castle, Penrith, the chief seat of the family.

In 1882 the title passed to Hugh Cecil Lowther, 5th earl (1857-1944). He was

5th Earl of Lonsdale,  
British sportsman  
Russell

born on January 25, 1857, was educated at Eton, and became devoted to sport and adventure. In 1878 he led an expedition to the Arctic and discovered gold in Klondike before the boom. He rode in steeplechases, was master of famous packs, won the St. Leger with Royal Lancer in 1922, and was a picturesque figure on the racecourse. In 1923 his Latto took the Waterloo Cup. President of the National Sporting Club, in 1911 he awarded gold belts for boxing at five weights. Dying childless on April 13, 1944, he was succeeded in the title by his brother Lancelot (b. June 25, 1867). See Boxing.

**Lonsdale, Frederick** (b. 1881). A British playwright. Frederick Leonard, a native of Jersey, was born on Feb. 5, 1881. He established his reputation as the librettist of musical comedies and operettas, e.g. *The King of Cadonia*, 1908; *The Balkan Princess*; *The Maid of the Mountains* (q.v.). This was eclipsed by his fame as the author of sophisticated, witty comedies of social life, adroitly characterised and deftly put together. These included *Aren't We All?* 1923; *Spring Cleaning*, 1923; *The Last of Mrs. Cheyney*, 1925; *On Approval*, 1927; *Canaries Sometimes Sing*, 1929. But for the *Grace of God*, 1947, struck a more serious note.

**Lons-le-Saunier.** A town of France, capital of the dept. of Jura. It lies on the river Vallière, 56 m. by rly. S.W. of Besançon, and is a rly. junction of note. There is trade in mineral waters, wine, timber, and agricultural produce, and the town's salt baths are resorted to for rickets and other ailments. The principal buildings are the prefecture, formerly a convent, the hôtel de ville, with a small museum, and

Looe, Cornwall. Town and harbour, with the bridge connecting E. and W. Looe, looking inland Frith

the 12th-15th cent. church of S. Désiré. The town was the birthplace of Rouget de Lisle (q.v.). Pop. 15,568.

**Looe.** A card game. Three-card loo may be played by several persons, 5 or 7 making the best game. He who cuts lowest deals, giving three cards, one at a time, to each player. An extra hand, termed a miss, is also dealt, which the eldest player may exchange for his own, but if he looks at the miss he must take it or be loosed. So long as the miss remains on the table any player may take it in his turn. Each dealer puts a certain stake into the pool, which is also increased by penalties. The card left at the top of the pack is turned for trumps, but when the pool contains only the minimum amount the round is usually played without trumps. The knave of clubs, known as Pam, is the principal card.

The first player looks at his cards and decides to play his own hand, take the miss, or drop out; the next player doing in like manner; and this continues till it is seen how many players stand the pool. The eldest hand then leads a card, and the next player must, if possible, either head the trick by a higher card or trump it. Each player's card is left in front of him as played; the winners taking a third of the pool for each trick and those players who have not won a trick are loosed, by having to pay a certain stake into the next pool, making it, with the dealer's contribution, a double.

**Looe.** Seaport, holiday resort, and urban dist. of Cornwall, England. It stands on Looe Bay, 16 m. W. of Plymouth, terminus of a branch rly. from Liskeard. The

urban dist. includes East Looe and West Looe, which are connected by a long bridge across the river Looe. The main buildings are the parish church of S. Martin, which has a Norman doorway, the restored chapel of S. Nicholas, and the old town hall. Industries are shipping, fishing, and fish canning. The two Looes are ancient places, and were at one time flourishing seaports; the tidal harbour is still used by the small fishing fleet. Privileges were granted to them in the 14th century, and in 1558 E. Looe became a corporate town. W. Looe obtained a like distinction later, and then the two began to send members to parliament. In 1832 the right to separate representation was taken away, and later the privileges of both boroughs were lost. Off the mouth of the river is Looe Island, once a haunt of smugglers. Market day, Sat. Pop. 3,800.

**Loofah** (*Luffa cylindrica*). A climbing herb of the family Cucurbitaceae. A native of Africa, it has long stems that climb by means of tendrils. The alternate leaves are large, rough, five-lobed. The flowers are white, the females distinct from the males. The fruit is long, like a cucumber, but stouter. The flesh is permeated by a network of tough fibres, and when the flesh is macerated this is left intact and forms the bath loofah.

**Looking Backward, 2000-1887.** Utopian romance by Edward Bellamy (q.v.), first pub. 1888. The hero, put

into a mesmeric sleep in 1887, wakes up over a century later to find the world reorganized on a socialist basis with the aid of all kinds of mechanical invention. Among other happy prophetic strokes, Bellamy depicted the flooding of a private house with music or the performance of a concert, drama, or oration, all at the turn of a switch.

**Lookout.** Mountain ridge in the U.S.A. It extends from the N.W. corner of Georgia to the Tennessee river, and thence S.W. into Alabama, and is noted for the grandeur of its scenery. It reaches 2,125 ft., and is traversed by a rly. See Chattanooga.

**Loom.** Apparatus for weaving cloth. Some looms are operated by hand, some by power. The hand loom has now only a limited

Frederick Lonsdale, British playwright

Lons-le-Saunier arms

Loofah. Leaf, flower, and fruit

application in village industry and handicraft work; its development is dealt with under Weaving. The power loom on which most of the woven fabric of the civilized world is made is a complicated machine. Looms are specially designed to do certain work; thus a loom built to make cotton sheeting would not be suitable for crêpe-de-chine, still less for velvet or towelling.

The basic parts of the power loom are, as for the hand loom, the beam on which the warp is wound, and from which it passes to the shafts, frames set with wire healds each with a central eye, so that by raising a shaft all warp threads passing through heald eyes on that shaft are raised simultaneously; the shuttle, carrying a bobbin of weft backwards and forwards across the warp; the sley, an oscillating frame carrying a comb-like wire reed for pressing the weft threads up against their predecessors; and the take-up roller, on which woven cloth is wound.

The cycle of operations for a simple weave is as follows:—the shafts lift all odd threads and leave all even threads lying on the shuttle-race; the shuttle is given a violent jerk by a flexible wooden rod with a rawhide thong attached to the end; the sley moves backwards and presses the newly-inserted weft in place; then moves forwards, and at the same time the shafts controlling the odd

threads lower them to the race, and those controlling the even threads lift these; the weft shuttle is returned, and the second pick of weft "beaten up" against the first. At the same time, the take-up roller moves the cloth on the distance of one pick, and a similar length of warp is released from the beam at the back.

Looms can be divided into three types, depending on the means used for raising and lowering the shafts. The Tappet is light and fast, but can be used only for comparatively simple weaves. The Dobby will accommodate up to 48 shafts, and on it elaborate weaves such as herringbones can be woven. Mechanism controlling the lifting of the shafts is contained in a box. The Jacquard has no shafts, but each warp thread passes through a separate heald hung on a cord, and can be lifted independently. The lifting is controlled by a series of feeler wires working in conjunction with holes punched in cards, rather like player-piano rolls; Jacquards are slow and tedious to set up, but are used for elaborate work such as damask.

In the ordinary loom the operator has to watch for shuttles running empty and to replace them. In the automatic loom a feeler mechanism brings a shuttle-change into operation when a shuttle is nearly empty, the old one being pushed aside and a full one put in its place. The operator's

only duties are to see that there is a reserve of full shuttles, and to repair breaks when there is a stoppage. One man can look after eight or more machines.

Special looms are required for chenilles; pile fabrics such as velvets; carpets; and towelling. In most of these, a second and independent weft or warp forms a series of raised loops over wires; in towellings these loops are left intact, but in velvets and carpets the wires are forged into knife-edges at the end, and as they are withdrawn by the loom mechanism

they cut the loops, leaving the pile. More cumbersome looms are used for weaving asbestos belting, brake linings, etc.

Ribbons, tapes, and webbings are woven on smallware looms, usually large structures really consisting of about a dozen looms side-by-side. The shuttle is not thrown backwards and forwards, but is positively moved by rack and pinion; this is possible because for a tape an inch wide the shuttle can be 10 ins. in length, whereas for a 100-inch calico the shuttle would have to be about 9 ft. long for a positive drive. A newer smallware loom is the Unit type: its shuttle works in a semi-circular track, while the shafts and sley are replaced by two fittings like metal combs with teeth facing and capable of overlapping.

Modern developments include circular looms, which insert the weft in a continuous spiral, and so form a tubular fabric; and shuttleless looms, with nippers to pull the weft across the cloth from a large bobbin. These machines do not at present constitute any serious threat to the orthodox type. *Consult Automatic Weaving, W. A. Hanton, 1929.*

F. V. Davies, A.R.I.C.

**Looming.** Nautical expression for an enlarged, and often indistinct, appearance of an object. This magnifying process frequently occurs with slight fog over the sea or near the coast, and is due to the refraction of light in the surface layers of the atmosphere. *See Mirage.*

**Loon** (also loom, from old Norse *lōmr*). Name applied popularly in Scotland to the great northern diver (*q.v.*). In N. America the name is given to several similar diving birds of the genus *Gavia*.

**Loon.** Town and harbour of Bohol, Philippine Islands. It lies on the W. declivity of a hill in which steps have been cut to enable the town to be approached. The harbour is protected by a mole 109 yds. in length. Loon trades in local produce, chiefly cocoa, coffee, maize, tobacco, and coconuts. *Pron. Lo-on.*

**Looping the Loop.** Aerobatic manoeuvre, involving a complete revolution in flight in a vertical plane. In the normal loop, the upper surface of the aircraft is on the inside of the circle; the opposite is true of the inverted or outside loop. The term is derived from a fun-fair "thrill" popular in the early 20th cent., a development of the switchback railway in which the passengers'

Loom. Jacquard loom, a large machine used for weaving elaborate fabrics such as damask

Looping the Loop. Diagram showing successive positions of an aeroplane during a loop

car followed the rails through a complete loop.

**Loos.** Mining village of France, in the dept. of Pas-de-Calais, 3 m. N.W. of Lens. As the result of the fighting around it in the First Great War the original houses were obliterated, but a new village was built, with a memorial to over 20,000 missing British soldiers. It is sometimes known as Loos-en-Gohelle, to distinguish it from Loos, a small town to the E. of Lille.

The village is famous for the battle of Loos, an engagement of the First Great War. This was one of the earliest large-scale Allied offensives against German forces on the western front, Sept.-Oct., 1915. The attack was timed to coincide with a French offensive in Champagne, and its object was to recover from German hands the mining district and the town of Lens, and possibly Lille if the initial attack were successful. The battle was notable as being the first time the British new armies, raised in 1914, were employed in offensive warfare, and the first occasion on which gas was used against the Germans. As it happened, the latter proved a handicap to the British, as the wind shifted just as the gas was released from the cylinders.

The German positions, which included the so-called Hohenzollern Redoubt, Hill 70, and Fosse 8, were of great strength; and the battle was preceded by heavy artillery bombardment of these positions, lasting four days. The attack began in the early hours of Sept. 25, on a front of over 20 m. Troops taking part were the British 1st, 2nd, 7th, 8th, 9th, 15th, and 47th divisions, and the Indian corps, with the 21st and 24th divs. in reserve; and to the immediate S., two French corps and two French divisions. The German positions were deeply penetrated in some places, but wire and machine guns had soon checked the attack elsewhere.

The 15th and 47th divs. both entered Loos, the former forcing a way right through the village. By noon the situation was that British reserves might have clinched a signal victory; but the reserves were too far from the front, which they could not reach before night-fall, by which time the Germans had counter-attacked strongly. The French, attacking at midday, had gained some ground. Heavy fighting raged for the next two days. New attacks by the British 21st and 24th divs. met with no

Loos. Plan of the battlefield showing relative positions of Allied divisions

success in the face of machine-guns and gas shells. There were many German counter-attacks, but by Sept. 28 the battle had come almost to a standstill. While the French took over the Loos sector, at Sir J. French's request, and the Allies were consolidating their new front, the Germans made several local attempts to recover ground, notably at the Hohenzollern Redoubt, which the British 9th div. had stormed the first day. There was severe fighting for the Redoubt between Sept. 29 and Oct. 8, and part of its tangle of trenches was re-occupied by the Germans

The net result of the battle was the Allied gain of a salient towards Lens with a depth, at its deepest point, of about 3,500 yards, together with the village of Loos and Souchez and the W. slopes of Vimy Ridge. The British force engaged had been about 250,000, the French almost as large. British losses, 47,000 during the first three days, probably finally exceeded 60,000. Individual battalions suffered grievously, e.g. of the 9th King's Liverpool only 5 officers and 120 men were left. German casualties were smaller than those of the Allies. The attempt to pierce the German front where it was strongest might have succeeded had the Germans been surprised and had ample Allied reserves been available. Neither of these conditions being fulfilled, the struggle, after the initial success, resolved itself into a series of ill-supported and ill-concerted attacks on German machine-gun positions under heavy fire. The heroism of the troops on both sides was remarkable. Few battles have ever been more desperately contested. Apart from the official war histories, vivid descriptions of the battle are to be found in *The First Hundred Thousand*, Ian Hay, 1915; *Realities of War*, Sir P. Gibbs, 1920; *Peter Jackson*, Cigar Merchant, G. Frankau, 1920; *The Great Push*, P. McGill, 1916.

**Loosestrife.** Folk-name applied to several plants, but especially to *Lysimachia* (common loosestrife) and *Lythrum salicaria* (purple loosestrife), both tall herbs found on river banks. Common loosestrife (*Lysimachia vulgaris*) is a herb of the family Primulaceae. It has lance-shaped leaves, and yellow flowers in clusters at the top of the stem. Purple loosestrife, family *Lythraceae*, has narrow leaves and purple or pink flowers, forming handsome spikes. It is often mistaken for willow herb (*g.v.*).

Loosestrife. Flower spray of purple loosestrife

**Lope de Rueda** (c. 1510-65). Spanish dramatist. Born in Seville, and a gold-beater by trade, he became a pioneer of the popular Spanish drama, writing prose plays which Cervantes, who calls him "the great Lope de Rueda," witnessed in his youth. The ablest member and manager of a small company of players, he displayed much ability in the representation of roguish servants, Biscayan boors, etc., travelling from town to town with crude properties and costumes, and performing in a wagon. More popular were his short pastoral dialogues and interludes, interspersed with songs. His plays were usually drawn from Italian sources. He was buried in Córdova cathedral.

**Lope de Vega** (1562-1635). Spanish dramatist and poet, whose full name was Lope Felix de Vega

Lope de Vega,  
Spanish dramatist

Carpio. He was born in Madrid, Nov. 25, 1562, and educated at the imperial college and the university of Alcalá. As a soldier, he took part in the Armada expedition against England, and he belonged to the same regiment as Cervantes. He eloped with and married a lady of the court, but after killing an opponent in a duel he spent some years in banishment from Madrid. After the death of his second wife, in 1614 he took holy orders, became a member of the order of S. Francis, and was a familiar of the Inquisition. He amassed honours and wealth, enjoyed universal popularity, and dying in Madrid, Aug. 27, 1635, was buried in the convent of Jesus and Mary.

Called *El Fenix de España*, the Spanish phoenix, he wrote nearly 2,000 plays, religious dramas, and interludes, of which 430 plays and 50 autos, or religious dramas, are extant. The chief founder of the national drama of Spain, he introduced the drama of intrigue, familiarly known as that of the cloak and sword. His best known plays include *La Carbonera*, *Bella Aurora*, *Noche de San Juan*, and *Por el Puente Juana*. While in contemporary England women's parts were being taken by boys, Lope assigned them to women. Despite the vastness and variety of his output—probably no more prolific writer has ever lived—he wrote spirited dialogue, displayed infinite invention, and had a won-

derful gift for drawing pictures of manners from real life.

His other works embrace epics, poems, and prose romances. He wrote a long continuation of Ariosto's *Orlando Furioso*—*Hermosura de Angélica*, 1602; *La Dragontea*, 1598, an epic attacking Drake and Queen Elizabeth; in rivalry with Tasso, a poem of 20 cantos entitled *La Jerusalén Conquistada*, published 1603; a religious poem, *San Isidro*, 1599, on the patron saint of Madrid; *La Corona Trágica*, 1627, an epic on Mary Queen of Scots; *Arcadia*, 1598, a pastoral romance in prose and verse; a long novel, *El Peregrino en su Patria*, 1604; and a religious pastoral, *Pastores de Belén*. He also composed sonnets of merit. See *Drama*; *Spain*; *Literature*.

*Bibliography.* Works: Edition in 21 vols., 1876-79; definitive edition, 1890-1920; *Some Account of his Life and Writings*, Lord Holland, 1817; *L. de V. and the Spanish Drama*, J. Fitzmaurice-Kelly, 1902; *Life*, 1904, and *The Spanish Stage in the Time of L. de V.*, 1909, H. A. Rennert.

**Lopes, Sir Manasseh Masseh** (1755-1831). British politician. Of Spanish-Jewish descent, he was born in Jamaica, Jan. 27, 1755. Becoming a Christian, he was elected M.P. for New Romney in 1802, and was created a baronet three years later. In 1819 he was tried for corruption, and it was found that he had bribed the electors of Barnstaple with £3,000 and those of Grampound with £2,000 for seats in those constituencies. Fined £1,000 and sentenced to two years' imprisonment for the latter offence, upon his release he was elected for his pocket borough of Westbury. He died March 26, 1831, leaving a large fortune.

**Lopez, Carlos Antonio** (1790-1862). Dictator of Paraguay. Born at Asunción, Nov. 4, 1790, his early knowledge and grasp of public affairs aroused the hostility of his uncle, J. G. R. Francia, then dictator of Paraguay, and he was forced into obscurity until Francia's death in 1840. By 1844 he had become president, governing nominally under a republic constitution, but actually as an autocrat. His rule was sagacious, and was chiefly directed to developing the resources, both material and military, of the country.

His son, Francisco Salano Lopez, born at Asunción, July 24, 1826, was educated in Paris, and in 1845 was appointed commander-in-chief of the Paraguayan army. In 1854 he

was sent on a diplomatic mission to Europe and on his return was made minister of war. President from

F. S. Lopez,  
dictator of Paraguay

the death of his father, he was almost constantly at war with Brazil, Argentina, and Uruguay. His cruelty in the wholesale execution of leading men suspected of disloyalty to him alienated many supporters. Driven to the N. of Paraguay by the victorious Brazilians, he was overtaken near the river Aquidaban and killed, March 1, 1870. A study by R. B. Cunningham Graham appeared in 1933. *Pron.* Lo-payth.

**Lopez, Vicente Fidel** (1814-1903). Argentine author. The son of Vicente Lopez (1784-1856), one of the founders of the republic, he was born in Buenos Aires and became a lawyer. Fearing the dictator Rosas, he fled to Chile, and at Valparaiso founded in 1842 one of the first reviews published in that country. He returned to Argentina in 1852 to become head of the university at Buenos Aires. Among his writings, all in Spanish, are *The Bride of the Heretic*, or *The Inquisition of Lima*; *The Races of Peru before the Conquest*; *History of the Argentine Republic*.

**Lop-nor** or **LoB-nor**. Lake-system of China, in Sinkiang prov. Situated between the Kuruk and Altyn ranges, it collects the drainage of the Tarim basin. Described in early Chinese annals and visited by Marco Polo about 1273, its former sites are now desiccated, salt-encrusted desert. Since the 17th century the Tarim has discharged more southerly and westerly into the reed-grown Karakoshun lagoon, visited from 1876 onwards by Prjevalsky and Stein.

**Lopokova, Lydia** (b. 1892). The former name of Lady Keynes, Russian-born dancer. Born in Russia, Oct. 21, 1892, she studied at the imperial ballet school, St. Petersburg, and performed at the Marinsky Theatre in *The Sleeping Princess*, 1901. She became a famous dancer in Paris and New York before making her London début in 1918 with Diaghilev's company, of which she was for a time prima ballerina. Outstanding in grace and technique, she created the characters of Columbine in *Carnaval*, and the can-can dancer in *La Boutique Fantasque*, and her brilliant sense of comedy was

Lydia Lopokova, Russian dancer, in *The Good-Humoured Ladies*

probably at its best in *The Good-Humoured Ladies*. As an actress she gave notable performances in Shakespeare, Molière, and Ibsen. She married J. M. (Lord) Keynes (*q.v.*) in 1925.

**Lopolith** (Gr. *lopos*, basin). In geology, a large basin-shaped intrusion of igneous rock. The mass may originally have been a thick sill which, as the magma reservoir below emptied, sagged centrally, thus taking the present shape. Important lopoliths include the Bushveld area of Africa, and the Sudbury norite in Canada; with the latter are associated world-famous nickel deposits.

**Lopping.** Term in England for the ancient right of cutting forest trees for firewood. While woodland was subject to rights of common of pasture, the lopping right was often vested in the lord of the manor. In Essex, by a right known as "the common of estovers," residents of the villages of Epping Forest had the privilege of cutting wood within reach of the axe every year between Nov. 11 and April 23, by virtue of a grant from Queen Elizabeth as lady of the manor of Loughton (*q.v.*). By the 1860s the right was confined to Loughton and Theydon Bois. When the forest was secured for the public the loppers were compensated partly by a grant, partly by the formation of a lopping endowment charity, and by the building at Loughton in 1883 of the public Lopping Hall. The pollarded condition of the vegetation in the forest is due to the custom. Consult London's Forest, P. J. S. Percival, 1909.

**Loquat** (*Eriobotrya japonica*). Japan quince or medlar. An evergreen shrub or small tree of the family Rosaceae, it is a native of Japan and S. China. Its large, oblong, and wrinkled leaves are downy on the underside. The white flowers are in drooping sprays, and the orange-red, downy fruit hangs in clusters. Its flavour is much like that of a sharp apple, but the fruit is not edible until about May.

**Lorain.** City of Ohio, U.S.A., in Lorain co. At the mouth of the Black river, on Lake Erie, 25 m. W. of Cleveland, it is served by the Baltimore and Ohio and other rlys., and by lake steamers. It has a good harbour, from which a shipping trade in coal, iron, lumber, etc., is carried on. The steel industry on which the city's economy is based became important in 1894 when Tom Johnson brought his works here. Incorporated in 1836 as Charleston, Lorain received its present name in 1874, and became a city in 1896. Pop. 44,125.

**Lorraine, ROBERT** (1876-1935). British actor and airman. Born at New Brighton, Jan. 14, 1876, he went on the stage at 13, and soon played small parts for George Alexander at the St. James's Theatre, London. His John Tanner in *Man and Superman* (*q.v.*),

Robert Lorraine, British actor and airman

New York, 1905, and his Bluntschli in *Arms and the Man*, 1908, proved him a foremost Shavian actor. Other parts included Charles Surface in *The School for Scandal*; the lead in *Cyrano de Bergerac*; Rasendyl in *The Prisoner of Zenda*; Mirabel in *The Way of the World*; Simon and his son in *Mary Rose*. Lorraine was the first to cross the Irish Sea in an aeroplane, 1910, and served with distinction in the R.A.F. during the First Great War. He died Dec. 23, 1935.

**Loranthaceae.** A family of evergreen shrubs, parasitic upon trees, and natives of the tropical and temperate regions. The usually opposite leaves are leathery, yellowish green or olive brown. In some species the sexes are combined in one flower, in others they are separate. They have no petals, and are succeeded by berries, each containing a single seed. Not all the species are out-and-out para-

sites. Those, like the European mistletoe, that have green leaves, merely absorb water and salts from the sapwood of the tree and elaborate these materials (with

Loquat. Foliage and flower sprays of the Japan quince; inset, flower

carbon from the atmosphere) into food. Some species of *Loranthus* are almost leafless.

**Lorca.** Town of Spain, in the prov. of Murcia. It stands on the river Sangonera, 41 m. by rly. S.W. of Murcia. Crowned by a Moorish castle, the old section of the city is crowded on the slope of a hill; the modern part, with broad streets, fine squares, law, courts, town hall, hospitals, theatre, etc., lies on the plain. Lorca cathedral is a Gothic structure, dating from the 12th cent. Gunpowder, chemicals, porcelain, woollens, and leather are manufactured; there is a trade in wine, agricul-

Lorca arms

Lorca, Spain. Façade of the church of S. Patricio

tural produce, and cattle. In the vicinity are silver and lead mines. Lorca figured prominently in the wars of the Moors. In 1802 thousands perished through the bursting of its huge irrigation reservoir. Pop. 70,139.

**Lorca, FEDERICO GARCÍA** (c. 1898–1936). A Spanish poet and dramatist. The date of his birth is unknown.

He was born in Fuentevaqueros, Granada, and in youth was a friend of De Falla (*q.v.*), with whom he shared a love of Andalusian folk music and dancing. During 1919–28 he lived in Madrid and Granada, and in 1930 went to New York. He was assassinated by fascists in Granada at the outbreak of the Spanish Civil War.

A truly popular modern poet, Lorca had an important influence on his contemporaries, for the emotional forces he released became part of the revolutionary movement. It was said that "he summoned the traditions, tragedy, and suffering of his own life to face, fight, and overcome death." His first collection of poems was published in 1921, and his best-known lyrical work, *Romancero Gitano*, in 1928. Poems inspired by his unhappy New York experiences, *El Poeta en Nueva York*, appeared posthumously. Among his plays were *Mariana Pineda*, 1927; two great tragedies, *Bodas de Sangre*, 1933, and *Yerma*, 1934; *Doña Rosita la Soltera*, 1935. *Bodas de Sangre* was translated into French as *La Maison de Bernarda* by J. M. Créach, and into English as *Blood Wedding* by Roy Campbell. A selection of Lorca's poems was translated by S. Spender and J. L. Gili, in 1939. *Consult Life*, A. Barea, 1944.

**Lord** (A.S. *hláford*, from *hláf*, loaf, bread; and probably *weard*, warden, keeper). Originally meaning master of a household, hence generally master, ruler, nobleman, or man of high official rank; title applied specially in Great Britain to peers and various dignitaries. The general sense occurs in land-lord, lord of the manor, and the Scottish laird.

As applied to God the word is used to render the Hebrew *Yahveh* (Jehovah) and *Adonai*, Gr. *Kyrios*, and Lat. *Dominus*. As a special

title the word lord is never given to other than British persons. It is applied to peers of the realm (lords temporal and spiritual), and may be substituted for the legal or courtesy titles marquess, earl, viscount, or baron, the following "of" being omitted, but is never given as a title to a prince or a duke. Lord is nearly always substituted for baron. By courtesy it is prefixed to the first name and surname of younger sons of dukes and marquesses. Every bishop of the Church of England, diocesan or suffragan, and every Welsh bishop consecrated before the disestablishment, is styled the lord bishop, unless retired. *See* Address, Forms of.

**Lord Advocate, or KING'S ADVOCATE.** Principal law officer of the crown in Scotland. As head of the administration of criminal justice, he acts as public prosecutor, and pleads in all causes that concern the crown. Almost invariably an M.P. before the creation of a secretary of state for Scotland he was responsible for all parliamentary business relating to that country. The office of lord advocate was established early in the 16th century. His salary since 1894 has been £5,000 a year.

**Lord Chamberlain.** Chief officer of the British royal household, and the second dignity of the court. The symbols of his office are a white staff and a key. He is in charge of all the household above stairs, and appoints the royal physicians and tradesmen. All state ceremonies are in his care. He is a peer, a privy councillor, and a member of the ministry. With some exceptions he licenses the London and metropolitan theatres, and those at Windsor and Brighton, and at other places when visited by the sovereign. In 1624 the lord chamberlain replaced the master of the revels as licenser of plays, and now all plays given in Great Britain must be licensed by him under the Theatres Act of 1843. A queen-consort has a separate lord chamberlain's department. *See* Censorship; Chamberlain; Royal Household.

**Lord Chief Justice.** Name given to the judge who in England presides over the king's bench division of the high court of justice. He ranks next to the lord chancellor, the president of the chancery division. There was a justiciar in England very early, and in the time of Henry II a lord chief justiciar or justice. At first the highest officer of state, a kind of prime minister, he was after a time confined to his legal duties, and became president of the court of king's bench. Until 1873 there was also a chief justice of the court of common pleas. In the U.S.A. the chief justice is the president of the supreme court. *See* King's Bench.

**Lord Great Chamberlain.**

The sixth great officer of state in England. As the name chamberlain suggests, he was originally in personal attendance on the king, but many of his duties have now lapsed. He still has charge of the palace of Westminster and of the arrangements when the sovereign opens parliament and is in evidence at a coronation, when he claims as part of his perquisites the bed in which the king slept the night before the ceremony. In 1133 the hereditary office was granted to Aubrey de Vere: the sole hereditary holder in 1948 was the 2nd earl of Ancaster. *See* Chamberlain.

**Lord High Chancellor.** Highest judicial functionary of Great Britain. He is a cabinet minister, a privy councillor, and relinquishes office on a change of government. The lord high chancellor, keeper of the great seal, and as such keeper of the king's conscience, may not be a Roman Catholic. He issues the royal commissions for the opening and proroguing of parliament, and for giving assents to bills, and reads the king's speech when the sovereign is not present.

The chancellor appoints all justices of the peace, some of the high court, and all county court judges, makes rules for carrying out the Summary Jurisdiction Acts, and issues all writs. He is president or speaker of the house of lords, his seat being known as the woolsack, and *ex officio* its president when it is the supreme court of appeal. He takes precedence immediately after the archbishop of Canterbury, receives a salary of £10,000 per annum, and is entitled to a pension of half that amount on relinquishing office. As ex-chancellor he is *ex officio* a judge of the house of lords. There was a lord high chancellor

Federico Lorca,  
Spanish poet

Lord Chamberlain  
in court uniform

for Scotland until 1707. *See* Chancellor; Chancery; Lords, House of; Woolsack.

**Lord High Commissioner.** Representative of the sovereign at the general assembly of the Church of Scotland. His presence gives the sanction of the civil authorities to the assembly's deliberations. The office is normally filled by a Scottish peer. *See* Scotland, Church of.

**Lord High Steward.** First great officer of state in England. He waited at the royal table on certain feast days, then only at coronations, and later presided at the trials of peers. The last permanent steward was Thomas, duke of Clarence, d. 1421. The office is now revived only for a coronation or the trial of a peer.

**Lord Howe.** Island in the S. Pacific belonging to New South Wales. It is 300 m. N.E. of Sydney. Mountainous and precipitous, its highest point reaches 2,840 ft., and it covers 5 sq. m. Lord Howe is also the name of a group in the Solomon Is.

**Lord in Waiting.** Personal attendant on the British sovereign. He is invariably a peer belonging to the political party in power, and as such leaves office on a change of government. Usually seven in number, these lords attend on the sovereign in turn. A queen-consort has sometimes a lord in waiting, not a political office. *See* Royal Household.

**Lord Keeper.** In England, until about 1760, one of the great officers of state. He was the keeper of the great seal, originally only as a deputy of the lord chancellor during the absence of the latter abroad, or pending the appointment of a lord chancellor, but in course of time his office was made permanent, and included the work of affixing the seal to documents.

**Lord-Lieutenant.** Official representing the sovereign. There is one for every county in the U.K., usually a nobleman with estates therein. The lord-lieutenant is appointed by the sovereign by patent under the great seal. His original duty was to raise a defence force under a commission of array on the occasion of disorders, and this survives in his office as president of the county T.A. association. He is usually *custos rotulorum*, or keeper of the records, for the county, and recommends the names of persons for appointment as magistrates. Before the creation of the Irish Free State in 1922 there was a lord-lieutenant of Ireland. *See* County.

**Lord Mayor.** Title of the chief magistrate of the City of London and of other English cities. It is

Lord Mayor of London in his robes

commonly assumed to have been first bestowed upon the mayor of London in 1354 by Edward III, though it is doubtful if the prefix "lord" was ever formally conferred. The lord mayor of London is elected at Michaelmas, and sworn into office on Nov. 8, is addressed as right honorable, and on state occasions in the City ranks next to the sovereign. His wife is called the lady mayoress. The mayor's court, a survival of the courts of record, was absorbed into the City of London court in 1920. Other English cities in which the mayor is known as the lord mayor are Birmingham, Bradford, Bristol, Hull, Leeds, Leicester, Liverpool, Manchester, Newcastle-upon-Tyne, Norwich, Nottingham, Plymouth, Portsmouth, Sheffield, Stoke-on-Trent, York. *See* Mayor; Provost. *Consult* London, W. J. Loftie, 1887.

**Lord Mayor's Show.** Procession to mark the formal installation of the lord mayor of London, when on Nov. 9 he proceeds in state to and from the law courts, to receive the sovereign's assent to his election. The first lord mayor's show was held in 1215, and the first by water in 1453. The Puritans suppressed the show for 16 years. After 1711, when the lord mayor was thrown from his horse, a coach was used. An elaborate coach, with panels by the Italian painter Cipriani, was employed from 1757 till 1896, when it was replaced by a copy. The medieval procession has been succeeded by a pageant, usually representative of some feature of the British Commonwealth—e.g. sport in 1946, agriculture in 1947. At the Guildhall banquet on the night of the show the prime minister makes an important speech, traditionally dealing with foreign policy.

**Lord of Appeal.** Persons qualified to sit in the house of lords when it acts as a court of appeal are mentioned under Law Lord. *See also* Appeal, Courts of.

**Lord of Misrule.** Name given to a lord of the revels in the Middle Ages. He is also generally known as the Abbot of Unreason (*q.v.*).

**Lord of the Isles.** Title formerly borne by chieftains who ruled the Western Isles of Scotland. The earliest was Somerled, who expelled Norse invaders from parts of the Hebrides in the 12th cent. The title is one of those borne by a prince of Wales.

**Lordosis.** Increase in the anterior curvature of the lower part of the spine. It may be secondary to dislocation of the hip-joint or disease of the hip-joint, but is most often the result of sustained faulty posture. *See* Spinal Column.

**Lord President of the Council.** In the U.K., one of the great officers of state and usually a member of the cabinet. The council is the king's privy council, and it first had a regular president in the time of Charles I. Previously the lord chancellor or some other high official had presided. Since about 1680 the office of lord president has existed, and under the party system has been filled by a member of the party in power. The duties were considerable as long as the council looked after matters for which separate departments were afterwards created, e.g. public health, education, and agriculture; but then the lord president did little more than preside over meetings of the privy council (*q.v.*). Sometimes, however, the office is held in conjunction with a more laborious one, by the leader of the party in either house, or by a member of the commons who is virtually deputy prime minister.

**Lord Privy Seal.** In the U.K., a high officer of state, whose functions are now almost obsolete. Probably in Norman times the English kings had their privy seal as well as great seal, and for this also there was a keeper, who may have been employed by the kings as a check on the power of the chancellor. By the 16th cent. it was usual for state documents approved by the king to pass to the keeper of the privy seal, who sealed them and passed them to the chancellor, who took this as authority to affix the great seal. In 1884 legislation altered the practice, so the work came to an end. The office remains, its holder ranking as the fifth great officer of state. It is held by a politician of cabinet rank. *See* Chancellor.

**Lord Provost.** Chief municipal magistrate in the larger Scottish cities, Edinburgh, Glasgow, Aberdeen, etc. *See* Provost.

## HOUSE OF LORDS AND ITS HISTORY

A. F. Pollard, M.A., Prof. of History, London University, 1903-31

*The information in this article is supplemented by those on Commons, House of; Parliament; Peerage; Privy Council. See also the biographies of notable peers, both past and present*

The term the house of lords was first used in 1544 to describe those councillors, hereditary and other, whom the crown was accustomed to summon by special writ to parliament. Later it was applied to the chamber of the palace of Westminster in which they sat.

This house was thus originally the king's council in parliament, and its members sat in parliament solely in virtue of a special summons from the crown; that, indeed, is their title at the present day, although a series of decisions by the lords themselves has deprived the crown of its power to refuse the writ of summons to peers of the U.K. Peerage in this sense is, however, a comparatively modern conception. Edward I was ignorant of it, and the only persons who were necessarily present in his parliaments were the members of his council. They were always summoned by writ from the lord chancellor, who shared with the king the distinction of sitting in parliament without any summons.

Edward I, however, established the custom of also summoning to parliament, besides the representatives of shires, boroughs, and lower clergy, a number of great tenants-in-chief of the crown, such as the archbishops, earls, and bishops, and some barons and abbots selected by the crown. No one had a right to be summoned; it was a matter of obligation and duty, of suit and service at the king's court due from tenants-in-chief in return for the lands they held of the king; and the general tendency in the Middle Ages was to evade it. The number of abbots sank early in the 14th century to 27, and the number of barons from 100 to less than 50.

In time, however, a place in parliament came to be a seat of authority, and the service to be regarded as a privilege which was sought by some and denied to others. A peculiar and not very consistent theory of baronage and peerage was evolved, which restricted "peerage" or "equality" to a narrowing circle of increasingly powerful barons, and associated it with the tenure of land, and subsequently with the possession of certain dignities created by the crown. Possessors of these qualifications succeeded in denying to those councillors who did not

possess them a vote in the great council chamber in parliament. Even More, who, as chancellor, summoned every peer to parliament, and presided over their deliberations, was denied a vote. To avoid this anomaly it became the custom to create the chancellor a peer, although as late as Anne's reign there was still a chancellor who was not a peer. Other members of the council—judges, attorney- and solicitor-generals, serjeants-at-law—while they continued to be summoned by special writ to parliament, were reduced to the position of advisers. The term house of lords came into use in Henry VIII's reign in obvious imitation of the phrase house of commons, which was some two centuries older.

### Increase in Numbers

With the dissolution of the monasteries the abbots disappeared, and in the reign of Charles I the crown was finally denied the right of either omitting to summon a peer who had once been summoned before, or of refusing to summon the successor to a "peerage." The only means left to the crown of influencing the composition of its council in parliament was the creation of peers, and an attempt to limit this prerogative by the Peerage Bill of 1719 was frustrated. There were 44 temporal peers in 1529, and about 60 at the end of Elizabeth's

reign. James I added about 54, and on the eve of the Scottish union in 1707 there were 178. Sixteen Scottish peers were then added, and 28 Irish by the union of 1800, but the younger Pitt nearly doubled the total number by creations.

In 1893 there were 567, and in 1948 over 800. The bishops, however, remained fixed at 26; four Irish bishops, added at the union, disappeared with the disestablishment of the Irish Church in 1869, and the English bishops, with the exception of the two archbishops and the bishops of London, Durham, and Winchester, have to wait their turn of seniority before receiving a writ of summons. The disestablishment of the Church in Wales did not make any difference in the number of bishops sitting. So, too, the elected Scottish peers remain 16 and the Irish 28. The power of creating peers in order to pass a particular measure was only once used, and then by the Tories in 1712, the mere threat being sufficient to secure the passing of the Reform Act of 1832 and the Parliament Act of 1911.

This vast increase in numbers was accompanied by a decline in authority and influence. The peers as such lost in the middle of the 19th century that supreme judicature which they inherited from the king's great council in parliament. When the so-called house of lords now sits as a supreme court of appeal, only those members who hold or have held high judicial office can participate in its proceedings. The control of the peers over making law has also

House of Lords. Interior of the chamber from the public gallery, looking towards the thrones. On the left are government benches; on the right, opposition; between them is the raised back of the woolsack. From 1941 the chamber was used by the House of Commons, pending the rebuilding of their own chamber, destroyed by German bombs

tended to follow their control over its interpretation. The Parliament Act of 1911 removed from their veto any bill deemed by the Speaker to be a money bill; any other bill rejected by them in three successive sessions could be presented for the royal assent without their consent two years from the time it first received a second reading in the house of commons. The Parliament Act of 1949 reduced this time of waiting to one year.

Reform of the house of lords has often been proposed; but inter-party negotiations in 1948 for agreed reform of its composition and powers came to nothing.

**Lords and Ladies.** Variant name of *Arum maculatum*, also known as cuckoo-pint (*q.v.*) or wake-robin (*q.v.*).

**Lord's Cricket Ground.** Headquarters of the Marylebone Cricket Club. It is in St. John's Wood, London, N.W., near St. John's Wood station on the Bakerloo (Stanmore) line. Its founder, Thomas Lord (1757-1832), a native of Thirsk, Yorks, was groundsman at the White Conduit Club c. 1780, later had charge of a cricket ground for the earl of Winchester, and in 1787 started a ground of his own on the site of what is now Dorset Square. In 1811 he moved the turf to a new site close to the Regent's Canal, whence in 1814 he transferred it to its present position. Besides the home matches of the Middlesex club, the Oxford v. Cambridge and Eton v. Harrow fixtures and test matches against sides from the dominions take place here. *Consult* Lord's, 1787-1945, Sir P. Warner, 1946.

**Lord's Day Observance Society.** British religious organization. Founded by Bishop Daniel Wilson 1831, its history is one of evangelical campaigning against all forms of Sunday entertainment. Its London office is at 55, Fleet Street, E.C.4.

**Lord's Prayer.** **THE.** Prayer given by Christ to His disciples on the Mount (Matt. 6 *vv.* 9-13; Luke 11, *vv.* 2-4). Different versions are given by the two Evangelists and in the Book of Common Prayer. The Teaching of the Twelve Apostles, which is attributed to the 1st century A.D., directed that the prayer should be said three times a day by all Christians. Like the Creed, it was at first taught only to catechumens just before their baptism. As Christianity spread, it came to form a part of every service or fresh division of a service. The doxology (For Thine is the kingdom, etc.), a liturgical

addition, is Jewish in origin, but is found in The Teaching of the Twelve Apostles. S. Luke does not give it, and it is omitted from the R.V. text of S. Matthew. In the Book of Common Prayer, the Lord's Prayer, occurs twice in the daily offices, once in the Litany, and twice in the office for Holy Communion. The doxology was appended in 1661 for three of these: once in each of the daily offices

Lord's Cricket Ground, London. Part of the famous M.C.C. ground, also used by Middlesex, showing the pavilion. The total area is about 20 acres

and once in Holy Communion. The doxology is not included in the Litany. *See* Paternoster.

**Lord's Supper.** **THE.** Term used in the English prayer book for the service whereat Holy Communion is received. It is also much used by Nonconformists for their equivalent service, in which the partaking of bread and wine is sometimes regarded as a simple memorial rather than a sacramental act. *See* Communion, Holy; Eucharist.

**Lord Steward.** Officer of the British royal household. He is the first great officer of the court. He presides over the board of green cloth and directs all the household below stairs, having authority over all the royal officers and servants except those of the chamber, the chapel, and the stable. He is, by his office, a peer, a privy councillor, and a member of the ministry, and receives his office from the sovereign in person. Many of his duties are actually carried out by a permanent official with the title of master of the household. *See* Royal Household.

**Loreburn, ROBERT THRESHIE REID, EARL** (1846-1923). British lawyer and politician. Born April 3, 1846, in Corfu, he was educated at Cheltenham and Balliol College, Oxford. He was called to the bar in 1871, and became Q.C. in 1882, having two years previously been chosen Liberal M.P. for Hereford. In parliament he represented Dumfriesshire continuously from 1886 until 1905. Reid was

solicitor-general and attorney-general in 1894; in 1898 he represented his country in the dispute over the boundary of Venezuela; and in 1905, when the Liberals returned to power, was made lord chancellor and a peer. He secured the passing of the Court of Criminal Appeal Act, 1907. Made an earl in 1911, he retired next year, not in full sympathy with the Liberal programme. In 1917 he came forward as a

follower of Lansdowne's peace policy, and he wrote *How the War Came*, 1919. Loreburn died childless, Nov. 30, 1923.

**Lorelei** or **LURLEI.** Rocky eminence on the right bank of the Rhine, near St. Goar, Germany. Over 400 ft. high, it stands in a narrow and formerly dangerous part of the river, and affords a remarkable echo. The legend that it is haunted by a siren who lures boatmen to their doom originated with a poem by Brentano, 1802. Later it was the subject of numerous songs and operas. Heine

Lorelei, Germany. The Lorelei Rock and bend of the Rhine, looking towards St. Goarshausen

and later poets and novelists have made the rock the theme of song and story. A railway tunnel runs through it.

**Lorentz**, HENDRIK ANTOON (1853-1928). A Dutch physicist. Born at Arnhem, July 18, 1853, he studied at Leyden, where he became professor of mathematical physics in 1878. Director of research at the Teyler institute at Haarlem from 1923, he continued to lecture at Leyden on physics. Awarded the Nobel prize for that science (with his pupil Zeeman) in 1902, he died Feb. 4, 1928.

Lorentz attempted to account for the fact that the speed of light appears the same for all observers, in whatever direction they may be moving (see Ether, p. 3155). Fitzgerald had suggested (1892) that all matter, including measuring rods, suffers a contraction in the direction of its motion. Lorentz worked out the amount of this contraction and of a similar change in time intervals. The Lorentz transformations (1903) connecting coordinates ( $x, y, z, t$ ) and ( $x', y', z', t'$ ) in relative motion with velocity  $v$  along the  $x$ -axis are:

$$x' = \frac{x - vt}{\sqrt{1 - v^2/c^2}}, \quad y' = y, \\ z' = z, \quad t' = \frac{t - (v/c^2)x}{\sqrt{1 - v^2/c^2}}$$

where  $c$  is the speed of light. These formulae later found their place in Einstein's special theory of relativity (*q.v.*).

**Lorenz**, ADOLF (1854-1946). Austrian surgeon. Born in Silesia, he graduated at Vienna university in 1880, and became professor of surgery there, specialising in orthopaedy. His treatise on Dislocation of the Hip, 1895, created considerable discussion, and his "bloodless" method of reducing congenital dislocation of that joint was new to surgery. By this method, which consists of manipulation of the muscles and, if necessary, the breaking of bones, there is no outward wound and no haemorrhage.

**Loreto**. North-easternmost and much the largest department of Peru. It is bounded E. by Brazil and N. by Ecuador and Colombia, which have conflicting claims to those parts of the territory which lie N. of the Marañon. Mainly in the Amazon valley, it is traversed by the Marañon and the Ucayali. Largely covered with forests, it yields rubber, cinchona, gold, tobacco, and salt. The climate is exceedingly hot and unhealthy for Europeans. Below the capital, Iquitos (*q.v.*), the Amazon vir-

Lorient, Brittany. Place Bisson, with the church of S. Louis, built 1709, on the left

tually begins. Area, 119,270 sq. m. The pop., consisting mostly of Indians, is 168,611.

**Loreto**. A city of Italy, in the prov. of Ancona. Situated on the slopes of a hill, 3 m. from the Adriatic, and 15 m. by rly. S. of Ancona, it is one of the leading places of pilgrimages for Roman Catholics, who are attracted to the Santa Casa or Holy House, in which it is said the Virgin Mary lived when at Nazareth. According to legend it was carried by angels from Galilee to Dalmatia, and from there to its present site. The Santa Casa is a small, stone building, encased by a marble screen designed by Bramante. A handsome Renaissance church with a rich dome was built over it, 1465-1587. A fire on Feb. 22, 1921, damaged the altar and destroyed the ebony image of Our Lady. Further damage was done in a German air raid, July 5, 1944.

**Loretto School**. Scottish public school, situated about 6 m. E. of Edinburgh. It owes its character to H. H. Almond, headmaster 1862-1903, who held advanced ideas on education, stressing the importance of attention to physical development as a prerequisite of mental alertness. Loretto boys still wear shorts and open flannel shirts and spend much time in the open air, whatever the weather. Numbers are strictly limited to 200 in the upper school and 53 in the junior. There are four sides: classical, modern, mathematical, and scientific. In 1946 the school's administration was transferred from a company to a board of trustees. *Consult* Loretto School Past and Present, H. B. Tristram, 1911.

**Lorian Swamp**. An extensive marshy tract in Jubaland, Kenya Colony, just N. of the equator.

**Lorient**. Town and seaport of France, in the dept. of Morbihan, Brittany. It stands near the junction of the Scorff and

the Blavet, 30 m. W.N.W. of Vannes. One of the chief naval stations in the country, it has state docks, ship-building yards, magazines, barracks, etc. Guns and naval armour are made. There is also a commercial harbour. Lorient has a trade in coal, etc., and is a fish-

ing centre for oysters and sardines. The church of S. Louis was built in the 18th cent. Pop. 11,838.

Lorient dates from about 1630, when some warehouses were built here. It flourished for many years as a station of the French East India Co., whence its name of l'Orient. On the dissolution of the company about 1770, the dockyards were taken over by the government, and developments of the 18th century made it into a first-class naval base. During the Second Great War the Germans converted this into a submarine base, and the town suffered heavily from Allied bombing. When the Germans withdrew E. in 1944, Lorient was one of the towns in which they left a garrison to prevent its use by the Allies, who contained but did not attack it. The garrison did not surrender until May 9, 1945.

**Lorimer**, SIR ROBERT STODART (1864-1929). Scottish architect, born Nov. 4, 1864. He experimented in domestic architecture, and won international fame as architect of the Scottish national war memorial chapel on the Castle Rock, Edinburgh, and of the new chapel for the Knights of the Thistle in S. Giles's cathedral. Knighted in 1911, he died Sept. 13, 1929. *Consult* a study by C. Hussey, 1931.

**Loriners' Company**. London city livery company. Originally a guild of bridle (Lat. *lorum*, thong, bridle-rein), bit, and spur makers, it had existed as a fellowship for about 500 years when it received its charter, 1711. It had a small hall in London

Loriners' Company arms

Wall, demolished c. 1765. The clerk's offices are at 31-33, High Holborn, W.C.1. The spelling, lorimer, survives in a family name.

**Loriquet.** A popular name for certain genera of small parrots. Allied to the lories, they are found in the E. Indies and Australasia, except New Zealand. One of the largest is Swainson's loriquet, which is  $6\frac{1}{2}$  ins. long in body, with a tail of almost equal length. Its general colour is green, with a purple head and blue under-parts,

Loriquet. Scaly-breasted variety, *Trichoglossus chlorolepidotus*

the under-wing coverts being red. It has a red beak with a yellow tip, lives mainly on honey, and generally congregates in large flocks in the forests. See Lory.

**Loris.** Name applied to a group of lemurs found in tropical Asia. They are small and have usually little or no tail, while the index finger of the hand is extremely small and feeble. They are nocturnal in habit and move with such slowness and stealth as to be called the slow lemurs. They vary in size from 8 ins. to about the size of a cat, are stoutly built, and have very broad heads. The eyes are round and conspicuous, rather suggesting those of an owl. The loris eats leaves, fruit, insects, eggs, and small birds. One species, the slender loris, is remarkable for its extremely slim limbs.

**Loris-Melikoff, MICHAEL** TARILOVITCH, COUNT (1826-88). A Russian soldier and statesman.

Count Loris-Melikoff, Russian soldier

Born at Tiflis (Tbilisi), he first saw service in the Caucasus, distinguished himself in the Crimean War, and took Kars in the Turkish War of 1877. A Liberal in politics, he held various civil posts, being minister of the interior to Tsar Alexander II. His administration was characterised by humanity and sincere efforts towards bringing about social reform. He died Dec. 22, 1888.

**Lorna Doone.** Romance of Exmoor by R. D. Blackmore (*q.v.*), first published in 1869. The scene is laid in Somerset and Devon in the 17th century, and deals with the feud between John Ridd (sup-

posed narrator of the story), a farmer of Oare, and the Doones, a band of outlaws who made their home in a fastness on Exmoor and lived by plunder and blackmail. The feud is terminated by the extinction of the outlaws and the marriage of John Ridd to Lorna Doone, a high-born, motherless maid who had been brought up amongst them. The story is built upon a substratum of fact, both John Ridd, a farmer famous for his immense physical strength, and a race of wild Doones having lived in the neighbourhood of Exmoor. Set against an historical background of the time of James II, touched in with great dexterity and fidelity to fact, the novel ranks among the best romances produced in the 19th century, distinguished by simplicity, vigour, purity of sentiment, racy humour, and much admirable word painting of nature. See Doones; Exmoor.

**Lorne.** District of Argyllshire, Scotland, which lies between Loch Awe and the coast. The marquess

Loris. Small animal of lethargic habit found in tropical Asia, also known as the slow lemur

of Lorne is one of the titles of the duke of Argyll, being borne as a courtesy title by his eldest son. It was long held by the nobleman who married the Princess Louise and became the 9th duke in 1900. (See Argyll, Duke of.) The Firth of Lorne is a strait separating the district of Lorne on the mainland from the island of Mull. There is a sympathetic description of the district in John Splendid, by Neil Munro.

**Lorne, MARION** (b. 1888). An American actress. Born in Pennsylvania, Aug. 12, 1888, she was educated there before making her stage debut in New York, 1905. On the London stage from 1915, she became known for her portrayals of fluffily-minded women in a series of comedies mostly written by her husband, Walter Hackett (*q.v.*), including Ambrose Applejohn's Adventure, 1921; Other Men's Wives, 1928; 77, Park Lane, 1928; Road House, 1932; Hyde Park Corner, 1935.

**Lörrach.** Town of Baden, Germany. It stands above the river Wiese, 5 m. N.E. of Basel. It manufactures textile goods, chocolate, and furniture, and has a trade in wine and fruit. It became a market town in the Middle Ages. Near is the castle of Rotteln, once a residence of the rulers of Baden.

**Lorrain, CLAUDE.** Name taken by the French painter Claude Gélée (*q.v.*), who was born in Lorraine.

**Lorraine** (Ger. Lothringen). Dist. of France. Between Luxemburg in the N. and Alsace in the S., it covers about 2,400 sq. m. The old duchy of Lorraine was much larger than the present district, as it included Nancy and the country thereabouts. Its chief rivers are the Moselle and the Saar. Population, 696,246. For map and illus. see Alsace, pp. 342-43.

Lorraine dates from 855, when once again the empire of Charlemagne was divided among his descendants. One part of it, a strip between France and Germany and including Alsace and Lorraine, was given to a certain Lothair, from whom it takes its name, through the Latin Lotharingia. After the fall of the Frankish empire, Lorraine was a bone of contention between France and Germany, and, roughly speaking, that has been its history ever since. Early in the 10th century it became a French possession, but in a few years it was handed over to Germany, and German it remained until 1542.

At first there were two Lorraines, Upper and Lower, but in a short time Lower Lorraine became known as Brabant, and the name was confined to Upper Lorraine, the country of the Moselle. From about 1050 this Lorraine was ruled by a line of dukes nominally vassals of the German kings, but so powerful that one of them was strong enough to defy the famous emperor Frederick II, and in 1542, when France and Germany were at war, Duke Anthony managed to make Lorraine independent of the latter country.

Its independence did not last very long, for French influence was making itself felt in the land. Duke Charles the Great, who reigned from 1545 to 1608, had been educated in France and was a son-in-law of King Henry II, and he assimilated French customs, which he transmitted to later dukes, and through them to the majority of their subjects. Cardinal Richelieu sent French officials to assist in governing the country; to this the duke objected, but without effect, and

in the end he became a vassal of the French king. The French obtained an increasingly firm hold upon Lorraine, and in 1736 they secured the duchy for Stanislaus, the exiled king of Poland, whose daughter was the wife of Louis XV.

In 1766, when Stanislaus died, Lorraine became part of France and remained so until 1871. In that year it was seized by Germany and by the treaty of peace was reduced in size. Nancy, hitherto the capital, was kept by France, but most of Lorraine was transferred to the conqueror and with Alsace became the imperial province of Elsass-Lothringen, known outside Germany as Alsace-Lorraine (*q.v.*).

The outbreak of the First Great War in Aug., 1914, saw considerable fighting near the Lorraine frontier, the recovery of the lost territory having long been one of the avowed aims of France. German forces advanced from Lorraine, occupied immediately the Briey ironfield, and gained command of the Vosges passes, and a French offensive opened on Aug. 10 ended in defeat on Aug. 23. But in two great battles before Nancy, Aug. 24-26 and Sept. 4-12, the Germans were checked, and thereafter fighting languished in the area until the closing weeks of the war, in 1918, when Foch concentrated large forces to envelop and capture Metz.

The whole of Lorraine, with Alsace, was restored to France in 1919 by the treaty of Versailles. But after the defeat of France, May-June, 1940, in which Lorraine and the Maginot line positions there were by-passed, the province was again annexed outright by Germany and incorporated within the Reich. In Nov., 1940, over 100,000 French were expelled, with the option of going to Poland, Silesia, or unoccupied France; and German families were brought in from the over-populated Saar and Ruhr regions to occupy their empty homes and farms. With the Saar, Lorraine became the German Westmark, with a status similar to that of Ostmark (Austria). Later, large numbers of French were conscripted for forced labour in Germany while others were drafted into the German army to fight against Russia.

As in Alsace, every attempt was made by the Germans to stamp out all trace of French national feeling. But a strong resistance movement grew up, which was finally able to assist in the liberation of

Lorraine by General de Lattre de Tassigny's 1st French army during the Allied advance to the Rhine, Feb., 1945.

The family of the old dukes of Lorraine is still represented in Europe. Duke René II had a younger son, Claude, who was the ancestor of the Guises, one of whom was Mary of Lorraine, the wife of James V of Scotland and the mother of Mary Queen of Scots. From Mary, through James I, the royal family of Gt. Britain is directly descended. A later duke, Francis, married the Empress Maria Theresa, and from them were descended the emperors of Austria, whose family is known as that of Hapsburg-Lorraine.

**Lorraine, CHARLES ALEXANDER, PRINCE OF (1712-80).** Austrian soldier and statesman. The son

Prince of Lorraine, Austrian soldier

of Leopold Joseph, duke of Lorraine, he was brother to the emperor Francis I, and married a sister of Maria Theresa. In the first Silesian war he was decisively defeated by Frederick I in the battle of Chotusitz or Ozaslau, in 1742; the next year he repeatedly defeated the Bavarians, occupied the country, and entered Alsace, but on the outbreak of the second Silesian war was sent to Bohemia, from which he drove the Prussians. Advancing into Silesia he was routed by Frederick at Hohenfriedberg, in 1745, and by Saxe at Raucoux in the Netherlands, in 1746. In the Seven Years' War Lorraine was utterly defeated by Frederick at Leuthen (*q.v.*), Dec. 5, 1757. He then returned to the Austrian Netherlands, which he governed wisely until his death, July 4, 1780.

**Lorraine, CHARLES LEOPOLD, DUKE OF (1643-90).** An Austrian soldier. He was born April 3, 1643, the son of Prince Nicholas Francis, a cardinal. In 1670 the French seized Lorraine, and expelled the reigning duke, Charles. On his death in 1675, his nephew, Charles Leopold, became titular duke.

He had previously twice been a candidate for the Polish throne.

Duke of Lorraine, Austrian soldier

He married Eleonora, the widowed queen of Poland, sister of the emperor Leopold I, and rejected the French offer of a part of his duchy. Serving in the Austrian army, he distinguished himself by helping to beat the Turks before Vienna in 1683, and in 1687 gaining the great victory of Mohács. He commanded in the war against France in 1689, but died April 18, 1690.

**Lorraine, CROSS OF.** Emblem first suggested by Adm. Muselier, and adopted by Gen. de Gaulle for the land, sea, and air forces he organized in 1940 for service with the Allies in the Second Great War. The cross of Lorraine had been borne by Joan of Arc, and first appeared in French heraldry on the arms of the dukes of Lorraine, in memory of their ancestor, Godfrey de Bouillon, who brought it back from the Holy land. The double-branched cross was used on the tombs of early Christians as a disguised cross to prevent desecration of their graves. In heraldry the cross is called Benedictine. See Free France illus.

**Lorry.** Name given originally to a large low horse-drawn truck. It is now applied colloquially to a large variety of power-driven vehicles used for transport, *e.g.* the steam lorry, motor lorry. A familiar example in the Second Great War was the three-ton truck for general transport duties. See Motor Vehicles.

**Lory.** A family of beautifully coloured parrots, found only in Australasia. There are about ten species, and all have rather long tails. The beak is less curved than in many parrots, and the long tongue is provided with a brush with which it gathers the nectar on which the birds largely feed. They also eat fruit, and usually congregate in small flocks. Lories readily learn to talk, and for this reason are in demand as pets. See Loriquet.

**Los (Span. *Islas de los Idolos*).** Group of islands situated off the coast of French Guinea. A British possession from 1818 until 1904, when it was ceded to France, it includes the four small islands, Coral, White (Île Blanche), Factory, and Tamara, which are of great strategic value, as they lie immediately W. of the port of Konakry. Principal product, groundnuts. Pop. about 800.

**Los Alamos.** Locality in the desert of New Mexico, U.S.A., 25 m. N.W. of Santa Fé. Here was one of the three principal

Los Angeles, California. 1. Roman Catholic cathedral of S. Vibiana. 2. University of California at Los Angeles, which occupies a site of 375 acres on the western outskirts. 3. Busy junction of main streets. 4. City Hall, the tower of which rises to a height of 464 ft.; at the top is a beacon for the guidance of air pilots

divisions of the atomic bomb project of the Second Great War. At this vast research and development laboratory, by the summer of 1945 many eminent scientists and their families had lived for two and a half years. This community had no post office and its mere existence was a closely-guarded secret. Extending over 70 sq. m., the project included 37 laboratories and plants, 201 other technical structures, and 302 apartment buildings. The pop. reached 6,000. *See Atomic Bomb.*

**Los Andes.** Former territory of Argentina. In 1943 it was divided between the provinces of Catamarca, Jujuy, and Salta.

**Los Andes.** Formerly a state of W. Venezuela. Named from the branches of the Andes running through it, it is now divided into the states of Táchira, Mérida, and Trujillo (*q.v.*).

**Los Andes** OR SANTA ROSA DE LOS ANDES. Town of Chile, in the prov. of Aconcagua. It stands on the Juncal on the W. slopes of the Andes, 18 m. by the trans-Andean rly. E.S.E. of San Felipe, and gives its name to an administrative district. Cattle raising and mining are carried on.

**Los Angeles.** City of California, U.S.A., co. seat of Los Angeles co., California's largest city, it is fifth largest municipality in pop. and, with its 451 sq. m., largest in area in the U.S.A. Since 1900, the pop. has doubled or more than doubled in every decade except 1930-40. The principal factors in this fabulous growth are the Calif. sunshine, climate, and soil productivity; the discovery of

oil; the development of a great man-made port which ranked third among U.S. ports in total tonnage in 1944; the enterprise and ingenuity that brought water and electric power hundreds of miles across desert and mountain; and the concentration of the U.S. motion-picture industry in several Los Angeles suburbs, the best-known being Hollywood (*q.v.*). The city sprawls across the 4,155 sq. m. of the co., having annexed some of the neighbouring communities. Among its best-known neighbours and appendages are Long Beach, Beverly Hills, Santa Monica, Venice, Glendale, Pasadena, and Inglewood.

Los Angeles stands on the Los Angeles R.; with its suburbs it stretches from the San Gabriel Mt. foothills across the coastal plain to San Pedro and Santa Monica bays on the Pacific; it includes a large part of the San Fernando Valley. The artificial harbour, constructed with federal govt. and city funds, embraces the ports of San Pedro and Wilmington and is connected with the channel of Long Beach harbour; it has a 40-m. waterfront. Los Angeles is the home-base of the U.S. Pacific fleet and is the nearest U.S. Pacific port to the Panama canal. Steam and motor ships connect it with Hawaii and many Pacific ports, while it is served by several rlys. and a municipal airport a mile square. Street rlys., including 1,000 m. of interurban electric lines, and motor buses serve Los Angeles and its satellites; private motor car traffic is exceedingly heavy.

Los Angeles architecture is a hodge-podge of styles and periods; but the civic centre, with its tall white gleaming edifices, is impressive. Buildings of special note are the 464 ft. city hall with a skyscraper tower, the 18-storey U.S. post office and court house, the county hall of justice, the hall of records, the Shrine auditorium, the Union passenger terminal, which is T-shaped and consists of thirty low, white stucco, red-tile-roofed units in mission architecture, the R.C. cathedral of S. Vibiana with a 135-ft. clock tower, seat of the Southern Calif. archdiocese, the county museum of history, science, and art, and the Angelus temple, a domed auditorium seating 5,300 in which Aimee Semple McPherson (*q.v.*) staged her meetings. Among educational institutions are the university of Southern California, the university of California at Los Angeles (the state university's southern division), Occidental college, the R.C. Loyola university of the South, and the California institute of technology at Pasadena. Churches exceed 600.

Los Angeles co. is first among U.S. counties in the value of products obtained from the soil. The country's first cooperative farm marketing project was organized here. Products include citrus and other fruits, almonds, walnuts, lettuce, celery, sugar beet, barley, alfalfa, tomatoes, flowers, and seeds.

In 1913 an aqueduct bringing water to the valley and the city through the Mohave desert from the Sierra Nevada mts. 233 m

away was completed. A newer aqueduct, bringing water from the Colorado R. to irrigate 250,000 acres and supply water to Los Angeles and twelve other cities, penetrates six mountain ranges and includes 38 tunnels. Electric power is brought over 266 m. of transmission lines from Boulder dam. Petroleum and its by-products constitute 85 p.c. of the port's exports. Los Angeles imports raw silk, sugar, copra, coffee, vegetable oils, whisky and other spirits, newsprint, and crude rubber. Her manufactures include petroleum and its products, aircraft and accessories, women's clothing for the newly developed Calif. fashion industry, chemicals and drugs, paint, glass, foundry and machine-shop products, furniture, celluloid for the film industry, structural and ornamental ironwork, tinned fruits, fish, and other foods, processed meat, and rubber products. Natural gas is abundant. Within 300 m. of the city are deposits of copper, salt, potash, graphite, limestone, marble, and onyx.

#### City of Colour and Charm

Los Angeles has a distinctive appearance, with its broad streets lined by palm trees, front lawns blanketed in golden California poppies and other flamboyant and semi-tropical flowers, and the low, white or pastel-coloured houses showing, for the most part, a Spanish influence. Los Angeles is noted for the number and variety of the religious, political, and other cults which flourish there, and for the informal, colourful attire of its inhabitants.

The diversified pop. of Los Angeles includes enough Mexicans to make it the fifth largest Mexican city in the world, negroes, Chinese, Japanese, and Filipinos; white inhabitants include aspirants to cinema fame, aircraft-factory and oilfield workers, retired farmers and their wives from the Middle West, the "Okies" and "Arkies" — natives of Oklahoma and Arkansas — who migrated here from the "dust bowl" areas in the 1930s, and wartime migrants from the South to aircraft plants and shipyards.

Settled in 1781, Los Angeles was at various times the capital of the Mexican province of California. It was captured by a U.S. naval force in 1847. Its city charter dates from 1850. The name is an abbreviation of the Spanish *El Pueblo de Nuestra Señora La Reina de los Angeles de Porciuncula*, or *The City of Our*

Lady Queen of the Angels of Porciuncula. The 1940 pop. of the city itself was 1,504,277, of the met. dist. 2,904,596. In the city, Mexicans constituted 17.1 p.c. of the foreign-born white pop. The pop. of Los Angeles co. was 2,785,643. In 1900, the city's pop. was 102,489.

M. McGowan

**Los Angeles.** Capital of the Chilean prov. of Bio-Bio. Between the rivers Bio-Bio and Laja, it is a branch terminus of the main rly. which runs through Candelaria. It was settled in 1739. Pop. about 12,000.

**Losch, OTHELIE ETHEL** (b. 1902). An Austrian-born British dancer, known as Tilly Losch. A Viennese, she appeared at the opera house when a child, and later became première danseuse under the direction of Reinhardt, making her American début in his production of *A Midsummer Night's Dream*, 1927. Engaged by C. B. Cochran, she achieved outstanding success at the London Pavilion in *This Year of Grace*, 1928, and *Wake Up and Dream*, 1929. She was the Nun in a revival of *The Miracle* at the Lyceum in 1932, and formed her own ballet company next year. During her marriage to the 6th earl of Carnarvon, 1939-47, she retired from the stage.

**Los Rios** (Span., the rivers). Inland province of Ecuador. It is situated on the W. slope of the Andes between the provs. of Bolívar on the E. and Guayas on the W. The surface is mountainous, but is well watered by the Guayaquil and many other rivers. The chief occupations are agriculture and stock raising. The capital is Babahoyo or Bodegas, a busy, thriving town. Area, 2,295 sq. m. Pop. est. 150,830.

**Lossie.** River of Morayshire, Scotland. It rises on Carn Kitty and follows a winding N.E. course past Elgin to the Moray Firth at Lossiemouth. Its length is 30 m.

**Lossiemouth.** Police burgh, seaport, and watering-place of Morayshire, Scotland. It stands at the mouth of the Lossie, 5 m. by rly. N. of Elgin. The harbour handles the third largest volume of white fish in Scotland. A situation on the Moray Firth attracts visitors, for whom there are good beaches and golf links. The burgh was founded in the 19th century from three villages, Lossiemouth, Branderburgh, and Stotfield. Here Ramsay MacDonald was born and buried. The ruined Kinneddar Castle and Spynie Palace are in the vicinity. Pop. 4,400.

**Lost Horizon.** Novel by James Hilton. Published in 1934, it was notable for its imaginative treatment of the adventures of an Englishman in a Tibetan monastery, Shangri-la (symbolising spiritual awareness), and its subtle evocation of Oriental mysticism. Awarded the Hawthornden prize, it was widely read, and was made into a film, with Ronald Colman, in 1937.

**Lost Property.** In English law finding is not keeping. A lost article remains the property of the losing owner; and he can sue the finder, or anyone else who has it in his possession, for its recovery; or, if he pleases, for damages for "conversion." A finder who converts property found to his own use may be charged with larceny. If a bill of exchange, promissory note, or cheque should be lost, the true holder can still sue on it, and the judge may order that the loss shall not be set up as a defence, provided the holder (loser) gives an indemnity to the persons sued on the instrument. If a document has been lost, secondary evidence of its contents may be given.

In London there are several lost property offices, including those of the Metropolitan Police, at 109, Lambeth Road, S.E.1, and of London Transport, at 200-202, Baker Street, W.1. The main line railways also have their own offices.

**Lost Ten Tribes, THE.** Term for the N. branch of the Hebrew race, which disappeared about 140 years before the dispersion of the Jews. In 722 B.C. the Assyrians destroyed the kingdom of Israel and removed many of the inhabitants to Media and other outlying parts of their empire, where they disappear from history. This disappearance has in modern times been a matter of anxiety to many Jews and Christians, especially to those who look for a restoration of the Jewish kingdom, in which the ten tribes ought to be represented, as well as Judah and Benjamin, to which the present Jews mainly belong. Consequently attempts have been made to prove the existence of the lost tribes in one part of the world or another.

About 1644 Antonio de Montezinos (Aaron Levi) announced that some Israelite tribes existed in America, and it was supposed that they had spread there from Tartary and China. In 1649 John Sadler suggested in his *Rights of the Kingdom* that the English were of Israelitish origin. The suggestion was developed by Richard Brothers (1757-1824) in many

volumes, and was adopted by John Wilson (1840), Edward Hine (1871), and a number of subsequent writers. The Anglo-Israelite doctrine has many adherents in English-speaking countries, though not countenanced by any scholars of repute. See British Israel World Federation.

**Lostwithiel.** Mun. borough and market town of Cornwall, England. It stands on the Fowey, 23 m. N.E. of Truro, with which there is rly. connexion. The chief buildings are the church of S. Bartholomew and the duchy hall, a 14th century building. The 14th century bridge, the nearest bridge to the sea, gave the town its strategic importance. In the Middle Ages markets, and fairs were held at Lostwithiel, and it became important under the earls of Cornwall. The stannary courts were held there, and there are slight remains of the stannary prison. It was given the right to coin tin, and some of the county business was carried on here. From 1305 to 1832 it sent two members to parliament, and it was made a corporate town by James I. In Sept., 1644, the parliamentary forces under the earl of Essex surrendered to the royalists at Lostwithiel, except only Essex and the horsemen who escaped. Near are Lanhydrock House and Restormel Castle. Pop. 1,325.

**Lot or Sort.** Object chosen or cast to determine a question. The question may be determined by its number, inscription, etc., or the way in which it falls when cast or thrown. Casting or drawing lots was an ancient method of divination. It was employed by the Israelites as a means of ascertaining the divine will in times of crisis or perplexity (Prov. 16, v. 33). The mysterious Urim and Thummim (Ex. 28; 1 Sam. 28) are believed to have been engraved images or jewels carried in a pouch under the breastplate (q.v.) of the priest, and used in this connexion. The lots seem to have been usually tablets of wood or stone suitably inscribed. They were used to detect a culprit (Josh. 7; 1 Sam. 14; Jonah 1); to choose an office-bearer (1 Sam. 10; 1 Chron. 24; Acts 1); in the selection of the sin-offering and the scapegoat (Lev. 16); and for the division of the land of Canaan (Num. 26). The practice was continued in the early Church, and is referred to by S. Augustine; by the Puritans, who were ridiculed by Swift on account of it; by the Bohemians in selecting bishops; and by the Moravians.

Practised to some extent in ancient Greece, drawing of lots was much more common among the Italians, being specially referred to by Cicero, Suetonius, Livy, and other writers. Distinction is made between the *sortes* (lots) in temples and those drawn commonly. The *sortes* were tablets of wood, bronze, or other material, inscribed with a verse or proverb. By Cicero's time this form of divination had become virtually obsolete, except at Praenestê, but the word *sortes* survived as a term for any kind of oracular deliverance. Virgil applied it to the Sibylline Books (q.v.). The opening at random of Homer or Virgil, the Bible or the Koran, and regarding the

Lostwithiel, Cornwall. Parish church of S. Bartholomew  
From a drawing by G. G. Harper

first line upon which the eye falls as prophetic is a form of drawing lots. See Divination; Lottery; Situla; Sortes; Urim and Thummim.

**Lot.** River of France. It rises in the Cévennes, on the Mont du Goulet, Lozère dept., and flows across the Central Plateau to join the Garonne at Aiguillon, Lot-et-Garonne. Its length is about 300 m., and its course mainly westward. Its chief tributaries are the Truyère and the Celé. The lower half of its course has been canalised. Like the Tarn, the Lot has carved the plateau limestones into a series of bluffs, or causses, with numerous caves where surface water disappears into sinkholes.

**Lot.** Department of France. In the S.W. of the country, it has an area of 2,017 sq. m. Much of it is hilly, and the chief river is the Lot. Others are tributaries of the Tarn and the Dordogne. The vine is extensively grown; horses, sheep, and cattle, poultry, and bees are reared; iron, coal, zinc, and limestone are worked. Wheat,

maize, and oats are also cultivated, as are potatoes, tobacco, and fruits. Cahors is the capital; other towns are Figeac, Gourdon, and Rocamadour. Pop. 154,897.

**Lot.** Son of Haran and nephew of Abraham (Gen. 13). He accompanied Abraham from Mesopotamia to Canaan, but as a result of strife among the herdsmen he parted from his uncle and was assigned the Jordan valley as his country, making his home at Sodom, whence he was taken captive by Chedorlaomer, but was rescued by Abraham. He was visited by mysterious messengers at Sodom, who rescued him and his family from the destruction of the city by fire. The story of Lot's wife has been connected with the fantastically shaped masses of rock-salt found S.W. of the Dead Sea. The narrative of the incestuous birth of Moab and Ammon is perhaps intended to stigmatise two of the chief enemies of Israel.

**Lota.** Harbour and coal port of Chile. It is situated on the E. side of Arauco Bay in the province of Concepción, just S. of Coronel. It exports the coal found in the Cousino mines, mainly for use on the state rlys. Here is the celebrated Cousino Park. Pop. 34,445.

**Lot-et-Garonne.** Department of France. An inland region in the S.W., it is in general flat and fertile. The Garonne flows right through it, as does its tributary, the Lot. There are some low hills in the N., while a little of the dept. is in the Landes district. Wheat and other cereals, tobacco, and vegetables are grown, and there are numerous orchards and vineyards. Iron is mined and is worked at Fomel and elsewhere. Agen is the capital, and other places are Marmande, Villeneuve-sur-Lot, and Nérac. The dept. covers 2,078 sq. m., and was formerly partly in Guienne and partly in Gascony. Pop. 265,449.

**Lothair.** Novel by Lord Beaconsfield, considered by many critics to be his masterpiece. It was written in 1870, and relates the story of Lothair, a young and wealthy nobleman who has left England to fight in the war of Italian independence; the central incident is the attempt to win him over to the R.C. Church. The leading characters were taken from real life. Lothair is the third marquess of Bute, who came of age in 1868, and joined the R.C. Church. The duke is the first duke of Abercorn. Cardinal Manning and Bishop Samuel Wilberforce appear under pseudonyms.

**Lothair I** (795-855). German king and Roman emperor. Eldest son of the emperor Louis I, he was a grandson of Charlemagne. A kingdom was found for him in Bavaria, 815, and in 817 he was crowned joint emperor at Aix-la-Chapelle and in 823 at Rome. He died Sept. 29, 855, in the monastery of Prüm, leaving three sons. It was the division of the kingdom between these three at Verdun in 843 which gave rise roughly to the modern France and Germany with between them a "middle kingdom" called Lotharinga (after the second son Lothair) and stretching from the North Sea to the Alps. It was divided 959 into two parts, the northern half of which later became Brabant, the southern Lorraine, of which the present Lorraine (a corruption of Lotharinga) is a part.

**Lothair II** (c. 1060-1137). German king and Roman emperor. The son of a count in Saxony, he inherited his father's lands and soon became a man of mark there. Although a rebel against the emperor Henry IV, he was for a time more friendly to Henry V, who about 1106 made him duke of Saxony. As such he led the Saxons in their enmity to the family to which Henry V belonged, and until the death of that monarch in 1125 there was constant trouble between him and his powerful vassal. In 1125 Lothair was crowned German king in preference to the late king's nephew, Frederick of Hohenstaufen, and a war with the Hohenstaufen family followed quickly. In this the new king was successful. His later years were passed in Italy, where he was crowned emperor in 1133, and in a renewed quarrel with the Hohenstaufen, which on the whole enhanced his authority in Germany. Lothair died on his return from Italy, Dec. 4, 1137.

**Lotharingia**. Name of a medieval kingdom of Europe. See Lorraine; Lothair I.

**Lothario**. Character in Nicholas Rowe's tragedy *The Fair Penitent* (1703). From him is derived the phrase a gay Lothario, signifying a deceiver of women.

**Lothbury**. London thoroughfare. First called Lodebure, it is N. of the Bank, between Coleman Street and Throgmorton Street, E.C. In the 16th century it was the abode of founders or candlestick makers. The old Founders' Hall which stood from 1531 to 1845 in Founders' Court, was occupied by the G.P.O. The foundation of S. Margaret's Lothbury, has been traced back to the 12th century.

The church, rebuilt by Wren in 1690, with a finely carved font by Grinling Gibbons and a wooden chancel screen, belonged to the abbey of Barking until 1540, when the living passed to the crown.

**Lothian**. A dist. of Scotland which stretched originally from the Cheviot Hills to the Forth, thus including the counties of Berwick, Roxburgh, Haddington, Edinburgh, Linlithgow, and probably Selkirk. Originally a Brythonic dist., it was included in the 7th century in the English kingdom of Northumbria, having probably been conquered by King Ethelfrith. For many years its possession was disputed between the English and the Scots, but after 1018, when the Northumbrians were decisively beaten by Malcolm II, king of the Scots, it was annexed by the latter. At present the Lothians include only the three shires of Haddington, now called East Lothian (*q.v.*), Edinburgh, now Midlothian (*q.v.*), and Linlithgow, now West Lothian (*q.v.*).

**Lothian, EARL AND MARQUESS OF**. Scottish titles borne by the family of Kerr. Mark, the first earl, belonged to the noted border family of Ker of Cessford. Prominent in Scotland in the time of James VI, he was made Lord Newbattle in 1587 and earl of Lothian in 1606. His son left only a daughter, but she married a Kerr, and so the title remained in the family. This William Kerr became the 3rd earl, and having taken part in public life in England, he died in 1675.

His son, Robert, the 4th earl (1636-1703) inherited also the earldom of Ancrum from an uncle, and was made a marquess for his services to William III in 1701. A succession of marquesses in the direct line followed. The 11th is noticed separately below, and the 12th was Peter Francis Walter Kerr (b. Sept. 8, 1922). The chief seats of the family are Melbourne Hall, Derby, and Monteviot, Roxburghshire. The marquess sits in the house of lords as Baron Ker, and his eldest son is known as earl of Ancrum. The family has adopted the spelling Kerr in preference to Ker (*q.v.*).

**Lothian, PHILIP HENRY KERR, 11th MARQUESS OF** (1882-1940). British politician and diplomatist.

Born April 18, 1882, and educated at the Oratory School and New College, Oxford, he edited *The*

11th Marquess of Lothian

*Round Table*, 1910-16. Thence until 1921 he was secretary to the prime minister, D. Lloyd George. He succeeded to the peerage in 1930, and in 1931 was appointed chancellor of the duchy of Lancaster in the National govt. Parliamentary under-secretary in the India office and chairman of the India franchise commission, he retired from the govt., 1932, on the tariff issue, as a convinced free trader. As British ambassador in Washington from April, 1939, he did much to ensure U.S. friendship for Great Britain during a critical period. An eloquent appeal to the U.S.A. to help Great Britain to the utmost in carrying on the war against Germany was read on his behalf at a banquet in Baltimore, Dec. 11, 1940, and made a great impression. He himself was too ill to attend the banquet, and died the following day.

**Lothian Regiment**. Another name for the Royal Scots, who are recruited mainly in Edinburgh and the Lothians. Its official title was changed in 1920 from *The Royal Scots (Lothian Regiment)* to *The Royal Scots (The Royal Regiment)*. See Royal Scots.

**Loti, PIERRE** (1850-1923). Pen name of French novelist, Louis Marie Julien Viaud. Born at Rochefort, Jan. 14, 1850, at 17 he entered the navy, becoming captain 1906. He published his first story, *Aziyadé*, in 1879. In 1880 came *Rarahu*, reprinted in 1882 as *Le Mariage de Loti*, the story of an Englishman and a Tahitian girl, which won him instant popularity, and he rapidly produced a series of somewhat sad, sentimental stories and impressions of travel, which led to his election to the Academy in 1891. Loti's experiences at sea form the background to *Le Roman d'un Spahi*, 1881; *Mon Frère Yves*, 1883. In *Le Pêcheur d'Islande*, 1886, a tender, tragic romance of Breton life, he broke new ground, but his melan-

Pierre Loti, French novelist

choly remained. Later came *Propos d'Exil*, 1887; *Fantôme d'Orient*, 1892; *La Galilée*, 1895; *L'Inde sans les Anglais*, 1903. Lotti died, June 10, 1923. *Consult Life*, E. d'Auvergne, 1926

**Lotion** (Lat. *lotio*, washing). Name for a solution of drugs intended for external use. Lotions may be solutions in water or alcohol, and are known as antiseptic, anti-pruritic, astringent, sedative, or stimulating, according to their uses and contents. Some are known as washes, e.g. mouth washes. Antiseptic lotions may contain boric acid, carbolic acid, etc.; soothing lotions, zinc compounds, calomine, etc.; and stimulating lotions, ammonia, cantharides, etc. Evaporating lotions are prepared with spirits of wine or methylated spirit and water, and are chiefly used for the treatment of sprains and inflammations.

**Lotta Svard**. Finnish national women's organization. Named after a heroine of the war between Sweden and Russia in 1808-09, the organization became prominent in the Russo-Finnish campaign of 1939-40, when some 100,000 women undertook voluntary non-combatant duties.

**Lottery**. In English law, a distribution of prizes by lot or chance. In Tudor and Stuart times lotteries were popular in England, and were even promoted by the state as a source of revenue. But they proved so demoralising, and were associated with so much cheating, that in 1802 all lotteries not authorised by parliament were declared illegal. The last state lottery was held in 1826.

The Betting and Lotteries Act, 1934, made legal two kinds of lottery. The first is the small lottery or raffle held at an entertainment such as a bazaar. This will be legal, however, only if the whole proceeds of the entertainment (including proceeds of the lottery), after deductions for certain expenses, are devoted to purposes other than private gain. None of the prizes may be money; tickets must not be resold; nor may the result of the lottery be announced except on the premises during the entertainment.

The second type of legal lottery is the private one promoted for, and the sale of tickets confined to, (1) members of one society established for purposes not connected with gaming; (2) persons who all work on the same premises; (3) persons who all reside on the same premises. The whole proceeds, after deductions for expenses, must

be used either as prizes or for the objects of the society. Detailed rules are laid down in the Act as to what must appear on the tickets and the methods of selling them.

In unlawful lotteries the following acts are illegal: printing the tickets; selling them or advertising the sale; advertising the lottery; publishing a list of prizewinners; publishing anything describing the draw or relating to the lottery which is calculated to induce people to participate; bringing or inviting any person to send into Great Britain any ticket for sale or distribution; sending out of Great Britain any money or valuable thing received in respect of the sale of a ticket or any document recording the sale or identity of the holder. Thus the mere purchase of a ticket is (probably) not an offence. *See Betting*.

**Lotti**, ANTONIO (1664-1740). Italian composer. Born and educated in Venice, in 1692 he became assistant organist at S. Mark's and in 1736 director of music. Composer of many masses and other pieces of sacred music, he also wrote elegant trios and quartettes, and published a collection of duets and madrigals in 1705. His operas were popular and so widely known that Lotti was invited to Dresden by the elector to write operas for the theatre there, 1717-19. He died Jan. 5, 1740.

**Lotto** OR **KENO**. A gambling game played with special cards, popular in passenger liners. On the cards are marked combinations of numbers from 1 to 90. On each card are arranged three rows of five numbers, there being no duplicate numbers on any one card. Every card bears across its face a distinguishing number which the player must see registered, as he has to pay a certain sum for the card. Any quantity of cards may be chosen. The banker puts 90 small numbered balls into a bag or other receptacle which allows one ball to escape at a time. He calls aloud its number, and the player first to cover with disks the five numbers contained in any horizontal row claims the pool or prize. *See House*.

**Lotto**, LORENZO (c. 1480-c. 1556). Italian painter. He was born at Venice, and studied under the Vivarini. About 1512 he settled at Bergamo, where many of his paintings are preserved; among them his masterpiece, the *Madonna and Saints* of S. Bernardino. In 1532 he was again at Venice, but in 1552 removed

finally to Loreto, where he died in a monastery. His religious pictures are characterised by ecstatic emotion, and are sometimes highly dramatic.

**Lotus**. Genus of herbs and subshrubs of the family Leguminosae. They are world-wide in their distribution, and

Lotus. Flowers and circular leaves of the sacred lotus of India and China

five species are recognized as British. The bird's-foot trefoil (*L. corniculatus*), is abundant in every pasture and waste. From a perennial woody root stock tufted stems arise with a spreading habit, and with distant leaves divided into four or five oval leaflets. The clusters of bright yellow, pea-like flowers are in evidence all through summer, and are succeeded by slender, curved pods. There is no connexion between these plants and the lotus of the lotus-eaters, which is supposed to be the jujube-tree (*Zizyphus lotus*), a species of Rhamnaceae and a native of the Mediterranean region.

The sacred lotus of the Egyptians, referred to by Herodotus, which figures in the sculptures of the ancient temples, was a water-lily (*Nymphaea lotus*), while the tamara or sacred lotus of India, China, and Tibet is the *Nelumbium speciosum*. The latter plant figures also on the Egyptian monuments, but less frequently; and as it is no longer found in the Nile, it is supposed that it was an introduction from India. It differs from the other water-lilies in the fact that neither leaves nor flowers float on the surface, but are raised on long stalks above the water. It was accurately described by Theophrastus (368-286 B.C.).

**Lotus-eaters** (Gr. *Lotophagi*). In Greek mythology, a people whom Odysseus came across in his wanderings. They were accustomed to eat of a fruit called the lotus, which caused those who did so to lose all desire to return to their native country. It has been identified with various plants, more particularly with the jujube (*q.v.*). According to Herodotus, a people of the name inhabited the N. coast of Africa and the island of Merminx (Jerba), also called Loto-

phagitis, in Tunisia, at the entrance to the gulf called Syrtis Minor. The legend is the subject of a famous poem by Tennyson.

**Lotze, RUDOLF HERMANN** (1817-81). German philosopher. Born at Bautzen, Saxony, May 21, 1817, he qualified at Leipzig in philosophy and medicine. He became professor of philosophy at Göttingen in 1844 and in 1881 at Berlin, where he died during his first term, on July 1. Lotze founded what he called teleological idealism. Starting as a physiologist with the materialism of Herbert Spencer, modified through the influence of Leibniz, Herbart, and Hegel, he regarded the mechanical and individualistic theory of existence as valid, but incomplete. One absolute being, who must be a personal God, is the origin of all that exists; the course of the world proceeds in accordance with a final purpose. Metaphysics has its starting-point, not in itself, but in ethics. Philosophy cannot attain to complete truth; it can only acquire a view of the world, which sets before us valuable aims in life and shows us how to reach them. His most important work is *Microcosmos, Ideas on the History of Nature and of Mankind*, Eng. trans. 4th ed. 1890. *Consult* critical study by H. Jones, 1895.

Rudolf H. Lotze, German philosopher

**Loubet, ÉMILE** (1838-1929). A French statesman. He was born at Marsanne, Drôme, on the last day of 1838, the son of a peasant proprietor, and studied law in Paris. Admitted to the bar, he was by turns mayor of Montélimar; president of the council of Drôme; deputy for Montélimar, 1876; senator, 1885; minister of public works, 1887-88; premier and minister of the interior, 1892. Then he became president of the senate, 1895, and in 1899 took office for seven years as president of the republic.

Émile Loubet, French statesman  
Manuel

As mayor Loubet initiated local improvements and financial economy; as minister of public works he directed a huge scheme for the better drainage of Paris; as

prime minister and president he promoted the better relations of France with Great Britain, Italy, and Russia. Few French statesmen have been more popular. Naturally a student, he kept aloof from party cliques, eschewed needless ceremony, married Marie Denis, daughter of an ironmonger of Montélimar, and was called "the lovable-looking man in the blue sash." He died Dec. 20, 1929.

**Loudon, ERNST GIDEON, BARON VON** (1717-90). Austrian soldier, born Feb. 2, 1717, in Livonia. His family came originally from Scotland, and his father was an officer in the Swedish service. Ernst entered the Russian army, in which he served against Turkey, but in 1741 transferred his services to Austria and became a Roman Catholic. During the Seven Years' War he won a reputation as a fighting general. Among his successes were victories over Frederick the Great at Kunersdorf and Landeshut, but he was beaten at Liegnitz. Marshal Loudon commanded an army in the war of the Bavarian succession, 1778, and captured Belgrade from the Turks in 1789. His abilities were well rewarded by the Austrian rulers. He died July 14, 1790. *Consult* Life, G. B. Malleon, 1894.

E. G. von Loudon, Austrian soldier

**Loudoun**. Parish, castle, and hill in Ayrshire, Scotland. The parish is a large one on the river Irvine. Loudoun Castle, about 7 miles E. of Kilmarnock, is an ancient stronghold, restored in the 17th cent., and was long the seat of the earls of Loudoun. The hill is near the borders of Ayrshire and Lanarkshire. Here in 1307 Bruce defeated the English.

**Loudoun, EARL OF**. Scottish title held from 1633 by the families of Campbell and Abney-Hastings. John Campbell (1598-1663) married a granddaughter of Hugh, 1st Baron Loudoun, and himself took that title. In 1633 he was made an earl, and the title passed to his descendants. The 5th earl was succeeded by his daughter Flora, who married the 1st marquess of Hastings, and the earldom subsequently passed to successive marquesses of Hastings, until the higher title became extinct in 1868. A sister of the 4th marquess then inherited the earldom. Her son, Charles Edward Abney-

Hastings, 11th earl, died in 1920, and was succeeded by his niece, Edith Maud, as countess. The title carries with it the barony of Botreaux (cr. 1368).

**Loudspeaker**. Sound-diffusing portion of a sound reproduction apparatus. The loudspeaker converts audio-frequency electric currents into the corresponding sounds, and may be of either the magnetic diaphragm or the moving coil type. Loudspeakers range in strength from the small one incorporated in the home radio receiver to the large one used in the open air which may have a range of 10 m. Loudspeakers on the principle of line telephone systems are used in railway stations to announce train times, in dance halls to ensure synchronisation, and in churches and concert halls to improve acoustics. Similar types at aerodromes and in camps and ships broadcast instructions to personnel. A loudhailer is a special variety enabling ships at sea to communicate by sound over short distances; it has largely replaced the megaphone. *See* Amplifier; Radio; Sound Reproduction.

**Loudun**. Town of France. In the dept. of Vienne, it is 45 m. S.W. of Tours, with which it is connected by rly. It has an agricultural trade and a few manufactures, but its chief interest is historical. The keep of the castle still stands, and there is also a gateway, a relic of the town's fortifications. The church of S. Croix is now used for secular purposes; S. Pierre is a Gothic building. Loudun was a Roman station, and Roman remains have been found here. In the Middle Ages it was a fortress in the co. of Anjou, and its castle was a residence of the counts.

**Lough**. Irish form of the word loch, used for lakes and for deep coastal indentations. Sea loughs are usually due to glacial action, and many river loughs have been formed by the solution of the limestone bed of a river. *See* Erne; Neagh; Loch.

**Loughborough**. Mun. borough and market town of Leicestershire, England. It stands on the Soar,

Loughborough arms

10 m. N. by W. of Leicester, and has rly. stations. The chief building is the large old church of All Saints, with a fine tower. There are a technical college (*v.i.*), a grammar school for boys, and a high school for girls. Other buildings include

Loughborough war memorial, a carillon tower with 47 bells. See also Carillon illus

the town hall and free library. The staple industries concern hosiery, heavy engineering, electrical apparatus, and coach work; also dyeworks and bellfounding. Loughborough, which gives its name to a county constituency, existed in Anglo-Saxon times and had

a market in the Middle Ages, but it was a small place until the introduction of lace manufacture about 1800. This was supplanted by the hosiery trade. The place was made a borough in 1888. Market days, Mon. (cattle), Thurs., Sat. Pop. est. 33,500.

**Loughborough College.** A school of technical and scientific education at Loughborough, Leics. Founded in 1918, it accommodates 750 students in 16 residential halls. The school of engineering offers courses in mechanical, electrical, automobile, aeronautical, and civil engineering, and maintains its own workshops, generating station, and an aerodrome. Students spend alternate weeks in lecture rooms and in the workshops. The school of applied science gives instruction in chemical technology and engineering, and has facilities for research. There is also a department for the training of teachers. Under a department of physical education come gymnastics and sport, for which there are 120 acres of playing fields.

**Loughrea.** Market town of co. Galway, Eire. It stands on Lough Rea, 18 m. S.W. of Ballinasloe, with a rly. station. The chief building is the modern cathedral of the R.C. diocese of Clonfert. The town grew up around a castle built by a Norman baron, and was at one time a fortified place. There are a few remains of a religious house. Market day, Thurs. Pop. 2,891.

**Loughton.** Part of the urban district of Chigwell, Essex, England. It is on the Central Line, 11½ m. N.N.E. of Liverpool Street, also served by Green Line, and on the borders of Epping Forest. The 12th century church of S. Nicholas was pulled down in 1847

and the memorial chapel of S. Nicholas built on its site in 1877, some 16th century brasses being preserved. The existing parish church of S. John the Baptist dates from 1846; that of S. Mary from 1871. The public hall was erected in 1883 (see Lopping). Loughton Hall, 1879, stands on the site of a Tudor mansion, rebuilt in the 17th century by Sir Robert Wroth, and burnt early in the 19th century, when the pictures and 10,000 books and MSS. were destroyed. Ben Jonson refers to the gay doings at the hall in his time. The history of the manor or manors goes back to the days of the Confessor. Loughton is mentioned eight times in Domesday, and is associated with the abbots of Waltham and Stratford. It became a royal manor in 1540, and was later incorporated with the duchy of Lancaster. From the family of Wroth it passed to that of Maitland, and is now owned by the L.C.C. Pop. est. 15,000.

**Louis** or **LOUIS D'OR.** French gold coin. It was minted by Louis XIII in 1640, and continued in use till after the Revolution. It was

Louis. Obverse and reverse of the old French gold coin. ¾ actual size

worth about 16s., and half and double louis were also coined. The name is also given colloquially to the 20-franc piece or napoleon.

**Louis.** A masculine Christian name. Louis is the French form, the English being Lewis, the German Ludwig, and the Italian Lodovico. It originated among the Franks as Chlodwig, and has been popular with rulers, having been borne by 19 kings of France, a number of German emperors and kings, and by kings of Hungary and princes in Italy. The emperor Louis I counts also as Louis I, king of France, as his realm included that country. For kings, Louis is used instead of Ludwig in this work. See Ladislav.

**Louis I** (778-840). German king and Roman emperor. He was third son of Charlemagne, who had him crowned king of Aquitaine in 781. The deaths of his elder brothers made him the emperor's chief heir. He was crowned joint emperor in 813, and in 814 on Charlemagne's death became

its head. He died June 20, 840. Louis is called le Debonair and also, for his generosity to the Church and regard for morality, the Pious. His last ten years were spent in warfare with his sons about their respective shares of his empire. One of them was the emperor Lothair, another Louis the German, and the youngest was the emperor Charles the Bald.

**Louis II** (c. 822-875). German king and Roman emperor. The eldest son of the emperor Lothair I, he was associated as king of Italy with his father in the government of that country from 844, and showed great energy in quelling the disorder in the S. He made many efforts to expel the Mahomedan invaders. He established Pope Benedict III, who was threatened by a rival, in 855, and in the same year, on his father's death, he succeeded to the empire and Italy. On his brother Charles's death in 863, Louis inherited Provence. He recovered Naples and Apulia for the empire, and was preparing to conquer Calabria and Sicily when he died, Aug. 12, 875.

**Louis III** (880-928). German king and Roman emperor. The son of Bosco, king of Provence, and Ermengard, daughter of the emperor Louis II, he was adopted, on his father's death, in 887, by the emperor Charles the Fat. Crowned in Rome by Benedict IV in 901, he was speedily expelled from Italy, but returned in 905, and in July was overpowered at Verona by agents of Berengar of Friuli, blinded, and deposed. He lived thenceforward at Arles, his Provençal capital. By his wife, Adelaide, daughter of Rudolph of Upper Burgundy, Louis became the ancestor of the house of Savoy.

**Louis IV** (1287-1347). German king and Roman emperor. The son of Louis, duke of Bavaria, he was chosen emperor in 1314 by four electors—others choosing Frederick of Austria, known as the emperor Frederick III or IV. A diet at Nuremberg having confirmed his election Louis defied Pope John XXII, and was excommunicated in 1324. He marched into Italy, was crowned emperor in Rome, January 17, 1328, and set up an antipope, Nicholas V, but had to take flight in Aug. In 1338 an electoral union declared that the election of emperor was valid without confirmation by the pope. Louis seized Lower Bavaria in 1341; Tirol and Carinthia came to his family of Wittelsbach by marriage. In 1346 by his marriage to

a daughter of the count of Holland, he inherited Holland, Zeeland, Frisia, and Hennegau. On Oct. 11, 1347, Louis was killed while hunting.

**Louis.** Name of 18 kings of France. The emperor Louis I ranks as the first of them, as France as well as Germany was in his empire. Louis II was the son of the emperor Charles the Bald. He ruled over the West Franks, as the French were then called, from 877 to April, 879. Louis III was the son of Louis II. He reigned with his brother Carloman over the Franks from 879 to Aug., 882.

**Louis IV (921-54).** King of France, 936-54. A son of Charles III, he passed his boyhood in exile in England, to which fact he owes his name of Outremer, or beyond the sea. In 936 the French chose him king and, returning, he was crowned at Laon. His reign was mainly spent in fighting his numerous foes, who included the emperor Otto the Great. During a war with the Normans he was captured, and for about three years was the prisoner of Hugh the Great, count of Paris. The king died from the effects of a fall while hunting, Sept. 10, 954. His successor was his son Lothair.

**Louis V (c. 967-987).** King of France, 986-87. The son of Lothair, he began to reign in March, 986, and died in May, 987. He was the last of the Carolingian kings, and his successor was Hugh Capet.

**Louis VI (1078-1137).** King of France, 1108-37. His father, Philip I, made him joint king in 1100, and left the government in his hands. His great rival was Henry I of England, and Louis surrendered Brittany and Maine by the peace of Gisors, 1113. To check the nobles Louis favoured the peasants and burghers, established communes, granted charters, and asserted his authority in the provinces by commissioners. Louis VI died Aug. 1, 1137.

**Louis VII (1120-80).** King of France, 1137-80. After reigning for six years jointly with his father Louis VI, he succeeded him in 1137, marrying in the same year Eleanor, heiress of Aquitaine, who, after he had divorced her, married Henry of Anjou, 1152, bringing him Guienne and Poitou. Henry having succeeded to the English throne two years later, a struggle between the two kings broke out in 1157, and lasted intermittently for 20 years. The English king's power grew until 1173, when Louis attacked him at the head of a great alliance which included Flanders, Scot-

land, Normandy, Brittany, and Henry's rebellious sons. The design failed, and peace was made at Ivry in 1177. Louis died Sept. 18, 1180.

**Louis VIII (1187-1226).** King of France, 1223-26. Born in Paris, Sept. 5, 1187, he was the eldest son of Philip Augustus. He assisted his father in his war against England, and in 1216, answering an invitation of some English barons, he invaded that country in order to depose John. He met with a number of successes, but, in 1217, John being then dead, he was beaten at Lincoln and by a treaty agreed to give up his claim. He then

took part in the crusade against the Albigenes. In 1223 Louis became king, but he only reigned until Nov. 8, 1226, when he died at Montpensier. In that short time, however, he had captured Poitou from the English, and had taken Avignon and crushed the religious insurgents in Languedoc. He married Blanche, daughter of Alphonso, king of Castile. Of their large family the eldest son was S. Louis.

**Louis IX (1214-70).** King of France, 1226-70, known as Saint Louis. Born at Poissy, April 25, 1214, he was the son of Louis VIII and Blanche of Castile. His mother

Louis IX a prisoner of the Saracens after his defeat at Damietta. From the painting by A. Cabanel in the Panthéon, Paris

subjected him to a rigorous religious training, and his personal piety caused him to become known as perhaps the most devout of monarchs. His father died in 1226, and his mother, acting as regent, did much to curtail the power of the great feudal nobles, so that when he took up the work of administration in 1236 he was free to devote himself to the task of regulating civil affairs, setting up departments for the control of government, justice, and finance. Frank and affable, though modest and reserved, he showed himself as precise in worldly as in spiritual matters.

In 1242 he forced Henry III of England to renounce his claims to Normandy, Anjou, Maine, and Poitou, and in 1248 directed the seventh crusade, attempting to reach Palestine through Egypt; but although he took Damietta, he was forced to retreat, and was ultimately captured, along with the remains of his army. Upon payment of a heavy ransom he was set at liberty in 1249, and succeeded in reaching Palestine, where, however, he accomplished nothing of military importance. Returning to France in 1254, he made preparations for another crusade, the objective of which was Tunis. But when besieging that city in 1270 he fell a victim to the plague, and died Aug. 25.

**Louis X** (1289-1316). King of France, 1314-16. Eldest son of Philip IV and Joanna of Navarre, he was born Oct. 4, 1289, and succeeded his father Nov. 29, 1314. A weak prince, he was controlled by his uncle Charles of Valois, and was powerless against the turbulent nobles, who formed a league for the restoration of their old privileges, and wreaked vengeance on the officials of the late king. Opposed also by the Church and the communes, Louis endeavored to gain the provinces by charters, and enabled serfs to purchase freedom. He also sold offices to raise money for a war with Flanders. He died suddenly, June 5, 1316, and was succeeded by his brother Philip V.

**Louis XI** (1423-83). King of France, 1461-83. The son of Charles VII, he was born at Bourges, July 23, 1423. The story of his reign is that of the consolidation of modern France. His democratic leanings, real or assumed, were to some extent responsible for raising the status of the lower and middle

classes, from whom he chose his most trusted counsellors, while jealously curbing the power of the nobility. Coarse in his pleasures and choice of associates, cruel and sensual, he was nevertheless a man of extraordinary subtlety, great administrative capacity, and of the highest personal courage.

Louis, who had embittered the last years of his father's life by his continual intrigues, succeeded him in 1461. Pitiless taxation brought about a general revolt in 1465, which resulted in the remission of certain burdens. Louis was made prisoner by his powerful rival, Duke Charles of Burgundy, while on a visit to that ruler in 1468, and only escaped execution by dint of many promises. Treachery on both sides brought the hostilities which ensued to a speedy close. In 1473 coercive measures of the most infamous kind were taken against the nobility, who had proposed to assign the crown to Edward IV of England. Edward landed in France with a large army, but was bought off, and Louis's cajolery rendered the invasion nugatory. Louis died at Plessis-le-Tours, Aug. 30, 1483.

**Louis XII** (1462-1515). King of France, 1498-1515. A son of Charles, duke of Orleans, the poet, he was descended from Charles V, but did not become heir to the throne for some years. He married Jeanne, a daughter of Louis XI, and as duke of Orleans was an active personage during the reigns of that king and of Charles VIII. Under the latter he led a revolt which resulted in his imprisonment, but he was soon free, and in 1494 he served with the French forces in Italy. In April, 1498, he became king on the failure of direct heirs to Charles VIII.

Asserting his right as heir to the Two Sicilies and as grandson of Valentina Visconti to Milan, Louis invaded Italy in 1499 with Ferdinand of Spain, a project which led to a prolonged rivalry between France and Spain. He secured the adherence of a province of doubtful loyalty by his marriage with Anne of Brittany, the widow of his predecessor, divorcing his first wife for this purpose. In 1508 he entered with Pope Julius II, the emperor, and Ferdinand into the league of Cambrai, the purpose of which was to quell the growing power of Venice, but once its pretensions had been checked, he drifted into hostilities with Julius and by the great victory of Ravenna in 1512 subjugated practically the whole of

Italy, which, however, he was unable to retain. A quarrel with Henry VIII of England led to the defeat of the French at Guinegate, near Calais, in 1513, and the ensuing treaty of Orleans was disadvantageous to France.

Louis took, as his third wife, Mary, sister of Henry VIII, but survived the wedding by only three months, dying Jan. 1, 1515. In 1506 he had received by public acclamation the title of father of his people, proof that, despite his many military misfortunes and unwise foreign policy, he was appreciated by his subjects for the many political advantages he had conferred upon them. *Consult* Louis XII et Anne de Bretagne, P. Lacroix, 1882; *Histoire de Louis XII*, A. R. de Maulde, 1889-93.

**Louis XIII** (1601-43). King of France, 1610-43. The son of Henry IV and Mary de' Medici, he was born Sept. 27, 1601, and came to the throne on the death of his father in 1610. A spoilt child, he received the worst possible guidance from his mother, and from the first was plunged in an atmosphere of court intrigue, to which his weak character was never able to rise superior.

The absence of settled government and the menace of the Protestant party centred at La Rochelle precipitated civil war in 1619, and after a conflict of two years, in which the king, the great nobles, and the queen dowager opposed each other in ever-varying combinations, the rise of Richelieu introduced stability into affairs. He reduced La Rochelle in 1628, and succeeded in gaining absolute influence over the weak Louis, who, though courageous as a military leader, was no match for the astute churchman in diplomatic affairs. The establishment of a central power uncontrolled by nobles or parliament was achieved, and by the efforts of the cardinal the French crown became more powerful than at any former period.

This elevation awoke an inordinate pride in Louis, who became dead to all natural feelings and acquiesced in the insults which Richelieu directed at his mother, brother, and queen, the unfortunate Anne of Austria. He died May 14, 1643, leaving a reputation for personal courage, combined with a weak understanding. He left two sons, Louis XIV and Philip, duke of Orleans.

*Bibliography.* *Louis XIII et Richelieu*, M. Topin, 1876. *Histoire de Richelieu*, G. Hanotaux, 1893-1903; *Louis XIII d'après sa correspondance avec Richelieu*, R. de Beauchamp, 1902; *Court of Louis XIII*, K. A. Patmore, 1909.

**Louis XIV** (1638-1715). King of France, 1643-1715. A son of Louis XIII and Anne of Austria, he was born at St. Germain-en-Laye Sept. 5, 1638. He became king before he was five, and was educated for that position. In 1660 he really began to rule, in the same year marrying Maria Theresa, a Spanish princess.

Louis reigned for 72 years, one of the most glorious periods in the history of France. For much of it her armies were invincible, but it was more notable for its art and literature, while the influence of the court on manners and taste can hardly be exaggerated. Of all the national activities, Louis was the centre. His industry was tremendous and he spoke truly when he said "the state, it is I." His hand was in almost every move of European politics, planning aggressions, arranging campaigns, buying alliances; he attended personally to all, and also found time to build palaces, to encourage literature and art, and to take a fill of pleasure.

Louis carried on a series of wars, the main object of which was to make him the dictator of Europe. By 1678 he had achieved a great measure of success, but afterwards he was less fortunate, and the treaty of Utrecht (1713) was a deep humiliation to France. He did, however, extend his country's boundaries, while for fifty years he was the most influential figure in European politics. After the death of Maria Theresa in 1683, Louis married his mistress, Mme. de Maintenon, who had great influence, and is regarded as being responsible for the interest in religion, or perhaps rather in orthodoxy, that marked his concluding years. His earlier mistresses included Mme. de la Vallière and Mme. de Montespan. His son Louis, and his grandson, the duke of Burgundy, died before him, leaving his great-grandson, afterwards Louis XV, his heir. Natural children included two sons by Mme. de Montespan, who were legitimatised. Louis died Sept. 1, 1715.

As a man Louis did not possess exceptional abilities of any kind, but he was certainly great

as a king. He impressed himself upon his age as no modern sovereign has ever done, and stands out as the ruler who more than any other typifies kingship. Although his colossal vanity was accompanied by a good deal of practical sense, his extravagance and selfishness cost France dear. In the sun king, the grand monarch—as he called himself—are seen both the best and the worst of absolute monarchy.

*Bibliography.* Siècle de Louis XIV, Voltaire, 1751; *Memoirs of Saint Simon*, Eng. trans., 1899; Louis XIV, A. Hassall, 1895; *Histoire de France*, vols. 7-8, ed. E. Lavisse, 1901; *The Age of Louis XIV*, Lord Acton, 1902; Louis XIV, Sir C. Petrie, new ed. 1940.

**Louis XV** (1710-74). King of France, 1715-74, Son of Louis, duke of Burgundy, he was the great-grandson of Louis XIV, to whose throne he became heir in 1712. Born Feb. 15, 1710, his mother being a princess of Savoy, he was educated under the direction of Fleury. At five he became king and in 1723 was declared of age, but the conduct of affairs was not in his hands until 1743, and then only partially.

His long reign was one of misfortune for France. The Seven Years' War ended in a humiliating peace, while the financial condition of the country grew steadily worse, and without ability or industry Louis did nothing to avert the approaching cataclysm. His private life is generally regarded as more than usually scandalous. He had a succession of mistresses, of whom Mme. de Pompadour and Mme. du Barry are best known, while stories are told of his seraglio in the Parc aux Cerfs. He married in 1725 Marie Lezczynska, daughter of Stanislaus, the deposed king of Poland. Undeservedly, he won the

title of Louis the Well-beloved because, during an illness in 1744, a good deal of anxiety was shown for his recovery. This feeling was not in evidence when he died, May 10, 1774, to be succeeded by his grandson, Louis XVI. The saying attributed to Louis, "After me the deluge," characterises the man and the age. *Consult* The Real Louis XV, A. C. P. Haggard, 1906. Louis XV and His Times, P. Gaxotte, 1934.

**Louis XVI** (1754-93). King of France, 1774-92. Born at Versailles Aug. 23, 1754, the son of Louis, the dauphin, and a grandson of Louis XV, he became heir to the throne in 1765 and at 19 became king. For 15 years he ruled, while the condition of the country grew steadily worse, and then, in 1789, came the Revolution. He remained on the throne for a further three years, although his power sank to zero. In June, 1791, he fled to Varennes, but he was brought back to Paris, where he took an oath to reign as a constitutional king. In Sept., 1792, the kingly office was abolished.

Louis Capet, as he was called, was without any justification tried, found guilty of treason against the republic, and on Jan. 21, 1793, was guillotined; his wife, Marie Antoinette, a Hapsburg princess, whom he had married in 1770, shared his fate. Their elder son died before his parents; a son and a daughter remained—the titular Louis XVII, and Marie Thérèse, who survived the horrors to which she was submitted, and died in 1851. Louis XVI's intentions were good, and his personal character formed a pleasing contrast to that of his grandfather, but he lacked entirely political insight and judgement. *Consult* Louis XVI and Marie Antoinette, A. C. P. Haggard, 1909.

**Louis XVII** (1785-95). Nominal king of France, 1793-95. The second son of Louis XVI, he was born at Versailles, March 27, 1785. In 1789, on his elder brother's death, he became heir to the throne which he never ascended. In Aug., 1792, he was taken to the Temple, and from then onwards the boy's history is

Louis, kings of France. Left to right, Louis XI, 1461-83; Louis XII, 1498-1515; Louis XIII, 1610-43; Louis XIV, 1643-1715; Louis XV, 1715-74; Louis XVI, 1774-92; Louis XVII, titular king, 1793-95; Louis XVIII, reigned de facto, 1814-24

largely conjecture. He became nominally king on the execution of his father, Jan. 21, 1793, but he remained in the Temple, and in June, 1795, his death was announced. Some think, however, that he escaped, and after the restoration of the Bourbons a number of persons claimed to be he. *Consult* The Dauphin, G. Lenôtre, Eng. trans. 1922; The Shadow-King, H. R. Madol, Eng. trans. 1930.

**Louis XVIII** (1755–1824). King of France. Grandson of Louis XV and brother of Louis XVI, he was born at Versailles, Nov.

*Louis* 17, 1755. Extremely jealous of Marie Antoinette, Monsieur, as he was styled, was involved in all the court intrigues, and at the first murmuring of the Revolution posed as a friend of the people. He remained in Paris until the flight of Louis XVI, when, more fortunate than his brother, he succeeded in making his way to Coblenz. Here he figured as the head of the Royalists, declared himself regent after the execution of Louis, and on the death of the dauphin, in 1795, proclaimed himself king as Louis XVIII. The next 12 years he spent wandering about Europe, welcomed nowhere, and reduced at times to extreme poverty.

In 1807 Louis went to England, where he remained until the victory of the Allied armies in 1814 opened the way to Paris. He entered his capital May 2, but after some months of unsatisfactory government, was obliged to take flight on Napoleon's escape from Elba. Once again, after Waterloo, he returned to Paris, July 8, 1815, to reign until his death. Crippled with gout and enfeebled by his life of disappointments and wanderings, he passed from the hands of one favourite to another and failed to establish his government on a firm basis by the granting of such constitutional reforms as the age demanded. He died Sept. 16, 1824, and, his marriage having been barren, the throne passed to his brother, Charles X. *See* Louis XVIII, M. F. Sanders, 1910.

**Louis I** (1786–1888). King of Bavaria. A son of Maximilian Joseph, who became in 1799 elector and in 1806 king of Bavaria, he was born at Strasbourg, Aug. 25, 1786. Politically hostile to France and a sympathiser with liberal ideas, he showed this latter trait after 1825, when he became king, and the earlier years of his reign formed a period of enlightened progress in politics, in education and culture, and in industry. He also sym-

pathised with the desire of Greece for independence.

Louis became less liberal in his ideas as years went on, or allowed his advisers to make him so. In

Louis, kings of Bavaria. Left to right, Louis I, Louis II, and Louis III

1846 he formed a connexion with the dancer Lola Montez, who used her influence especially against the dominant Catholic party. This was followed by the unrest of 1848, and the king's abdication on March 20. Louis lived on, partly in Rome, until Feb. 28, 1868. He had four sons, one of whom was Otto, king of Greece, and another his successor, Maximilian II. Munich owed to him its finest buildings and its great art collections.

**Louis II** (1845–86). King of Bavaria. The eldest son of King Maximilian II, he was born Aug. 25, 1845. His interests were in art and music rather than affairs of state, of which he was quite ignorant when he became king in 1864. His ministers committed Bavaria to the side of Austria in 1866 and to that of Prussia in 1870. He became friendly with Richard Wagner, to carry out whose expensive ideas he provided immense sums, a course that made both very unpopular with the Bavarians. He had other favourites, and soon developed symptoms of mental derangement, one symptom of which was a desire for solitude. To gratify this whim great sums were spent on residences at Hohenschwangau and elsewhere, on the performance of plays with himself as the only spectator, and on other eccentricities. In June, 1886, he was declared incapable of ruling. His uncle Luitpold became regent on June 10, and on June 13 the king and his doctor were drowned in the lake of Starnberg. *Consult* Romance of Ludwig II; Life, F. M. Ofen, Eng. trans. 1937. F. Gerard, 1899.

**Louis III** (1845–1921). King of Bavaria. A son of Prince Luitpold, and grandson of King Louis I, he was born Jan. 7, 1845. In 1868 he married the archduchess Maria Theresa of Austria-Este-Modena. On the death of his father, Dec. 12, 1912, he succeeded him as regent of Bavaria, King Otto being insane. Proclaimed king Nov. 5, 1913,

he abdicated Nov. 9, 1918, and died, Oct. 17, 1921. *See* Bavaria.

**Louis I** (1326–82). King of Hungary and Poland. A son of Charles Robert, king of Hungary, he became king in 1342. His reign was one of warfare, in which he was usually successful; this and his dealings with other kings in the interests of his country won

for him the title of the Great. He fought Venice for the possession of Dalmatia, which was given to him in 1358, and a further war (1378–81) confirmed his possession thereof. He was less successful, however, in his efforts to secure Naples. In 1370 he succeeded his uncle Casimir as king of Poland, and about the same time was involved in a war with Turkey. He died Sept. 10, 1382, leaving two daughters, of whom one was to have Hungary and the other Poland. *See* Hungary; Poland.

**Louis II** (1506–26). King of Hungary and Bohemia. The son of Ladislas, king of Bohemia, who had been chosen king of Hungary in 1490, he succeeded his father in March, 1516. As he grew up he cared only for pleasures, and was incapable of governing his

Louis II, King of Hungary

two troubled kingdoms. The Turks steadily advanced against Hungary, and Louis could obtain no aid from foreign powers, except from the emperor Charles V, whose troops, however, arrived too late. The loyalty of John Zapolya being suspected, the young king assumed the command of his little army, which was utterly overthrown by the sultan Solymán at Mohacs, Aug. 29, 1526. Louis was drowned while taking flight. The royal house of Hungary and Bohemia being extinct, the vacant thrones were conferred on Ferdinand of Hapsburg. *See* Ferdinand I; Mohacs.

**Louis** (c. 804–876). King of the Franks, called the German. A younger son of the emperor Louis I, and a grandson of Charlemagne, he received Bavaria and the lands E. of it in 817, and in 825 he began to rule this kingdom, his capital being Ratisbon. He was also occupied in

the constant quarrels in the royal family, which came to a head when the old emperor died in 840. War broke out, the result being the important treaty of Verdun (843), by which the empire was divided among Louis and his two brothers. In 869 Louis and his half-brother, Charles the Bald, agreed to divide the lands of their dead nephew, Lothair. Louis died Aug. 28, 876.

**Louis** (893-911). German king, called the Child. Through his father, Arnulf, he was descended from Charlemagne, of whose house he was the last representative in Germany. He was only a child on Arnulf's death in 899, and the government of Germany was placed in the hands of Otto, duke of Saxony, and Hatto, archbishop of Mainz. He died Sept. 24, 911.

**Louis, COUNT OF NASSAU** (1538-74). Dutch soldier. Born Jan. 10, 1538, at Dillenburg, he was a

Louis of Nassau,  
Dutch soldier

younger brother of William the Silent, prince of Orange (*q.v.*). He became the head of the party known as the Gueux, or Beggars. Retiring to Germany, he was

summoned to appear before the Council of Blood, but replied by entering the Netherlands with an armed force. Defeated at Jemmingen, he withdrew to Germany, and raised a force to aid the Huguenots in France. After sharing in the defeat at Moncontour in 1569, Louis surprised Mons, and on its recapture again went to Germany. He invaded the Netherlands, but was defeated and slain, with his brother Henry, on the heath of Mook, April 14, 1574.

**Louis, JOE** (b. 1914). American boxer. Joseph Louis Barrow was born near Lexington, Ala., May 13, 1914. Entering the championship ring in 1934, this negro made over two million dollars from 57 contests up to 1942, of which with his tremendous punch he won 49 by knock-out and seven on points. The only opponent to beat him was Max Schmeling, June 19, 1936. Louis became the youngest world heavyweight champion by beating J. J. Braddock, June 22, 1937,

Joe Louis,  
American boxer

and met over 20 challengers for his title including Schmeling, the Welshman Tommy Farr, and Max Baer. Louis, nicknamed the "brown bomber" and renowned for his clean fighting, retired undefeated in 1949.

**Louisa.** Christian name, the feminine of Louis. The form Louise is frequent in England and France. Louisa Dorothea (1710-67), wife of Frederick II, duke of Saxe-Gotha, made her court a centre of culture. Louisa Ulrika (1721-82), a sister of Frederick the Great, married Adolphus Frederick, king of Sweden. She founded an academy at Stockholm. Louise of Savoy (1476-1531), the mother of Francis I of France, took a leading part in the politics of her time.

**Louisburg.** Town and port of Cape Breton, Nova Scotia, Canada. It is 25 m. S.E. of Sydney, on the Sydney-Louisburg rly. Standing on a fine harbour, it has important fisheries. Pop. 1,012.

The interest of Louisburg is mainly historical. On the opposite side of the harbour stood the greatest French fortress in the New World. By the treaty of Utrecht, France gave up Nova Scotia, but retained Cape Breton and certain fishing rights. On Cape Breton the French built a strong fortress which they called Louisburg. In 1745 the colonists in the New England states, having suffered much from French competition in the fisheries, sent an expedition against it. The home government

aided with a fleet, and in March, 1745, the siege began. The fortress held out until June 27. It was kept by the British until 1748, when it was restored to France by the treaty of Aix-la-Chapelle. In 1758 it was again attacked by a force of 12,000 under Amherst, and a fleet under Boscawen, which assembled at Halifax, and the men landed, Wolfe taking a prominent part in this operation. After the French fleet had been destroyed, the place surrendered. The old fortifications, dismantled at the surrender, now form part of the Louisburg natural historic park.

**Louise** (1848-1939). British princess, known also as the duchess of Argyll. The sixth child

and fourth daughter of Queen Victoria and Prince Albert, she was born March 18, 1845, and baptized Louise Caroline Alberta. She was educated privately, and on March 21, 1871, was married to the marquess of Lorne, afterwards 9th duke of Argyll.

Princess Louise,  
Duchess of Argyll

She accompanied him to Canada when he was governor-general. The princess, who had no children, was left a widow in 1914, and devoted herself to charitable pursuits. She died Dec. 3, 1939.

**Louise** (Ger. *Luise*) (1776-1810). Queen of Prussia. Daughter of Duke Charles of Mecklenburg-Strelitz, she was born at Hanover, March 10, 1776, and on Dec. 24, 1793, married the crown prince of Prussia, who in 1797 became King Frederick William III (*q.v.*). Her high character and spirit endeared her to the Prussians, especially when, in 1807, she visited Napoleon at Tilsit and vainly tried to induce him to

Louisburg, Nova Scotia. View of the harbour from the ruins of the old French fortress

mitigate the terms imposed on Prussia. She died July 19, 1810, and was commemorated by the Louise foundation for educating girls and the Order of Louise.

**Louisiade.** Archipelago, or group of islands, off the S.E. extremity of New Guinea. Included in the Australian Commonwealth Territory of Papua (*q.v.*), the largest are Tagula, Rossel, St. Aignan, Joannet, and Pig. There are numerous small islets, or atolls, and reefs included in the archipelago. The largest islands are mountainous, having peaks rising from 2,800 ft. to 3,400 ft. The islets are low and mostly of coral formation. Gold is found on some of the larger islands, which are

inhabited mostly by Papuan and Melanesian savages. Discovered by Torres in 1606, they were occupied by the British in 1888, and taken over by Australia in 1901.

In March, 1942, the Japanese occupied the is., which gave them command of the N. entry into the Coral Sea, and established airfields. Australians recaptured the is., May, 1944.

**Louisiana.** Former French province in N. America, much larger than the present state. La Salle sailed down the Mississippi, and took possession of the region in the name of Louis XIV, in whose honour he named it Louisiana, April 9, 1682. It extended nominally from the British colonies in the E. to those of Spain in the W., and from the present Manitoba and the Great Lakes, to the Gulf of Mexico. The Rocky Mts. were regarded as dividing it from Spanish territory, except that Texas was not claimed by France. An unsuccessful proprietary colony under Antoine Crozat during 1712-17, Louisiana was granted to John Law's Mississippi Company. The new scheme failed through wild speculation, and in 1732 the province reverted to the crown.

On the loss of Canada, the left bank of the Mississippi, except New Orleans, was ceded to Great Britain by the peace of Paris, 1763, the remainder passing to Spain, which did little to develop the country. Talleyrand urged Spain to realize the necessity of a strong barrier between the U.S.A. and Mexico, and on Oct. 1, 1800, by the secret treaty of St. Ildefonso, Louisiana was restored to France. In May, 1803, France sold the province to the U.S.A. for £3,000,000. More than 1,100,000 sq. m. were transferred. The coast region of W. Florida to the Perdido river was claimed as part of Louisiana, but remained Spanish till 1819.

**Louisiana.** S. central state of the U.S.A. It has an area of 48,523 sq. m., and a well indented coastline of 1,700 m. It is situated on the Gulf of Mexico at the mouth of the R. Mississippi. The coast region is swampy and subject to inundation; the N. and N.E. portions of the state are upland, whence the surface gradually slopes away to the S. The state contains immense forests of pine, cypress, oak, etc. It is the main source of cane sugar in the continental U.S., and is the leading rice producer. Vegetables and fruit are also widely grown.

Louisiana has a thriving fishing industry, sulphur and salt mines and petroleum wells and refineries, and manufactures associated with the products of the land. With 4,794 m. of navigable waterways—more than any other state—Louisiana has also 4,276 m. of rlys. There are a state and other universities, and an agricultural and other colleges. Baton Rouge is the capital, but New Orleans is the largest city. Pop. 2,363,880, of whom 849,303 are negroes. Louisiana is unique among the states for the strong French element. Many of the inhabitants are descendants of French royalists who sought asylum during the Revolution. It became part of the U.S.A. in 1803 when it was purchased, and was admitted to the union in 1812. It sends two senators and eight representatives to Congress.

**Louisiana.** A city of Missouri, U.S.A., in Pike co. On the Mississippi river, 93 m. N. by W. of St. Louis, it is served by rlys. Among its industries are nursery gardening, stone quarrying, flour milling, and the manufacture of boots and shoes, lumber products, tools, tobacco, cigars, and carriages. It also carries on trade in cattle, fruit, and agricultural produce. Founded in 1818, Louisiana was incorporated in 1845 and became a city four years later. Pop. 4,669.

**Louis Philippe** (1773-1850). King of the French, 1830-48. Eldest son of Louis Philippe, duke

*Louis Philippe*

of Orleans, known as Philippe Égalité, he was born Oct. 6, 1773. Like his father, he professed revolutionary principles, repudiated his titles, and became a colonel of dragoons in the revolutionary army, fighting at Valmy and Jemappes. After his father's execution he became head of the Orleans branch of the Bourbons, which was descended from a son of Louis XIII. The government having ordered his arrest, he fled with Dumouriez to Switzerland, and spent many years wandering about Europe. At the court of Palermo, in 1809, he married a daughter of Ferdinand, king of the Two Sicilies. Reinstated in 1814, he was driven from France by the hostility of Louis XVIII, and lived at Twickenham until 1827.

His opportunity came with the revolution of 1830, when Charles X and his family were expelled. The bourgeois constitutionalists, who had made the revolution, invited Louis Philippe to the throne. He accepted as a citizen king, the chosen of the people. His precarious task was to steer a middle course between democracy and privilege, to guard material interests, and to maintain peace. For the first few years of his reign, and again in 1840, France was on the verge of revolution. The king opposed the rising tide of republicanism and socialism by maintaining a limited franchise, muzzling the press, curtailing the jury system, and by bribery.

A close entente with England soon turned into covert hostility, largely as a result of the spirited foreign policy of Palmerston. Studiously avoiding foreign complications, the government seemed to the ardent idealists who carried on the Napoleonic tradition to be compromising the national honour. The support given to Belgium, and the conquest of Algeria, in which two of the king's sons played a part, failed to make the constitutional monarchy popular, while the intervention in Spanish affairs caused scandal abroad. The dismissal of Guizot came too late to avert the revolution of Feb., 1848. Louis Philippe fled to England, and died at Claremont, Surrey, Aug. 26, 1850. His eldest son, Louis, duke of Orleans, had died in 1842, leaving a son, the count of Paris. *Consult* Public and Private Life, L. G. Michaud, Eng. trans. 1851.

**Louis Style.** Term applied to four styles of French furniture, and named after Louis XIII, XIV, XV, and XVI. The Louis Treize (XIII) was a reaction against the Henri Quatre, with its riot of pilaster, entablatures, contorted cornices, and superabundance of carving and painting. Louis Treize chairs were small, rectangular in contour, with slight wood frames concealed by well-padded velvets, tapestries, and embroideries, fastened by round-headed brass nails. Arms were rarely padded; the legs were joined by stretchers. Armoires, chests, and desks were embellished by inlay of coloured woods, ivory, and bone, depicting flowers and birds. Walls were panelled and adorned with large mirrors.

Louis Quatorze (XIV) was a heavy classic style, but florid; the furniture being overloaded with carvings, rich inlays (such as those of Boulle), and heavy, carved

metal mountings. Chairs had tall backs, square or V-shaped; sofas were ample in size, and rich brocades and tapestries of florid design were used. Cabinets were large, glazed, and often bowed.

Louis Quinze (XV) is the florid rococo style. Wood was heavily carved, or covered with composition, moulded into enrichments of shells, rocks, waterfalls, and scrollwork, among which were doves, cupids, heads, and busts of women terminating in foliage. Most of this was gilded, or painted in delicate tints. Couches and chairs had sweeping, curved backs, upholstered in tapestries with flowers, figures, and animals, or flowered brocades, the woodwork gilded. Cabinets were replaced by bow-shaped commodes and *bonheurs-du-jour*, little cabinets on tables, like low-boys. There were also corner cabinets and little round tables (*guéridons*) enriched by inlays of birds, figures, and landscapes, carried out in natural tinted and stained woods.

Louis Seize (XVI) is a more chaste version of the Renaissance, presenting rectangular panels with simple mouldings, fluted columns, with quill and husk fillings. Dainty ribbons and bows in marqueterie or ormolu surrounded richly painted Sèvres plaques, while silver was introduced to tone down the gilding. Red and green were the predominating colours. Tapestry of Beauvais and the Gobelins and silks were used for upholstery. Chair backs were rectangular or oval; the legs tapered, fluted, and connected by stretchers. See Chair; Furniture.

**Louisville.** City of Kentucky, U.S.A., the co. seat of Jefferson co. Situated 90 m. S.W. of Cincinnati, 130 m. by river and 110 m. by rail from that city, on the Illinois Central and other rlys., it is a river port on the lower Ohio, here obstructed by rapids, which provide hydro-electric power. The

city has a river front of 7 m., and is a great rly. junction with three rly. bridges. The oldest municipal university in the U.S.A., it is the chief of a large number of educational institutions, and among the U.S. government institutions are the only coastguard

**Loulé.** Town of Portugal, in the prov. of Faro. It stands on a mountain slope 201 m. by rly. S.S.E. of Lisbon and 10 m. N.N.W. of Faro, and is encompassed by ruined Moorish walls, with a citadel overlooking the little stream of Loulé. It manufactures porcelain, leather goods, and articles made from the palm, agave, and esparto grass. Pop. 23,700.

**Louny.** Town and dist. in the Bohemian portion of Czecho-Slovakia. Situated on the river Cheb, 64 m. by rly. N.E. of Prague, it has

iron and sugar refining industries.

### Louping Ill.

Disease of sheep. A form of chorea or paralysis, it is known in some districts as trembling. It appears to be due to a germ which the animals pick up when feeding. There is no cure for the disease, which is at its worst in spring and autumn, and an animal once infected dies.

institution in the interior, a federal reserve bank, a marine hospital, and a fish hatchery. At Fort Knox, 33 m. to S.W., the U.S. gold reserve is stored (see Knox, Fort). Cherokee and Iroquois are the largest of many parks. A great trading and manufacturing centre, the city is a market for leaf tobacco, and its manufactures include tobacco and cigarettes, Bourbon whisky, processed meat, machinery, leather, and timber goods. Incorporated as a town in 1780, it became a city in 1828. Pop. 319,077 (metropolitan area, 434,408). The Kentucky Derby is held here in May.

**Loulan.** Ancient town and kingdom in Chinese Turkistan (now Sinkiang prov., China), also called Shanshan. Situate on the caravan route between China and the Roman Orient, the region embraced the classical Issedon Serica. Destroyed by desert encroachment, Loulan was identified by Hedin in 1901 in the heart of the Lop desert. Stein's expeditions in 1907 and 1914 revealed human and cultural remains of primitive alpine round-heads, besides fine brocaded silks of the Han dynasty, 1st century B.C., and iron implements which had been used by immigrant traders of higher culture.

Louis Style. 1. Ebony commode in the shape of a marriage chest, with marquetry of metal in tortoiseshell, Louis XIV period. 2. Commode, with overlaid marquetry of mahogany, and heavily mounted with chased ormolu; probably by Caffieri, Louis XV period. 3. Jewel cabinet and stand, Louis XVI period.

1. Wallace Collection, 2 and 3, Jones Bequest, 4 and A. Muscum

**Lourdes.** Town of France, in the dept. of Hautes-Pyrénées. It lies in hilly country on the Gave de Pau, 12 m. by rly. S.S.W. of Tarbes. Except for some local quarrying and agricultural trade, the town relies almost entirely on the constant stream of pilgrims to the grotto of Our Lady of Lourdes. The basilica, 1876, and the church of the Rosary, 1889, are close by the shrine, as also is the large Hospice de Notre Dame des Douleurs. The old château of Lourdes stands on an eminence overlooking the right bank of the river. The treaty of Brétigny, 1360, handed over Lourdes to the English, who retained it until 1406. Pop. 13,974.

The famous pilgrimage arose from the alleged appearances of the Virgin Mary to a poor peasant girl named Bernadette Soubirous (1844-79) in 1858. The shrine, erected in the small grotto, where Bernadette saw the Virgin, and the healing spring close by, soon attracted large numbers of pilgrims seeking cures, and many apparently well-authenticated recoveries have been recorded. Pilgrimages are organized from all parts of France and from other countries, chiefly during the summer months, when the town is thronged with pilgrims, many of them cripples, and scenes of extraordinary excitement are witnessed. A conservative estimate of the number of pilgrims in a normal year is well over 500,000. The great novel by Émile Zola, entitled *Lourdes*, published 1894, is a rational account of happenings during a pilgrimage. See Bernadette.

**Lourenço Marques** or  **LORENZO MARQUES.** Seaport of Mozambique. Situated on the harbour of Delagoa Bay, one of the finest natural harbours in the world, the city is the terminus of the most direct rly. route to the Transvaal, from which it derives the bulk of its transport trade. It is a port of call for B.O.A.C., and for flying boats from Europe. The rly. station is considered the finest in S. Africa. A new road to Durban (425 m.) was opened 1934. There are a R.C. cathedral, Anglican and Methodist churches, a synagogue, a mosque and a Chinese temple, also a fine hospital, a botanic garden, and municipal bus services. Pop. 38,000.

**Louse** (plural lice). Name given to a group of small wingless insects, parasitic on birds and mammals. They form the order Anoplura (286 British species). Lice lay their eggs on the hair or feathers, and the mouth parts are

Lourdes, France. Left, the basilica, in front of which is the Chapel of the Rosary. Right, the miraculous grotto and basilica

developed into a hooked tube, with which they bore into the skin and suck the blood of their hosts. The eggs hatch out in a few days, and reproduce their species in about a fortnight. Hence the rate of reproduction is rapid. The biting-lice or bird-lice (*mallophaga*) live chiefly on birds. The true-lice or sucking-lice (*siphimculata*) are confined to mammals. The human louse (*Pediculus humanus*) exists in two races: the head louse (*capitis*) and the body louse (*corporis*). The last-named is the chief agent in the spread of epidemic typhus fever. Other lice-born diseases are a form of relapsing fever and trench fever.

**Lousewort** (*Pedicularis sylvatica*). Perennial herb of the family Scrophulariaceae, native of Europe. It has a short rootstock and branching leafy stems a few inches high. The narrow oblong leaves are deeply cut into segments from the sides. The tubular two-lipped flowers are rose-coloured. The name is due to an ancient

idea that the plant when eaten by sheep made them lousy. It is a parasite upon the roots of other plants. Another species, the marsh lousewort (*P. palustris*), which is an annual, grows in bogs.

**Louth.** County of Eire, the smallest in the country. In the prov. of Leinster, it has an area of 317 sq. m. The coastline on the Irish Sea is broken by Carlingford Lough, Dundalk Bay, and the estuary of the Boyne. The chief rivers are the Fane, Lagan, Glyde, and Dee, while the Boyne flows along the S. boundary. The surface is flat, save in the N.E., where are the Carlingford Mts., and the S.W. Chief industries are agriculture, for which there is much fertile land, on which oats, barley, potatoes and flax are grown; and fishing, including the culture of oysters. The co.'s principal towns are Dundalk, the county town, Drogheda, and Ardee. Carlingford and Greenore are watering-places. Three members are elected to the Dáil.

Originally part of Orgial, or Argial, Louth became a county in the 13th century, being for many years part of Ulster. It has remains of several monasteries as well as some pre-Christian buildings, the most noted being at Monasterboice. Louth, from which the county takes its name, is a village 5½ m. from Dundalk. Once a flourishing place, known as Knockfergus, it had a monastery, of which there are some remains, said to have been founded by S. Patrick. Pop. 65,108.

**Louth.** Mun. bor. and market town of Lincolnshire, England. It stands on the Ludd, 26 m. N.E. of

Lousewort. Foliage and flower-head of this parasitic herb

Louth, Lincolnshire. Parish church of S. James

Lincoln, with a rly. station. A canal, dating from 1761-63, connects it with the Humber. The chief building is the large and beautiful church of S. James, a Perpendicular edifice, notable for its spire and rebuilt in the 15th cent. Louth is the trading centre for a large agricultural dist. and has works for making agricultural

Louth borough arms

implements, brewing and malting establishments. Alfred Tennyson and his brothers were educated at the grammar school. Near the town, at Louth Park, are the remains of a Cistercian abbey, founded about 1140.

With a market dating from Anglo-Saxon times, Louth was prosperous in the Middle Ages, when there was a trade in wool here. The town, incorporated in 1551, received a charter in 1834. It gives its name to a county constituency. On May 29, 1920, serious floods, after a cloudburst, did enormous damage. Market days, Wed. and Fri. Pop. 9,678.

**Louvain** (Flemish, *Leuven*). Town of Belgium, in the prov. of Brabant. It lies on the river Dyle, 19 m. by rly. E.N.E. of Brussels, and is an important rly junction. The town was surrounded by remains of old fortifications, later turned into promenades; outside this circle lay the manoeuvre ground, the 16th cent. château of Héverlé, and the Abbaye de Parc, a Premonstratensian house of note. The chief industries are brewing, lace making, printing, and tobacco manufacture. Pop. 36,311.

The hôtel de ville, one of Belgium's finest buildings, a late Gothic work begun in 1448-69, with a profusion of sculptured ornament, escaped damage during the destruction of Aug., 1914. The neighbouring church of S. Pierre, of the same period, was less fortunate. The famous university of Louvain is the intellectual centre of Belgian Catholicism, and has five faculties with various technical and agricultural schools affiliated. Founded in 1426, it was counted the leading university of Europe in the 16th century. Suppressed by the French, 1797, and secularised by the Dutch, 1817, it was revived as a R.C. institution 1834.

Louvain itself dates from 891, was capital of the dukes of Brabant, and one of the wealthy cloth centres of the Low Countries in medieval times, when its pop. numbered about 120,000. Its decay began with the ruthless suppression, by Duke Wencelas in 1382, of a townsmen's revolt, which led to the migration of many weavers.

In the First Great War, German troops entered Louvain, Aug. 19, 1914. A week later, on the pretext that Belgian civilians had shot at German soldiers, they began an orgy of massacre and terrorism. Whole streets of houses were set on fire and the inhabitants shot down as they tried to escape. Townsfolk were deported to German prisons, some being forced to march until they dropped, when they were mercilessly shot or

bayoneted. The town was methodically sacked and burned from Aug. 27 until Sept. 2; many of its public buildings were destroyed, including the church of S. Pierre and the university library, with its priceless treasures. Cardinal Mercier stated that 176 persons had been shot or burned to death. That this outbreak of barbarity was part of a deliberate plan to subdue the Belgian populace was shown by a letter found by the French in 1919, written by the Kaiser, William II, to the Austrian emperor.

When the Germans invaded Belgium in 1940, British forces which had come to the aid of the Belgian armies occupied a line on the river Dyle, having Louvain as its centre. The town was heavily shelled and bombed, and the university library, rebuilt with American help after the First Great War, was again destroyed. The Grenadier Guards put up a magnificent stand at Louvain, but the Germans took the town on May 17, the Guards retiring on Furnes. On Sept. 4, 1944, British troops occupied Louvain

Louvain, Belgium. 1. Fifteenth cent. town hall. 2. The university library which replaced the historic building sacked in Aug., 1914, and was itself destroyed in May, 1940

against negligible resistance, strategically valuable bridges across the Dyle being secured undamaged with the help of members of the Belgian resistance movement.

**Louviers**. Town of France. In the dept. of Eure, it is the chief town of an arrondissement. It lies on the river Eure, 16 m. by rly. S.S.E. of Rouen, and is a railway

junction. It has busy cloth manufactures which date from medieval times, and some smaller industries, and is noteworthy for its Gothic church of Notre Dame, with a fine S. portal of the 15th century.

**Louvois,** FRANÇOIS MICHEL LE TELLIER, MARQUIS OF (1641-91). French statesman.

Born in Paris, Jan. 18, 1641, the son of Michel le Tellier, he was trained for public life and soon attracted the attention of Louis XIV. In 1666 he became minister of war in succession to his father, and rapidly brought the French army to a high state of efficiency. This was proved when war broke out in 1672, and during the next 18 years Louvois was one of the directors of the policy of France, both military and civil. He succeeded Colbert as the king's chief adviser, but had lost some of his influence when he died suddenly, July 16, 1691.

**Louvre, THE.** Old palace of the kings of France, in Paris, now containing a great museum of art and antiquities. Situated on the right bank of the Seine, the building, with its courts, occupies an area of about 7 acres. It has been suggested that it was originally a meeting-place of wolf-hunters, whence the name (*louverie*, from *loup*, wolf). The first official mention of the Louvre by its name occurs in 1204, in the reign of Philip

Louviers, France. Gothic church of Notre Dame

Augustus; but probably a fortified palace existed on the site two or three centuries earlier. While Philip Augustus may be considered as the originator of the Louvre, the monarch responsible for the beginnings of the present building was Francis I, before whose reign the palace had been abandoned as a royal residence for many years.

Francis, having pulled down the old tower and introduced modern improvements, afterwards reconstructed it on a new plan, first with the assistance of the Italian architect Serlio and afterwards with that of Pierre Lescot. The parts designed by Lescot rank among the masterpieces of Renaissance architecture. During the latter half of the 16th cent. numerous additions and improvements were made.

Meanwhile the adjacent palace of the Tuileries (*q.v.*) had been built, and Henry IV revived an old idea of connecting the Tuileries and the Louvre so as to form one great group of buildings. A long gallery had actually been begun in 1566 with this intention; the structure was completed about 1608. In 1624 notable alterations were made to the Louvre. Lemercier, instructed by Richelieu to prepare plans for the completion of the palace, pulled down the whole of the N. wing and built what is now

Louvre, Paris. North palace of the New Louvre, 1852-57, from the Place du Carrousel. Top, right, Apollo Gallery, decorated by Le Brun in 1661, and rebuilt 1845-51, with ceiling paintings by E. Delacroix

known as the *pavillon de l'horloge*. The magnificent Apollo Gallery dates from Louis XIV's reign. Some further important alterations were made by Perrault, and the building was still unfinished at the Revolution.

Napoleon put the finishing touches to the work of centuries and filled the galleries with a priceless collection of works of art obtained from foreign capitals. Although much of this loot was subsequently restored, the collection remains one of the finest in the world. Its sculpture includes the Winged Victory of Samothrace and the Venus of Milo, and among the galaxy of world-famous pictures here are Raphael's Holy Family, Leonardo's Virgin of the Rocks,

the Mona Lisa, and other Italian masterpieces, and an unrivalled collection of the French school.

The Salle Rubens, filled with the series of allegorical paintings executed for Catherine de' Medici; the Salle Van Dyck; the Salon Carré, which contains the greatest masterpieces of various schools; and the Grande Galerie are among the more famous of the Louvre's many galleries. During the Second Great War 800 of its treasures were hidden at Valency castle on the Loire. See Architecture; Art; Paris; consult The Art of the Louvre, M. K. Potter, 1905; Le Palais du Louvre, G. Geffroy, 1909.

**Louvre** or **LOUVER**. Term in architecture applied to a small turret raised above the aperture in the roof of a medieval hall (*q.v.*), to allow the smoke to escape and to prevent the rain from entering. The sides were often covered with overlapping boards with spaces between them. Hence boards or slips of glass arranged in this way are termed *louvre*s or *louvre-boards*. See Chimney; Lantern.

**Loveage** (*Ligusticum scoticum*). Perennial herb of the family Umbelliferae. It is a native of N.

Loveage. Foliage and flower spray. Inset, flower-head and single flower

Europe, N. Asia, and N. America. It has a stout branched rootstock and large, much divided leaves. The erect, grooved stem is two or three feet high, the branches bearing umbels of small white or pink flowers. The root is aromatic, and the leaves are used as a pot-herb.

**Lovat, BARON**. Scottish title borne by the family of Fraser with an interval since about 1458. Hugh Fraser, who was made a lord of parliament, took the title of Lord Lovat, or Lord Fraser of Lovat, this being the name of his seat in Inverness-shire. The title passed from one descendant to another, until it came to Simon Lovat (*v.i.*), the Jacobite. When he was executed in 1747 his titles and estates

were forfeited, but the estates were restored to his son Simon, who raised the Fraser Highlanders. His direct heirs became extinct in 1815. In 1837, a kinsman, Thomas Alexander Fraser, a descendant of the 2nd baron, was created Baron Lovat.

His descendant, Simon Joseph (1871-1933), became the 16th baron. He raised Lovat's Scouts, commanded them in the S. African War, and on his return raised two yeomanry regiments which formed part of the Highland Mounted Brigade. In the First Great

16th Baron Lovat, British soldier Russell

War he served in Gallipoli, France, and Flanders, later devoting himself to the forestry corps. He was parliamentary under-secretary for the dominions, 1927-28, and chairman of the Oversea Settlement League. On his death, Feb. 18, 1933, the title passed to his son, Simon Christopher Joseph Fraser (b. July 9, 1911), 17th Baron. He served in Commandos in the Second Great War, won the D.S.O., and reached the rank of brigadier. He was under-secretary of state for Foreign Affairs in the Churchill "caretaker" govt., May-July, 1945. Lord Lovat's seat is Beaufort Castle, Beaulieu, Inverness-shire. *Pron. Luvvut. See Fraser.*

**Lovat, SIMON FRASER, 12TH BARON** (c. 1667-1747). Scottish Jacobite. Son of Thomas Fraser, of Beaufort, and grandson of the 7th baron, he was educated at Aberdeen. He was a strange mixture of a barbarous chieftain and an accomplished gentleman. Disappointed in an arrangement to marry his cousin, an heiress, he planned to seize her by force, but captured her widowed mother instead, and compelled her to marry him in 1696. This outrage brought such vigorous punitive measures down upon him that in 1698 he was found guilty of high treason and sentenced to death. For some years he was a fugitive in the northern Highlands, succeeding to the title in 1699.

In 1701 he secured a pardon from William III for his political offences, but, failing to obey a summons to appear before the high court to answer for his outrage on the dowager Lady Lovat, he was declared an outlaw. His subsequent career is one continuous story of intrigue and treachery, a considerable part of his time being spent in French, Scottish, and English prisons. At one time he is said to have been a Jesuit preacher. He forsook the Jacobite cause in 1715, but turned to it again. Joining the Young Pretender in 1745, he was captured after Culloden and executed in London, April 9, 1747.

**Lovat's Scouts**. This British regiment, raised by the 16th Lord Lovat (*q.v.*), has been incorporated in the Scottish Horse (*q.v.*).

**Love**. Passionate or emotional sense of attraction felt by one person towards another, or in an extended sense towards an impersonal object. Based on a universal instinct, and therefore found among lower animals in a rudimentary state, notably in the forms of sexual and parental affection, love in man becomes a complex emotion, comprising moral and spiritual elements, tending to become disinterested or to identify the happiness of the lover with that of the loved. The awakening of sexual love is normally accompanied by a great widening of sympathy and of the emotional and intellectual horizon. Through Christianity and the European conception of chivalry the ideal of sexual love has been clarified and raised to a higher level than in antiquity or in the East today. The age of the troubadours, though not without its extravagances, marked an advance. Dante's Vita Nuova is the classic of medieval love. As expressions of modern feeling may be mentioned the poetry of Shelley, especially Epipsychidion, E. B. Browning's Sonnets from the Portuguese, D. G. Rossetti's House of Life, Meredith's Modern Love, and much of Yeats.

The conception of love has a prominent place in many religious and philosophic systems. Empedocles found the two fundamental forces of the universe in love and strife—the principles of attraction and repulsion. To Plato, in the Symposium and elsewhere, *eros* or passionate, sensuous love is at once a shadow of and a preparation for the love of the soul for the eternal ideas of the good and beautiful. Like seeks like, and

Simon Fraser, Lord Lovat  
Portrait by Hogarth, Nat. Port. Gallery

the soul, being itself an idea or immaterial substance, seeks union with ideal beauty. The thought of a loving relation between man and God was alien to classical antiquity, though found in various Eastern religions. Thus, in many forms of Hinduism salvation is sought in a passionate or ecstatic devotion to Krishna or Siva, a belief which, though often degraded, was expressed by some teachers in the loftiest language. Similar doctrines form a leading part of the mystical poetry of the Persian Sufis.

The Hebrew prophets, by developing the idea of mutual love, as of a husband and wife, between Jehovah and Israel, led up to Christianity. In the Wisdom literature the personified Thought of God loves those who love her (Prov. 8, v. 17). In the N.T. love is the fulfilling of the law, i.e. love to God and man is the one essential motive of right action. Its nature is described in 1 Cor. 13 by S. Paul, after whom in Christian ethics love ranks as the chief of the triad of virtues. Pantheistic thought adopts the idea of love as the mainspring of the universe, as in Shelley, while to Spinoza the highest function of the soul is the intellectual love of God, i.e. the enthusiastic conviction that one's own good is identical with the will of the world-soul.

**Love Bird.** Name popularly given to a small parrot of the genus *Agapornis*. The idea of mutual affection conveyed by the name is quite without foundation, the birds perching close together merely for the sake of warmth. Solitary love birds do not pine; and the fact that the death of one of a pair is sometimes followed by that of the other merely indicates that both were in ill-health. Their handsome appearance and pretty ways make them favourites for the aviary, but they are apt

Love Bird. Grey-headed variety of Madagascar

to prove delicate. The rosy-faced love bird is the hardest, and will often breed in captivity, if provided with a roomy and suitable aviary. There are about nine species of this genus of parrots, all natives of Africa and Madagascar. They fly in flocks, feed on berries and seeds, and have the habit of taking possession of the nests of other birds instead of building for themselves. See *Budgerigar*.

**Lovedale.** Mission station near Alice, Cape Province, S. Africa. It was founded in 1841 by the Free Church of Scotland, and was long under the care of Dr. James Stewart, to whom there is a monument on Sandili's Kop. The school gives technical and other instruction to about 700 pupils.

**Love Feast.** Alternative term for the common meal taken weekly by members of the early Christian Church (2 Peter 2; Jude 12). It is also called *Agapē* (q.v.).

**Love for Love.** Comedy by William Congreve (q.v.). It was first produced April 30, 1695, when Betterton took the part of Valentine Legend, and Mrs. Foresight and Mrs. Frail were played respectively by Mrs. Bracegirdle and by Mrs. Barry. With its scintillating wit and shrewd character-drawing, it is undoubtedly Congreve's masterpiece, and is by many critics considered the best English comedy of manners. Its coarseness, though sometimes obtrusive, is characteristic of its period. A bowdlerised version was produced in 1871 without arousing much enthusiasm. Later revivals in its original form include: Aldwych Theatre (Stage Society), 1917; Sadler's Wells, 1934; Phoenix and Haymarket Theatres (John Gielgud company), 1943-44.

**Love-in-a-Mist** (*Nigella damascena*). Annual herb of the family Ranunculaceae, a native of S. Europe. The alternate leaves are

divided into thread-like segments, and the large blue or white flowers are surrounded by the divided bracts—the "mist" of the name. It is also called devil-in-the-bush and fennel-flower. Another species (*N. hispanica*), also much grown in gardens, has deep blue flowers and crimson stamens, but lacks the "mist."

**Love-in-idleness.** Popular name for the pansy or heartsease. See *Pansy*.

**Lovelace, RICHARD** (1618-58). English cavalier and poet. Eldest son of Sir William Lovelace of Woolwich, who was killed in the Low Countries, he was educated at Charterhouse and Gloucester Hall, Oxford. For presenting to the Long Parliament the petition of Kentish royalists on behalf of Charles I, he was imprisoned in the Gatehouse, Westminster, where he wrote his *Stone Walls do not a Prison Make*, 1642. He took up arms for Charles in 1645, and fought for the French king against Spain, 1646. On his return to England he was again, 1648, cast in prison, at Petre House, Aldersgate, where he prepared for the press his *Lucasta: Epodes, Sonnets, Songs, etc.*, published 1649. The original of *Lucasta* is said to have been Lucy Sacheverell, who was affianced to him, but married after hearing a false report of his death at Dunkirk. Lovelace, one of the handsomest men of his day and of high character, after spending his estate in behalf of the royal cause, died a pauper in Gunpowder Alley, Shoe Lane, and was buried in old S. Bride's Church, Fleet Street. He is best remembered by his lyrics, *To Lucasta: On Going to the Wars*; and *To Althea from Prison*. His poems were edited by W. C. Hazlitt, 1864, new ed. 1904.

Richard Lovelace, English poet

**Love-lies-Bleeding** (*Amarantus caudatus*). Annual herb of the family Amaranthaceae. A native of India, it has alternate undivided leaves, and minute dark crimson flowers, clustered like catkins.

**Lovelock, JACK.** See *N.V.*

**Lover, SAMUEL** (1797-1868). Irish novelist and song writer. Born in Dublin, Feb. 24, 1797, he was by turns miniaturist, song writer, novelist, and dramatist. Secretary of the Royal Hibernian Academy, 1830, he became a member in 1836. He helped to found

Love-in-a-Mist. Spray of foliage and flowers: right, fruit and bracts

the Dublin University Magazine, 1835, and was associated with Dickens in the establishment of

Samuel Lover,  
Irish novelist

Bentley's Miscellany, 1837. He had to abandon painting in 1844 through failing eyesight. He gave recitals which he called Irish evenings, in London, Canada, and the U.S.A., 1846-48; was pensioned in 1856 and, dying at St. Helier, Jersey, July 6, 1868, was buried at Kensal Green. He wrote Rory O'More, a National Romance, 1837; Handy Andy, 1842; L.S.D., afterwards called Treasure Trove, and He Would Be a Gentleman, 1844; but is best remembered by his ballads Rory O'More, The Low-backed Car, The Angel's Whisper, The Four-Leaved Shamrock, Molly Bawn, and Widow Machree. He wrote music for his songs and sang them with excellent effect.

**Love's Labour's Lost.** Romantic comedy by Shakespeare, his first play. The princess of France and her three ladies, Rosaline, Maria, and Katharine, frustrate the attempt by Ferdinand, king of Navarre, and Biron (or Berowne), Longaville, and Dumaine, his chief courtiers, to keep the court as an academy from which all women were to be excluded for three years. In Don Armado, a fantastical Spaniard; Sir Nathaniel, a curate; and Holofernes, a schoolmaster, euphuism and pedantry are good-humouredly satirised. The scene is laid in Navarre.

Written about 1592, the same time as some of the Sonnets, with which it has points in common, this play was first printed in a revised form in 1598. The text contains passages which combine the early draft and the revision. Its plot is original, but the author was influenced by Lyly's Euphues, 1580, the same writer's comedies, 1580-92, and by contemporary events, particularly those in France. Armado, Biron, Rosaline, and Dull are respectively precursors of Parolles, Benedick, Beatrice, and Dogberry. The play was mentioned by Meres in 1598. Remarkable for its lyrics, notably the song, When daisies pied, it contains 2,789 lines, including 1,086 prose, 579 blank verse, and 1,028 pentametric rhymes.

**Loving Cup** (Lat. *poculum caritatis*). Large cup filled with wine or punch, and passed from

hand to hand at state banquets, civic feasts, and university gatherings to pledge health. The formal procedure is for the diner who drinks to stand to receive the cup from the diner on his right, to pledge the one on his left, and to remain standing to guard the latter's rear until he has in turn passed the cup.

A form of the old wassail bowl, it is sometimes called the grace cup, and it is said that Margaret Atheling, wife of Malcolm Canmore, in order to induce the Scots to remain at table for the grace after meat, filled a cup of this kind with choice wine, of which each guest was allowed to drink as much as he liked after grace had been said.

The custom of drinking from one cup was observed at the ancient Jewish paschal supper, and in memory of Our Lord's words, at the Last Supper. Drink ye all of it (Matt. 26, v. 27), the cup at Holy Communion is sometimes called the loving cup.

**Low, ARCHIBALD MONTGOMERY** (b. 1888). British scientist, inventor, and author. Born at Broughty Ferry, Dundee, he was educated at S. Paul's School and the Imperial College, London. After serving in

Archibald M. Low,  
British scientist

the First Great War in the army and navy, he became honorary assistant professor of physics at Royal Artillery College. Later, specialising in electrical engineering, he earned reputation by ingenious practical demonstrations. The photography of sound and the development of radio apparatus owe much to Low's imagination. He also invented a radio-control gear for torpedoes, the vibrometer, and the audiometer. A prolific writer for the non-technical reader, he published

over 50 books, including Recent Inventions; Modern Electrical Invention; The Story of Life; Science in the Home; Romance of Transport; Science in Industry; Romance of Fire; Our Own Age.

**Low, DAVID** (b. 1891). New Zealand born cartoonist. Born at Dunedin, April 7, 1891, he was cartoonist to several journals in his own country and Australia. In 1919 he joined the Star in London and soon became known for witty political caricatures. He was, 1927-50, the political cartoonist of the London Evening Standard, in which his work became world-famous, his reactionary Colonel Blimp being a particularly recognizable creation. In 1950 Low joined the Daily Herald. He published The New Rake's Progress, 1934; Political Parade, 1936; Cartoon History of Our Times, 1939; British Cartoonists, 1942; Years of Wrath, 1946. See Caricature illus. p. 1771.

David Low,  
political cartoonist

**Low, SIR SIDNEY JAMES MARK** (1857-1932). A British author and journalist. Born in London, Jan. 22, 1857, he was educated at King's College School and Balliol College, Oxford, and was called to the bar at the Inner Temple, 1892. He edited the St. James's Gazette, 1888-97, and was afterwards associated with the Standard. An authority on imperial questions, Low was made lecturer on imperial and colonial history at King's College, London. He was an alderman of the L.C.C., 1901-05, and was knighted in 1918. His books include The Governance of England, 1904; Political History of England, 1837-1901, 1907. Low died Jan. 13, 1932.

**Low Archipelago.** Series of islands in the Pacific Ocean, lat. (approx.) 20° S., long. (approx.) 150° W. Known by the natives as Paumotu and Tuamotu, it includes the Gambier Islands, Clermont Tonnerre, Krusenstern; most are coralline, many of them being atolls. They yield pearls and copra. Most of them belong to France. See Oceania.

**Low Countries.** Name given to the Netherlands, including Belgium and sometimes Luxemburg. See Belgium; Netherlands.

**Lowe, SIR HUDSON** (1769-1844). British soldier. He was born at Galway, July 28, 1769, the son of

Loving Cup presented by Samuel Pepys to the Clothworkers' Company of London

a military surgeon. He joined the army in 1787, serving with distinction against the French, especially during the Egyptian campaign of 1801. A good linguist, he did much valuable work in S. Europe, and for two years was governor of the Ionian Islands. During 1813-14

Sir Hudson Lowe,  
British soldier

he was sent on missions and served with the Russian and German armies. In 1815 he was appointed custodian of Napoleon at St. Helena. His duties brought upon him much odium and misrepresentation, but he seems to have acted conscientiously in a difficult position. He died Jan. 10, 1844. Consult Sir H. Lowe and Napoleon, R. C. Seaton, 1898.

**Lowell.** City of Massachusetts, U.S.A., one of the two co. seats of Middlesex co. At the junction of the Merrimack and Concord rivers, 26 m. N.W. of Boston, it is served by rlys. and an airport. Its buildings include a city hall, textile school, a state normal school, and the memorial building. An important industrial city, Lowell obtains power chiefly from the Merrimack. Its textile industry, modelled on English methods, made the city in the 19th century the nation's greatest producer of cotton goods. Founded in 1822, Lowell was incorporated in 1826 and became a city in 1836. Population, 101,389.

**Lowell, ABBOTT LAWRENCE** (1856-1943). American historian. Born Dec. 13, 1856, at Boston, a brother of Percival Lowell, he was educated at Harvard and Berlin. He studied law and was a practising barrister, 1880-97, but his real interests were in the problems of government, and in 1896 he made an international reputation by his *Government and Parties in Continental Europe*, written from a new point of view, that of an American observer. In 1897 he became lecturer and in 1900 professor of the science of government at Harvard, and in 1909 president of that university. He retired in 1933, and died Jan. 6, 1943. He wrote *Essays on Government*, 1889; *The Government of England*, 1908; *Public Opinion and Popular Government*, 1913.

**Lowell, AMY** (1874-1925). An American poet. Sister of Percival and Abbott Lowell, she was born at Brookline, Mass., Feb. 9, 1874.

Her poetry, in which free verse was united with vivid and unconventional imagery, belonged to the Imagist school, of which she was the avowed head. Her publications included *A Dome of Many Coloured Glass*, 1912; *Men, Women, and Ghosts*, 1916; *Legends*, 1921; *East Wind*, 1926; *Ballads for Sale*, 1929. She produced a biography of Keats, 1905. She died May 12, 1925. Selected Poems, ed. J. L. Lowes, appeared in 1928.

**Lowell, JAMES RUSSELL** (1819-91). American poet, essayist, and diplomatist. He was born at Elmwood, Cambridge, Mass., Feb. 22, 1819, son of the Rev. Charles Lowell, pastor of the Unitarian West Church. He was of Puritan descent; his paternal grandfather in 1780 introduced into the Bill of Rights, a clause abolishing slavery in Massachusetts; an ancestor on his mother's side was Sir Patrick Spens of the famous ballad. After graduating at Harvard, 1838, he studied law and began practice in Boston, but abandoned law for literature. He became editor of *The Pennsylvania Freeman*, in which he took the side of the abolitionists; lectured on poetry at the Lowell Institute, Boston, 1854-55; was professor of belles lettres at Harvard, 1855-77; edited *The Atlantic Monthly*, 1857-61; and, with C. E. Norton, *The North American Review*, 1864-72. He was U.S. minister in Madrid, 1877-80; and in London, 1880-85. In 1844 he married Maria White (1821-53), herself a poet and a writer against slavery, who profoundly influenced his outlook; and in 1857 Frances Dunlap (d. 1885). He passed several summers in England, 1886-89, and died at Elmwood, Aug. 12, 1891.

As America's representative in London, Lowell displayed a tactful firmness that did not hinder his material influence on the improvement of the relations between the two English-speaking peoples. His literary life displayed versatility of genius and was marked by high achievement. It is recorded that he was hushed to sleep as a child by the reading of Spenser's *Faerie Queene*. His first volume, *A Years' Life* and other Poems appeared in 1841; his last, *Heartsease and Rue*, in 1888. His gift

J. R. Lowell,  
American writer

for satirical humour was revealed in the poems in Yankee dialect which began in *The Boston Courier* in 1846, as the work of one Hosea Biglow. Inspired by opposition to the Mexican war, they were published as *The Biglow Papers* in 1848.

His *Fable for Critics*, published anonymously, a rhyming review of contemporary American literature, in which vivacity is combined with critical insight, and the beautifully lyrical *Vision of Sir Launfal*, an excursion into Arthurian legend, also belong to 1848. The second series of *The Biglow Papers*, prompted by the Civil War, began in *The Atlantic Monthly*, 1862, and were collected, 1867. In addition to *The Vision of Sir Launfal*, Lowell's best poetry includes *The Present Crisis*, 1845; *Ode recited at the Harvard Commemoration*, July 21, 1865; *The Cathedral (Chartres)*, 1870; *Agassiz*, 1874; *Three Memorial Poems*, 1877; and a number of nature poems, sonnets and simple but touching lyrics.

Lowell's prose works, cultured, graceful, brilliant, suggestive, but full of learned allusions and appealing on the whole to the select few, include *Fireside Travels*, 1864; *My Study Windows*, 1871; *Among My Books*, 1870-76, containing his notable essay on Dante; *Democracy and Other Addresses*, 1887; *Political Essays*, 1888; *A Life of Hawthorne*, 1890; *The Old English Dramatists*, 1892; *Latest Literary Essays*, 1892; *Impressions of Spain*, 1900. He edited the works of several English poets and wrote an introduction to an edition of Walton's *Compleat Angler*, 1889.

**Bibliography.** Writings of J. R. L., Riverside ed., 11 vols., 1899; *The Poet and the Man*, F. H. Underwood, 1893; *Letters*, ed. C. E. Norton, 3 vols., 1894; J. R. L. and His Friends, E. E. Hale, 1899; J. R. Lowell, H. E. Scudder, 1901; *Life and Work*, F. Greenslet, 1905; *Bibliography*, G. W. Cooke, 1906; and *His Poetry*, W. H. Hudson, 1912; *L. as a Critic*, J. J. Reilly, 1915; *New Letters*, ed. M. A. de W. Howe, 1934.

**Lowell, PERCIVAL** (1855-1916). American astronomer. Born March 13, 1855, in Boston, he was educated there and at Harvard. After some years in Japan and Korea, he devoted his energies to the erection of the Lowell Observatory at Flagstaff, Ariz., and the prosecution of researches there. In 1902 he was made non-resident professor of astronomy at the Massachusetts institute of technology. He devoted

himself especially to researches on planetary markings and believed himself to have confirmed and enlarged Schiaparelli's discovery of canals on Mars, for which he was awarded the Janssen medal of the French astronomical society in 1904. The ill-defined markings on Mercury and Venus were submitted by him to an equally searching scrutiny. He wrote *Mars*, 1895; *The Solar System*, 1903; *Mars and its Canals*, 1906; *Mars as the Abode of Life*, 1908; and volumes on the *Far East*. He died Nov. 12, 1916. See *Mars*.

**Lower Deck.** The principal gun deck in sailing ships of war, and frequently so called. Below it were the orlop deck and cockpits, and above it, in the order given, the middle, main, and upper decks. In modern warships almost the whole armament is mounted on the upper deck, and in the First Great War ships with lower deck guns, such as *Good Hope* and *Monmouth*, often found them practically useless, as they were too close to the water. The forward part of the lower deck was formerly used for the messing and berthing of the ship's company, whence the petty officers and men of the navy are referred to collectively as the lower deck.

**Lower Saxony.** A *Land* of W. Germany, in the British zone of occupation, formed 1946 from the provs. of Hanover, Oldenburg, and Brunswick (*qq.v.*), with the city of Hanover as its cap. In 1949, 30 p.c. of the pop. were refugees and displaced persons.

**Lowestoft.** Mun. bor., market town, seaport, and watering-place of Suffolk, England. The full

Lowestoft arms

title of the bor. is Lowestoft and Oulton Broad. It stands at the mouth of the Waveney, 16 m. by rly. S. of Great Yarmouth. The chief church is S. Margaret's, a Perpendicular building. There are esplanades, piers, etc. The old town is on a hillside, and the narrow streets leading down to the sea are called the scores. There are an inner and an outer harbour, and large fish quays and markets. Near by is Lowestoft

Ness, the most easterly part of England. Lowestoft originated as a fishing port, but soon obtained the right to hold markets and fairs, and in 1885 became a borough. It gives its name to a county constituency. Market day, Wed. Pop. 41,768.

The battle of Lowestoft is the name given to the naval engagement between the English fleet under James, duke of York, and a Dutch one, June 3, 1665. War had broken out in March. When the rival fleets met off Lowestoft, an obstinate battle took place, ending in the flight of the Dutch vessels, after the flagship of their admiral Opdam had been blown up.

A naval base during the First Great War, Lowestoft was bombarded by the Germans from the sea and bombed from the air. On April 25, 1916, and again on Nov. 26, 1916, it was attacked by German warships. On July 26, 1918, a German submarine operating off the town sank two smacks and took the crews on board. Lowestoft also suffered from German air raids in the Second Great War.

**Lowestoft.** Name of a hard paste china made at Lowestoft, England, 1775-1802. It has a good body and an Oriental character, with decorations in blue and white. Polychrome was used for scenery and figure painting. An earlier soft paste porcelain and an earthenware were made from 1756 onwards.

Lowestoft. Specimens of the china-ware formerly made at Lowestoft. From Herbert Allen collection, Victoria and Albert Museum

**Lowicz.** Town of Poland. In the co. of Warsaw, it stands on the Bzura, a tributary of the Vistula, 45 m. S.W. of Warsaw, and on the Warsaw-Berlin rly. There were soap, candle, oil, and vinegar factories and tanneries, and trade was done in corn, leather, and horses. The neighbourhood had flour mills and sugar factories. In the 14th cent. it was the capital of a principality.

**Lowland.** Stretch of country which is, on the whole, low or level, especially if compared with neighbouring regions. Thus the Lowlands of Scotland comprise the region between the northern highlands and the southern uplands. Great Britain, S.E. of a line joining the mouths of the Tees and Exe rivers, is also a great lowland,

Lowestoft, Suffolk. S. Margaret's parish church. Top, left, yachts in the Basin decorated for a regatta

for the hills which cross it rarely attain an elevation of 1,000 ft. Lowlands are much more suitable for settlement than highlands, and in temperate latitudes concentrate the most important modern commercial activities. See *Highland*; *Plain*.

**Lowland Regiment.** Former British army unit. Formed at Edinburgh in Dec., 1940, it provided primary training for volunteers and national service men preparatory to their being drafted into one of the Scottish Lowland regiments. It was disbanded in July, 1943, when its functions were transferred to the newly-formed General Service Corps.

**Low Latin.** Name generally given to the Latin in use from A.D. 600 to 1500, sometimes used to include the Latin of the period 175-600, which, however, is more commonly called Late Latin. It is chiefly characterised by extensive borrowing from Greek,

Teutonic, and Oriental languages, and neglect of grammatical rules. See Latin Language.

**Lowndes, MARIE ADELAIDE** RENÉE BELLOC (1868-1947). British writer. Daughter of Louis Belloc, French barrister, and sister of Hilaire Belloc (*q.v.*), she was educated in England and in 1896 married F. S. A. Lowndes. Her first novel was *The Heart of Penelope*, in 1904; her second, *Barbara Rebell*, 1905, made her reputation as a writer of distinction. Her later novels were often more sensational. *The Lodger*, 1913 (based on the mystery of Jack the Ripper), was translated into many languages, sold some million copies, and was also successful as a film. Well remembered were *What Really Happened*, 1926; *The House by the Sea*, 1937; *Lizzie Borden*, 1940. Her best work was contained in reminiscences: *I too Have Lived in Arcadia*, 1941; *Where Love and Friendship Dwelt*, 1943; *The Merry Wives of Westminster*, 1946; *A Passing World*, 1948 (posth.). She died Nov. 14, 1947.

Mrs. Belloc Lowndes, British novelist  
Hoppe

**Lowndes, WILLIAM THOMAS** (c. 1798-1843). British bibliographer. The son of a London publisher, he devoted 14 years to compiling a *Bibliographer's Manual*, which, modelled on Brunet's *Manuel du Libraire*, appeared in four vols., Jan. 1, 1834. During 1839-43 he issued several parts of *The British Librarian*, but his laborious and unremunerative drudgery reduced him to poverty of health and pocket. He died July 31, 1843. H. G. Bohn (*q.v.*), having acquired the copyright of the *Manual* from W. Pickering, brought out a new and revised edition 1857-64. The first work of its kind in English, it is still a useful guide to English literature down to the middle of the 19th century.

**Low Sunday.** Name given to the first Sunday after Easter. According to some authorities it was so called because it is a kind of second or lower celebration of the great feast, and it was once a custom to repeat some of the paschal solemnities on this day. Others suggest a corruption of *Laud Sunday*, *laudes*, i.e. praises, being the first word of the sequence (*q.v.*) for the day. Yet another suggestion is a corruption of *Close Sunday*. The

French call the day *Pâques closes* (Lat. *Pascha clausum*), or close of Easter; the Greek Church uses the term *New Sunday*, in reference to the new life entered upon by the newly baptized. In old times the day was called *Dominica in albis*, or the Lord's Day in albs, or white garments, those who had been baptized on Easter Eve wearing their chrisoms, or white robes, for the last time before these were deposited in the church.

**Low Temperature Carbonisation.** Term generally applied to the carbonisation of bituminous coal of medium or weakly caking type, or of brown coal or lignite, at temps. up to 600° C. (1,110° F.) in retorts constructed of metal or of firebrick. The main object in carbonising coal at low temps. is to produce easily combustible smokeless fuel (low temp. coke) for use instead of coal in open domestic fires. In addition to coke, which is the chief product, gas, tar, and ammoniacal liquor are also obtained. The burning of raw coal entails the loss of valuable by-products, recovered in the production of low temp. coke, as well as polluting the atmosphere.

Carbonisation of the charge of coal can be effected either by heating the retorts externally by means of gas (coal gas, water gas, or

oven coke, and can be burned in all types of domestic fireplace.

The coal gas produced from bituminous coal in externally heated retorts is of high calorific value—800 to 900 B.Th.U. per cu. ft.—and contains high proportions of unsaturated hydrocarbons (ethylene, propylene, butylene) and saturated hydrocarbons (methane, ethane, propane) as compared with town's gas produced by high temp. carbonisation. The gas produced in internally heated retorts is mixed with the burned gases used for carbonising the charge. It is in consequence appreciably lower in calorific value—180 to 230 B.Th.U. per cu. ft.—than the gas from externally heated retorts, the calorific value depending on the vol. of burned gases used to effect carbonisation. In one type of internally heated retort the coal is carbonised by steam heated to 550° C. (1,020° F.) and gas is produced similar in composition to that obtained in externally heated retorts.

Low temp. tars differ appreciably in physical and chemical properties from tars produced in gasworks retorts and coke ovens at high temp.—1,350° C. (2,460° F.). They contain higher homologues of the compounds present in high temp. tars. They also contain

	Low temp. carbonisation		High temp. carbonisation
	External heating	Internal heating	External heating
	Yields per ton of coal as charged		
Moisture in coal as charged p.c.	6-10	10-15	2-3
Coke, cwt. . . . .	13.5-15.5	8-12	13.5-14.5
Gas, cu. ft. . . . .	2,500-4,000	30,000-50,000	12,500-20,000
Gas, calorific value B.Th.U. per cu. ft. . . . .	800-900	180-230	450-560
Gas, therm. . . . .	22.5-32	69-90	70-90
Tar, gals. . . . .	18-22	16-18	10-14
Tar, s. g. . . . .	1.00-1.04	1.04-1.06	1.09-1.12

producer gas) burned in chambers surrounding the retorts, or internally by means of hot combustion gases passed through the charge of coal. In the latter case the heating gases can be (a) produced by the combustion of a portion of the coal gas made in the process, (b) produced when air is passed through the charge, (c) generated in a separate plant. Many different designs of retorts have been used for the process; in some the charge of coal is stationary, in others in motion, during treatment.

The coke produced, owing to its physical structure and its relatively high volatile matter content, ignites easily, is more combustible than gasworks or coke-

higher proportions of paraffinic and phenolic compounds with appreciably lower proportions of pitch and free carbon. The liquor produced contains only a small quantity of ammonium compounds and is not commercially useful.

The yields of products vary considerably according to the type of plant used. Typical yields from externally and internally heated retorts are shown in the table, together with the yields obtained by high temp. carbonisation.

D. MacDougall

**Lowther, JAMES** (1840-1904). British politician. Born Dec. 1, 1840, he was educated at Westminster School and Trinity College, Cambridge, and called to the

bar in 1864. He entered parliament as Conservative M.P. for York in 1865. Between 1867 and 1880 he held office as parliamentary secretary to the poor law board, under-secretary for the colonies, and chief secretary for Ireland. After eight years' absence from the house he sat for Thanet from 1888, a Tory "diehard" but a popular member, dying Sept. 12, 1904.

**Lowther, JAMES WILLIAM.** Speaker of the British house of commons, 1905-21, who became Viscount Ullswater (*q.v.*).

**Lowther Arcade.** A covered avenue formerly connecting the Strand with Adelaide Street, London, W.C. Designed 1830-32 by Witherdon Young, and named after a chief commissioner of woods and forests, it was 245 ft. long, had a domed glass roof, and held shops for the sale of toys and fancy goods. Its site has been occupied since 1904 by Coutts's Bank.

**Lowther Hills** OR LEADHILLS. Range of hills in Scotland. They are on the borders of Lanarkshire and Dumfriesshire. Green Lowther (2,403 ft.) and Lowther Hill (2,377 ft.) are the loftiest summits.

**Loy, MYRNA** (b. 1905). American film actress. Her surname was Williams, and she was born of Scottish-Welsh stock at Helena, Mo., Aug. 2, 1905. She studied dancing with Ruth St. Denis, and entered films in 1925. In early pictures she usually played the part of an adventuress, but in 1934 became famous by her brilliant performance with William Powell in *The Thin Man*, a picture which led to a series of "comedy thrillers." She went back to drama in *The Rains Came*, 1940. Bachelor Knight was shown in 1947.

**Loyal Regiment.** Regiment of the British army and the only unit to incorporate "Loyal" in its title. The 1st battalion was raised in Scotland in 1740 as the 47th Foot and saw active service in the Jacobite rebellion of 1745. Drafted to Nova Scotia in 1758, it served at the siege of Louisburg and was known as *Wolfe's Own*. At Quebec (1759) it was in the centre of the thin British line which broke up the French attack. From Canada, the 47th went to America and, after fighting at Bunker Hill, was part of the British force that surrendered at Saratoga. It received the title *The Lancashire*

Regiment, 1782, and served under Wellington throughout the Peninsular War. It was in the Burmese war, 1825-26, the Crimea, and the Afghan war, 1878-79.

In 1793 the present 2nd battalion of the Loyal Regiment was raised as the 81st Foot and called the Loyal Lincoln Volunteers. It first saw service in the Kaffir war, 1800, and then served in the Peninsula, fighting under Moore at Corunna. It served with distinction at Waterloo and in Afghanistan, 1878-79. The 47th and 81st Foot were linked in 1881, to form the 1st and 2nd battalions of the Loyal North Lancashire Regiment, which distinguished itself in the relief of Kimberley.

Twenty-one battalions of the Loyals were raised for the First Great War and gained the battle honours: Mons; Aisne, 1914, '18; Ypres, 1914, '17, '18; Somme, 1916, '18; Lys; Hindenburg Line; Suvla; Gaza; Bagdad; and Kilima-Njaro. In 1920 the regiment's title was altered to Loyal Regiment (North Lancashire). During the Second Great War there were eleven regular and territorial battalions at home and overseas. The 1st was in France (1939-40), Africa, and Italy; the 2nd and 5th were captured at Singapore; the 10th served throughout the Italy campaign; the 6th, a reconnaissance regiment with the 2nd div. in Burma, earned distinction at Kohima; and the 7th acted as an A.A. unit in N.W. Europe (1944-45). The regimental depot is at Preston.

**Loyalties.** Drama by John Galsworthy. Ronald Dancy, an army officer, is accused by Ferdinand de Levis, a wealthy Jew, of stealing money from him at a house party. Some of those who know Dancy believe he may be guilty—as indeed he is—and the play traces the conflicts of loyalties, to relative, friend, profession, club, race, and to truth and justice, which beset them. *Loyalties* was first performed at the St. Martin's Theatre, London, March 8, 1922.

**Loyalty.** A group of French islands in the Pacific Ocean, approx. 60 m. E. of New Caledonia. Lifou, Mare, and Uvea are the largest islands. Bananas and coconuts are cultivated, sandalwood, copra, and rubber are exported. The people, mostly Roman Catholics, are of mixed Polynesian and Melanesian descent. The group has been French since 1864, and forms one of the dependencies of New Caledonia. Area, 800 sq. m.

**Loyola, S. IGNATIUS OF** (1491-1556). Founder of the Society of Jesus. He was the son of Don Beltran Y. de

S. Ignatius of Loyola, founder of the Society of Jesus. Painted by Sanchez-Coello, Madrid.

Oñez y Loyola and Marina Saenz de Liconay Balda (Lopez de Recalde is an error), and was born in the Basque prov. of Guipuzcoa. In youth Loyola was in contact with the court circle of Ferdinand and Isabella; he was talented, ambitious, and dissipated. In 1517 he became a soldier and in 1521 defended Pampeluna so gallantly against the French that when a cannon-ball tore one of his legs and shattered the other the garrison surrendered. He asked for romances as distraction, about heroes he might imitate: only lives of saints were found: he day-dreamed alternately about rivaling these, and about chivalry and ideal ladies.

Suddenly he saw the futility of this; he went on a pilgrimage to Montserrat and made his knight's vigil before Our Lady and hung up his arms there. During 10 months of fierce penance and scruples in a cave at Manresa and of sickness in hospitals, he made notes which finally became his booklet, *Spiritual Exercises*. He voyaged amid incredible hardships to Jerusalem meaning to stay there, but was sent back wondering what to do. At least he must be educated, so he gave 11 years to this, beginning with Latin among schoolboys at Barcelona, then philosophy and theology at Alcalá, Salamanca, and Paris, harassed by attacks on his orthodoxy and reforming zeal and, in his destitution, begging alms as far as Flanders and England. Friends deserted him, until in 1534 with six others (to whom he later added a further three) he vowed poverty and chastity. They simply placed themselves at the pope's disposal, meanwhile serving in hospitals and preaching.

In 1537 Ignatius was ordained and went to Rome, calling his group the company (a military term) of Jesus. Jesuit, a word never used by Ignatius, had long been a snoring nickname for men who cantingly repeated the holy Name. Like the name Christian, from a term of scorn it became normal

Loyal Regiment badge

and respectful. These men gradually saw they needed a minimum rule of life: the first formula was approved in 1540, but the company (of which Ignatius became general superior) was at first limited to 60 members. The earliest text of *Spiritual Exercises* belongs to 1541; its solemn approbation to 1548. It is a method by which a man, reviewing in solitude the great truths of religion and the example of Christ, may seriously choose how best to spend his life. Ignatius made rules reluctantly, desiring the maximum of spontaneity together with discipline among his men; his Constitutions received their final touches only after his death. He had no specific aim other than liberty to work at whatever the needs of the Church might indicate: hence he abandoned any special dress, the singing of choir, dangerous honours, and obligations proper to ecclesiastical high rank: all his additions, which included service of the plague-stricken, of the bashful poor, of prostitutes, and even educational (the Roman and German colleges and university work generally), were due to pressure of circumstances.

But the society grew rapidly, and sent missionaries everywhere; already in 1549 Francis Xavier was provincial of India. Before Ignatius died his firm paternal government was controlling 12 provinces. He was a man of intense prayer and complete self-abnegation; as calm as he was fearless; as wise as he was simple; grave, yet beloved. He died July 31, 1556. In 1622 he was canonised. The best biography is *The Origin of the Jesuits*, J. Brodrick, 1940. Consult also Loyola's Testament, Eng. trans. E. Rix, 1900. Pron. Lo-yo'-la. See Jesuits.

C. C. Martindale, S.J.

**Lozenge.** In heraldry, diamond-shaped charge, differing from the fusil (q.v.) in being broader. A

Lozenge in heraldry

lozenge may be pierced; if the hole is circular, the charge is called a rustre; if the hole is square, it is described as square pierced; if lozenge pierced, showing a narrow band, it is called a mascle, and is supposed to represent a link of chain armour. A shield divided by diagonal lines from right to left, and crossed by diagonal lines from left to right, is said to be lozengy.

The word is also used for a small tablet, often medicated, such as the familiar cough lozenge.

**Lozère.** Dept. of France. It is a mountainous area situated high up on the Central Plateau, N.W. of the Cévennes scarp. The Causses of the S.W., dry limestone areas, some over 3,000 ft. high, are a feature of the dept. The chief rivers are the Lot and the Tarn. The staple industries are the rearing of cattle and sheep, and the growing of cereals and fruit. Silk culture is increasing. Cheese is made and bees are kept. The principal places are Mende and Florac. Before the Revolution the dept., which has an area of 1,996 sq. m., was in the province of Languedoc. Pop. 90,523. See Aveyron.

**L.S.D.** Symbol for pounds, shillings, pence. These are the initial letters respectively of the Latin *librae*, *solidi*, and *denarii*. As *livre*, *sol* (sou), and *denier*, these terms were originally brought from France to England.

**Lualaba.** River of the Belgian Congo. One of the head-waters of the Congo, it rises near the S. borders of the Katanga prov., and flows generally N. to its confluence with the Lukuga. Its most important affluent is the Luapula, which unites with it to form what is generally spoken of as the Lualaba-Congo. The river is navigable for launches

intermittently from Bukama, the terminus of the railway from Cape Town to Kongolo, and from Kindu to Ponthierville. The chief places on the banks are Bukama, Ankoro, Kabalo, the terminus of the rly. from Albertville on Lake Tanganyika, Kasongo, Kindu, Lova, and Ponthierville.

**Luang Prabang.** Capital of the kingdom of Laos, Indo-China. It stands at the confluence of the Mekong and Namkan 250 m. S.W. of Hanoi. The ruler is assisted by a French administrator.

**Luapula.** River of Northern Rhodesia and the Belgian Congo. Forming part of the boundary between these countries, it issues from Lake Bangweulu, and flows N. through Lake Mweru, where it becomes the Luvua, and thence to the Congo. From Johnston Falls to Lake Mweru it is navigable.

**Lubaantum.** Ruins in British Honduras of an ancient Mayan city near Punta Gorda. The ruins are of vast extent and have been investigated by the British Museum. They date from 3,000 B.C. to A.D. 1,700.

**Lubbock.** City of Texas, U.S.A., and co. seat of Lubbock co. Situated 110 m. S. of Amarillo, it is served by the Atchison, Topeka, and Santa Fé rly. Originally a cattle town and now a centre of dairying and cotton growing and processing, it is also a commercial and financial centre. The Texas technological college occupies 2,000 acres, including an experimental farm. Lubbock was founded in 1891 when the communities of Monterey and Old Lubbock decided to pool their resources. Pop. 31,853.

**Lübeck.** City, former principality, and until 1945 free state of W. Germany. It is situated in Schleswig-Holstein near the mouth of the river Trave, which drains into Lübeck Bay, and is 38 m. N.E. of Hamburg, 145 m. N.W. of Berlin. Its name, of Wendic origin, means lovely one; in spite of the destruction of many of its remarkable medieval and 18th cent. buildings by bombing from the air in 1942, the city still deserves its name. Lübeck originated the northern form of Gothic architec-

Luang Prabang, Indo-China. Dancers and musicians at a performance in the open-air theatre

ture, in which whole sections of the city were built in plain or glazed brick, with lofty spires or gabled fronts; and the inner town, on an island formed by the rivers Trave and Wakenitz and the Elbe-Trave canal, remains a show piece of medieval art. S. Mary's (1280-1304) was gutted during the Second Great War, and its 407-ft.-high twin spires were destroyed, but the vaulting remained and the church was re-roofed. The cathedral, founded 1173 by Henry the Lion and completed 13th to 14th

cents., with two towers nearly 400 ft. high, was damaged, but not beyond repair; most of its treasures, including the altar painting by Hans Memling, were saved. S. Catherine's (14th cent.), which had been converted into a museum, escaped damage and was reconverted into a church. S. James's (13th cent.) was undamaged, as was the remarkable Rathaus (1250 and later, an outstanding building of its kind), except for damage by fire to the interior of the great hall. The Holy Ghost hospital (13th cent.), the shipmen's guildhouse (16th cent.), and the monumental Holsten gate (1477) were all preserved. The Buddenbrook house (1758), setting of the most famous novel by Lübeck-born Thomas Mann, was destroyed, though its façade remained standing.

#### Chief Baltic Port

The free state of Lübeck was 115 sq. m. in area, pop. (1935) 140,900, by 1949 increased by refugees from Russian-occupied Germany to 241,400. The city had (1935) 133,021 inhabitants; the only other town of the state, the small port and seaside resort of Travemünde, was incorporated with the city in 1915. Lübeck's economic importance derived from its old rôle as main port of the Baltic, and head of the Hanseatic League: a rôle it preserved until recently through its modern port facilities and the deep canal which permitted sea-going vessels to come right into the city. Before the Second Great War about 9,000 seagoing vessels entered the port annually; 3,000 inland vessels up to 7 ft. draught also reached it by the Elbe-Trave canal from Hamburg and the Elbe. Lübeck's own industries employed more than 50,000 workers and comprised blast furnaces, iron- and steelworks, engineering yards, shipbuilding, and the making of enamelware, furniture, wooden and earthen ware, food preserves, sweets, etc.

As a free port, Lübeck stocked timber, grain, ore, fertilisers, etc., and dealt with all the countries round the Baltic. Its marchpane and its liquors were famous.

Lübeck was founded in 1143 by Count Adolf of Holstein and, under Henry the Lion, about 1160 became an important settlement of Westphalian merchants; it came under the protection of the Holy Roman empire 1181, and, after a short Danish occupation, received the privileges of a free city 1226. German colonisation spread N. and E. from it; the Hanseatic league developed, and by the end of the

13th cent. Lübeck was its undisputed head, greatest seaport between Riga and Bruges and, under a patrician council, successful in home and foreign struggles. In 1530, however, a democratic opposition under Jürgen Wullenwever (*q.v.*) enforced Protestantism. Civic strife followed and, in 1535, led to a collapse from which neither the Hansa nor Lübeck recovered. Several wars, with Denmark, Sweden, etc., and in the 17th cent. the Thirty Years war, which left Sweden dominant in the Baltic, reduced Lübeck's importance still more. It recovered in the 18th cent. Taken by Napoleon, 1806, incorporated with France, 1810, and liberated, 1813, although now encircled by Danish territory, it regained its importance as a trade emporium. It joined the N. German confederation and customs union in 1868 and, under the empire as well as under the Weimar republic, preserved its republican constitution and its rights as a free city and port. It was governed by a diet of 80 and a senate of 11 under a burgomaster elected for two years; it had a particularly progressive system of education. During the Nazi regime it was subordinated, with Mecklenburg, to a *Reich Statthalter* whose seat was at Schwerin.

During the Second Great War the R.A.F. heavily attacked Lübeck, setting the port installations and U-boat building yards and parts of the city on fire, in the night of March 28-29, 1942. It was captured May 2, 1945, with very little fighting, by the British 11th armoured div., and came within the British zone of occupation.

Edgar Stern-Rubart

**Lübeck Bay.** Inlet of the Baltic on the German coast. It runs in, as a continuation of Mecklenburg Bay, from N.E. to S.W., for a distance of 16 m., to the free state of Lübeck, between Holstein and Mecklenburg. The river Trave, which flows into it, has been deepened to afford connexion with the port of Lübeck, 14 m. inland, available for ocean-going steamships. It is sometimes called Neustadt Bay, from the port of that name on the Holstein coast.

**Lubitsch, ERNST** (1892-1947). German-American film director. Born in Berlin, Jan. 29, 1892, he entered the film world as a comic actor in 1913, and within a year had become a director. His first important film was *Gypsy Blood*, 1921, after which he went to Hollywood. By a series of musical comedies with Maurice Chevalier

in the leading part, including *The Love Parade*, 1929, *The Smiling Lieutenant*, and *One Hour with You*, he established his reputation as a brilliant and witty director. His later films include *Trouble in Paradise*, *The Man I Killed*, and *Heaven Can Wait*. He died Nov. 30, 1947.

**Lublin.** Town of Poland, the capital of the co. of the same name. It gives its name also to one of the six military dists. into which Poland is divided. It is 100 m. S.E. of Warsaw, on the Bistrzyca, a tributary of the Wieprz, and on the Warsaw-Kovel rly. It was long the second city of Poland, until it was eclipsed by Lodz, and in appearance remained inferior only to Warsaw. Its chief industries have been brewing, and the manufacture of beet-sugar, tobacco, candles, and soap, and a considerable trade was done in corn, wine, linen, and woollen goods. Poland's independence was proclaimed here Nov. 9, 1918, by a workers' and peasants' council.

When the Germans invaded Poland in Sept., 1939, they bombed Lublin heavily from the air. After the partition of the country between Russia and Germany, Lublin town and co. were occupied by the Germans who set up at Maidanek (*q.v.*), close to the town, one of their chief extermination camps. Lublin town was captured by troops of Rokossovsky's 1st White Russian army in an assault by tanks, cavalry, and infantry on July 24, 1944. Next day a "popular assembly" meeting there invested with provisional powers a Polish committee of national liberation set up July 22 at Chelm, 43 m. to the E., and declared Lublin the temporary capital. The committee moved there, and on Dec. 31 proclaimed itself the provisional govt. of Poland. It was recognized as such by Russia, Jan. 5, 1945. The Russians liberated Warsaw Jan. 17, and on the 18th the Lublin govt. moved there. See Poland: History.

**Lubricants** (*Lat. lubricus*, slippery). Substances used to reduce friction in all kinds of machinery where solid surfaces move in contact. This reduction of friction is brought about by the substitution of fluid friction between the moving surfaces for solid friction, which may be as much as ten thousand times as great. Lubricants may be liquid or solid. Liquid lubricants are called lubricating oils, and these

may be either fixed (fatty) oils or mineral oils. The fixed oils (so-called because they cannot be distilled) may be of vegetable or animal origin. Typical vegetable lubricating oils are castor oil (for a long time accepted as the best lubricant for the petrol engine) and rape oil. Animal oils used include lard oil, sperm oil, and neatsfoot oil. In general, the fixed oils have the disadvantage that they tend to oxidise easily, particularly at the high temperatures prevailing in engines.

The petroleum industry provides a wide range of mineral lubricating oils whose great advantage over the fixed oils is their stability, resistance to oxidation, and cheapness. They are produced in a great variety of viscosities, ranging from thin, light oils to heavy, immobile semi-liquids. However, mineral oils do not form such a tenacious adsorbed layer in contact with metal surfaces as do the mixed oils, i.e. they are relatively deficient in oiliness.

#### Solids and Semi-solids

For special purposes, such as steam cylinder lubrication, it is common to blend mineral oils with a small percentage of fixed oils to improve oiliness while retaining stability. Additives are also frequently added to petroleum lubricating oils for special purposes—e.g. to keep carbonaceous particles in dispersion (detergent additive) or to prevent gum and varnish from formation (gum inhibition). For oils which will be subjected to high shearing forces, as in some types of gears, substances such as certain sulphur derivatives are added to strengthen the oil-metal bond.

Solid lubricants are materials such as graphite, talc, soapstone, and mica, whose action is to fill the small pits and irregularities in surfaces which bear on each other, and in this way to reduce the solid friction. They are generally used in association with an oil or grease, which acts as a vehicle.

Semi-solid lubricants, or greases, are more common. They are combinations of various types of petroleum lubricating oils with soaps and vary considerably in stiffness. Greases can be classified as lime or calcium soap greases and sodium soap greases. Potassium, lithium, or aluminium soaps are also sometimes used for special purposes.

Specification of all the properties of a good lubricant is difficult, since a good oil for one purpose

may be quite unsuitable for another. Mere appearance, colour, or feel is a very unsafe guide, and extended trial under working conditions is necessary.

**Lubrication** (Lat. *lubricus*, slippery). Term for the process by which a liquid film is inter-

Lubrication. Railway axle-bearing with eccentricity to journal exaggerated. A wedge-shaped film of lubricant forms between

posed and maintained between two surfaces which are moving relatively to each other. The motion may be rotary, e.g. a shaft in its bearings, or sliding, e.g. the piston or crosshead of an engine, or a combination of the two motions as in the case of a thrust block. With lubricated surfaces fluid friction, due to the shearing of the film, is substituted for solid friction, thus reducing the energy wasted and heat generated to a comparatively small amount, with a corresponding reduction of wear.

Viscosity is an important property of a lubricant, since a lubricant of high viscosity gives a high resistance to shear and hence an increase in frictional resistance, while low viscosity gives a film that may not sustain loads without being squeezed out. Since viscosity diminishes rapidly with increase of temp., bearings which tend to run warm should be supplied with lubricant of fairly high viscosity at ordinary temp. In fact, semi-solid greases are often used for bearings which tend to heat during running. Lubricants which tend to oxidise and form gummy deposits should be avoided.

With film lubrication the surfaces are separated by a film of oil, there being a pressure in this film which increases from zero at the boundaries of the area of contact to a maximum at some intermediate point. For the formation and maintenance of this film there must be a finite difference between the radius of the journal and that of the bear-

ing, and the bearing must be slightly eccentric to the journal so that the film formed is wedge-shaped (see fig). The lubricant should be introduced at the point of lowest pressure. The minimum thickness of the film is usually small, varying from 0.004 in. to 0.006 in., so that freedom from particles of grit is of the utmost importance. If the supply of lubricant fails, or is inadequate, the film is gradually squeezed out, and metallic contact and eventual "seizing" may take place.

Certain vegetable oils, such as rape seed, cotton seed, and castor oils, adhere to (or are adsorbed by) the surfaces of metals by molecular attraction and are not easily removed. Thus, blending a small percentage of vegetable oil with a straight mineral oil reduces the tendency to seize as a result of a failure of lubrication. This is known as boundary lubrication.

#### Supply of Oil

In general, if a liberal supply of oil is conveyed to the bearings by forced lubrication, a straight mineral oil of the required viscosity will give good results. With drip lubrication and with reciprocating surfaces, a blended oil is desirable.

In order that a film may be formed and maintained, a continuous supply of lubricant must be provided. Where it is possible to enclose the whole of the working parts, forced lubrication is adopted, the oil being conveyed under pressure (20 to 40 lb. per sq. in. usually) from a gear pump to the separate bearings. Only sufficient pressure is required in the supply piping to ensure an adequate supply to each bearing at a point of low pressure. This pressure takes little part in supporting the load, as the film will maintain itself under maximum pressures of 2,000 lb. per sq. in.

For bearings of slow speed engines and line shafting, the ring oiler may be used, consisting of a loose ring hanging on the shaft and dipping into a reservoir of oil. Where the upper part of the bearing is unloaded, or intermittently loaded, as in the case of a gudgeon pin, the oil may be introduced at the top and grooves provided for spreading the oil. Grooves should not be cut in the lower part in this case, as maintenance of a continuous film then becomes difficult.

Various devices are used for drip feed. The sight-feed lubricator used for steam engines depends on the displacement of

lubricant by steam condensing in a small coil. In some internal combustion engines a pump, driven by a ratchet motion from an eccentric on the lay-shaft, is used.

Graphite suspended in the lubricant is often used for new bearings. This fills up microscopic irregularities in the surface and thus assists the formation and maintenance of the film.

Reciprocating surfaces present a more difficult problem, and entry of the oil should be assisted by easing off the sliding part at the point of entry and in some cases by dividing the surface into a number of strips.

Lubrication of the piston of a trunk engine is of very great importance, since the greater part of the friction of the engine is piston friction. The problem is complicated by the possibility of "blow-by" from the combustion products, producing contamination and loss of viscosity.

Collar thrust bearings have always given rise to a problem, particularly for large marine engines. With a plain bearing the pressure over the surface is uniform and formation of a film is difficult, so that pressures have to be restricted to from 30 to 50 lb. per sq. in. With the newer Michell bearing, tilting pads are used and a film is maintained with pressures of 500 lb. per sq. in. and upward, so that a single collar can take a thrust requiring eight to ten collars with the older type.

**Lucan** (A.D. 39-65). Roman poet whose full name was Marcus Annaeus Lucanus. He was born at Corduba in Spain, a nephew of Seneca. Owing to the latter's high position at the court of Nero, Lucan started his career under the best auspices, and first attracted notice by a panegyric of the emperor. Later he incurred the jealousy of Nero, who regarded himself as a consummate artist, and viewed with disfavour the growing reputation of the young poet, and this estrangement from the emperor drove Lucan into the arms of those who under the leadership of Piso formed a conspiracy to assassinate Nero. The conspiracy was discovered, and Lucan denounced his own mother and others, but this did not save him, and he was compelled to commit suicide at 26. Had he lived longer Lucan might have done great work. As it is, the *Pharsalia*, an epic dealing with the fall of the Roman republic, especially the war between Caesar and Pompey, Lucan's hero, the only work of his which has been

preserved, is a poem abounding in many passages of brilliant rhetoric, if not true poetry. Trans. by N. Rowe, 1718; E. Ridley, 1919.

**Lucan, GEORGE CHARLES BINGHAM, 3RD EARL OF** (1800-88).

3rd Earl of Lucan,  
British soldier

Born in London, April 16, 1800, he was the eldest son of the 2nd earl. Educated at Westminster School, he entered the 6th Foot in 1816, but saw no active service until the Crimean War. During 1826-30 he was M.P. for Mayo, and in 1839 succeeded to the earldom. In 1854 Lucan went to the Crimea in command of the cavalry division. This he led at Balaclava, and some part of the blame for the catastrophe there is his; Lord Raglan asserted it was due to the earl's failure to interpret instructions properly. Lucan was recalled to England, where, refused a court-martial, he defended his conduct in the house of lords, and published his divisional orders and correspondence. In 1887 he was made a field-marshal. Died Nov. 10, 1888.

The 5th earl (1860-1949), also a soldier, was chairman of the City of London Territorial Force Assoc., 1912-41, and a captain of the corps of Gentlemen-at-Arms, 1931-40. He was succeeded by his son George (b. 1898). An eldest son is called Lord Bingham. Lucan is a small town 7 m. W. of Dublin.

**Lucania**. Ancient division of S. Italy. It lay between the Tyrrhenian Sea and the Gulf of Taranto, S. of Apulia, and N. of Brutii. There were many flourishing Greek colonies on the coast. Lucania was conquered from the Oscans by the Lucani, an offshoot of the Samnites, in the 5th century B.C., and subdued by the Romans 272-201 B.C. It is now a region, commonly called Basilicata; area 3,856 sq. m.; pop. 602,000.

**Lucas, EDWARD VERRALL** (1868-1938). British writer. Kinsman of Lister, he was of Sussex Quaker stock, and at 16 was apprenticed to a Brighton bookseller, proceeding to University

College, London. In 1893 he joined the staff of the *Globe* newspaper. An authority on Charles and Mary Lamb, he edited the first complete collection of Lamb's letters, 1935. Lucas, who became chairman of the publishing firm of Methuen, was a master of anthology (*The Open Road*, 1899) and a distinguished essayist. His travel books included *Highways and Byways of Sussex*, 1904, and the *Wanderer* series, beginning with *A Wanderer in Holland*, 1905. Of his fiction, *Over Bemerton's*, 1908; *Mr. Ingleside*, 1910; *London Lavender*, 1912; *Verena in the Midst*, 1920; and *Rose and Rose*, 1922, were popular.

E. V. Lucas,  
British author  
Russell

They were very much "essayist's novels," urbane and good-humoured studies of pleasant social scenes and characters, with little in the way of story or incident. He produced many amusing satirical works, and wrote with discerning appreciation on painting and painters, especially Vermeer and Constable. A regular contributor to *Punch*, he also had a weekly article, *A Wanderer's Notebook*, in the *Sunday Times*, 1924-38. His reminiscences, *Reading, Writing, and Remembering*, appeared 1932, in which year he was made C.H. Died June 26, 1938.

**Lucas, JOHN SEYMOUR** (1849-1923). British painter. Born in London, Dec. 21, 1849, he began his career as apprentice to a wood carver and sculptor, and his earliest artistic efforts were in this medium, but in 1870 he entered the R.A. schools. He first exhibited at the R.A. in 1872, was elected A.R.A. in 1886, and R.A. in 1898. He painted a fresco at the Royal Exchange, representing William the Conqueror granting the first charter to the City of London. He died May 8, 1923.

**Lucas, VRAIN-DENIS** (1818-?). French literary forger. A peasant's son, he was born in Eure-et-Loir, and, going to Paris in 1852, became assistant in a genealogical bureau. Elected a corresponding member of the archaeological society of Eure-et-Loir, he became head of a provincial library. After a prolonged study of old books, MSS., and autographs, he met Chasles, the geometrician and astronomer, who was also an enthusiastic collector, and between 1861 and 1870 sold

5th Earl of Lucan,  
British soldier  
Russell

him more than 27,000 forgeries for nearly £6,000. Lucas pretended that the documents were handed to him for disposal by an impoverished descendant of a count, a pre-Revolutionary collector. A feature in all the letters was the praise of France, and two represented that Pascal had forestalled Newton's great discovery. These were disclosed by Charles and condemned as forgeries by Sir David Brewster. At last the eyes of the French Academy were opened to the imposture, and in 1870 Lucas was sentenced, and disappeared from history. See *Literary Forgeries*.

**Lucca.** Maritime prov. of N. Italy, in Tuscany. It is bounded W. by the Gulf of Genoa, and inland

Lucca. Arms of the province

occupies the middle valley of the Serchio. Area, 555 sq. m. The prov. is hilly, fertile, and cultivated. The products are wine, oil, silk, and chestnuts. The capital is Lucca

and the chief harbour Viareggio. Lucca was incorporated in Tuscany in 1847.

**Lucca.** City of Italy, capital of the prov. of Lucca. It stands on the river Serchio, 15 m. by rly. N.E. of Pisa. Its fortifications (1504-1649) are remarkable and well preserved. The 11th cent. cathedral is rich in sculptures, paintings, stained glass, etc.; there are many old and interesting churches and several fine palaces. The old ducal palace, now used as a town hall, contains an important picture gallery. There are remains of a Roman amphitheatre and aqueduct. The chief manufactures are silk, jute, velvet, cotton, tobacco, and olive oil. Lucca is an agricultural centre. A few miles up the valley are the famous hot baths of Lucca. First mentioned as Luca 218 B.C., it was colonised by Rome 40 years later. A bishopric from 347, it was made an archbishopric in 1726. In the Middle Ages it became an important city, and a republic from 1369 to 1797, when it was taken by the French. Napoleon made it a principality for his sister, Princess Bacciocchi, in 1805. Pop. 82,300.

**Luce, HENRY ROBINSON** (b. 1898). American publisher and editor. Born April 3, 1898, he was educated in Lakeville, Conn., and at Yale and Oxford. Until 1949 he was editor and publisher of *Time*, which he founded 1923; he began the publication of *Fortune* in 1930

and *Life* in 1936, becoming editor in chief of the group 1949. The topical film series, *The March of Time*, was started in 1935. His wife, Clare Boothe Luce (b. April 10, 1903), represented Fairfield co., Conn., in congress 1943-47. She edited *Vanity Fair*, 1933-34; wrote *Europe in the Spring*, 1935; and several highly successful plays, *Abide With Me*, 1935; *The Women*, a sensational piece with an all-female cast, 1936; *Kiss the Boys Good-bye*, 1938; *Margin for Error*, 1939.

**Luce Bay.** Extensive bay in the S. of Wigtownshire, Scotland. It penetrates inland for 16 m. and measures 18 m. across the entrance from the Mull of Galloway to Burrow Head. The quicksands along the N. and W. shores have caused many shipwrecks.

**Lucena.** Town of Spain, in the prov. of Córdoba. It stands on the river Cascajar, 37 m. by rly. S.E. of Córdoba. There are manufactures of bronze lamps, pottery, especially *tinajas* or oil and wine jars, wine, and brandy. A famous breed of

Lucca, Italy. Campanile and façade of the cathedral of S. Martino

horses is reared in the dist., in connexion with which there is a yearly fair. Pop. 23,000.

**Lucera** (anc. *Luceria*). City of Italy, in the prov. of Foggia. It stands in a plain 12 m. by rly. W.N.W. of Foggia, and is dominated by a castle founded by the emperor Frederick II early in the 13th cent. and rebuilt about 1280. It has a Gothic cathedral and a town hall containing antiquities. Silk is the chief manufacture. The city was destroyed by Constans II in 663, but was restored in 1223 by Frederick II. Pop. 17,000.

**Lucerne** OR ALFALFA (*Medicago sativa*). Species of medick (*q.v.*). It is a deep-rooted perennial leguminous plant, with racemes of

purple flowers. When sown by itself, or with a corn crop, it stands for several years, and is tolerant of thin, calcareous soils, for its roots strike down into the cracks of the underlying rock. It is sometimes made into hay, but is most valued for fattening stock, being cut in the green state and given to cattle and sheep.

**Lucerne** (Ger. *Luzern*). Central canton of Switzerland. It is situated in the basin of the Aar, other rivers being the Reuss and Emme. Its surface is mountainous, especially in the S. section, the highest peak being the Brienzer Rothhorn, 7,714 ft.

Lucerne. Arms of prov. and town

The canton contains the lakes of Sempach and Baldegg, with part of Lake Lucerne. The valleys are fertile, and many cattle are raised. There is a large trade in agricultural produce, chiefly butter and cheese. The inhabitants are mainly German-speaking and Roman Catholic. Lucerne threw off the Austrian yoke and joined the Swiss confederation in 1332. Area, 576 sq. m. Pop. 206,608.

**Lucerne** (Ger. *Vierwaldstättersee*, i.e. lake of the four forest cantons). Lake of Switzerland. It is enclosed by the cantons of Lucerne, Schwyz, Uri, and Unterwalden. It is one of the most beautiful of the Swiss lakes, largely because of its irregular shape. Its length is 23 m. and its breadth varies from one half to 2 m. Its greatest depth is 701 ft., and its alt. 1,434 ft.; its area is 44 sq. m. The promontories that jut into it make it subject to sudden changes of wind and violent storms. Among the prominent landmarks are the peaks of Rigi, Pilatus, and Great Mythen. The first steamboat was put on the lake in 1835. The Reuss flows into it at its S.E. end and emerges at the N.W. corner. The lake of Lucerne is closely associated with the beginnings of Swiss history. During the Second Great War, the Swiss government's gold reserves were placed in watertight cylinders and sunk in the lake to protect them in the event of the country being drawn into hostilities. Arrangements were also made for similar storage of emergency food supplies. See *Switzerland*; *Tell*.

**Lucerne.** City of Switzerland, capital of the canton of Lucerne. It stands on the N.W. arm of Lake

Lucerne. Map of the lake of Lucerne and the neighbouring country

Lucerne, at the point where the river Reuss leaves it, 59 m. by rly. S.E. of Basel and 25 m. S.S.W. of Zürich. Dominated by the Rigi and Pilatus (q.v.), it is partly enclosed by well-preserved walls with nine watch-towers, built in 1385. There are seven bridges, two of them roofed and decorated with paintings.

With fine quays and hotels, Lucerne is deservedly one of the chief tourist centres of Switzerland. The principal church, S. Leodogar or Ledger, was part of a Benedictine monastery rebuilt about 1633-35, and has a fine old organ. The town hall, which dates in part from the early 16th cent., contains the cantonal museum, with historical relics; there is also a museum of Peace and War, and in the Glacier Garden is the Lion of

Achille, Luchaire devoted himself to historical research, and after spending ten years as professor at Bordeaux, took in 1889 a chair at the Sorbonne, Paris. He died Nov. 14, 1908. Medieval history, French and Papal, was the subject of his lifelong study, and its first results

Lucerne. A picturesque place, alt. 1,500 ft., it is said to be named after its old water tower, which was once a lighthouse (*lucerna*). The city is first mentioned in 840; it came under the Hapsburg dominion in 1291, and joined the confederation in 1332. The pop. is mostly German-speaking and Roman Catholic and numbers 54,716.

**Luchaire**, **ACHILLE** (1846-1908). French historian. Born in Paris, Oct. 24, 1846, and baptized as Denis Jean

graceful style Luchaire wrote two volumes of Ernest Lavisse's *Histoire de France*.

**Luchu Islands**. Alternative name for the Riukiu Islands, Japan (q.v.).

**Lucian** (c. A.D. 120-180). Greek satirist. He was born at Samosata, on the Euphrates, in Syria. Though

Lucian, Greek satirist. From a bust

Greek was not his mother tongue, he wrote Greek prose reminiscent of the best period of Greek literature. According to his own account he was apprenticed as a youth to a sculptor, but he became a travelling rhetorician, giving lectures and teaching in various cities in Asia Minor, Greece, Italy, and Gaul.

Lucerne, Switzerland. 1. General view from the east. 2. Axenstrasse, the road by the lake hewn in the mountain side. 3. Schweizerhof Quai and promenade, looking toward the Hofkirche, or church of S. Leodogar

He settled for some time at Antioch, then at Athens, and towards the end of his life received an official appointment in Egypt, where he died.

A sceptic by temperament, Lucian tilted against old faiths, philosophies, and conventions in the most audacious manner. His varied writings, grave as well as gay, afford a valuable picture of the manners of his age. To the modern reader he is one of the most entertaining of the ancient writers. Some of his most brilliant and diverting *jeux d'esprit* are cast in the form of dialogue, such as the *Dialogues of the Dead*, the *Dialogues of the Gods*, and the *Dialogues of the Courtesans*. In several of his pieces there are interesting references to Christianity. His *True History*, which was written to travesty the artificial romances of the period, anticipates such works as *Gulliver's Travels*, *Rabelais' Voyage of Pantagruel*, and *Cyrano de Bergerac's Journey to the Moon*. There are translations of his works by H. W. and F. G. Fowler, 1905; T. Francklin, 1780; and W. Tooke, 1820. See *Golden Ass*.

were seen in his works on the early institutions of France. His great work, however, is his elaborate study of the life and times of Pope Innocent III, in six parts, tracing minutely the ramifications of that pontiff's ambitious and world-wide policy. In his clear and

**Luciani, SEBASTIANO** (1485–1547). Italian painter, also called Sebastiano del Piombo. Born at Venice, he studied under the Bellini and Giorgione, and about 1512 went to Rome, where he decorated the new Farnesina Palace with frescoes. At Rome he formed a strong friendship with Michelangelo, and collaborated with that artist with a view to driving Raphael from the field. With Michelangelo as composer and designer and Luciani as colourist of a picture, the plan nearly succeeded. Works by Luciani which were designed by Michelangelo include the Flagellation and Transfiguration, in the church of S. Pietro in Montorio, Rome, and the Raising of Lazarus, in the National Gallery, London. He excelled also as a portrait painter. After the death of Raphael he became Pope Clement VII's favourite painter.

**Lucifer** (Lat., light-bringer). Name given to the planet Venus as the morning star; in mythology, the son of Aurora. In the O.T. (Isa. 14, v. 12) it is found as the translation of a Heb. word, *hēlēl*, which means literally "shining one." The term is used here as an epithet of the king of Babylon, and must really denote a waning luminary, perhaps the moon in its last quarter seen at dawn. A misinterpretation of this passage in connexion with Luke 10, v. 18, Rev. 9, vv. 1–11 led to the identification of Lucifer with Satan. See Devil.

**Lucilius, GAIUS** (c. 180–103 B.C.). A Roman satirist. Born at Suessa Aurunca, in Campania, a member of the equestrian order, the wealthy middle class of Rome, Lucilius was conspicuous in society but took no part in political affairs. He was a friend of Laelius the Wise and of Scipio Africanus the Younger, and served under the latter in the Numantine War. His comments on men and things were set down in 30 books of *Sermones* (talks), but all his works have been lost, with the exception of fragments surviving in later writers. These confirm the high estimation in which he was held by his own and immediately succeeding generations. Horace expressly men-

tions him as his model in this kind of poetry. Lucilius's writings, giving a descriptive account of contemporary life cast in hexameter verse, and interspersed with pungent criticism, constituted a new form of literature, and one which was a purely Latin invention.

**Lucina.** In Roman mythology, goddess of light and patroness of childbirth. She was often confounded with Juno and Diana, who also were patronesses of childbirth. See Hera; Juno.

**Lucius.** Name of three popes. Lucius I spent part of his eight months' papacy (253–254) in exile. Lucius II, a Bolognese, was

also dyeworks and other manufactures. Here in the Middle Ages was a monastery. A village in the time of Frederick the Great, it became a town in 1808.

**Lucknow.** Division and district of India, in the Oudh section of the Uttar union. The division lies between the Ganges and Gogra rivers, and includes the district of Lucknow drained by the Gumti river and the adjacent districts of Unao and Bara Banki. The whole area forms a part of the treeless, stoneless plain of the Ganges and is almost perfectly level throughout, sloping on an average less than a foot per mile, in a general

north-west to south-east direction. There are usually three harvests annually; in the spring, wheat, grain, barley; in the rainy season, rice and millet; and in the autumn, native food grains. The district is fertile and highly cultivated, except in

the large and barren sandy tracts near the rivers. Communications are easily maintained by the railways and roads, but the rivers are of little value for traffic. Railways radiate from Lucknow city. At least 80 p.c. of the people are Hindus. Division: area, 12,002 sq. m., pop. 6,530,932. District: area, 967 sq. m., pop. 949,728.

**Lucknow.** City of India, joint headquarters with Allahabad of the government of the Uttar union. Lucknow is the tenth most populous city in India and has the seat of the provincial legislature. Notable monuments include the Imambara or mausoleum of Asaf-ud-daula, the Jamá Masjid, the Chattr Manzil palace, the Kaisar Bagh, and the Farhat Baksh. Most of the city lies on the right bank of the Gumti. Among modern institutions the Canning and Mar-

pope 1144–1145, a stormy period in which a revolutionary republic tried to remove the pope's temporal power. Lucius III, a Cistercian of Lucca, succeeded Alexander III, 1181–1185. Dissensions in Rome forced him to spend over three years in exile. His synod at Verona (1184) anathematized heretics. He died preparing a crusade, 1185.

**Luck.** Polish form of the name of the Russian town Lutsck (*q.v.*).

**Luckenwalde.** Town of E. Germany, in the *Land* (former Prussian prov.) of Brandenburg. It stands on the Nuthe, 31 m. S. of Berlin. It was a centre of the textile industry, and had

Lucknow, India. View from Huseinabad Terrace; left, mausoleum of Asaf-ud-daula; right, Huseinabad mosque

tière Colleges are notable; so too are the chief court, the legislative buildings, the museum, and Lucknow university (founded 1920).

Lucknow rose to importance in 1732 as the capital of the nawabs of Oudh, and became the storm centre of the mutiny of the Bengal Army of 1857. Lucknow still bears traces of that tragedy. The ruined residency, the heroic defence of which is commemorated by a memorial cross, was preserved as a monument and over it the Union Jack flew day and night until Aug. 15, 1947, when it was hauled down at the request of the government of the newly formed dominion of India. Industries include the manufacture of luxuries in silver, gold, ivory, silk, muslin, and glass. Railway workshops, cement and lime works, motor car works, and a paper mill have contributed to the city's prosperity. The offices of the Pioneer, formerly published in Allahabad, were moved here in 1931.

**Lucknow, SIEGE OF.** Incident of the Indian Mutiny, 1857-58. Sir Henry Lawrence had foreseen the revolt of the Sepoys, and when it broke out, on May 30, 1857, he had already fortified and provisioned the residency or Government compound at Lucknow. Thither on July 2 he retired, with all the European inhabitants and the small garrison of 300 British soldiers, 36 volunteers, and a few hundred loyal Sepoys. On that day the siege of the residency by the mutineers began, and two days later Lawrence died of a shell-wound. For over 80 days the siege continued, the little garrison performing prodigies of valour, and, thanks to Lawrence's judgement and foresight, kept the mutineers at bay. Then on Sept. 25 Sir Henry Havelock and Sir James Outram, with 2,500 men, broke through and reached the residency, of the defence of which Outram then took command.

On Nov. 10 Sir Colin Campbell, who had advanced from Cawnpore with 5,000 men and 30 guns, relieved the Alum Bagh, and the residency, Nov. 16, but his force was not sufficient to dislodge the rebels from the city, so he took away the beleaguered garrison with its women and children. By Jan. 1858, the rebels had strongly fortified Lucknow, but two months later Campbell began the siege, and by March 19 the whole city had fallen into British hands. See Lucknow and Oudh in the Mutiny, J. J. McL. Innes, 1895.

**Lucretia.** In Roman legend, wife of Lucius Tarquinius Collatinus. During the siege of Ardea

Lucknow. *Jessie's Dream.* It is said that during the siege of Lucknow, Jessie Brown, a corporal's wife, heard in a dream the bagpipes of the relieving force and heartened the beleaguered garrison to hold out until Sir Colin Campbell arrived

From the picture by Fred. Goodall, R.A., in the Sheffield Corporation Art Gallery

(510 B.C.) the royal princes paid a surprise visit to their wives, all of whom were found feasting except Lucretia. Sextus Tarquinius, son of King Tarquinius Superbus, inflamed by her beauty, forced her to yield to his desires. On the following day Lucretia stabbed herself in the presence of her father and her husband. Junius Brutus, cousin of Tarquinius, seized the dagger and raised it as a standard of revolt. The Tarquins were driven from Rome and the monarchy was overthrown.

**Lucretius** (c. 98-55 B.C.). Roman poet and philosopher, whose full name was Titus Lucretius Carus. He was a contemporary of Cicero and Caesar, but hardly anything is known of his life, although his great philosophic poem in six books, *De Rerum Natura* (On Nature), ranks as one of the world's masterpieces. *De Rerum Natura* is an attempt to express the author's system of Epicurean philosophy and thus to afford his fellow-men a rational explanation of life and matter destined to free them from the terrors and cruelties springing from superstition and ignorance, especially, in his view, from belief in divine intervention. Hence he inquires into the causes of the most alarming natural phenomena. Intensely earnest, he is animated by pity for the self-torturing human race.

The poem suffers considerably from the fact that Lucretius is a philosopher first and a poet second. Except for the hexameter form, many passages where the author is attempting to explain some phenomenon or drive home some truth are indistinguishable from prose. Yet the general conception is in so lofty a plane that the reader never loses sense of the presence and in-

spiration of a great creative mind, while a vein of noble poetry runs through the whole structure, and in certain parts, especially where he broods over the great mysteries of life and death, Lucretius rises to heights touched by no other Roman poet. The hexameter in his hands did not reach the perfection to which Virgil brought it, yet it has a strength and stateliness which accord well with the subject.

Though Lucretius was not a scientist in the modern sense, it is astonishing how many of the theories he propounds anticipate the discoveries of modern times. His conception of the phenomenon of light was in advance of Newton; his notion of the atomic constitution of matter accords with the results of the last analyses of modern physics and chemistry; while his famous account of the origin of life and the development of human society anticipated the doctrine of evolution. See Lucretius (text, commentary, and translation), H. A. J. Munro, 1908; Roman Poets of the Republic, W. Y. Sellar, new ed. 1881; Latin Literature, J. W. Mackail, 1895.

**Lucrino** (Lat. *Lacus Lucrinus*). Small lagoon of Italy. It is about 13 m. W. of Naples and  $\frac{1}{2}$  m. S. of Lake Averno (*q.v.*), and is separated from the Gulf of Pozzuoli by a dyke. Much larger in Roman times, the volcanic upheaval of Monte Nuovo (alt. 455 ft.) on Sept. 30, 1538, half filled the lake and destroyed the harbour, Portus Julius, built by Agrippa, and the canal connecting it with Lake Averno. Famed then, as now, for its oyster beds, its banks were studded with Roman villas, including Cicero's Academia. The Via Herculeia, an ancient embankment, can be seen below the surface.

**Luculi.** Irregular specks of light covering the surface of the sun. They were first noted by Short, the optician, during the eclipse of July 14, 1748. They gave to the sun, according to Short, a mottled appearance like the skin of an orange; and it seems not unlikely that Short perceived what are now called granulations. See Sun.

**Luculia gratissima.** Evergreen shrub of the family Rubiaceae. A native of the Himalayas, it has opposite, elliptic leaves, and rosy, tubular, fragrant flowers in large clusters at the end of the shoots.

**Lucullus, LUCIUS LICINIUS** (c. 110–57 B.C.). Roman soldier and epicure. He served in the Social War (90–89), and again under Sulla in the first Mithradatic War (88–84). In the third Mithradatic War, which began in 74, he was in chief command for some eight years. He conducted his campaigns with great military skill, and succeeded in driving Mithradates out of his kingdom of Pontus. In 69 he defeated Tigranes, king of Armenia, with whom Mithradates had taken refuge, but he penetrated too far into Mesopotamian Armenia, and, his soldiers becoming disaffected, he was compelled to return to Asia Minor.

In 66 Lucullus was superseded by Pompey, and devoted his retirement to the gratification of his luxurious tastes by means of the vast wealth he had amassed in Asia. He was, however, a generous patron of art and letters, and collected a fine library, which he freely threw open to the use of those likely to benefit by it. His gardens on the Pincian Mt. and his villas at Tusculum and Neapolis were famous. The splendour of his banquets became proverbial. He is said to have introduced the cherry from Cerasus. There is a *Life of Lucullus* by Plutarch.

**Lucy.** Name of an English family. It traces descent from Thurstone de Cherlecote, whose son Walter was given the village of Charlecote in Warwickshire c. 1190. Sir Thomas Lucy (d. 1600), who rebuilt the manor house there, was knighted by Elizabeth in 1565. High sheriff for his county, he is interesting mainly for his alleged association with Shakespeare; according to a story current at Stratford about 1585, Shakespeare stole deer at Charlecote, was prosecuted by Lucy, and fled to London, where he took his revenge by satirising the knight

*Luculia gratissima.* - Leaves and flower-head of this Indian shrub

as Justice Shallow in King Henry the Fourth. In 1947 Sir Henry Montgomerie Fairfax-Lucy, 4th bart., presented Charlecote to the National Trust.

**Lucy, SIR HENRY WILLIAM** (1845–1924). British journalist. Born Dec. 5, 1845, at Crosby, and educated in Liverpool, he was apprenticed to a merchant. Beginning his journalistic career as chief reporter of *The Shrewsbury Chronicle*, he studied at the Sorbonne,

Sir Henry Lucy, British journalist  
Russell

Paris, and became the best known parliamentary press writer in England, contributing to leading London, provincial, and American papers. His chief work was done for the *Daily News* from 1873, and Punch, of which he was Toby, M.P., contributing *Essence of Parliament*, from 1881 until 1916. Lucy made parliamentary reporting amusing as well as informative, is believed to have originated lobbying, and was the author of numerous books on the parliaments and parliamentarians from 1880. He gave two sums of £1,000, one in 1903 to found the Lucy Trust for the aid of gallery men in temporary need, and the other in 1913 to endow a bed in the London Hospital for parliamentary journalists. He was knighted in 1909, and died Feb. 20, 1924.

**Luddites.** The name given to bands of rioters who appeared in the midland counties of England in 1811. Industrial distress was acute, and bodies of unemployed went about breaking machinery, which they regarded as the cause of their misfortunes, especially in Notts and Leicestershire. The riots continued in 1812 and broke

out again in 1816, extending into Lancs, Yorks, and other parts of the country. By accident the rioters became known as Luddites, a mentally deficient boy named Ned Ludd, living in a Leicestershire village, giving his name to the movement. The story goes that, when annoyed by some other boys, he chased one of them, and, failing to catch him, in his anger destroyed some stocking frames. When others were destroyed by the rioters, it became usual to put the deed down to Ludd, while the leader of a band called himself General Ludd. See *Industrial Revolution*; consult *Risings of the Luddites, Chartists, etc.*, F. Peel, 1888.

**Ludendorff, ERICH VON** (1865–1937). German soldier. He was born April 9, 1865, entered the army from a cadet school, 1882, and served on the general staff 1898–1914, working from 1904 in the operations section which planned the German attack on France through neutral Belgium. As a maj.-gen. on the staff in the 2nd army, he received the surrender of Liège in Aug., 1914 (see Leman, G.M.J.G.; Liège). On Aug. 22 he became chief of staff to Hindenburg (q.v.) on the Russian front, where he was mainly responsible for the German victory at Tannenberg and for the successes of 1915. After the attack on Verdun (1916), which he had opposed with Hindenburg, who feared a failure, he and Hindenburg were placed in virtually supreme command of all German forces, Aug. 29, 1916. Ludendorff organized the army and devised new methods of attack. He proved himself a bold strategist, but with great talent rather than genius; cold and heartless, lacking that deeper insight which marks the supreme leader. At the end of Sept., 1918, when the German army was facing defeat, he called for immediate peace negotiations, but when these were eventually opened he refused his consent, and was dismissed, Oct. 28, 1918.

E. von Ludendorff, German soldier

After the war he wrote his *War Memories*, 1919; *The General Staff and its Problems*, 1920; and *Warfare and Politics*, 1922. He was involved in several nationalist risings, and on Nov. 11, 1923, marched with Hitler in

the unsuccessful *putsch*. But later a coolness developed between Hitler and himself, and he played little part in public life. Occasionally he attacked his former chief Hindenburg, and was a bitter opponent of the Christian church, declaring himself to be a pagan. He died at Munich, Dec. 20, 1937. *Consult* Life, L. Buat, 1920.

**Lüderitz Bay.** A port of S.W. Africa. It is the principal port of Namaqualand. Originally named Angra Pequena by Bartholomew Diaz, who landed there in 1486, it was renamed after a German, Adolf Lüderitz, who founded a settlement there in 1883. Situated 150 m. N. of the mouth of the Orange, in a sterile and arid region, the town owes its existence to a rich diamond field, and has fish canning factories. It has no natural water supplies, being dependent upon that brought by train from Garub, 65 m., supplemented by distillation of sea water. An average of 100 ships enter and clear Lüderitz annually, handling some 16,000 tons of cargo, mostly imports. Pop. 23,500.

**Ludgate.** Gate of old London. It stood on the W. side of the wall, near to the Old Bailey. According to tradition it was built 66 B.C. by King Lud, but, that monarch being more or less mythical, its name is derived by modern authorities from a Saxon word meaning postern. First mentioned in 1100, it was repaired in 1215 and 1260, rebuilt 1586, and restored after the Great Fire. It was a debtors' prison 1378-1419, was held for Queen Mary by Lord William Howard against Sir Thomas Wyatt in 1554, and was demolished in 1760. Its statue of Elizabeth was removed to a niche in the outer wall of S. Dunstan's-in-the-West, Fleet Street.

**Ludgate Hill.** A London thoroughfare. It extends E. from Ludgate Circus, where it is crossed by a rly. viaduct, to S. Paul's Churchyard. At one time the name applied only to the part from the Fleet Bridge to the old gate; the extension from the gate to S. Paul's Churchyard being first called Bowyer Row and then Ludgate Street. It was widened in 1864, when Ludgate Circus was formed, and in 1893. On the N. side the church of S. Martin, built by Wren in 1684, replaced a structure dating from 1437 and destroyed in the Great Fire. Samuel Purchas (*q.v.*) was rector in 1613. Ye Old London Coffee House tavern, marking, approxi-

Ludgate Hill, London. View looking east, showing S. Paul's Cathedral and the spire of S. Martin's

mately, the site of the old gate, succeeded the London Coffee House, 1731-1867, once kept by the grandfather and then by the father of John Leech (*q.v.*), the caricaturist, and a meeting-place for London publishers. On the S. side are the shops of several religious book societies. Bombs created large gaps on both sides during the Second Great War. The viaduct was hit, and wine vaults in the arches below were seriously damaged. Incendiary bombs destroyed the premises of Cassell and Co., and Treloar's carpet warehouse was among the shops that disappeared. The roof of Stationers' Hall, in Stationers' Court, was burnt. *See* La Belle Sauvage; *consult also* Ludgate Hill Past and Present, W. P. Treloar, 2nd ed. 1892.

**Ludhiana.** Dist. and town of India, in the Jullundur division, Punjab state. The district lies S. of the Sutlej in the E. of the state; three-quarters of it is cultivated, and yields wheat and grain. There is a little irrigation from one of the branches of the Sirhind Canal. Most of the people are hard-working Jats. Area, 1,452 sq. m. Pop. 800,000.

The town, which is 110 m. E.S.E. of Lahore, is an important rly. junction in the centre of the dist., with a large trade in wheat; it specialises in the manufacture of textiles, particularly Kashmir shawls and turbans. Pop. 111,000.

**Ludi.** A Latin word meaning games; also applied to athletic training institutions and educational and art schools (music, rhetoric, reading, and writing).

Roman games may be classed as private or public, provided by individuals to gain public favour or commemorate events in their lives; regular or extraordinary; circus, amphitheatre, or theatrical. The games were in their origin essentially religious. Twice a year (March 14, Dec. 15) chariot and horse races, under the superintendence of the pontifex maximus, were held in the valley between the Aventine and Palatine hills in honour of Mars and Consus, the patron deities of horses. Later, these were supplemented by *ludi scenici*, dramatic performances introduced from Etruria. From an early date games were celebrated in honour of Jupiter by triumphant generals on their return from a campaign. These *ludi Romani*, or Roman games, later developed into a yearly festival, even if no triumph justified them. Superintended by the curule aediles, they at first lasted only one day (Sept. 15), but afterwards extended over 14 or 15 days.

The *ludi plebei*, or plebeian games (220 B.C.), held by the plebeian aediles in the Circus Flaminius, were supposed to commemorate the secession to the Sacred Mount. The *ludi Apollinares* (212), held by the city praetor, were introduced in honour of Apollo during the 2nd Punic War, it having been predicted that the Carthaginians would never be driven out of Italy until the god had been so honoured; the *ludi Megalenses*, or games in honour of the Great Mother of the Gods, were instituted (204) with the same object, on the removal of the sacred stone, supposed to represent the goddess, from Pessinus, in Phrygia, to Rome. Other games were held in honour of Ceres, Flora, and other divinities.

The *ludi saeculares*, or secular games, established in early republican times in obedience to the Sibylline books, were held at intervals of 100 to 110 years. They lasted three days and three nights, the most magnificent celebration being in the reign of Philip the Arabian (A.D. 247), to commemorate the 1,000th anniversary of the foundation of Rome. These games were managed by certain officials, called "the fifteen" (originally two), who had the care of the Sibylline books. A famous ode of Horace was written on the occasion of these games during the reign of Augustus.

**Ludlow.** Semi-mechanical type composing machine. It differs from other slug-casting machines, such

as the linotype (*q.v.*) and intertype, in that it is not operated by means of a keyboard. The matrices required for the casting unit are assembled and spaced by hand.

The compositor gathers about three to eight matrices in the order required and places them in the Ludlow stick at one operation. The speed of assembling in this way is appreciably quicker than setting type by hand. Having placed all the matrices for the line in the stick, spaces are inserted between the words, and this process is facilitated by the standard widths of the spaces and corresponding markings on the assembly stick. The stick containing the line of justified matrices then becomes the mould for casting. It is placed in a groove on the top of the machine and locked in position. A lever starts the mechanism whereby the mould moves to the casting position, molten metal is pumped into it, and the slug is cast. The stick is then removed from the machine and the matrices distributed back into the cases. Meantime, the slug is trimmed by the machine and finally delivered on to a galley. The metal employed is the same alloy of lead, antimony, and tin that is used by other slug-casting composing machines.

**Ludlow.** Mun. borough and market town of Shropshire, England. It stands on the Teme, where it is joined by the Corve, 27 m. S. of Shrewsbury, with which it has rly. connexion. Interest in the town is mainly historical. The church of S. Lawrence is a cruciform building in the Perpendicular style, and there is a grammar school founded in the 13th century. The castle ruins include the Norman keep, the council hall, Mortimer's Tower, and a Norman chapel. Broad Gate, one of the town gates, still stands. Of the old houses the most notable is the Feathers Inn.

Ludlow grew up around a castle built by the Normans, and was an important place on the marches of Wales. It became a borough, and was separately represented in parliament from 1471 to 1885. The court of the marches held its meetings here until its abolition about 1700. The castle, the residence of the president of the marches, was destroyed after its capture in 1646 by the parliamentarians. Ludlow is one of England's most beautifully situated towns. It gives its name to a county constituency. Market day, Mon. Pop. 8,123. See Inn.

**Ludlow, EDMUND** (c. 1617-92). English politician and author. Born of a Wiltshire family, the son

Edmund Ludlow,  
English politician

of Sir Henry Ludlow, he was educated at Trinity College, Oxford. When the Civil War broke out, he joined the parliamentary army, was made governor of Wardour Castle, and after its surrender saw service in the field. In 1646 he entered parliament for Wiltshire. He favoured Pride's Purge, was a member of the court that tried Charles I, and signed the death warrant. A member of the council of state, he went to Ireland in 1651, and was for about a year in command there. He appeared next as an opponent of Cromwell. In 1659 he re-entered parliament, sat on the council of state, and went as commander to Ireland. At the Restoration, Ludlow was turned out of the Convention parliament, and as one of the regicides was condemned, but escaped to Switzerland, where he died.

**Ludlow, JOHN MALCOLM** (1821-1911). British lawyer. Born in India, March 8, 1821, he was educated in Paris, and became a barrister, Lincoln's Inn, 1843. A Christian Socialist, he helped secure the passing of the Industrial and Provident Societies Acts, 1852 and 1862. He was registrar of friendly societies, 1874-91. He died Oct. 17, 1911.

**Ludlow Group.** In geology, the uppermost subdivision of the

Silurian rocks in Great Britain. They consist mainly of shales, passing gradually into the Old Red Sandstone. The group is so called from its typical development near Ludlow. It abounds in fossils, notably *Cyathaspis ludensis*, the earliest British vertebrate fossil, trilobites, brachiopods, gastropods, etc. See Silurian.

**Ludwig.** German form of the masculine Christian name better known by its French form Louis (*q.v.*).

**Ludwig, EMLL** (1881-1948). German-born Swiss dramatist and biographer. Of Jewish stock, his real name being Cohen, he was born at Breslau, Jan. 25, 1881. Educated at the university there and at Heidelberg, he made an early reputation as a writer of verse plays. Of his later pieces, *Versailles*, produced in London 1932, contained portraits of Lloyd George and Clemenceau. After the success of his *Goethe*, 1920, Ludwig devoted himself chiefly to biography, dealing with Napoleon, 1925; Bismarck, 1927; Lincoln, 1930; Hindenburg, 1935; Beethoven, 1945. *Gifts of Life*, 1931, was autobiographical. The Germans, 1942, was much discussed. A Swiss citizen from 1932, Ludwig died Sept. 17, 1948.

**Ludwig, KARL FRIEDRICH WILHELM** (1816-95). German scientist. Born at Witzenhausen, Hesse, Dec. 29, 1816, he studied physiology at the universities of Erlangen and Marburg. He became professor at Marburg in 1846; in 1849 he went to Zürich, and in 1855 to Vienna. From 1865 he was professor of physiology at Leipzig, where he died April 23, 1895. Ludwig is known for his discoveries in regard

Ludlow, Shropshire. Ancient stronghold of the English border, Ludlow Castle stands nobly on a hill above the junction of the rivers Corve and Teme

to the movements of the blood and lymph, for his invention of the kymograph, mercurial blood-pump, and other apparatus for conducting experiments. His chief work is a Text Book of Human Physiology, 1852-56.

**Ludwig, Otto** (1813-65). German author. Born Feb. 11, 1813, at Eislefeld, in Saxe-Meiningen, he struggled against illness and poverty. Like Hebbel a pioneer of realism, he published two powerful tragedies, *The Hereditary Forester*, 1853, and *The Macca-bees*, 1855, distinguished by masterly technique and vigorous character drawing. Of his tales, *Between Heaven and Earth*, 1857, is the most famous. His *Shakespeare Studies*, 1871, illustrate his theories of dramatic composition. Ludwig died Feb. 25, 1865.

**Ludwigsburg.** Town of Württemberg-Baden, W. Germany, 9 m. N. of Stuttgart, near the Neckar.

The chief building is the palace, formerly the residence of the rulers of Württemberg; it is a magnificent edifice in a fine park; others are churches and buildings used for public purposes. Ludwigsburg was founded in 1704.

Ludwigsburg, Germany. Schloss Solitude, in the environs of the town formerly a military school which Schiller attended in 1773-75

when Eberhard Louis, duke of Württemberg, in a fit of pique, decided to leave Stuttgart. A town grew up around his new palace and his successors added to its buildings. It became also the military centre of Württemberg and later a thriving industrial centre, with textile, metal, surgical instrument, food etc., factories, and a spa. Near the town is the hunting lodge of Monrepos, also, until 1918, a residence of the king of Württemberg. Pop. (pre-war) 34,135.

**Ludwig's Canal.** Inland waterway of Bavaria, Germany. It was built, 1836-45, under Ludwig I of Bavaria and named after him, and links the Danube with the Main, and thereby the Black Sea with the North Sea. Utilising the Regnitz and the Altmühl, tribs. respectively of the Main and the Danube, and with over 100 locks, it was only 5 ft. deep and 108 m. long. Part of it was incorporated in the huge Rhine-Main-Danube Canal started 1926, still incomplete 1939, which, with only 24 locks, admits ships of 1,200 tons and produces electric power on a large scale.

**Ludwigshafen.** Tn. of Rhineland-Palatinate, W. Germany. On the left bank of the Rhine opposite Mannheim, it developed rapidly. Though founded in 1606 as a fortified bridgehead, it received its present name only in 1843, and urban rights in 1859. Its pop. increased from 3,900 in 1864 to 108,000 in 1950. Originally a trading centre for grain, coal, fertilisers, iron, etc., it became a thriving centre of the chemical industry, the German Dyestuffs federation, later merged in the I. G. Farbenindustrie, having been established in 1865. Over 20,000 workers were employed in the factories, producing explosives and other chemical products, and metal, textile, wood, and other factories were built. The port, with 6 basins, received more than 12,000 vessels a year. The town was a good example of planned building and had wide streets.

During the First Great War it was attacked by air, and during the latter stages of the Second was almost destroyed. It was taken by armoured units of the U.S. 3rd army, March 21, 1945, and was included in the French zone of occupied Germany.

**Ludwigslust.** A town of the Land of Mecklenburg, E. Germany, in Russian occupation after Germany's surrender in 1945. It is 27 m. N.N.W. of Wittenberge, being a rly. junction on the Berlin-Hamburg line. The manufactures include cloth and chemicals, and the buildings two palaces and several churches. "The pleasure of Louis," the town grew up around the palace built in 1770-80 by Frederick II, grand duke of Mecklenburg-Schwerin, in honour of his father, Christian Louis. Another royal palace was erected, and the grand dukes had residences here until the changes of 1918. Pop. (1950) 14,000.

**Luff.** Side of a ship next the wind; the forward, or weather, edge of a sail. To luff is to bring a

vessel's head nearer to the wind; to luff up is to throw her head right into the wind.

**Lufthansa** (Ger.). Abbreviation of Deutsche Lufthansa (German air union). Founded in 1926, to maintain a daily air mail and passenger service between Weimar and Berlin, Lufthansa eventually operated all air transport services over German territory and had controlling interests in the German Chinese company Eurasia and the Brazilian Condor syndicate. It was a pioneer in the use of the multi-engined, all-metal, commercial monoplane; and established the first regular air service across the S. Atlantic. Lufthansa introduced the ocean seaplane-tender with the Westfalen, a ship stationed in the S. Atlantic midway between Bathurst (Gambia) and Pernambuco (Brazil) for refuelling aircraft. It also initiated the catapulting from Atlantic liners of aircraft carrying urgent mail. The Bremen and Europa were so fitted, enabling letters to arrive in Bremen or New York one day ahead of the ship. Lufthansa operated 80 separate European services and 10 S. American.

**Luftwaffe** (Ger., air weapon). The existence of the German air force, known under this name, was admitted by Hermann Goering (g.v.), its first c-in-c., in a proclamation of March, 1935. This was a direct contravention of the provisions of the Versailles treaty, which laid down in 1919 that the defeated German nation should have no military or naval air force or personnel, and restricted the size and numbers of its civil aircraft.

Even in pre-Nazi days much ingenuity went to the secret building up of air strength. There was an air intelligence department at the defence ministry from 1922, and an international air agreement, 1926, eliminated the restrictions on civil aviation, so that the commercial Lufthansa (*v.s.*) became the largest and one of the most efficient air line organizations in Europe. Many of its standard aircraft were clearly designed for easy conversion to military use, and as many crews as possible were trained in long-distance navigation. Another source of potential flying strength was the flourishing gliding movement, officially encouraged and developed.

As soon as the Luftwaffe openly ranged itself among the world's fighting forces, Goering and his air staff, chief among them Erhard

Milch and Ernst Udet, decided to test their more promising aircraft and their tactical theories on the battlefield. Some 200 operational aircraft and 50 transports were sent to equip the Condor Legion (*g.v.*) in the Spanish Civil War. The c.-in.-c. was General Sperrle, later to command the 3rd air fleet against Great Britain. The Messerschmitt 109 fighter, Junkers 87, Dornier 17, and Heinkel 111 bombers, as well as the Junkers 52 transport, were all used in Spain, and were sufficiently successful to be put into large-scale production.

At the time of the occupation of Austria (1938) and Czechoslovakia (March, 1939), first-line strength of the Luftwaffe had reached 4,000 aircraft, and was impressive in its obvious flexibility of movement. This was to remain a feature of the Luftwaffe, in which squadrons and groups could be switched swiftly where required, thanks to the generous provision of Ju 52 aircraft.

The German air staff had decided to concentrate on the production of single-seat fighters—in which class the Me 109 long held its own—and the Dornier and Heinkel medium-size bombers, in which armament and bomb-load were sacrificed to performance. While the Luftwaffe had relatively weak opposition—particularly, as in the Low Countries, against an enemy with pitifully small air strength—this policy paid. The Ju 87, known as the Stuka (dive bomber), achieved even greater success in *Blitzkrieg* warfare, operating as the spearhead of the army's armoured attack.

#### Deficiencies of the Luftwaffe

The Luftwaffe was, in fact, designed for mobility and intimately close support of ground forces: when the German army was finally confronted in the late summer of 1940 by the English Channel, the accompanying air force, though still on the offensive, was forced to fight a different war from static bases, against a highly trained enemy with equal morale and, at close quarters, devastating fire-power. The deficiencies of the Luftwaffe began to appear; not only the poor self-protection of its bombers, but also the lack of a clear policy in its command. Great damage was inflicted, especially by the night raiders of 1940–41, but this switching from day to night attack was in itself a confession that the Luftwaffe had been halted. Even the much publicised promotions of Goering to Reichsmarschall and of

Kesselring, Sperrle, and Milch to field marshal's rank now seemed premature. (*See Air Raids; Air Warfare; Britain, Battle of.*)

Germany's next attacking moves were in the Mediterranean theatre, and for two years a bitter and fluctuating struggle was waged in the desert, with the Luftwaffe always a potent factor. This was proved especially in the capture by the Germans of Corinth and Crete, 1941, when the twin techniques of dropping troops by parachute and of towing them in gliders to battle were triumphantly justified. (*See Airborne Forces; Crete in the Second Great War.*)

#### Failing Resources

It was Hitler's insistence on the invasion of Russia that broke the back of the Luftwaffe. With his factories still geared to the production of the same basic types of aircraft—now supplemented, however, by the Focke-Wulf 190, a first-class fighter, the Me 110 and its derivatives, and the ubiquitous Ju 88—and training affected by the loss of fine leaders in action and the lack of all-round experience in large-scale static warfare, Germany could ill afford the turning of two-thirds of her entire first-line air strength on a new enemy. Moreover, although the dramatic entrance of Japan into the war provided Germany with an ally, that ally was unable to help directly, and a large U.S. air force was soon aiding the R.A.F. in harrying the Luftwaffe and its feeble shadow the Italian Regia Aeronautica.

The longest battle of the air war was in the Atlantic, with the Allied convoys being hunted and attacked by the Luftwaffe with bomb, machine-gun, and air-launched torpedo and mine. The four-engined Focke-Wulf 200 was a tremendous asset, but Germany lacked numbers in the heavy long-range class of bomber.

By Sept., 1943, the Allies were again astride the Mediterranean; and on and after D-Day (June 6, 1944), suffering from ceaseless attack, the Luftwaffe proved surprisingly helpless. The disappearance of the "air umbrella" lost Germany her defensive battles as surely as its presence had helped her in 1940.

Inventive ingenuity was far from dead in the final days of the Luftwaffe. The glider bomb found many a target in the war at sea. Most important, but too late to influence the course of the war, was the introduction of the jet-propelled aeroplane. Germany was first in this field, with the Me 262 and Arado 234 in service, while her rocket-propelled Me 163 was the fastest aircraft in any air force at that time. (*See Jet Propulsion.*)

The production programme was inevitably devoted to such defensive weapons, and Luftwaffe strategy was conditioned by the formation in 1944 of a huge home defence Fighter Command, at first numbering 3,000 first-line aircraft, then about half the total strength. In command was the veteran Gen. Stumpff, who had led the Luftwaffe in the campaign in Norway (1940). The Luftwaffe included throughout the war about 90 p.c. of the total *Flak* (A.A. defence) organization of the Reich, numbering about 1,000,000 men. This integration of anti-aircraft with the air service worked smoothly. *Consult* The German Air Force, A. Lee 1946.

G. D. H. Linton

**Lug.** In engineering, an extension or projection forming an integral part of an engineering structure, machine, or fitting. It serves as a means of attachment for another part and may be drilled for bolts, wires, etc. The name is perhaps derived from the colloquial or dialect word for ear.

**Lugano** (anc. *Ceresius Lacus*). Lake of Central Europe. It is partly in Italy and partly in Switzerland, being between lakes Maggiore and Como. Its length is about 22 m., its width 2 m., greatest depth 945 ft., alt. 899 ft., and area 20 sq. m. Of irregular shape, it is nearly surrounded by mountains, rising steeply from the lake; its W. arm is almost cut off by the promontory of Mt. Salvatore. The St. Gotthard rly. borders it and traverses it between Lugano and Capolago. Its waters are discharged by the river Tresa into Lake Maggiore. Between the villages of Bissono and Melide, S. of the town of Lugano, there is a fine bridge. A steamboat service was started on the lake in 1856.

Lugano. View of the north end of the lake, near Portezza

**Lugano.** City of Switzerland, in the canton of Ticino. On the N. shore of Lake Lugano, 15 m. by rly. S. of Bellinzona and 51 m. N. of Milan on the St. Gotthard line, it is the largest town in the canton, and was formerly one of its three capitals. Beautifully situated and sheltered by mountains—San Salvatore (3,004 ft.), Generoso (5,591 ft.)—it is Italian in scenery, architecture, and population. Lugano has fine quays, theatre, picture gallery, and an English church. S. Lorenzo, the cathedral church of the bishop of

Kong, 1907–12. Appointed governor next of both N. and S. Nigeria, he united the two in 1914 and governed for another five years. During 1922–36 he was on the League of Nations permanent mandates commission. Knighted in 1901, he was created a baron in 1928. His books include *The Rise of Our East African Empire*, 1893; *The Dual Mandate in British Tropical Africa*, 1922, in which he urged the necessity of governing through native rulers. Lugard died April 11, 1945, leaving no heir. His

Minho, 72 m. by rly. S.E. of Cornunna. Its lofty, thick walls, with numerous towers, date from about the 3rd cent., and were built by the Romans, who also built bath-houses for its celebrated sulphur springs. Lugo is an episcopal see and has a Gothic cathedral of the 12th cent., with a façade dating from the 18th. Manufactures include leather articles. Pop. 50,933.

**Lugo.** Town of Italy. In the prov. of Ravenna, it is 35 m. by rly. E. of Bologna. It has a 15th cent. castle and normally holds an important fair in September. The

Lugano, Switzerland. Left, the town from S. Lorenzo. Right, lake front at Lugano, looking towards Mt. Salvatore

Lugano, dates from the 15th cent. S. Maria degli Angioli has frescoes by Luini. Lugano became Swiss in 1512. In 1848 Mazzini made it his headquarters. It is the most important health resort and centre of banking, trade, and industry in Italian Switzerland. Pop. 17,030.

**Lugansk.** Former name of the Russian city Voroshilovgrad (*q.v.*).

**Lugard, FREDERICK JOHN** DEALTRY LUGARD, BARON (1858–1945). A British administrator.

Born Jan. 22, 1858, and educated at Rossall and Sandhurst, he joined the army and saw service in Afghanistan, the Sudan, and Burma.

Lord Lugard, British administrator

Resigning in 1888 he led a successful expedition against the Arab slave-traders in Nyasaland, being severely wounded. The British East Africa Co. made him administrator of Uganda; later he commanded forces sent to Borgu and Lake Ngami. In 1897, as commissioner in W. Africa, he raised and commanded the W. African Frontier Force (*q.v.*). He became governor of Hong

wife, Flora Shaw (*q.v.*, d. 1929) was sometime head of The Times colonial department.

**Lugg** or **LUG.** River of England and Wales. It rises in Radnorshire and flows through Herefordshire to the Wye, which it enters below Mordiford. Its tributaries include the Arrow and the Frome, and Leominster is on its bank.

**Lugger.** A craft carrying lug sails. Luggers may have one, two, or three masts. Sometimes they are also fitted with top sails. Owing to their extreme handiness luggers were formerly a favourite craft of the old-time Channel smugglers. See Boat.

**Lugnaquilla.** Mountain of co. Wicklow, Eire. It is 15 m. W. of Wicklow and attains an altitude of 3,040 ft., the highest summit in the county.

**Lugo.** Maritime prov. of N.W. Spain, bounded N. by the Bay of Biscay, and drained by the Minho. It is mountainous, and is particularly rich in copper, lead, granite, marble, and slate. An agricultural prov., it yields cattle and farm produce, besides timber and fibre, and contains many thriving towns. Area, 3,815 sq. m. Pop. 538,745.

**Lugo** (anc. *Lucus Augusti*). City of Spain, capital of the prov. of Lugo. It stands on the river

manufactures include rope and furniture, while there is a brisk trade in corn, wine, and hemp. Pop. 27,950.

**Lugos.** A town of Rumania. It is situated on the Temes, where that river leaves the mts., at the W. end of the Transylvanian Alps, and is an important rly. junction on the route from Budapest to the Danube at Orsova. Wine is the chief product. Pop. 23,674.

Lugo, Spain. Façade of the 12th century cathedral

**Lug Sail.** Fore and aft sail, with a spar along its upper side, carried across the mast. It is a common rig in boats, and easy to handle. A working lug can be let go at once to spill the wind. A dipping lug has to be lowered, or dipped, every time a tack is made. A balanced lug has a long, light boom, which makes it dangerous to use except in calm waters.

**Lug Worm.** Name often applied to the lob worm (*q.v.*). It is an annelid worm, living in burrows between the tide-marks along the seashore.

**Luini, BERNARDINO** (c. 1470–c. 1535). Italian painter. Born at Luino, Lake Maggiore, he studied under Stefano Scotto, but later adopted the style of Leonardo da Vinci (*q.v.*). His religious compositions are always tender and sometimes sickly; he lacked the virility of his great master. His best frescoes are the Life of the Virgin series in the Pilgrimage Church, Saronno, and there are others at Milan. Among his easel-pictures are several in the National Gallery, London, and many in continental galleries.

**Luke** (Gr. *Loukas*; Lat. *Lucanus*). One of the four evangelists. He is believed to have been a physician of Antioch, one of the early members of the Church of Antioch, and author of the third Gospel and of the Acts of the Apostles. A follower of Paul and his companion in his missionary journeys, he is said to have died or to have been martyred in Bithynia at the age of 74. According to tradition he was a painter, several pictures of the Virgin are ascribed to him, and he is regarded as patron saint of the fine arts. In ecclesiastical art he is represented by the ox, often winged, a symbol of sacrifice and priesthood. His festival is Oct. 18. See Acts.

**Luke, THE GOSPEL OF.** The traditional view which ascribes the authorship to Luke, the companion of S. Paul and the beloved physician, is accepted by many modern scholars, mainly on the ground that it is the theory which most satisfactorily explains the critical data of Acts.

The Gospel is dedicated to Theophilus, who was possibly a high Roman official, but there is little doubt that it was intended for the use of the Church as a whole, and especially for Gentile readers. Luke, as he tells us in the preface, obtained his information from eye-witnesses of the facts, and from written accounts. It is clear that he used Mark and the Logia (*q.v.*).

It is held by many that the section 1, v. 5 to 2, v. 52 is derived from the Virgin Mary. The Gospel, however, is not merely a compilation from earlier sources. It bears in a marked degree the impress of the writer's own personality. It shows, more clearly than any other of the Gospels, the universal scope of the teaching of Jesus. The horizon of Matthew and Mark is bounded by the confines of Palestine. The horizon of Luke stretches out to the limits of the Roman empire. Luke always exhibits an intense interest in the social aspects of the teaching of Jesus. The Gospel has often been called the Gospel of the poor and the outcast, because it lays special stress on the relations of Jesus with them. From the historical point of view its most interesting feature is the space which it devotes (nine chapters) to the narrative of the events connected with the last journey of Jesus to Jerusalem. Another remarkable characteristic of the book is the prominence which it gives to the work of women. See Gospels, the Four.

**Luke, GEORGE LAWSON JOHNSTON, 1ST BARON** (1873–1943). British industrialist and philanthropist. Born Sept. 9, 1873, and educated in Canada and Scotland, he travelled in Argentina and British dominions before returning in 1906 to join the board of Bovril, Ltd., which his father had founded, and of which he later became chairman. Johnston was on the council of the London chamber of commerce, and chairman of the national committee of the international chambers of commerce. A great benefactor of voluntary hospitals, he was chairman, 1922, of the committee which organized a combined appeal; also chairman of the British charities association, treasurer of the London Red Cross, and vice-president of the British and Foreign Bible Society. In 1936 he introduced in the house of lords a bill dealing with paying patients in voluntary hospitals. Knighted in 1920, he was raised to the peerage in 1929; his title was said to be taken from S. Luke, the patron saint of physicians. Lord Luke died Sept. 23, 1943, and the title went to his son, Ian St. John Lawson Johnston. Born June 7, 1905, and educated at Eton and Trinity College, Cambridge, he succeeded his father as chairman of Bovril Ltd.

**Lukin, LIONEL** (1742–1834). British inventor of lifeboats. He was for many years a fashionable London coachbuilder in Long Acre,

and later (1785) he obtained a patent for an unsinkable boat. In 1790 he published a description of his lifeboat with illustrations drawn to scale. Among his other inventions was a raft for rescuing people from under ice, an adjustable bed for invalids, and a rain-gauge. He died Feb. 16, 1834. See Lifeboat.

**Lukmanier Pass.** Mountain route in Switzerland, between the cantons of Grisons and Ticino. It is part of the carriage road from Disentis to Olivone and Biasca, on the St. Gotthard rly. Alt. 6,290 ft.

**Lukuga.** River of Africa. Flowing from Lake Tanganyika to the Congo, it forms an outlet for the surplus waters of the lake, but is not navigable. A rly. has been built along the Lukuga valley, from Albertville on the lake to Kabalo on the Lualaba.

**Luleå.** River of N. Sweden, in the govt. or län of Norrbotten. It issues from a lake at the foot of the Kjölen Mts., flows S.E., and discharges into the Gulf of Bothnia at Luleå. There is a fine waterfall in its upper reach. The length of the river is about 250 m.

**Luleå.** Seaport of Sweden, in the govt. or län of Norrbotten. It stands at the entrance of the Luleå into the Gulf of Bothnia, 58 m. W.S.W. of Haparanda, and is connected by rly. with Gällivare and Narvik in Norway. It has a good, well-equipped harbour. Among the principal exports are Gällivare iron ore, timber, tar, reindeer hides, and salmon. Most of the iron ore from Luleå went to Germany, to whom it became of special importance on the outbreak of the Second Great War. It was sent by rail to Narvik, and thence by sea: the British action in mining the Norwegian territorial waters around Narvik, so as to force the iron-ore boats into the open sea where they could be attacked by naval patrols, was cited by Germany as a factor justifying her invasion of Norway in 1940. Pop. 15,208.

**Lule Burgas or BURGOS.** Town of European Turkey. On the Karagach, it is about 35 m. S.E. of Adrianople (Edirne), and lies on the Sofia-Istanbul rly. It is a commercial centre. A battle was fought there Oct. 28–Nov. 2, 1912, between the Bulgarians and the Turks in the First Balkan War. The Bulgarians attacked on a 25-mile front from the Ergene to Bunar Hissar, and after two days' fighting with fluctuating fortunes forced their way into Lule Burgas on Oct. 31. The Turkish army, cut in two, broke off the fight and retired; but

the Bulgars, who had lost 15,000 men from wounds and sickness, were too exhausted to pursue them.

**Lull, RAMON.** A Spanish mystic whose name is anglicised as Raymond Lully (*q.v.*).

**Lully** OR **LULLI, JEAN BAPTISTE** (1632-87). A French composer. Born at Florence, Nov. 29, 1632

J. B. Lully,  
French composer

(the year has been disputed), Lully went to France as a child and became a naturalised Frenchman in 1661. He entered the service of Louis XIV as a violinist, and later

was made conductor of the king's orchestra, given charge of the opera, made music master to the royal family, and honoured with a title of nobility. He composed in 1672 *Les Fêtes de l'Amour et de Bacchus*, which marks the beginning of French opera, following up this with about 20 operas. Molière collaborated with him in about 20 ballets written for the court. He died in Paris, March 22, 1687.

**Lully, RAYMOND** (1235-1315). Spanish philosopher and missionary. Also known as Ramon Lull, he was born at Palma, Majorca, of a noble and wealthy family, became a prominent figure at the court of Aragon, and achieved repute as a poet and man of the world. In 1265 he resolved to devote himself to the conversion of the Saracens. Believing that the truth of Christianity could be demonstrated by reason he devised the so-called Lullian method, for the solution of all problems, aided by a mechanical contrivance. He also acquired proficiency in Oriental languages, for the study of which he established chairs at Paris, Oxford, and Salamanca.

Raymond Lully,  
Spanish philosopher

After journeys in Asia and Africa, on the occasion of a third missionary visit to Tunis, where he preached against Islam, he was stoned and left on the seashore, whence he was rescued by a sea-captain, but died on board ship, June 30, 1315. His voluminous works include *Ars Magna*, descriptive of his method for the acquisition

of knowledge, and two books against Averroes and the Averroists. He was known as the enlightened doctor, and much of his teaching was remarkably liberal for his age. His followers combined mysticism with alchemy. Consult Raymond Lull und die Anfänge der Catalonischen Literatur, A. Helfferich, 1858; Fool of Love, E. A. Peers, 1947.

**Lulworth.** Two villages of Dorset, England. West Lulworth lies on the coast 8 m. S.W. of Wareham, and near it is Lulworth Cove, a circular bay about 500 yds. across and almost enclosed by hills. Here Keats wrote his last sonnet before finally leaving England. Along the cliff may be traced a fossil forest. At East Lulworth, inland and 3 m. away, is a 16th century castle. During the Second Great War Lulworth was a training ground for the Royal Armoured Corps. Pop. 1,368.

**Lumbago** (Lat. *lumbus*, loin). Painful affection of the muscles of the loins and their tendons, due to inflammatory changes in the fibrous tissue or fascia which surrounds the muscles. The affection may follow a strain in lifting weights and is often associated, in a way not understood, with nervous strain or fatigue. Exposure to cold and wet is a frequent exciting cause. The pain comes on suddenly, and the patient often rises from bed or from a sitting posture with great difficulty. Rest of the muscles is an important part of the treatment. The back should be protected from cold, and the application of heat and counter-irritants, or of short wave or infra-red rays, may result in sudden cure. Injections of cocaine or its derivatives into the local sensory nerves often give dramatic relief.

**Lumbar Puncture.** A procedure now common in the diagnosis and treatment of many diseases, especially those affecting the nervous system. It consists essentially of puncturing the spinal canal with a hollow needle, inserted between the third and fourth lumbar vertebrae slightly to one side of the midline. The exact position of the patient, and the exact method of withdrawing fluid, vary with the technique of the individual surgeon.

Diagnosis is aided by the presence of cells, bacteria, altered appearance of the fluid, or altered pressure; and treatment is aided by the possibility of introducing drugs or sera directly into the spinal canal or of lowering pressure by mechanical removal of fluid.

Anaesthesia is frequently induced by this means, the patient remaining conscious but feeling no pain during operation.

**Lumber.** Timber sawn and split for use in the form of beams, boards, joists, etc. The term originated in America, where the

Lulworth Cove, Dorset. Bay, very nearly land-locked, which was once a favourite haunt of smugglers

fellings of timber and its transport was first begun on a large scale, this being called lumbering. On the E. seaboard, the industry in the U.S.A. and Canada gives winter employment to thousands of hands who work in summer and autumn on the farms. On the Pacific coast, owing to climatic differences, it is an all-the-year-round occupation, and forest practice, more highly mechanised than in the E., is carried on by means of logging railways and trucks which carry the logs to the water, where they are towed to their destination.

In the E., lumbering gangs begin work in the late autumn and the fellers work in pairs, one on each side of the tree. The trees are partly cut down with axes and partly by saws, hand- or power-driven. The felled and trimmed trees are hauled to the bank of the nearest stream and there usually sawn into lengths of from 12 to 20 ft. The logs are piled up by the river in readiness for the thaw, and when the ice melts and the river begins to flood, the logs are floated down the stream to the sawmills. All the logs, before being sent to the mills, are measured by scalers, who estimate the quantity of usable timber in each log. The operation of sending the logs down the river is one which requires much skill,

as there may occur a log jam. Such jams may hold up the river, and they can be prevented or cleared only by men who carry long steel-pointed poles, and keep the logs moving. Where the river admits of it, the logs are bound together by ropes or chains into large rafts. Some of these rafts, floated down the St. Lawrence, for example, are several acres in extent, and the lumber men in charge live on them for days at a time. At the saw-mills the rafts are broken up, sawn into beams and planks, and stacked to dry for export. See Forestry; Timber.

**Lumen.** Unit of luminous flux. It is the luminous flux emitted in unit solid angle by a point source of one international candle, i.e. the flux passing through unit area of a sphere of unit radius with its centre at the source. It is not possible to assign a definite mechanical equivalent, but at the wavelength (5,560 Å) of maximum eye sensitivity 621 lumens equal 1 watt. The density of flux received on a surface is a measure of the illumination (*q.v.*), the unit of which is the lux (1 lm. persq. metre).

**Lumière.** Name of two French brothers, Auguste Marie Louis Nicholas (b. 1862) and Louis Jean (1864-1948), joint inventors of the cinematograph, a primitive moving picture machine. Working as photographic manufacturers in Lyons, the brothers patented their projector in 1895, giving their first public film show in Paris in Dec. An exhibition of moving pictures made by the younger Lumière, at the London Polytechnic on Feb. 20, 1896, was the first display in public in England. Forty years later this programme was repeated at the Polytechnic with the original projector. See also Colour Photography, page 2249, col. 1.

**Luminescence.** Light emitted otherwise than as the result of heating or incandescence. It appears in several forms, *e.g.* fluorescence and phosphorescence, described under their respective headings, and in the light emitted by a number of animals and insects. Many solid substances re-emit light after illumination; the effect is generally feeble and of short duration, but is more intense at low temperatures such as the b.p. of oxygen or nitrogen. With some substances luminescence is shown by a substance in the pure state, with others only when they contain impurities. The luminescence of animals and insects, at one time confounded with phosphorescence, has nothing to do with the presence

of phosphorus in their tissues, but the exact cause has not yet been satisfactorily explained. Light is emitted by many deep-sea fishes, *e.g.* the lantern fish; surface sea animals like jellyfish; glow-worms, flies, etc. Such light is practically devoid of heat rays. See Firefly; Glow-worm.

**Luminosity.** Term in physics. The luminosity or brightness of a surface is measured by the amount of light emitted per unit area. The lambert is the unit of luminosity and corresponds to the emission of 1 lumen (*q.v.*) from one sq. cm. of surface. Alternatively the brightness of a surface may be expressed as candle-power per unit area. The milli-lambert, i.e.  $10^{-3}$  lambert, is the most useful unit; the luminosity of objects in sunlight is about 1 lambert, while indoor brightness may be between one and ten milli-lamberts. The luminosity of a high-current density carbon arc is about 60,000 and in contrast that of a glow-worm about .005. To measure the luminosity of a colour, a standard or unit of luminosity has to be fixed, and two cases have to be considered, the first when coloured lights are being evaluated, and the second when dealing with the colours seen when pigments are illuminated by white light. With coloured lights, the unit taken is some of the white light produced by the source which gives the coloured light. With pigments, it is the luminosity of a white surface illuminated by the same light.

The luminosity of a body is, in general, caused by its being so hot as to become incandescent, and the temperature at which bodies become luminous varies considerably. The luminosity of many flames is due chiefly to the incandescence of the carbon particles released by the chemical decomposition of the combustible gases. See Flame; Photometry.

**Luminous Night Clouds.** Clouds occurring at heights which have been determined photographically to be approximately 50 miles above the earth's surface. They have been seen at intervals in both hemispheres, about midnight, particularly just after the summer solstice. They show bluish-yellow coloration and most frequently move from the N.E. with velocities up to 300 m.p.h. See Cloud.

**Lumphanan.** Village of Aberdeenshire, Scotland, about 8 m. S. of Alford and served by rly. from Aberdeen. Here on Aug. 15, 1057, Macbeth was slain in battle by Malcolm Canmore, a cairn being supposed to mark the spot.

**Lumpsucker** (*Cyclopterus lumpus*). A family of short, thick fishes. They are found around the

Lumpsucker. Specimen of the species found on British coasts

coasts of the northern seas, one species being common in British waters. On the chest these fishes have an adhesive disk by which they attach themselves to the rocks. They are usually about a foot in length, and feed upon the young of other fishes, crustaceans, etc. The males have bright red and yellow sides, and are able to modify their colour to match their surroundings. It is they that watch over the eggs during the breeding season.

**Lumsden, Sir Harry Burnett** (1821-96). British soldier. Son of a colonel of the Bengal Artillery, he was born Nov. 12, 1821, and educated in England. In 1837 he entered the service of the East India Co., and in 1838 obtained a commission in the Bengal army. In 1842 he served as an interpreter in Afghanistan. After experience of border warfare, he was given the task of raising the corps of guides, with which his name is chiefly associated. He led the corps in the war against the Sikhs, and in several campaigns on the frontier, although not continuously in command. He retired in 1875, and died Aug. 12, 1896. See Guides.

**Lunacy** (Lat. *luna*, the moon). Term equivalent to insanity, since it is recognized that some forms of insanity are influenced by the phases of the moon. The lunacy laws deal with the care of the insane. See Insanity.

**Lunacy Commissioners.** Officials who formerly supervised the administration of laws relating to the insane. They were nominated and removable by the lord chancellor. By the Mental Treatment Act, 1930, their functions were transferred to the board of control. See Insanity.

**Lunar Caustic** OR SILVER NITRATE. Crystalline salt used as a caustic to destroy warts, exuberant granulations, etc. It is usually put up in the form of sticks, the thickness of a slate pencil. The name is due to the use in alchemy of Lat. *luna*, the moon, for silver.

**Lunar Cycle** OR METONIC CYCLE. Period of 235 lunations, which is almost exactly equal to 19 solar years. Discovered by Meton, a native of Athens, c. 433 B.C., the metonic cycle differs by  $1\frac{1}{2}$  hours from 19 Julian years. See Calendar.

**Lunardi, VINCENTO** (1759–1806). Italian aeronaut. Born at Lucca, Jan. 11, 1759, he was attached to the Neapolitan embassy in London. He studied aerostatics, and constructing a balloon with a circumference of 33 ft., which he filled with hydrogen, he made an ascent from Moorfields, Sept. 15, 1784. The balloon was furnished with oars, which proved useless, and after a journey of  $2\frac{1}{2}$  hours he descended at Ware. This was the first ascent in England. Lunardi later made ascents from Edinburgh and Glasgow. He died July 31, 1806. See Aeronautics.

**Lunar Month.** Period during which the moon goes through a complete sequence of its phases, i.e. from new moon to new moon. Its average period is 29 days, 12 hours, 44 minutes, 2-8 seconds.

**Lund.** City of Sweden. In the län or co. of Malmö, it is 13 m. N.E. of Malmö. The chief build-

Lund, Sweden. Western front of the Romanesque cathedral

ing is the large and noble Romanesque cathedral, consecrated in 1145. The university is a noted institution; connected with it are an observatory, botanical gardens, etc. The industries include sugar refining and making furniture. Pop. 31,313.

Lund was an important place in the 10th century or earlier. About 1050 it was made the seat of a bishop, while during 1163–1536 its archbishop was primate of Scandinavia. It was a seaport in early

Lundy Island, Bristol Channel. Harbour and landing place on south-eastern shore

times, the sea having now receded. Several historic events have taken place in or near Lund, which is said to have been the largest city in Scandinavia in the Middle Ages. In 1676 Charles XI of Sweden defeated the Danes here, and the peace which followed is called the treaty of Lund.

**Lunda.** Country in West Central Africa, divided between the Belgian Congo and Portugal. The Portuguese portion forms one of the six provs. into which Angola is divided. It is in the N.E. of the colony, and the administrative capital is Malanje, in the prov. of Loanda. Most of Lunda is drained by a series of parallel streams.

**Lundholm, CARL OLAF** (1850–1934). An Anglo-Swedish chemist. A native of Stockholm, in 1878 he went to Paris and met Alfred Nobel (*q.v.*), whom he soon joined in Scotland. Lundholm designed the fulminate factory erected in Stirlingshire, 1879–80, and was appointed assistant manager. For 20 years he managed the Ardeer factory in Ayrshire (later owned by I.C.I.). One of the most courageous and successful pioneers of explosives research, he became a naturalised British subject in 1890 and was technical adviser to the Nobel Trust during 1909–14. Lundholm died on May 8, 1934.

**Lundy** (Old Norse. grove island). Small island off the N. coast of Devon, England. It is 12 m. N.N.W. of Hartland Point. Almost entirely surrounded by cliffs, the island was at one time the resort of pirates, and possesses many antiquities, including the remains of Marisco Castle and round towers. From granite

quarried here part of the Thames Embankment was constructed. There is a lighthouse popularly known as Lundy Light. The island, owned from 1836 to 1916 by the family of Heaven, was purchased by A. L. Christie in 1917. It was long the headquarters of the family of Marisco, famous for their piracies.

Its area is 1,047 acres, being 3 m. long and about 1 wide. Lundy coins, called puffins, were withdrawn in 1927 as not being legal tender. Consult Lundy, Isle of Puffins, R. Perry, 3rd ed. 1946.

**Lundy's Lane.** Roadway in Canada,  $1\frac{1}{2}$  m. from Niagara Falls. It is known for an engagement here, July 25, 1814, between the British and the Americans. An American force, under Gen. Jacob Brown, had invaded Canada, when it was met by a small army of British regulars and Canadian militia, under Sir Gordon Drummond. The battle that followed was indecisive, both sides making captures, but the Americans abandoned the invasion. The British, who at the end of the day were in numbers about 4,500 to 2,000, lost about 700. The Americans' loss of about 800 included a high proportion of officers.

**Lune.** River of England. It rises in the S.E. of Westmorland and flows S. and S.W. through Lancashire to Lancaster Bay. On it stands Lancaster, and it is navigable for 6 m. between that town and the sea. Its length is 45 m., and near its mouth is Glasson, the port of Lancaster.

**Lüneburg.** A town of West Germany, in Lower Saxony. It stands on the Ilmenau, 33 m. by

Lüneburg, Germany. Market place and town hall

ry. S.E. of Hamburg. It retains in its old buildings many signs of its former greatness. The town hall consists of a group of buildings dating from the 13th to the 18th century, and contains the magnificent princes' hall (Fürstensaale). The most notable churches are those of S. Nicholas, an imitation of S. Mary's at Lübeck, and dating from the early 15th century; the Gothic church of S. John, with a 350 ft. tower and double aisles; and S. Michael's (1418). Other buildings are the merchants' hall and the old palace of the dukes. There are remains of the town walls and a number of old houses; also a large library, a museum, and other modern edifices. The salt deposits have been worked since the 10th century, and limestone and gypsum quarrying are also old industries. Manufactures include iron goods, cement, chemicals, etc. To the S. of the town are saline springs and baths. Mentioned in the time of Charlemagne, Lüneburg was an important member of the Hanseatic League in the Middle Ages. Near it took place the first fighting in the war of liberation, April 2, 1813. Pop. 29,000.

At a point on Lüneburg Heath, S. of the town, F.-M. Montgomery on May 4, 1945, received the surrender of all German armed forces in the Netherlands, N.W. Germany, Slesvig-Holstein, and Denmark, amounting to more than a million men. This virtually marked the close of Great Britain's European campaign in the Second Great War, and Lüneburg served for a time as main h.q. of the British forces. The site of the surrender is marked by a memorial. (See Montgomery, Viscount.)

The little duchy of Brunswick-Lüneburg, of which Lüneburg was the capital, was an offshoot of the duchy of Brunswick. It existed from 1235 to 1369. Later it was made into a separate principality for junior members of the family ruling over Brunswick. See Brunswick; Hanover.

**Lunenburg.** Town and seaport of Nova Scotia, Canada. It is 70 m. S.W. of Halifax, with a station on the C.N.R. It has a good harbour (22 ft. at low water), and the chief industry is fishing; there is also a cold storage plant. Pop. 2,856.

**Lunette** (Fr., little moon). Term in architecture denoting a round or oval window in a ceiling, flat or domed. As a method of lighting a dome it was used as an alternative to the lantern (*q.v.*) or cupola (*q.v.*), the chief drawback to such

use being that it broke the line of the curve. The term is also applied to a picture enclosed by an architectural circular or oval frame in the ceiling of a building.

**Lung.** Front and back views of the organ. 1. Right auricle. 2. Internal jugular veins. 3. Right ventricle. 4. Pulmonary arteries. 5. Pulmonary veins. 6. Left ventricle. 7. Aorta. 8. Trachea. 9. Upper lobe; 10, middle lobe; 11, lower lobe, right lung

**Lunéville.** Town of France, in the dept. of Meurthe-et-Moselle. It lies on the Meurthe, near its junction with the Vezouze, 20 m. by rly. E.S.E. of Nancy. It is the capital of an arrondissement and an important military centre, with large barracks. Now chiefly industrial, Lunéville has large rly. and motor engineering shops, industries in spinning, glove-making, tanning, and pottery, and trade in the agricultural produce of the district. The massive château, built by Duke Leopold I of Lorraine, 1703-06, and the 18th cent. church of S. Jacques are noteworthy features of the town, which was probably a Roman settlement known as Lunae Villa and became part of Lorraine in the 14th cent. It was a residence of the dukes of Lorraine from 1702 to 1737 and passed with the duchy to France in 1766. It was occupied by the Germans, Aug. 24-Sept. 11, 1914, and again in 1940. U.S. forces liberated it Sept. 16, 1944, without serious opposition from the Germans. Pop. 20,377.

**Lunéville, TREATY OF.** Peace made in 1801 between France and Austria. Napoleon's victories of Marengo and Hohenlinden forced Francis of Austria to ask for peace. By this treaty, signed Feb. 9, 1801, the Cisalpine, Ligurian, and Helvetic republics were recognized, and the Rhine was fixed as the boundary of France. It made France the dominant power in Italy, where Naples deserted Great Britain and made peace.

**Lung.** The organ of respiration. In man the two lungs occupy a bony cage, the thorax, which is bounded by the ribs laterally, by the spine at the back, and by the sternum, or breastbone, in front. They occupy almost the whole cage, which contains also the heart, the great blood vessels that enter and leave it, the trachea or breathing-tube, and the oesophagus, which is the first part of the alimentary tract. Each lung is cone-shaped, with the base resting on the diaphragm, the most important muscle in respiration. The apex of the cone extends upwards into the root of the neck, behind and above the collar-bone.

The root of the lung, or hilum, is fixed, in that it contains one division of the trachea, which there divides into its two main branches, the right and left bronchi. At this point also the main arteries and veins of the lung pass between it and the heart. Thus the root of the right lung contains the right pulmonary artery, which conveys venous blood from the right ventricle of the heart, and two pulmonary veins which bring back to the left auricle the arterial blood to be distributed to the body through the aorta and its divisions. Of this arterial blood the lung gets its share from the bronchial arteries which accompany the subdivisions of the main bronchus throughout the organ.

Each lung has round it a fine serous membrane, the pleura, which is in two layers. The inner, or visceral, layer is closely applied to the lung; it reflects at the root to form a second or parietal layer, which lines the inner surface of the thorax. The result is an interpleural space in which the lung can move freely on respiration. Movement is aided by the negative or sub-atmospheric pressure which exists in the space, and therefore does not oppose expansion of the lung by inspired air at atmospheric pressure.

The right lung is the larger and has three main parts called lobes;

the left has two lobes. These lobes are divided into several lobules, each about a quarter of an inch in length. A lobule is also cone-shaped, its apex being at the point of entry of its supplying air-tube called a terminal bronchiole. Each lobule is made up of bunches of alveoli or air-cells. Their very thin walls consist of elastic tissue containing the finest divisions of the pulmonary artery. It is through the air-cells that the lung fulfils its function of bringing about gaseous interchange. Oxygen in the inhaled air is brought in contact with the venous blood in the final subdivisions of the pulmonary artery. This venous blood contains carbon dioxide, the waste product formed in the metabolism of the body. The oxygenated blood which results becomes arterial blood, and is returned to the heart by the pulmonary veins, while the carbon dioxide is exhaled from the lung. See Anatomy; Pleurisy; Pneumonia; Respiration; Tuberculosis.

**Lungchingsun.** The name of several places in China, of which the chief is a village in Chekiang province, near Hangchow, famous for its green tea. The name means dragon well village.

**Lungchow.** Town of China, on the Li river, one of the head-streams of the West river. It is in the S.W. of Kwangsi prov., near the border of French Indo-China, a former treaty port, opened to trade in 1889. Pop. 45,000.

**Lungkow.** A port on the N. coast of Shantung prov., China. It was opened to foreign trade as a branch of the Chefoo customs in 1915. Pop. 10,676.

**Lungs of Oak** OR **TREE LUNGWORT** (*Lobaria pulmonaria*). Large lichen. It grows chiefly upon the bark of old trees, particularly the oak. It is brownish, and the margins are deeply lobed. The de-

pressions and net-like markings of the under surface suggested a resemblance to the lungs, so under the doctrine of signatures it was established as a remedy for pulmonary troubles, and the herb-doctors prescribe it as such today. Its real value is to the dyer, to whom it is one of the Cottles, and applied to the dyeing of yarn and woollen goods.

**Lungwort** OR **JERUSALEM COWSLIP** (*Pulmonaria angustifolia*). Perennial herb of the family

Lungwort. Leaves and flower clusters

of the same folk-name is *P. officinalis*, with broader leaves, always spotted, and pale purple flowers.

**Luni.** A river of India, in Rajputana. It rises in the Aravalli Hills, in the W. of Ajmer-Merwara, and flows generally S.W. through Jodhpur to the Rann of Cutch, along the S.E. edge of the Thar desert. Its main affluents, of which the Sukri is the longest, reach the left bank from the Abu mt. ridge. The whole of this river system is usually dry except during and immediately after the infrequent rains.

**Lunn, ARNOLD** (b. 1888). British writer. Born in Madras, April 18, 1888, son of Sir Henry Lunn, he was educated at Harrow and Balliol College, Oxford. He was president at different times of the Ski Club of Great Britain and other skiing and mountaineering clubs, and wrote entertainingly on winter sports and travel in Switzerland and Italy. Other books to attract attention were a life of John Wesley, 1928; *The Flight from Reason*, 1930; *Is Christianity True?* (with C. E. M. Joad), 1933; *Spanish Rehearsal*, 1937; *Communism and Socialism*, 1938; *The Good Gorilla*, 1943; *Is the Catholic Church Anti-Social?* (with G. G. Coulton), 1946. An autobiography appeared in 1940.

**Lunn, SIR HENRY SIMPSON** (1859-1939). British travel organizer. Born at Horncastle,

July 30, 1859, and educated at Dublin university, he went to India as a Wesleyan medical missionary in 1887. Returning in ill-health the following year, he took a leading part in the West London Mission, edited *The Review of the Churches*, 1891-96, and founded the Grindelwald conferences, 1892-96, out of which grew his famous travel organization. His published works included *Chapters From My Life*, 1918; *Secrets of the Saints*, 1933; *Nearing Harbour* (autobiography), 1934. He died March 18, 1939.

**Lunn, LOUISE KIRKBY** (1873-1930). British singer. Born in Manchester, Nov. 8, 1873, she studied at the R.C.M., London, and made her debut in Schumann's *Genoveva* at Drury Lane, 1893. She sang as Nora in *Shamus O'Brien*, 1896. Success was confirmed by her performances as principal mezzo or contralto with the Carl Rosa Company, 1897-99. During 1901-14 she sang each season at Covent Garden, and was a favourite in *Aida* and *Parsifal* at the Metropolitan, New York. Kirkby Lunn, who married W. J. K. Pearson, died Feb. 17, 1930.

**Lunt, ALFRED** (b. 1893). American actor, born at Milwaukee, Aug. 19, 1893. He made his stage debut at Boston in 1913 and scored a success in *Clarence*, 1919-21. In London he was known for witty and polished performances with his wife, Lynn Fontanne (q.v.). The first was *Caprice*, 1929. Other successes of "the Lunts" were *Reunion in Vienna*; *The Guardsman*; *Idiot's Delight*; *Amphitryon 38*; *There Shall Be No Night*; *Love in Idleness*, 1944.

Alfred Lunt. American actor

**Lunula** (Lat., little moon). Crescent-shaped gold ornament. It is undecided whether they were worn on the hair or the neck. The edges and horns were generally punched or engraved with chevron patterns. Of the 83 examples known there were found in Ireland 64, Cornwall 4, Scotland 4, France 6, Denmark 2, Wales 1, Belgium 1, Hanover 1. At Newtown, county Cavan, one was found in its oak case. Lunulae mark the channels of trade with early Bronze-age Ireland (1500-1000 B.C.), the alien finds having come from the vicinity of ancient harbours. The word

Lungs of Oak. Specimen of the large lichen which grows on tree trunks

denotes also an ivory crescent worn upon the leather boot (*calceus*) of senators in ancient Rome.

**Lupercalia.** Ancient Roman festival. It was held in honour of the god Lupercus, on Feb. 15. It was originally pastoral and centred round the idea of the fruitfulness of the earth and of nature. After sacrificing animals to the god at his altar on the Palatine, the priests cut leather thongs, called *februa*, from their skins, and as they passed through the streets the women crowded round to be struck by these thongs, in the belief that their fecundity would thereby be promoted. This festival is referred to in Shakespeare's *Julius Caesar*. See February.

**Lupescu, MAGDA** (b. 1900). Second wife of Carol II (*q.v.*) of Rumania. A native of Jassy, she was the daughter of a Jewish apothecary named Wolff, and first married an army officer. She met Prince Carol in 1923; he gave up his claim to the throne, and lived with her in Paris, where she stayed when he assumed the crown in 1930. Both divorced, they joined again when he left Rumania in the Second Great War, and lived in Lisbon, Mexico, and from 1944 Rio de Janeiro. In 1947, when she was suffering from seemingly fatal anaemia, they were married. Magda Lupescu was known to have exercised a wise influence upon the king.

**Lupin.** Genus of leguminous plants (*Lupinus*), cultivated for their flowers. They are hardy and half-hardy annuals and perennials, natives of America and S. Europe, ranging in height from 6 ins. to 5ft., and bearing white, yellow, pink, or blue flowers. They should be planted in autumn in rich soil, and the half-hardy, sub-shrubby kinds need the protection of a layer of litter in winter. The annual sorts should be treated as ordinary annual plants.

**Lupin, ARSENE.** Central figure in a series of detective novels by

the French author, Maurice Leblanc (*q.v.*). Among the rather extravagant adventures of the "gentleman crook" was one in which he crossed swords with Sherlock Holmes. He figured in *A.L., Gentleman Cambrioleur*; *A.L. contre Sherlock Holmes*; *Le Bouchon de Cristal*; *Les Trois Crimes d'A.L.*; *La Demoiselle aux Yeux Verts*.

**Lupino.** Name of a British theatrical family. It traces descent from George Lupino, of an hereditary Italian family of puppet players who migrated to England at the beginning of the 17th century. Numerous Lupinos won fame as acrobatic dancers and music hall artists. George (1853-1932), a dancer, married Florence Webster (1860-99), and their most famous son was Stanley (1894-1942), actor and dancer. Born May 15, 1894, he appeared in *Lyceum pantomime*, 1910, and in numerous revues and musical comedies in London and New York. His reminiscences, *From the Stocks to the Stage*, appeared in 1934. He died June 10, 1942.

His brother Barry, comedian and dancer (b. Jan. 7, 1884), became a star of London and provincial pantomimes, and appeared in a revival of *Me and My Girl*, 1941. His speciality was trap-door acrobatics. Ida (born Jan. 1, 1916), daughter of Stanley, studied at the R.A.D.A. and first appeared on the screen in *The Love Race*. Joining the Paramount company in Hollywood, 1933, she built up a reputation as a serious actress in such films as *Peter Ibbetson*; *The Light that Failed*; *The Hard Way*; *Devotion*, 1946. She became an American citizen in 1947.

Lupino Lane (Henry George Lupino, b. June 16, 1892), cousin of Stanley and Barry, played in pantomime, music halls, musical comedy, revue, and films, beginning at the age of 11 as Master Nipper Lupino Lane. In 1937 he produced, presented, and acted in *Me and My Girl* at the Victoria Palace, giving 1,550 performances. In this piece he created the *Lambeth Walk* (*q.v.*). Another of his shows was *Meet Me, Victoria*, 1944. His brother, Wallace Lupino (b. Jan. 23, 1897), was also a dancer and actor.

**Lupus.** One of the ancient constellations. In the S. hemisphere, between the Centaur and the Altar, it contains several double stars.

**Lupus** (Lat., wolf). Term applied to several distinct forms of disease of the skin. *Lupus vulgaris*, generally spoken of simply

as lupus, is due to infection with the bacillus of tuberculosis. The disease usually begins before the 10th year, and only exceptionally as late as the 20th. It is much commoner in females than in males. Unhealthy influences, such as bad housing and insufficient diet, increase the liability to the disease, as in all cases of tubercle.

Lupus may attack any part of the skin, but usually the nose, cheek, and ears. It begins with the formation of a little yellow or yellowish-red nodule or spot, which slowly spreads over the surrounding area; sometimes the centre of the patch heals with the formation of scar tissue, producing irregular lesions. Ulceration of the tissues may occur, leading to the destruction of parts of the nose, lips, or ears. The disease may last 20 or 30 years. General treatment consists in building up the constitution with good feeding and healthy living. Local treatment is to remove the affected tissue by caustics, cauterisation, scraping the affected area, or in some cases excision. Treatment by the Finsen light process, by light from a powerful electric lamp, the rays of which are passed through a column of distilled water, has been effective. Large doses of Vitamins A and D give good results.

*Lupus erythematosus* is an inflammatory disease of the skin, the exact cause of which is unknown. Much more frequent in females than in males, it usually begins with the appearance on the skin of flat red spots, which may have a smooth and dry or a scaly surface. The patch slowly spreads and often heals in the centre, producing irregular distribution. The bridge of the nose and the cheeks are the areas most often affected, and the shape of the patches in this region has led to the term butterfly lupus. The condition tends to last for a period of many years. Quinine, salicin, and arsenic are useful. The affected parts should be treated with protective lotions. Hot or cold air playing on the skin surface must be avoided, and a simple diet which does not cause flushing of the skin is indicated. As nearly all cases prove to be rooted in infected conditions of the teeth or sinuses, the clearing of this septic field is the first step in treatment.

**Luray.** Village of Virginia, U.S.A., in Page co., 96 m. N.N.W. of Richmond, and on a rly. It has tanning, flour, and other industries, and in the locality are mineral springs. Luray is chiefly notable

Lupin. Flower-spikes of *Lupinus roseus*

for a magnificent stalactite cavern, discovered in 1878, having a depth of 260 ft.

**Lurcher** (from lurch, variant form of lurk). Cross between a greyhound and a sheepdog. This breed possesses wonderfully keen sight and scent, moves about in absolute silence, and is quick to perceive and obey the slightest sign from its master. It is a born poacher and takes to the business with hardly any training. The

Lurcher. Dog which is a cross between greyhound and sheepdog

lurcher is usually faithful to its master, but a dangerous foe.

**Lurgan.** Urban dist. of co. Armagh, N. Ireland. It is 20 m. by rly. S.W. of Belfast. The chief industry is the manufacture of linen; another is that of tobacco. The poet A. E. (G. W. Russell) was born here. Near the town is Lough Neagh. Lurgan was founded by settlers from England early in the 17th century, William Brownlow being mainly responsible. The barony of Lurgan, dating from 1839, is held by the Brownlows, and Lurgan Castle was built as Lord Lurgan's seat. Pop. 13,766.

**Luria, ISAAC** (1534-72). Jewish mystic. Born in Jerusalem, he settled in Cairo, and became a merchant there. When about 30 he decided to give his life to study and meditation, and began to live in a hut near the Nile. From 1566 to 1572 he was at Sefid, where was a circle of Jews who held similar ideas, and among them he lived, an influential figure, until his death. Many stories are told of Luria's intense piety and asceticism, and of the curious forms it took. Disciples gathered around him, and he is said to have worked miracles. His teaching laid special stress on the sanctity of the Sabbath. See Jews; Mysticism.

**Luristan.** Mountainous region of W. Persia. It is bounded N. by Kermanshah, W. by Iraq, S. by Khuzistan, and E. by Hamadan. Anciently it was part of Elam, or Susiana. Khurramabad is the capital. The people are mainly semi-nomadic Lurs, allied to the Bakhtiariis. Area, 15,000 sq. m. This prov. is not to be confounded with Laristan, the district S. of

Farsistan, on the S.E. side of the Persian Gulf.

**Lusaka.** Capital of Northern Rhodesia. Situated on the main Cape-Congo rly., 80 m. S. of Broken Hill, the town is a prosperous farming centre in a rich mineral district. Its aerodrome is a port of call for Central African Airways. The foundation stone of the central govt. offices was laid by the duke of Kent in 1934 and the town became the capital in 1935. Old Lusaka and the new administrative centre were united next year. Pop. 2,700.

**Lusatia** (Ger. *Lausitz*). Dist. of Germany, which came to form parts of Prussia and Saxony. Upper Lusatia lies between Dresden and Breslau, just N. of Bohemia, and Lower Lusatia between Dresden and Berlin. The name comes from the Slavonic tribe, the Lusitzi. The boundaries of the district varied both before and after it became German about 900. It was a border region, and a margrave of Lusatia is occasionally mentioned, but it never became a separate state. Both parts passed to the king of Bohemia; Upper, then called Baudissin, the old name of its capital Bautzen, in 1160, and Lower, two centuries later. Both were afterwards for some years part of Hungary. In 1620, during the Thirty Years' War, Lusatia was taken by the elector of Saxony, who retained it by the treaty of 1635. By then the majority of the people had become Protestants. In 1815 Prussia secured much of Lusatia, Saxony retaining only Bautzen and about 900 sq. m. of Upper Lusatia. The upper course of the Spree flows through the district. The chief towns in Lower Lusatia are Guben and Kottbus: in Upper, Bautzen and Gorlitz.

**Lushai Hills.** Dist. of India, in Assam. It is a wild and comparatively unknown area between the Manipur and Chittagong Hill tracts, bounded on the E. by the Chin Hills dist. of Burma. Most of it drains N. to the Surma river. The Blue Mt. (7,100 ft.), in the S., lies within the great hairpin bend of the Kaladan river. It is estimated that 70 p.c. of the area is cultivable, while only 2 p.c. are actually under tillage, almost entirely for rice. Area, 8,142 sq. m. Pop. 152,786, of whom 90 p.c. are primitive animists. The Lushais having repeatedly raided then British territory, expeditions were undertaken against them in 1871-72 and 1889-90, and their country was annexed.

**Lushington, STEPHEN** (1782-1873). British judge and reformer. Born Jan. 14, 1782, second son of

Stephen Lushington, British judge

Sir Stephen Lushington, chairman of the East India Co., he was educated at Eton and Christ Church, Oxford, and was called to the bar at the Inner Temple in 1806. As M.P. for Great Yarmouth, 1806-08, and Ilchester, Tregony, and the Tower Hamlets, 1820-41, he was a prominent Whig, and ardently supported the abolition of the slave trade, R.C. emancipation, and parliamentary reform. In 1820 he was one of the counsel for Queen Caroline (q.v.). He was judge of the consistory court of London, 1828-38, and dean of arches during 1858-67. His decisions as admiralty judge, 1838-67, are still cited. He died Jan. 19, 1873.

**Lushun.** Japanese name for the naval station and trading port in Manchuria better known as Port Arthur (q.v.).

**Lusiads, THE.** English title of the chief work of the Portuguese poet Camoens (q.v.). The original title is *Os Lusíadas* (The Lusitanians), and the poem is an epic in *ottava rima* telling of the history and romance of Portugal and its voyagers. There are English translations by W. J. Mickle, 1775. J. J. Aubertin, 1878; and Sir R. F. Burton, 1880.

**Lusignan.** Town of France, in the dept. of Vienne. It lies on the right bank of the Vonne, 16 m. by rly. S.W. of Poitiers. There is local agricultural trade and brush making is carried on. The church was originally the chapel of a priory founded in 1025, and there are remains of the château of the Lusignan family.

Lusignan is famous as the seat of a noble family whose origins are traced to Hugh I, who lived in the time of Louis IV (936-954). One branch of the house remained in France and several of the most distinguished French families claim relationship with this. Another was that which founded the line of kings of Cyprus and Jerusalem. Amalric became constable of Jerusalem, c. 1180, and succeeded his brother Guy (q.v.) as king of Cyprus, 1195, and became king of Jerusalem, 1197. The Lusignan dynasty ruled in Cyprus until 1475. To Hugh IV Boccaccio dedi-

cated a work. Peter I (d. 1369), a lifelong foe of the Saracens, was the last typical representative of the Crusaders. Under James II (1440-73) the line became virtually vassals of Venice, and the last king was his posthumous son, James III. From 1342 to 1375 members of the family reigned in Armenia. *See* Cyprus; Jerusalem; Melusina.

**Lusitania.** A part of ancient Spain. Originally the territory of the Lusitani, an Iberian tribe, between the rivers Tagus and Douro, it became a Roman prov. of Hispania in 27 B.C. Corresponding roughly with the present Portugal, it embraced also Spanish Estremadura and part of Leon, reaching almost to the city of Toledo. Mérida (Augusta Emerita) was the capital. Patriotic writers of the 15th cent. applied the name to Portugal. *See* Spain.

**Lusitania.** Cunard liner, torpedoed and sunk in the First Great War by a German submarine off the Old Head of Kinsale, Cork, May 7, 1915. She was one of the world's largest liners, her tonnage being 31,500 gross. After a warning by the German commander, two torpedoes were fired at the ship, which sank within 20 mins. of being first struck. She was on her way from the U.S.A., and had on board 1,255 passengers and 851 crew. Of these 1,198, including 124 Americans, were either drowned or killed. This incident, which caused serious anti-German rioting in the E. end of London, horrified the world and may have been one of the influences that determined America's entry into the war. In Germany a medal was struck in commemoration.

**Lussin or Lussino.** Island in the Mediterranean, one of the Quarnero group off the E. coast

of Istria. The pop. exceeds 8,000, although the island covers only 28 sq. m. There is a good harbour, Lussin Piccolo. Lussin was ceded to Italy by Austria after the First Great War. On the surrender of Italy to the Allies in 1943, it was occupied by German troops, but Yugoslav patriots landed on Oct. 3 and overcame the garrison. After the war Lussin was handed over by Italy to Yugoslavia, although the people are predominantly Italian.

**Lustre.** In optics, a characteristic appearance, or sheen, of certain objects which reflect light. According to the nature of the surface from which the light is reflected, lustre is described as metallic, vitreous, pearly, silky, resinous, or adamantine. The intensity of lustre is splendid, shining, glistening, or glimmering. Its cause is probably related to absorption and reflection of the rays of light below the surface layer of the substance. *See* Iridescence.

**Lustre.** Term applied to pottery covered with an iridescent metallic film or glaze. The earliest kind was silver; then golden copper iridescent glazes were introduced. *See* Belleek Ware.

**Lustrum.** Religious ceremony for the purification of the people of ancient Rome, conducted by one of the censors just before the expiration of his term of office. This term became fixed at five

years, and by a natural transition the word lustrum came to be applied to that period of time.

**Lute** (Lat. *lutum*, mud). A pasty mixture used to seal orifices and cracks. The term is used more specifically in connexion with chemical and metallurgical plant. Luting pastes are used e.g. for repairing cracks and sealing joints in chemical stoneware plants. Inert resistant materials, such as powdered asbestos, quartz, and barytes are sometimes added. When greater elasticity and plasticity is required, packings made of asbestos rope soaked in linseed oil or paraffin wax are often used. There is an increasing tendency to use special packings of impregnated sheets and rings cut to standard size and shape. Such materials often consist of asbestos cloth or board impregnated with suitable oils or with rubber: sometimes unvulcanised rubber is used and sulphur incorporated so that vulcanisation occurs *in situ*.

Sodium silicate (water glass) cements are widely used in chemical plant where resistance to acids is of first importance and the joint is not subject to mechanical strain. Quartz, asbestos, barytes, and similar powdered materials form the solid ingredient. Under the action of acid, silica is formed, and the joint becomes hard though somewhat brittle.

Such cements resist strong acid but not water or alkali. Where heat resistance and mechanical strength are not important, sulphur and sand make a satisfactory and resistant joint. Sometimes about 2 p.c. carbon

black is added to improve flowing quality. The luting is applied hot and sets on cooling. For glass joints pure glycerine and pink or yellow litharge in the proportions of one to five are much used.

**Lute** (Fr. *luth* from Arab. *al ud* the wood). Stringed instrument in great vogue from the earliest ages to the 18th century. It is of Eastern origin, and is said to have come westward with the returning Crusaders. The body is usually pear-shaped, built up with staves of wood like a cask, and often highly decorated. It has a long neck and finger-board with frets (*q.v.*). Many varieties existed,

Lusitania. Top, the Cunard liner at anchor. Below, medal struck by German government to commemorate its sinking. On reverse, left, Death issuing tickets at the Cunard office, above which are the words Business above everything. On the obverse, right, above the sinking vessel are the words No Contraband; below The Lusitania sunk by a German submarine, 7 May, 1915

Lute, inlaid with ebony and ivory, French, 17th cent. Victoria and Albert Museum

and still exist, in the East, and many sizes were in use in Europe also during the 16th and 17th centuries—e.g. treble, small mean, great mean, counter tenor, tenor, and bass. A larger type of lute, known as the theorbo or arch-lute, had some extra, deep strings, tuned to some of the principal scale notes.

The tuning of these bass strings had to be altered

when the music changed its key, and the lute family thus had an important influence on musical form (*q.v.*), it being the custom, for the sake of convenience, to write all the movements of a suite (*q.v.*) in the same key. According to old authorities, the early lutes had four strings, tuned thus:

Later two extra strings appeared, thus:

and the free, bass strings of fixed pitch made the range as follows:

Other kinds of tuning were employed. The tone of the larger lutes was an adequate support for a solo voice, and the bass strings were effective in the primitive orchestras of the 17th century.

**Lutetia** or **LUTETIA PARISI-ORUM**. Chief town of the Parisii, a Gallic tribe. Mentioned by Caesar in his Gallic War, it was situated on an island, the modern La Cité, in the Sequana (Seine) in Gallia Lugdunensis. An important town in imperial times, in the 4th century it became known as Parisii or Parisea civitas, whence the modern name of Paris (*q.v.*).

**Lutecium**. A chemical rare-earth element. It was discovered in 1908 by the French chemist G. Urbain, being isolated from an ore of ytterbium, with which it is usually associated. It has atomic number 71, atomic weight 175.0,

and its chemical symbol is Lu. It is called after Lutetia, the ancient name of Paris.

**Luther, HANS** (b. 1879). A German statesman. Born in Berlin, March 10, 1879, he was lord mayor of Essen from 1918. Popular for his resistance to French military occupation of the Ruhr in 1923, and having consequently lost his position, he joined Cuno's cabinet as minister of food, where he proved an impartial administrator. He soon became minister of finance under Stresemann and shared the credit for the stabilisation of the German currency. Luther took part in the London negotiations on the Dawes plan, and himself became chancellor, 1925-26. In 1930 he succeeded H. Schacht as governor of the Reichsbank, but was ousted by the latter after Hitler assumed power. Ambassador to Washington, 1933-37, but never a party man, he lost Hitler's trust, and was imprisoned as a suspect in connexion with the bomb plot of July 20, 1944.

**Luther, MARTIN** (1483-1546). German reformer. He was born at Eisleben, Nov. 10, 1483. The family life was often one of struggle against want, but the boy had a good education at Magdeburg and Eisenach, and was sent to the university of Erfurt, where he took his master's degree in 1505. Then suddenly he entered a monastery at Erfurt, because, as he put it, he doubted of himself—i.e. of his salvation in the world. He was the most rigorous of monks, but his convent life became a prolonged agony of soul, which was not ended till, chiefly from reading the Pauline epistles, he became assured that salvation consisted not in his presenting to God a credit balance in his moral life, but was a free gift in Christ, in Whom God, here and now, was ready to forgive and be friends with any man who turned to Him with repentance and faith.

This evangelical liberation made a new man of Luther, but it did not make him any less a Catholic monk, and he had no idea of leaving the convent or the Church. His career followed a normal course, and in 1508 he was transferred to the university of Wittenberg, where he taught and preached with great power. The ecclesiastical crisis of his life was precipitated by the appearance in Wittenberg of a friar, John Tetzel, selling indulgences under the papal authority. Not only had the traffic many elements of scandal, but it raised for Luther the whole

doctrine of the forgiveness of sins. He intimated that he proposed to discuss this publicly, and, according to the usual academic form, posted up certain theses for discussion. But Luther's 95 theses were thunderbolts, and their appearance in 1517 is rightly reckoned as marking the actual beginning of the Reformation.

Luther was summoned to Rome, but this first order was withdrawn, and conferences were held between him and the Church authorities, the most notable being at Leipzig in 1519, where he was accompanied by Melancthon. These conferences did not convert Luther but rather made him a popular hero, as a German asserting truth and freedom against papal corruption and tyranny. He had now a great audience, to which he further appealed in his three treatises on Christian Liberty, The Reformation of the Christian Estate, and The Babylonish Captivity of the Church. A breach with Rome rapidly became inevitable. When, in 1520, a papal bull condemned his views, he publicly burned it in Wittenberg. The daring of the deed made an immense impression.

Luther's heresy was now a matter of national concern, and he was summoned to the diet at Worms in 1521. His journey there was like a royal progress. Faced by both imperial and papal power, he would retract nothing. The authenticity of his famous saying "Here I stand, I can do no other" is disputed, but there is good authority for believing it. He left Worms in 1522 under warning of outlawry. Seized by friendly violence, he was carried off secretly to the castle of the Wartburg in the Thuringian Forest, where he remained in safety for a year, and wrote his great German translation of the Bible and many famous hymns.

Luther then returned to the battle of the Reformation and the task of organizing the German Protestant Church. For a time he clung to the idea that he might reform the existing Catholic church in Germany, but this hope failed. His work was disastrously complicated by the outbreak of the Peasants' War, 1525, with its class bitterness and savagery. Luther, never really a democrat, urged the princes to put down the rising with relentless severity, and thus lost popular sympathy for the Protestant cause, besides making the German Protestant Church erastian and oligarchic. Luther's later

Martin Luther, from the bronze statue by Siemering, unveiled at Eisleben in 1883

life was engrossed with ecclesiastical and theological discussion. In 1525 he had married Catherine von Bora, who had been a nun; and, while the marriage of two persons who had taken the vow of chastity caused scandal, his home life is the sweetest side of his tumultuous career. He died Feb. 18, 1546, at Eisleben, and is buried at Wittenberg.

Whatever differences of opinion there may be about Luther's Protestantism, there can be no question of the extraordinary greatness of the man. Both the good and the bad in him were on the grand scale. He was also a personality full of great contradictions. His extreme violence is matched by his beautiful tenderness; his frequent coarseness—which it is unjust to represent as anything in the nature of vice—by an often surprising delicacy; his masterfulness and impatience were complemented by tact and prudence. No man of his time more powerfully broke through to reality, yet his mind never lost a strain of superstition. Finally, the amazing self-confident egotism of his assertions before men is matched only by his utterly humble reliance upon God in his prayers. It is not possible to characterize such a man from one point of view. His faults, limitations, and errors are better known today than ever; but even these little alter the impression of a personality which can hardly be described as less than immense and a power which was truly elemental.

moirs, J. Michelet, Eng. trans. W. Hazlitt, 1846; Lives, J. Köstlin, Eng. trans. 1877; T. M. Lindsay, 1900; A. C. McGiffert, 1911; H. Griesar, Eng. trans. 1913; J. MacKinnon, 1930; F. F. Brentano, 1936.

**Lutheranism.** Form of religious faith, based on the teaching of Martin Luther. The Lutheran Church—the first and still the largest of the ecclesiastical organizations resulting from the Reformation—was named after the great German reformer against his own desire, and its truer name is the "Evangelical" as distinguished from the "Reformed" Church, the latter being the title appropriated to the Calvinistic communions. The whole idea of a formation of a new church, or separation from the "Catholic" Church, was

*Martin Luther*

From the portrait by Holbein, Windsor Castle

no part of Luther's earlier aim. He hoped to see the Catholic Church—in Germany, at least—purified by the preaching of the true gospel aided by the civil authority; and

with this he would have kept the bishops and even recognized the pope as *summus episcopus*. Hence, the earliest arrangements in the congregations which accepted the reformed teaching in Germany; were of a makeshift character. But gradually it became clear that the reforming party could not live and work within the Roman Church. The pope excommunicated Luther, and Luther's attitude to the pope hardened into defiance and even detestation. An evangelical Church was imperative, if the evangel as the reformers conceived it was to survive in Germany.

Luther set about this, in the first instance, by arranging, in 1525-27, for a visitation of various districts, and this visitation revealed a state of great confusion in the reformed areas. In particular many of the priests who accepted the evangel as Luther taught it, were ignorant and quite incapable of organizing and governing a Church. To meet the situation, superintendents were appointed who acted in co-operation with the secular authorities. The government of the new Church—as also the control of schools and the care of the poor—came under consistories which were constituted by the territorial prince. It was not democratic, and Lutheranism never was self-governing, as from the first the Calvinistic Churches were.

This was due partly, no doubt, to the exigencies of the time; but also to the fact that Luther never was a democrat—and after the Peasants' War was less than ever inclined to be one—and also because he found the legatees of the old *jus episcopale* in the princes rather than in the people. Thus the organization of the German Protestant Church had grave defects. It was makeshift, oligarchic, and

Martin Luther. Left, the Cotta house at Eisenach, where the reformer spent part of his youth; right, the house at Eisleben where he was born

erastian. Luther—a man of genius in root principles of evangelical religion—had really no principles here, and simply took what the situation seemed able to afford. The Calvinistic Reformed Church was organized very differently.

In worship, as distinguished from government, the Lutheran Church was more free to follow its religious ideals. In some things—such as altars, candles, liturgy, clerical dress—Luther was conservative. Also the great Church festivals were retained. But the two characteristic features of Lutheran church worship were the place given to the preaching of the word and the congregational singing of hymns. The former is notable all through the Reformation beyond Germany as well as in it; but congregational singing was pre-eminently characteristic of Lutheranism. The medieval Roman Church had magnificent hymns, but these were sung by the choir. Lutheran hymns—Luther wrote about 40—gave the people a new voice, and were a notable feature in the reformed cultus. Luther's most famous hymn—*Ein' feste Burg*—spread all over Germany and became a national chorale.

#### Basis and History

Theologically, the fundamental standard of the Lutheran Church is the Confession of Augsburg of 1530. Its doctrinal matter is mainly Luther's, but its style and tone breathe the more conciliatory spirit of Melancthon. The Lutheran Church still bears the title of "the Church of the Augsburg Confession."

The history of the Lutheran Church is complicated, but its main phases may be mentioned. After its formative period, Lutheranism suffered from a period of theological strife and then sank into a moribund orthodoxy. The movement known as pietism, beginning in the latter part of the 17th and continuing up to the middle of the 18th century, served to deliver it from this. The father of German pietism was Spener (d. 1705), and under him it was both a revival of evangelical and practical religion, and an effort to make church organization less dependent on the secular authority and more the responsible work of the Christian people. But the royal supremacy continued to assert itself, sometimes in a tolerant and even indifferent spirit, as when Frederick the Great declared that all religions are equally good, and sometimes with a narrow goal, as when Frederick

William II tried to penalise Socinianism and deism.

Under Frederick William III, efforts were made to reorganize the Church with a view to a union between the Lutheran and the Calvinistic Confessions, both of which had their adherents in Germany. The king's appeal for this in his proclamation of 1817—about the time of the tercentenary of the Reformation—evoked widespread response, and various unions were realized in the smaller German states. In Prussia more difficulties were encountered, which were only partially solved when, in 1817, a union was accomplished under the name of the Evangelical United Church.

In the German empire created by Bismarck in 1871, the Lutheran Church was a state-established, state-controlled body; but it exhibited a vigorous life, both intellectually and religiously, and had within its borders both a

Lutine Bell. Bell salvaged from the wreck of the frigate Lutine and now in the underwriters' room at Lloyd's. The bell is tolled on the receipt of important news

liberalism which extended to rationalism, and an evangelicalism which included pietism. On the fall of the Imperial regime in the First Great War, a change came over the relations of Church and state under the Weimar republican constitution; but this government was short-lived, and National Socialism arose under Hitler. In the early days of the Nazi movement, Christianity was recognized as the 24th article of the party programme; but as Hitlerism developed its anti-Christian character was unmistakable, and the Nazi state more and more sought to use the Church for its political ends. This led to much division within the ranks of the Church, whose religious work was carried

on under great difficulty. But resolute resistance was offered by many pastors and congregations; and this saved the soul of the Church for the day of liberation which came with the collapse of Nazism in 1945. See Calvinism; Reformation.

**Lutine, LA.** A French frigate captured by the British. Renamed H.M.S. Lutine, she sailed in 1790 for Texel, off the Netherlands coast, carrying nearly £1,000,000 in specie. The ship was wrecked, there being only one survivor. Dutch fishermen obtained thousands of pounds' worth of gold from the wreck, and between 1857 and 1861 about £40,000 was recovered. In 1911 an attempt was made to bring up the bulk of the treasure, but after moving a million tons of sand only 5 grains of gold were recovered.

**Lutine Bell.** Bell of the old frigate Lutine (v.s.). During the attempts to recover the treasure lost when the vessel was wrecked, the ship's bell was salvaged and afterwards suspended in the rostrum of the room at Lloyd's, London, where the main business of insurance is transacted. The receipt of important news, such as a wreck or the arrival of an overdue vessel, is announced by tolling the bell.

**Luting.** For the details of this mixture, used for filling orifices and cracks, see Lute.

**Luton.** Mun. bor. and market town in Beds, England. It stands near the source of the Lea, 30 m.

by rly. N.W. of London. The chief building is the parish church of S. Mary, a large cruciform building, partly Early English, with a unique hexagonal baptistry. A new town hall in classic design, opened in 1936, replaced one burned down during the peace celebrations of July, 1919. Luton was once the centre of the strawplait industry, and the manufacture of ladies' hats is still a staple trade, though straw is not now a major material. It has light engineering products, including motor cars, ball-bearings, precision machinery, and industrial

Luton arms

Luton, Bedfordshire. The Town Hall, opened 1936. It was built to replace a former hall, destroyed by fire in July, 1919

chemicals. Luton is a borough constituency. There are grammar schools for girls and boys. Market days, Mon. and Sat. At Luton Hoo mansion, built by Robert Adam for the 3rd earl of Bute, 1762, are an art gallery and the Wernher Collection of tapestries, furniture, jewelry, etc., opened to the public by Sir Harold Wernher in 1950. Pop. est. 108,000.

**Lutsk** (Polish, Luck). Town of Ukraine S.S.R., in the region of Volhynia, formerly a Polish co. It is 40 m. E. of Vladimir, on the Styr and the rly. from Kazatin to Brest-Litovsk. There are cloth factories, tanneries, and paper mills. In the 11th century Lutsk was the capital of an independent principality; after passing into the hands of the Lithuanians and Poles, it was annexed to Russia in 1791.

The battles of Lutsk in the First Great War took place in 1915 and 1916. Following up strongly from the capture of Kovel and Vladimir Volynsk, an Austro-German force took Lutsk, Aug. 31, 1915. On the night of Sept. 7-8 the Russians launched a counter-offensive; on Sept. 23 they captured vital positions N. of Lutsk, and the town again fell into their hands. They had outrun their lines of communication, however, and were forced to retire on Sept. 28. On June

4, 1916, Russians in the Volhynia area attacked N.W. towards Lutsk and S.W. towards Brody and Lemberg (now Lwow). Lutsk fell to them within two days, a gain of 20 m.; pushing on, they penetrated to within 20 m. of Kovel and the same distance of Vladimir Volynsk.

After the partition of Poland by Germany and Russia in Sept. 1939, Lutsk was included in the Russian zone. The Germans captured it at the end of 1941 and held it until Feb. 5, 1944, when their garrison was driven out by units of the 1st Ukrainian army. It went, with the rest of Volhynia, to Russia by the Russo-Polish treaty signed in Aug., 1945.

**Lutterworth.** Market town of Leicestershire, England. It stands on the Swift, 7 m. N.E. of Rugby and 90 m. by rly. from London. It is chiefly famous for its associations with John Wycliffe, rector here 1374-84. S. Mary's church, a fine old building, contains the pulpit and other relics of the reformer. There is an obelisk to his memory in the town. Market day, Thursday. Pop. 3,000. See Wycliffe, John.

**Luttrell Psalter.** English illuminated manuscript of the 14th century. Executed about 1342 by Sir Geoffrey Luttrell, it

is one of the most interesting illuminated manuscripts and is preserved in the British Museum. It is illustrated with a lovely series of miniatures, in glowing colours, depicting sports, pastimes, customs, business methods, and every aspect of country life.

**Lutyens, Sir Edwin Landseer** (1869-1944). A British architect. Born March 29, 1869, he studied at the R.C.A. and began his career in 1888. During the 1890s he designed country houses and, in collaboration with Gertrude Jekyll, gardens notable for fine sense of detail. His chief works in London included Hampstead Garden

Lutterworth, Leicestershire. Parish church of S. Mary, restored and enlarged since the time of Wycliffe  
Valentine

Suburb, S. John's Institute. Tufton St.; houses in Little College St. and Smith Sq., Westminster; Britannic House, Finsbury Sq.; Midland Bank, Piccadilly; elevation of Midland Bank, Poultry; and fountains in Trafalgar Sq.

In 1912, when a member of the advisory committee to the government of India, Lutyens, with Sir Herbert Baker, designed the site and architectural scheme of New Delhi. This grandiose conception, like the R.C. cathedral at Liverpool, ranks among his most ambitious achievements, though in the U.K. he is associated chiefly with domestic architecture, and has been described as the innovator of the modern country house. As an architect, he was said to have evolved from the picturesque to the monumental.

Luttrell Psalter. Illumination from the Psalter, showing Sir Geoffrey Luttrell going out to uphold the family honour in a tournament. He is equipped by his wife, who hands him helmet and pennon, while another lady carries the Luttrell shield

The Cenotaph in Whitehall (reputed to have been worked out on a scribbling block during luncheon)

Sir E. L. Lutyens,

Russell

expresses his sense of a national monument. Other war memorials included those at Villers-Bretonneux and Manchester. He designed Hampton Court bridge; the tomb of George V at Windsor (with Sir W. Reid Dick as sculptor); an open-air memorial to George V, Windsor; the Queen's doll's house; and Benson Court, Magdalene College, Cambridge.

Lutyens was elected A.R.A. in 1913 and R.A. in 1920, becoming P.R.A. in 1938 in succession to Sir William Llewellyn, only the third architect to fill that office. He received a knighthood in 1918 and was awarded the O.M. in 1942, the first architect member. He died Jan. 1, 1944. *Consult* E.L., An Appreciation in Perspective, R. Lutyens, 1942.

**Lützen.** Town of Saxony, Germany, about 12 m. S.W. of Leipzig. It is famous as the scene of two great battles. On Nov. 16 (N.S.), 1632, Gustavus Adolphus, king of Sweden, defeated the Imperialists under Wallenstein, but was himself killed. On May 2, 1813, Napoleon defeated the Prussians and Russians.

In 1632 Gustavus was campaigning in Germany. With 20,000 men he marched from Naumburg to pick up a contingent of Germans, for Wallenstein was near Lützen, and a battle was soon almost inevitable. On Nov. 15 news that Wallenstein had sent off a considerable force on a plundering expedition caused Gustavus to change his plans. He turned towards Lützen to find and to fight a weakened enemy.

The enemy was ready. On Nov. 16 Wallenstein's army, also about 20,000 strong, was drawn up near Lützen. The infantry were in masses in the centre; the cavalry were on the wings; the artillery were in the front. The Swedish army had its trained infantry in smaller groups, but it, too, had cavalry on the wings and artillery in front. After some artillery exchanges, the battle was joined. The Swedish horse dashed against their foes and put them to flight, but the infantry, who had also taken the initiative, were not able to equal that performance. A

stout fight was waged at close quarters, and while this was proceeding Gustavus, leading his men to a threatened part of the line, was killed. Wallenstein's men then met with a temporary success until Bernhard of Saxe-Weimar, having taken over the command, succeeded in rallying the Swedes, and the lost guns and the ground were recaptured. The last stages of the battle began with the charge of Wallenstein's cavalry, just returned from their foray. They met with some success, but their leader, Pappenheim, was killed. The Swedish reserves then advanced,

to resist attack; waiting till both sides were exhausted, he then sent forward 100 guns to make a gap with case shot in the enemy lines and, pushing forward his reserve, finished the battle.

**Lützow, FRANCIS, COUNT** (d. 1916). Bohemian historian. He belonged to a noble family of that country, but on his mother's side

Luxembourg, Paris. Salle du livre d'or, gallery in the palace, where the golden book of records of the reigning family was formerly kept. Walls and ceiling were decorated by pupils of Rubens. Top, right, south front of the palace

and their charge decided the day, for the Imperialists fled. The site is marked by a chapel and other memorials. (*See* Gustavus Adolphus; Thirty Years' War.)

Before the second battle of Leipzig Napoleon's huge conscript army of combined nations had been reduced to a cipher by his Russian campaign, but he had, by the spring of 1813, 200,000 men moving towards the Elbe to meet the allied concentrations. He assumed command at Erfurt, April 25, and moved his advance guard on Lützen. The allied commander, Wittgenstein, designed to surprise him by an attack on the advance guard with a small force, while the remainder of his army was directed against Napoleon's right and rear. The combined Prussian and Russian attack began about 9 a.m. just as the head of the French main body was reaching Lützen. At 11 a.m. Napoleon heard Wittgenstein's guns opening the attack on his right rear, and, divining his plan, he galloped to the scene of action, and with his old promptness planned a counter-scheme. He organized a battle reserve, and disposed the remainder

was of English descent. He was a member of the Austrian Reichstag, 1885-89, and from 1881 to his death was chamberlain to the emperor of Austria. Much of his time was spent in England, and he held the Ilchester professorship in Slavonic languages at Oxford. He wrote on Bohemia in English and his works include *Bohemia: An Historical Sketch*, 1896; *History of Bohemian Literature*, 1899; *Life and Times of Master John Hus*, 1909; and *The Hussite Wars*, 1914. He died Jan. 13, 1916.

**Lützow, LUDWIG ADOLF WILHELM, BARON VON** (1782-1834). German soldier. Born May 18, 1782, he entered the Prussian army in 1795 and served in it until 1808, having fought at Auerstadt and elsewhere against Napoleon. In 1811 he returned to the service and in the war of liberation raised a corps of irregulars, known as the black Jaegers, which served against France until 1814. Lützow was with the cavalry of the regular army at Waterloo, and retired in 1830. He died Dec. 6, 1834. A German battle cruiser, Lützow, was sunk in the Jutland battle, 1916.

**Lux.** Unit of illumination, being the normal illumination produced from a light source of one candle power at a distance of one metre.

**Luxembourg.** Most southerly province of Belgium. It comprises the Belgian part of the Ardennes Highlands, and is the

most scantily peopled portion of the country. Iron is mined, slate quarried, and cast-iron manufactured. It was severed from the grand duchy of Luxembourg in 1839. Area, 1,706 sq. m. Pop. 216,745.

**Luxembourg.** French palace, situated on the left bank of the Seine in Paris. It was designed in 1615 by Jacques de Brosse, for Marie de' Medici, and erected on the site of a mansion purchased in 1612 from the duc de Piney-Luxembourg. De Brosse was instructed to copy the Pitti Palace at Florence, but the design, with its two bold flanking pavilions, bears little resemblance to the latter. The queen adorned the palace in the costliest manner, but after her death it was neglected. In 1836 the palace was almost entirely remodelled by A. de Gisors, who extended the garden façade by more than one-third, and rearranged the interior. The Musée du Luxembourg, famous for its collection of modern works of art, is on the E. side of the building. The Luxembourg Gardens, originally laid out by J. de Brosse, are extensive and beautiful.

**Luxembourg, François HENRI DE MONTMORENCY - BOUTEVILLE, DUKE OF (1628-95).** French soldier. Born Jan. 8, 1628, in Paris, he was related to the Condé family, and was educated with his cousin, the great Condé (q.v.). To escape the consequence of

François Luxembourg, French soldier

their share in the Fronde, the two entered the Spanish service together. In 1659 François reentered the French army and soon, having married an heiress, was made duke. In the war that began in 1672 he was in command of a force which defeated the Dutch under William of Orange, but his reputation was made by a retreat he conducted from Utrecht when followed by superior forces. He captured Valenciennes during the war that ended in 1678. On the renewal of war in 1689 Luxembourg, regarded as France's first soldier, was put in command in Flanders, where he beat his life-long adversary, William of Orange, at Steinkirk, Aug. 3, 1692, and Neerwinden, July 29, 1693. He died in Paris, Jan. 4, 1695.

**Luxembourg.** Country and a grand duchy of Europe. It comprises the S. portion of Ardennes

Highlands, draining to the Moselle, which forms its S.E. frontier. Belgium lies to

Luxembourg arms

the N. and W., France to the S., and Germany to the E. Its area is 999 sq. m. The chief economic importance of the state is in the S.W., where the Minette iron-field stretches into France. Up to 1914 Belgium imported quantities of iron ore from here, while a good deal more was turned into pig iron and exported to Germany. Three-fifths of the area is cultivated; oats and potatoes being the main crops, then wheat. The vine is grown in the Moselle valley; and horses and cattle are reared. The chief river is the Sure or Sauer. In addition to Luxembourg, the capital, the chief towns are Esch, Differdange, and Dudelange. The people are nearly all Roman Catholics. The govt. is in the hands of a council of state and chamber of 5 deputies. Pop. 281,572.

Luxembourg originated in a county, created in the 11th century, and taking its name from its chief town. Its counts became so important that in 1308 one of them, Henry, was chosen emperor, and in the 14th century the house of Luxembourg was one of the chief families of Europe. To it belonged John, king of Bohemia. In 1444 the duchy, as the county had been since 1354, became part of Burgundy and thus later passed to the emperor Charles V. It was a possession of his descendants, the kings of Spain, from 1555 to 1713, when it passed by arrangement to Austria. The French conquered it 1795.

The congress of Vienna, 1815, made it a grand duchy, and gave it as a personal duchy to William I of the Netherlands in exchange for the Orange-Nassau possessions in Germany. In 1830

Luxembourg, like the S. Netherlands, rebelled against William; and when in 1839 the powers recognized Belgium as a separate country, French-speaking W. Luxembourg (see Luxembourg) was given to her, E. Luxembourg remaining a grand duchy with William as its duke. This grand duchy, the present Luxembourg, joined the German customs union in 1842. During 1815-66, the grand duchy, large or small, was a member of the German confederation. In 1867, by the treaty of London, the powers declared it independent, and guaranteed its neutrality.

On the death of William III in 1890, the Netherlands passed to his daughter Wilhelmina; but at that time succession in Luxembourg was restricted to males, and the grand duchy went to Adolphus (d. 1905), a member of the elder branch of the house of Nassau. He was succeeded by his son William (d. 1912), and when it became apparent that with him the male line of the Nassau family would end, a law was passed allowing the accession of females. Charlotte (b. Jan. 23, 1896), second of William's six daughters, became grand duchess on the abdication of her sister Marie, Jan. 9, 1919.

Although Germany was among the signatories of the treaty of London, 1867, she invaded Luxembourg, simultaneously with her attack on Belgium, in 1914. A de-

Luxembourg. Map of the grand duchy, showing its position between Germany, France, and Belgium

tachment of German troops tore up the rails at Trois Vierges on Aug. 1, 1914, and during the night strong forces entered Luxembourg, asserting that the French were marching against it. A proclamation announced that the occupation would be only provisional; personal and religious liberty would be respected; iron discipline of the German occupying forces would be maintained, and all requisitioned goods paid for in cash. The Germans broke all their promises. Luxemburgers were seized as hostages, forcibly enrolled in the German army, condemned to death for alleged offences, though as far as is known none was executed. The country was stripped of food and raw materials, and was not evacuated until the armistice, Nov. 11, 1918.

By the treaty of Versailles, Luxembourg ceased to belong to the German customs union. In 1921 it concluded a customs union with Belgium.

The Germans again invaded undefended Luxembourg on May 10, 1940. The standing army of 250 could offer no resistance, and ruler and govt. fled to France, then to Canada, and in 1941 went to London. On July 28, 1940, a German civil governor of Luxembourg was appointed. The German language was made compulsory; Luxembourg was again included in the German customs union; and the Nazi system of education was introduced. On Aug. 30, 1942, the grand duchy was annexed to the Reich. The people endured worse hardships than in the First Great War; young men were called up for German labour service or service in the army, and one in ten of the pop. was sent to forced labour or a concentration camp.

On Sept. 10, 1944, troops of the U.S. 1st army crossed the frontier, the Germans retiring before them. They liberated the city of Luxembourg intact the same day. The German counter-offensive in the Ardennes (*q.v.*) made part of Luxembourg the scene of bitter fighting, Dec., 1944-Jan., 1945, and delayed the return of the grand duchess until April. During the Second Great War, Luxembourg changed from a rich to an impoverished country, with thousands homeless, and a third of the land devastated

In Sept., 1945, Luxembourg was given a zone of occupation in the Eifel dist. of Germany.

The Luxembourg govt., during its exile in London, entered in 1944 into a convention with the Netherlands and Belgian exiled govts. for a post-war customs union of the three countries. Ratification in 1947 brought the "Benelux" customs union into formal existence on Oct. 29 (*see* Benelux in N.V.).

Luxembourg participated in the European Recovery Programme, in the Brussels treaty, 1948, and in the North Atlantic treaty, 1949.

**Luxembourg.** Town and capital of the grand duchy of Luxembourg. It stands on the Alzette. The chief

buildings are the churches of S. Michael and Notre Dame and the palace. The church of S. Quirin is hewn out of solid rock. At one time Luxembourg was regarded as one of the strongest fortresses in Europe, but its fortifications were destroyed in 1867. The chief industries are iron

and steel working, brewing, and tanning. The town lies partly in the valley, with the older portion of the plateau above, and many streets zig-zag up the slopes or ascend by steps. The name means little town. Pop. 59,013.

**Luxembourg, Rosa** (1870-1919). German socialist. Of Polish Jewish origin, she was born at Zamosc, March 5, 1870, niece of one of the founders of the Bank of Poland. Having studied economics at Zürich, she became a professor in economic science, but getting into trouble with the authorities, escaped deportation to Siberia by flight to Berlin, where in 1898 she married Gustav Lübeck to secure German citizenship. Professor of economics in Berlin, she won notoriety as Red Rosa. She joined forces with Karl Liebknecht and was the founder of Polish social democracy. A cripple, small of stature, but a speaker and writer whose violence was almost equalled by her ability, she was long on the editorial staff of *Vorwärts*. During the First Great War she was imprisoned for anti-militarism. Liberated after the revolution of Nov., 1918, she took a leading part in the Spartacist (Communist) movement and, being arrested with Liebknecht in Berlin on Jan. 15, 1919, by a patrol of the

civic guard, was killed, it was believed, by the mob. Her study of the Russian revolution was issued in 1922. *See* Spartacus.

**Luxeuil.** Town of France, in the dept. of Haute-Saône. It is 10 m. N.W. of Lure, at the base of the Vosges. The mineral baths were known to the Romans. There are a fine 14th century church and ruins of a monastery founded in 590 by S. Columbanus.

**Lux Mundi** (Lat., light of the world). Name given to a collection of theological essays published in 1889. The editor was Charles Gore, then head of Pusey House, Oxford, who wrote one on The Holy Spirit and Inspiration. The book was an attempt to permeate the high church school with the results of modern Biblical criticism, and as such was violently assailed by the more conservative churchmen. *See* Oxford Movement.

**Luxor** (Arab. *el-Kusur*, the palaces). Town of upper Egypt. Situated on the E. bank of the Nile, 418 m. by railway S.S.E. of Cairo, it gives its name to the Luxor dist. of the Qena prov. It is a winter resort for invalids, with hotels, hospitals, and churches, and is the tourist centre for visitors to the Theban plain.

Luxor, with the adjacent Karnak, comprises the ancient city of Thebes. The two parts were connected, under Amenhotep III, c. 1400 B.C., by a paved avenue  $1\frac{1}{2}$  m. long, flanked by stone crosphinxes or recumbent rams. The Luxor temple, 852 ft. long, begun by that monarch in honour of Amon, Mut, and their son Khons, comprises a court 148 ft. by 168 ft., with double rows of clustered papyrus-columns on three sides, confronting a vestibule whose roof was supported by four rows of eight similar columns. Beyond this a group of smaller chambers includes a sanctuary rebuilt by Alexander the Great, and another converted into an early Coptic church. In front of the court is a colonnade of seven pairs of columns 52 ft. high.

Before the original fane Rameses II erected a court, 187 ft. by 168 ft., surrounded by 74 papyrus-columns, and now encumbered in one corner by a 7th cent. tomb-mosque. Standing colossi of the king, in red and black granite, are placed between some of the columns, and seated figures, 25 ft. high, of himself and his queen flank the portal to the colonnade. The massive pylon is sculptured with reliefs depicting the Hittite campaign, and with the poetical

Luxembourg. Great viaduct, built in 1861 across the Pétrusse valley

narrative of the Kadesh battle called the epic of Pentaur. The temple-walls bear spirited reliefs of royal and religious scenes.

In front of the pylon stood six colossal statues of Rameses II, of which two sitting ones, 45 ft. high, and one of the four standing ones, are preserved. Of the two pink

Gard, Aug. 5, 1578, as a young man he was intimate with Louis XIII. In 1617 he helped the king in the intrigue against the queen mother, Marie de' Medici, being largely responsible for the assassination of her favourite, Concini. His influence over Louis was supreme, and after negotiating the treaty of Angoulême, 1619, and suppressing a Huguenot rebellion, he became constable of France, 1621. At once he undertook a campaign against the Huguenots, but rapidly succumbed to a fever on Dec. 14.

**Luz** (Heb., almond tree). In the O.T., the old name for Bethel.

Duc de Luynes,  
French courtier

river. W. of the valley the Zambales range has a mean elevation of 4,000 ft.; E. of it the Eastern Cordillera, called in its N. portion the Sierra Madre, lies close to the coast, and is continued through the isthmus to the S.E.; N.E. of it the Caraballos Sur connects the S. ends of the Sierra Madre and the Caraballos Occidentales.

The S. peninsulas have a backbone of high ground, from which rise isolated peaks, of which the important is the still active volcano of Mayón, a perfect cone, 7,916 ft. high. The land rises steeply from the coasts, and the coastal slopes on the E. receive annual rainfall of over 100 ins.

Luzon was settled by Spaniards in the 16th century and was a Spanish colony until 1898, when it was ceded to the U.S.A. In 1946 it became part of the newly-formed Philippine republic. The

granite obelisks one, 82 ft. high, remains; the other occupies a position in the Place de la Concorde in Paris. See Egypt; Karnak.

**Luxullianite.** Rock of striking aspect found near Luxulyan, Cornwall, England. It consists essentially of pink potash-feldspar, black tourmaline, and quartz. A normal porphyritic granite with feldspar, mica, and quartz was attacked by boron-rich fluids which introduced tourmaline at the expense of original mica and some of the feldspar. Luxullianite has been used as an ornamental stone and is of petrologic interest, but little now remains.

**Luynes, CHARLES D'ALBERT, DUC DE** (1578-1621). French courtier. Born at Pont St. Esprit.

or of a village near it on the boundary of Ephraim. It was also that of an unidentified Hittite city.

**Luzon.** Largest of the Philippine islands. It consists of two sections, one, roughly rectangular, lying N.-S., and the other, an irregular group of connected peninsulas, lying E. and S.E. of Lamón Bay. With an area of 40,420 sq. m., it is 138 m. at its widest point and 8 m. at its narrowest.

In the N. section a valley, 150 m. long and 50 m. wide, extends from Lingayen Gulf to the lake Laguna de Bay. On the W. coast is Manila Bay, the best harbour in the Far East, which has an area of 770 sq. m., and a maximum depth of 150 ft. Connecting Laguna de Bay and Manila Bay is the Pasig

island is divided into 24 provinces and has a pop. of 3,800,000, of whom some 200,000 remain pagan and uncivilized. The population is of mixed race, ranging from the westernised Tagalogs to the Negritos, a tribe of pygmy head-hunters in the N. English or Spanish is spoken by the majority of the people, but the official language, like that of the rest of the

Philippines, is based upon Tagalog, a Malayan dialect. Tobacco, cotton, hemp, copra, rice, sugar, cacao, pineapples, and bananas are the principal agricultural products; there is considerable cattle raising to the S.W. of Laguna de Bay.

Baguio, the summer capital, which is the only chartered city besides Manila, the administrative capital, is the centre of the gold-mining area. Copper, iron, and coal are also mined. In the central area of the W. coast is a chrome deposit, estimated to be the world's largest, which has not yet been developed.

Gen. MacArthur was in command of combined Filipino-U.S. defence forces on Luzon when the Japanese invaded it on Dec. 10, 1941. He succeeded in holding the enemy in check until Dec. 22, when some six to eight Japanese divs. landed in Lingayen gulf, followed by steady reinforcements. Manila, declared an open city Dec. 25, bombed severely from the air next day, was entered by the Japanese, Jan. 2, 1942, U.S. and Filipino forces having retired to Bataan pen., where they held out until April 10, and the island of Corregidor, which surrendered only on May 6. U.S. forces returned to Luzon on Jan. 9, 1945, recapturing Manila in a battle lasting from Feb. 4 to 24. Isolated groups of Japanese were still holding out in the Sierra Madre when Japan surrendered in Aug. Luzon, particularly Manila and its neighbourhood, suffered terrible devastation during the fighting. For a fuller account of the war in the Philippines, see *Pacific War*; see also *Bataan*; MacArthur, D.

**Lvoff, GEORGE EUGENIEVITCH, PRINCE** (1861-1925). A Russian statesman. Born Oct. 21, 1861, and educated at Moscow university, he devoted his energies to educating the peasantry. In the famine year of 1891 he served on relief committees, and during the Russo-Japanese War was head of the Red Cross organization in Manchuria. In 1904 he came into prominence in connexion with the Zemstvo congresses which started the constitutional movement. To the first Duma he was returned as a leader of the Constitutional Democratic party known as the Cadets. For signing the manifesto at Viborg calling upon the people to refuse taxes, he was debarred from sitting. Prime minister in the provisional government 1917, he resigned owing to differences with the Socialists on the land question.

He left Russia on the advent of the Soviet regime, visiting Britain and the U.S.A., and died March 7, 1925.

**Lvoff, ALEXIS FEODOROVITCH** (1799-1870). Russian composer. Born June 6, 1799, he entered the army and attained the rank of general. Meanwhile he had given much time to music, and in 1836 succeeded his father as director of music at the imperial chapel, St. Petersburg. He was an excellent violinist and is remembered as the composer of the pre-revolutionary national anthem of Russia. He died Dec. 16, 1870.

**Lvov** (Polish *Lwow*; German *Lemberg*). City of the Ukraine S.S.R. which also gives its name to a region. Lvov, which means the City of Lions, lies in the eastern district between the San and Zbruecz rivers. Situated between two low ridges on the great east-west route from Cracow to Kiev, it was the capital of Red Ruthenia, part of the early Polish

whelmily Ukrainian in population, the city remained predominantly Polish. At the partition of Poland in 1772 Lvov was renamed Lemberg and became capital of the Austrian province of Galicia.

Lvov was the scene of bitter fighting in the First Great War, the first battle for it lasting from Aug. 31 to Sept. 2, 1914, when it fell to the Russians with 100,000 prisoners. Restoring its old name of Lvov, the Russians set up an administration, but in June, 1915, it was reoccupied by the Austrians during Mackensen's advance. Frequent riots occurred in 1917 and 1918, fomented by separatists, but the city passed into Russian

Lvov, Ukraine S.S.R. Partial view of the city with the hill Wysoki Zamek in the background. Above, right, main university building, formerly the Galician Diet

possession until 1923, when it was ceded to Poland.

Under Polish rule, Lvov was further developed as a cultural and commercial centre and became a link between eastern and western Europe. By 1931 its pop. had reached 312,000. Even under foreign domination

state, until it passed under the rule of the duchy of Kiev in the 10th century. In 1240, Lvov was rebuilt and fortified by Danilo, duke of Kiev, as part of the defence system against the Tartar invasion. It was reunited with Poland in 1340 and further fortified, while a natural barrier of hills made it practically inaccessible from the east. It became one of the bastions of western civilization, and successive invasions by Tartars, Turks, and Cossacks were halted at its walls.

In 1380 it was granted the right of emporium, or free trade, and in the middle ages it became an important trading centre, its population including Germans, Greeks, Jews, Tartars, and Armenians. Although in a territory over-

it had been a centre of Polish learning, the university having been established in 1634, while the Lvov Polytechnic was the oldest Polish technical institution. The Ossolineum library contained over a million volumes and there were numerous museums and theatres. It was the seat of three archbishops, Roman Catholic, Greek Orthodox, and Armenian Catholic. There were also a number of synagogues, most of them masterpieces of internal architecture. Under the Poles, considerable industry was established.

At the outbreak of hostilities between Germany and Poland on Sept. 1, 1939, Lvov was subjected to three days' intensive air attack, devastating the principal buildings and large areas of the city.

Surrounded on Sept. 19, the city capitulated three days later when the Jewish population was annihilated. On the partition of Poland between Germany and Russia, Lvov passed to the latter. Following the outbreak of the Russo-German war, Lvov was taken by the Germans on June 30, 1941. It was recaptured by Ukrainian forces of the Red army on July 27, 1944, and passed to the Ukraine S.S.R. under the Russo-Polish treaty of Aug., 1945.

**Lyall, Sir ALFRED COMYN** (1835-1911). A British administrator. Born at Coulsdon, Surrey, Jan. 4, 1835, he went to Eton and Haileybury, entered the Indian civil service, 1856, and served during the Mutiny. Minor appointments led to his becoming lieutenant-governor, N.W. Provinces and Oudh, 1882-87, and then a member of the India council in London until 1902. Lyall founded the new university of Allahabad, 1887. Knighted in 1881, he died at Farringford, I.O.W., April 10, 1911. His series of Asiatic Studies, 1882-99, were remarkable for their insight into Indian native rites and customs and for their value to the student of religion and mythology.

**Lyall, EDNA.** Pseudonym of Ada Ellen Bayly (1857-1903), a British novelist. Born at Brighton, March 25, 1857, she became an active social and religious worker. Among her novels are *Won by Waiting*, 1879; *Donovan*, which made her name, 1882; *We Two*, 1884,

Edna Lyall,  
British novelist  
Elliott & Fry

in which Charles Bradlaugh is thinly disguised; *Doreen*, the hero of which is Michael Davitt, 1894; *The Hinderers*, 1920. A woman of strong political convictions, she was a keen Home Ruler and supported Bradlaugh in his contest with the house of commons, though she had no sympathy with his religious views. She died Feb. 8, 1903.

**Lyautey, LOUIS HUBERT** (1854-1934). French soldier and administrator. Born at Nancy, Nov. 17, 1854, he passed through St. Cyr and in 1875 joined the army as a lieutenant of *chasseurs*. He was on active service in Algeria, 1880-82; Tongking, 1894-97; and Madagascar, 1897-1902. Then he was in Algeria, 1903-11, becoming general of division in 1907.

He was resident commissary-general in Morocco, 1912, and held the post until 1925, with one interval in 1916-17 as minister of war. In 1921 Lyautey received his marshal's baton without having ever served in France. He built up a colony with a great economic future and was probably the outstanding figure in the creation of French Africa. On July 27, 1934, he died. A Maurois wrote his *Life*, Eng. trans. 1931.

L. H. Lyautey,  
French soldier

**Lycabettus.** Hill in Greece. A conical rock to the N.E. of the city of Athens, it is 900 ft. above sea level. On its S.W. slope an aqueduct, constructed by Hadrian and Antoninus Pius and repaired during the 19th century, is still used for the water supply of Athens. The modern name is Mount St. George (*Ha'ios Georgios*), to whom a chapel on the summit is dedicated. See Athens.

**Lycanthropy** (Gr. *lykos*, wolf; *anthrōpos*, man). Term for the power popularly attributed in some countries to certain persons of turning themselves into wolves. In Great Britain such persons were known as were-wolves. The term is also used in folklore in a wider sense for the supposed transformations of men and women into other beasts, as bears or foxes. In pathology, lycanthropy is a form of mental disease in which the patient believes himself to be an animal and generally behaves like one. See Were-wolf.

**Lycaon.** In Greek mythology, a king of Arcadia, noted for his impiety. Zeus came down to earth to visit him, and Lycaon, to test his divinity, had the effrontery to offer him a dish of human flesh. For this insult he was changed into a wolf, as were all, save one, of his 50 sons.

**Lycænia.** Ancient district of Asia Minor. It was bounded N. by Galatia, W. by Phrygia, S. by Cilicia, and E. by Cappadocia. Its capital was Iconium, and its other chief towns were Derbê, Lystra, and Laodicea, all of which figure in the N.T., Acts 14, etc. It is part of the Turkish vilayet of Konieh.

**Lycastê.** Genus of handsome orchids. They are natives of tropical America. Some species grow in the ground, others on trees. The lip of the flower is furnished with a transverse fleshy appendage. *L. skinneri*, from Guatemala, has

large, white, solitary flowers (4 to 6 ins. across) suffused and blotched with rosy-crimson. See Orchid.

**Lycée** (Lat. *lyceum*). The name given in France to secondary schools under state control.

**Lyceum.** Gymnasium sacred to Apollo Lycius. Just outside the city of Athens on the S.E. side, it was famous as the place where Aristotle and his successors taught their philosophy. Hence the name was applied to the school in which Aristotelian philosophy was taught, and is now used for various educational institutions.

**Lyceum Theatre.** A former London playhouse in Wellington Street, Strand. On this site, purchased in 1765, the architect, James Payne, erected a building to house the exhibitions of the newly incorporated Society of Artists; the

Lyceum Theatre. The former London playhouse, made famous by Irving, and in 1945 converted into a dance hall

society became insolvent, and the building was sold and the back part converted into a theatre. Various entertainments were given in the place, including, in 1802, Madame Tussaud's first exhibition of wax-works. In 1809 the theatre was licensed and renamed the English Opera House. It was rebuilt in 1816 and burnt down in 1830.

Another theatre was put up on the site and opened in 1834, with opera. Balfe, the Keeleys, Fechter, and the Batemans were among those in management here, but the house is chiefly associated with Irving, who was its manager 1878-1902, and in conjunction with Ellen Terry made it world-famous by his Shakespearian productions. Irving's last performance here took place July 19, 1902. The theatre was then entirely reconstructed, and the new building, with the

old façade preserved, was opened in 1904. From 1907 The Lyceum was the chief home of melodrama in London under the management of the brothers Walter and Frederick Melville. It had a lavish annual pantomime. Its last night was March 11, 1939. Bought by the L.C.C., its site was to have formed part of a traffic roundabout, but the project was held up by war, and in 1945 The Lyceum reopened as a dance hall.

Lyche-Gate. Examples from Surrey churches. Left, Shere; right, Chiddingfold, restored Frith

East. In the time of the Roman emperor Claudius (A.D. 43) it was united with Pamphylia.

**Lycidas.** Elegiac poem by John Milton, published in 1638. Written in Nov., 1637, in memory of his friend Edward King, drowned in the Irish Sea, it is one of the most beautiful of Milton's works, yet it was censured by Dr. Johnson for want of sincere feeling. It abounds in quoted phrases like "fresh woods and pastures new"; "fame

Euboea, he flourished at Alexandria during the reign of Ptolemy Philadelphus, who gave him a post in the library. He wrote an essay on Comedy, several tragedies, and a poem on Cassandra, containing 1,500 lines in iambic metre, which is remarkable for the obscurity of its language, but of little value as a poetical effort.

**Lycopodiaceae.** A family of Pteridophytes, also known as club-moss (*g.v.*).

**Lycurgus** (c. 396-323 B.C.). Athenian statesman and orator. With Demosthenes and Hypereides he belonged to the national party at Athens which opposed all encroachments on the part of Macedonia. For 12 years he administered Athenian public finance with conspicuous success. Besides reorganizing the navy, repairing the dockyards, and completing the arsenal, he did much to improve and beautify the buildings of the city. As an orator he was lofty in tone, but his speeches lacked polish; 15 in number, only that against Leocrates has survived. See Philip, King of Macedon.

**Lycurgus** (fl. c. 800 B.C.). Reputed founder of the constitution of Sparta. No authentic facts are known about him, but the tradition was that, after acting as regent for his young nephew King Charilaus, he left Sparta and travelled extensively. On his return he was called

Lycurgus, reputed founder of the Spartan constitution

upon by the citizens to rescue the state from the confusion into which it had fallen. This he did with signal success, left the country never to return, and was worshipped as a god. Among the reforms attributed to him were the equitable division of the land among the citizens; the prohibition of gold and silver, and the substitution of iron as currency; establishment of the strict system of military training, common meals, and general education which gave Sparta military predominance in Greece and made her proverbial for courage and endurance.

**Lydd.** A mun. bor. of Kent, England. It is 3½ m. S. of New Romney, and 71 S.E. of London, and has a rly. junction. It is a member of the Cinque Port of New Romney. The chief building is the church of All Saints, a beautiful E. E. and Perpendicular

**Lyche-Gate** (A.S. *lic*, body). Roofed gate at the entrance to a churchyard. At a funeral the coffin here awaits the officiating clergyman. A number of churchyards in England retain their old lyche-gates.

**Lychnis.** Genus of plants of the family Caryophyllaceae. Five species are known in Great Britain, the commonest of which are the campion (*g.v.*) and ragged robin.

**Lychnoscope.** Small window (sometimes termed a low side window) near the west end of the chancel of a church, inserted lower than the other windows to permit communication between a person outside and the priest within. Originally this was unglazed and fitted with a shutter.

**Lycia.** Ancient country of Asia Minor. On the S. coast, it was bounded N. by Phrygia, W. by Caria, and E. by Pamphylia. Xanthus was the capital. According to tradition the inhabitants came originally from Crete. The Homeric hero Sarpedon is a Lycian. The people successfully resisted the Lydian empire of Croesus, but were conquered by Harpagus, the general of Cyrus. Persian sovereignty, however, was nominal, and with the rise of Athens the Lycians became members of the Athenian League. When Alexander became master of the world, Lycia was incorporated in Syria, but retained much of its independence, even after the Romans conquered the

is the spur"; "the hungry sheep look up and are not fed."

**Lyck** (Pol. Elk). Town of the former East Prussia, since 1945 in the Polish prov. of Masuria. It lies 115 m. S.E. of Kaliningrad. Lyck was the chief town of the Masurian Lakes district, situated on the Lyck lake and river. To its importance during the rule of the Teutonic Order, castle ruins testify. A rly. junction and a garrison town, it had some industry and an agricultural trade. The town was assaulted, and occupied by the Russians, also largely ruined by bombardment, in Aug., and again in Oct., 1914, but during the Masurian battle of Feb., 1915, they withdrew defeated. In Feb., 1945, after heavy fighting, it fell again to the Russians. Pop. 15,861.

**Lycomedes.** In Greek mythology, king of the island of Scyros in the Aegean. To him Achilles was entrusted by his mother Thetis, who desired to keep him from taking part in the expedition against Troy, in which she knew he was fated to be killed.

**Lycoperdon.** Scientific name for a genus of gasteromycetous fungi. See Puff-ball.

**Lycophron** (3rd century B.C.). Alexandrian poet and grammarian. A native of Chalcis in

Lyck arms

edifice, the longest church in Kent, known as the cathedral of Romney Marsh. Near the town is Dungeness. There is a permanent artillery camp, with experimental ranges, and the name of lyddite (*q.v.*) is taken from here. Lydd was originally on the coast and was a fishing village, but the sea has receded considerably. It became one of the Cinque Ports, and was made a borough by a bailliff. Pop. 2,778.

Lydd borough seal

the coast and was a fishing village, but the sea has receded considerably. It became one of the Cinque Ports, and was made a borough by a bailliff. Pop. 2,778.

**Lydda** (Heb. *Lod*, mod. *Ludd*). Town of Palestine. It stands on the plain of Sharon, 11 m. S.E. of Jaffa, and is said to have been founded by Shamed the Benjamite. According to legend, S. George was born and buried there, and his tomb is still shown. During the First Great War Lydda was captured from the Turks on Nov. 15, 1917. It is the principal airport of Palestine, and the rly. station is the junction for Jerusalem and Jaffa. Pop. (1944), 17,616, incl. 17,607 Arabs and 9 Jews. The surrounding country grows wheat and citrus fruit.

**Lyddite**. Name for the highly explosive trinitrophenol or picric acid, employed as a shell filling in the British service. The name is derived from the fact that the original experiments were conducted on the artillery range at Lydd, Kent. The explosive is melted and poured into the shell, where it solidifies to a compact crystalline mass. T.N.T. and amatol are preferred to lyddite as an explosive because of the acidic properties of the latter. Picric acid is known as an explosive under other names, *e.g.* melinite and picrinite.

**Lydekker**, RICHARD (1849-1915). British scientist. He was educated at Trinity College, Cambridge. During 1874-82 he was on the staff of the Geological Survey of India, but thereafter devoted himself mainly to writing on natural history. His works include *Phases of Animal Life*, 1892, and *The Horse and His Relations*, 1912. He compiled, in ten volumes, *Catalogues of Fossil Mammals, Reptiles, and Birds in the British Museum*. Made F.R.S., he died April 16, 1915.

**Lydenburg** (Afrikaans, town of suffering). Town of the Transvaal, S. Africa. It is on the rly., 170 m. E. of Pretoria, and stands

among the mountains, 4,600 ft. above the sea. It was established by the Boers in 1839, and was for 11 years the capital of a little republic. In 1858 this was amalgamated with the republic of Utrecht, and shortly afterwards was included in the Transvaal. It is a centre of gold mining, the mines having been worked by the Portuguese. In 1873 they were rediscovered, and proved the most profitable field in Transvaal outside the Rand. Pop. 3,845.

**Lydford** OR LIDFORD. Village and parish of Devon, England. It stands on the Lyd, 7 m. N.E. of Tavistock, with a rly. station. The chief building is the church of S. Petrock. Lydford was at one time an important place, owing doubtless to its proximity to the tin workings. It was a borough in Anglo-Saxon times. After the Norman Conquest a castle was built here, and there was a market and a guild. Lydford became one of the chief of the stannary towns, the castle containing the stannary prison. Therein, too, were held the Dartmoor forest courts, at which summary justice is said to have been the rule. It was restored in the 18th century and used for public purposes; but for the second time it fell into ruins. Lydford gorge is a beautiful ravine near. Pop. of parish, 2,218. See Lidford Law; Stannaries.

**Lydgate**, JOHN (c. 1370-1451). English poet. Born at Lydgate, Suffolk, he joined the Benedictine order at Bury St. Edmunds, being ordained deacon in 1393 and priest in 1397. He studied in Oxford and Paris. Court poet under Henry IV, V, and VI, he made the acquaintance of Chaucer about 1390, was prior of Hatfield Broad Oak, Essex, 1423-34, was pensioned in 1440, and, dying a poor man, was buried at Bury St. Edmunds. He wrote narrative poems, songs, fables, allegories, pageants, and is said to have written the prose work, *The Damage and Destruction of Realmes*, 1400. He also translated much Italian and French work, including some of Boccaccio.

John Lydgate, English poet

*The Temple of Glass*, ed. for the Early English Text Society, 1891, is an allegory in imitation of Chaucer's *House of Fame*. Lydgate enjoyed a great

reputation after his death, but his work is chiefly interesting to students of language and metre. A selection of his poems was edited by Halliwell in 1840.

**Lydia**. Ancient country of Asia Minor. It was bounded N. by Mysia, E. by Phrygia, S. by Caria, S. and W. by the Aegean. In Homeric times it was known as Maeonia, but this name disappeared when about 700 B.C. Gyges (*q.v.*) killed the king Candaules and seized his throne.

The dynasty of Gyges lasted 150 years, during which period Lydia became a great and prosperous state, reaching the zenith of its power under Croesus, to whose brilliant court at Sardis came distinguished men from all parts of Greece. Under Croesus the Lydian empire extended from the Aegean Sea to the river Halys, and the Greek cities of Asia Minor were tributary. But in 546 B.C. Croesus went to war with Persia and was defeated, the country passing under the dominion of Cyrus.

After the overthrow of the Persian empire by Alexander, Lydia became an independent kingdom again in 334 B.C., but it subsequently became subject first to the kings of Syria, and then to those of Pergamum. In 133 it became part of the Roman prov. of Asia. After the Persian conquest the national spirit of Lydia was lost, and the name of the Lydians became synonymous for luxurious effeminacy.

**Lydian Mode**. In music, an old Church mode beginning on F and using only the natural notes, *i.e.* the white keys of the pianoforte. The scale was:

with semitones between the 4th and 5th and 7th and 8th degrees. Its dominant was C. The Lydian mode was reputed by the Greeks to be soft and rather effeminate in its influence, and its use was discouraged in the training of the young. See Mode.

**Lydian Stone**, BASANITE, OR TOUCHSTONE. A velvet-black siliceous stone or flinty jasper. It is a cryptocrystalline variety of quartz. If a piece of precious metal be rubbed on the hard, black surface of lydian stone, the purity of the metal can be estimated by the colour of its streak.

**Lydoch** OR LIDON. Loch or lake of Scotland. It is in the district called the moor of Rannoeh,

on the borders of Perthshire and Argyllshire. It is 5 m. long and is noted for its trout. The river Gauer carries its waters to Loch Rannoch.

**Lye** (A.S. *lēah*, cognate with Lat. *lavare*, to wash). Name given to a solution of alkaline salt, frequently sodium bisulphite, used for cleansing purposes. Originally the term was applied to the liquid obtained on lixiviating wood-ashes, which was also known as soap-lye because it was used in the manufacture of soap. Lye is used in petroleum refining, tanning, in the textile industry, in the removal of grease, and in the composition of acid-hypo fixing baths in photography.

**Lyell, MOUNT.** A peak of Tasmania, Australia, in Montagu co. It is in the N.W. of the island, and since its discovery in 1886 has become an important source of copper ore. Granite rock intruded into sedimentary strata and caused the accumulation of ore here, as it did in the neighbouring silver lead mines of Mt. Zeehan and tin mines of Mt. Bischoff. Mt. Lyell rises 2,750 ft.

**Lyell, SIR CHARLES (1797-1875).** A British geologist. He was born Nov. 14, 1797, at Kinnordy, Angus, the eldest son of Charles Lyell, botanist, and was educated at Midhurst and Exeter College, Oxford, afterwards entering Lincoln's Inn and being called to the bar. He devoted himself to geology, specialising in marine remains of the Tertiary period. He travelled widely in Europe, and the results of these tours appeared in *Transactions of the Geological Society*.

His chief work, *The Principles of Geology*, 3 vols., 1830-33, won for him the title of the father of modern geology. Its chief value was its demonstration that the forces which produced geological conditions of the past were still going on. Lyell was a firm supporter of Darwin's theories, as he showed in *Geological Evidences of the Antiquity of Man*, 1863. He occupied the chair in his subject at King's College, London, 1831-33, was twice president of the Geological Society,

and president of the British Association. Knighted in 1848 and created a baronet in 1864, he died Feb. 22, 1875, and was buried in Westminster Abbey.

Sir Charles Lyell,  
British geologist.

Under his will the Lyell medal and fund were founded. *Consult* Life, Letters, and Journals, 1881.

**Lyly** OR **LILLY, JOHN** (c. 1554-1606). English story-writer and dramatist. A native of Kent, he was educated at Magdalen College, Oxford, and was also a graduate of Cambridge. Settling in London 1577, he became a familiar figure at court, supervising the court entertainments, 1578-98. He took part in the Martin Marprelate (*q.v.*) controversy in a pamphlet, *Pappe with a Hatchet*, 1589, notable for its badinage and references to the stage attacks on Martin, and was M.P. for Hindon, 1589; Aylesbury, 1593 and 1601; and Appleby, 1597. Dying in London, he was buried in the church of S. Bartholomew the Less, Nov. 30, 1606.

First of the English writers of prose fiction, Lyly is chiefly remem-

bered as the author of Euphuës, which gave the word euphuism to the English language. In two parts—*Euphuës: The Anatomy of Wit*, 1579; and *Euphuës and His England*, 1580—this work marks the beginning of the English novel of manners. Strong in feminine interest, it is composed in a style marked by erudite allusion, forced simile, and excessive antithesis, and vividly reflects the fashions of the time. Original in form, it is strung together by a slender love-story telling the adventures of a young Italian gentleman of wealth and position. Its dialogue is satirised in the speeches of Ben Jonson's *Puntarvalo*, Shakespeare's *Don Armado*, and Scott's *Sir Piercy Shafton*. It abounds in advice on friendship, love, education, and religion. Inspired by Spanish models, it had great influence on Lyly's contemporaries and ran into ten editions in 56 years.

**Bibliography.** *Dramatic Works* ed. F. W. Fairholt, 2 vols., 1858; *Complete Works, with Life and Notes*, ed. R. W. Bond, 3 vols. 1902; J. L. and Euphuism, C. G. Child, 1894; J. L. and the Italian Renaissance, V. Jeffery, 1929.

**Lyme Regis.** Mun. borough, seaport, and watering-place of Dorset, England. It stands on Lyme Bay, 23 m. W. of Dorchester,

Lyme Regis, Dorset. Promenade and foreshore of this picturesque watering-place

and is connected by a branch rly. line with Axminster. The church of S. Michael and All Angels is a fine Perpendicular building with a Norman tower. There is a guild-hall, and a curved stone pier, forming the harbour, and called the Cobb, is an interesting relic and a popular promenade. There are delightful old houses and inns. Apart from the tourist business, the chief industries are shipping and stone quarrying. The name Lyme Regis was given to the place about 1300 when the manor became a royal manor. Up to the 11th cent. it was known as Lyme Abbas, and then as Nether Supra Lime. It was already known as a port and had received the privilege of a borough. It had a merchant guild, and from 1295 to 1867 was separately represented in parliament. It was a flourishing port up to the Middle Ages and in Tudor times, but began to decline when

the wool and textile industries went N. as a result of the Industrial Revolution. In 1685 the duke of Monmouth landed here. Lyme received several charters, but since 1834 has been governed by a mayor and corporation on modern lines. But the beauty of the town has altered little since Jane Austen described it in *Persuasion* (1816). The Cobb was the scene of Louisa Musgrove's accident in that novel. Jane Austen had stayed at Lyme with her parents in 1804. Pop. 2,620.

**Lymington.** Mun. bor., seaport and market town of Hants, England. The bor., which extends

Lymington borough seal

across some 25 sq. m., includes Pennington, Everton, Milford-on-Sea, Hordle, Ashley, Bashley, Wootton, and Barton-on-Sea. The town of Lymington is a yachting centre, at the entrance to the Solent, 18 m. by rly. S. of Southampton. New Milton station is on

Lymington. The High Street of this Hampshire market town and yachting centre

the main line to London. Lymington is noted for the church of S. Thomas à Becket, which has an extensive gallery. It was a port by the 12th century and a corporate town by the 13th. For 300 years before 1885 it was separately represented in parliament, but now forms part of the New Forest div. Market day, Sat. Pop. of bor., est. 20,000.

**Lymm.** An urban district of Cheshire, England. It is 5 m. E. of Warrington and 16 m. S.W. of Manchester. There are two rly. stations in the district, Lymm and Heatley. The church of S. Mary the Virgin is modern. In the centre of "the village" is an ancient cross, with stocks in front. The Manchester Ship Canal forms

the N. boundary of the district, while the Bridgwater Canal runs through the centre. The general character is residential, but salt is produced in Heatley. Pop. 6,000.

**Lymph** (Lat. *lympa*, water). Fluid which exudes through the thin walls of the minute blood-vessels and comes into intimate contact with the tissues, to which it conveys nutriment. The lymph also gathers up from the tissues the waste products of their activity and passes into small vessels, the lymph capillaries, which open into the larger lymphatic vessels, joining a main trunk, the thoracic duct, which enters the blood-stream at the junction of the jugular and subclavian veins on the left side. There is a smaller duct at the right side. After a meal, the lymph in the thoracic duct is found to be milky in appearance, owing to the presence of fat, and is called chyle.

Lymphatic glands are bodies ranging in size from that of a hemp seed to that of a bean, through which the lymph vessels pass. Their function is to form some of the white corpuscles of the blood. They also act in a sense as filters by which bacteria and their toxins may be separated out. Hence lymphatic glands become enlarged in certain diseases of the blood, and a septic injury leads to their enlargement and perhaps suppuration, a protective mechanism.

**Lympne.** A village of Kent, England. It is 2½ m. W. of Hythe, and has an airfield notable since 1915, when the R.F.C. established a base for ferrying aircraft to France. After the First Great War, Lympne was taken over as a civil airport, with customs and other facilities. A fighter station for most of the Second Great War, it reverted 1946 to the Ministry of Civil Aviation. Pron. Lim.

**Lynceus.** In Greek mythology, one of the fifty

sons of Aegyptus. He was spared by his wife Hypermnestra, one of the fifty Danaides, in defiance of her father's instructions that each of his daughters should kill her husband on the wedding night. See Danaides.

**Lynch, ARTHUR** (1861-1934). Irish writer. Born at Ballarat, Australia, he adopted a military career, and became in 1899 colonel of the Irish brigade which fought against the British in the Boer War. Elected Nationalist M.P. for Galway, 1901, he was arrested on coming to London to take his seat, and sentenced to death for high treason, but was given penal servitude and released in 1904. During the First Great War he was colonel in the British army. Died in London, March 25, 1934. His works include *O'Rourke the Great*, 1922; *My Life Story*, 1924; *The Case against Einstein*, 1933.

**Lynch, PATRICIO** (1825-86). Chilean sailor. Of Irish descent, he was born at Valparaiso, studied at the naval school at Santiago, and served in the war against Peru, 1838. Transferring to the British navy, he saw action in the China War, 1840-42, and afterwards returned to join the Chilean navy. Governor of Valparaiso in 1865, he commanded an expedition against Peru, 1879-80, and won fame at the battle of Chorrillos. Promoted admiral of the Chilean navy and commander-in-chief of the army, he died on returning from a mission to Spain.

**Lynchburg.** City of Virginia, U.S.A., in Campbell co. It is on the James river, 145 m. W.S.W. of Richmond, and is served by the Chesapeake and Ohio and other rlys. The city was named after the quaker, John Lynch, who established a ferry here in 1757; it was incorporated in 1852, having become the leading American tobacco market. Nearly 8,000,000 lb. of tobacco are marketed here annually. Lynch-

Lympne, Kent. Parish church and, right, castle ruins

Lynchburg shoe factories are fourth in national importance. The leading educational institution is the Randolph-Macon college for women. Pop. 44,541.

**Lynching.** Infliction of the death penalty without a proper trial. Though far from unknown elsewhere, the practice of lynching is historically most closely associated with the U.S.A. The term is found in American publications early in the 19th century, but the theories of its derivation from a certain Judge Lynch in Virginia are entirely conjectural. It was originally applied to any kind of punishment inflicted by a self-constituted court without legal authority. During the settlement of W. America it was a common means of punishing horse-stealers and other offenders against the community, and often took the form of flogging or tarring and

man under the signature Y.Y. An essayist of unusual charm and distinction, his publications include

Robert Lynd,  
British essayist

Portraits and Impressions, 1908; The Art of Letters, 1921; The Peal of Bells, 1924; Dr. Johnson and Company, 1928; Life's Little Oddities, 1941; Things One Hears, 1945. He died Oct. 6, 1949. His wife, Sylvia Lynd, *née* Dryhurst (b. 1888), whom he married in 1909, edited the Children's Omnibus, 1932; and her collected poems appeared in 1944.

**Lyndhurst.** Parish and village of Hampshire, England. It stands in the New Forest, 9 m. S.W. of Southampton, with a railway station (Lyndhurst Road). It is a centre for visitors to the forest. The church of S. Michael and All Angels, which contains a fresco of The Ten Virgins by Lord Leighton, is fairly modern. Here is the King's House, containing a hall still used for the meeting of the forest courts, or

courts of Swainmote. Pop. 3,000.

**Lyndhurst, JOHN SINGLETON COPLEY, BARON (1772-1863).** British lawyer. Born at Boston, U.S.A., May 21 1772, he was the son of the painter J. S. Copley (*q.v.*). Educated at Trinity College, Cambridge, he was a successful barrister when elected Tory M.P. for Yarmouth in 1818. Later he sat for Cambridge university and Ashburnham. Solicitor-general in 1819 and attorney-general in 1824, he was appointed lord chancellor and raised to the peerage in 1827. In 1830 he became chief baron of the exchequer, returning to the wool-sack in Peel's ministries of 1834 and 1841-46. Lyndhurst usually

opposed reform, but stood and fell with his chief over the repealing of the Corn Laws. He was a vigorous speaker and a lucid expositor of legal matters. When he died on Oct. 12, 1863, the title lapsed.

**Lyndsay** OR **LINDSAY, SIR DAVID** (c. 1490-1557). Scottish poet. Born near Cupar, he be-

Sir D. Lyndsay,  
Scottish poet  
From a print, 1654

longed to the famous Fife family, the head of which is the earl of Crawford. Educated at St. Andrews, he entered the royal household and was sent abroad on errands of state. He was a member of parliament and joined the reforming party when the Reformation began. His poems, which powerfully if coarsely exposed the corruptions of the Church, are said to have done much to hasten the success of its teaching. They include the Dreame, The Historie of Squyer Meldrum, The Monarchie, and Ane Satyre of the Thrie Estaites, the last named being a satirical morality frequently acted in the open air. There is an edition of his works by D. Laing, 1879.

**Lynmouth.** Village and seaside resort of Devon, England. It stands at the junction of the E. Lyn and the W. Lyn, 18 m. N.E. of Barnstaple, at the base of a cliff, at the top of which stands Lynton. A cliff rly. connects Lynton and Lynmouth, but since the closing of the line to Barnstaple they are the remotest places in

Lyndhurst. View of this Hampshire village, a centre for visitors to the New Forest

feathering. Recently the term has been confined to the death penalty, especially when inflicted by white mobs on negroes in the southern states. Many of these lynchings have been accompanied by the most brutal tortures. Attempts made from time to time to enact a federal anti-lynching law have been defeated by the representatives in congress of the southern states. Yet the number of negro lynchings in the U.S.A. shows a steady decrease from 106 in 1901 to one in 1945.

**Lynd, ROBERT (1879-1949).** British essayist. Born in Belfast, April 20, 1879, he was educated at Queen's College there. Joining the Daily News in 1912 on its amalgamation with the Morning Leader, he became its literary editor in 1913, retaining the position when the paper was merged with the Daily Chronicle to become the News Chronicle. For years he also contributed shrewd and quietly witty articles to The New States-

Lynmouth, Devon. The village and River Lyn, looking inland

England from a rly. There is an old stone pier, and steamer connexion with Ilfracombe.

**Lynn.** City of Massachusetts, U.S.A., in Essex co. It is on Massachusetts Bay, 11 m. N.E. of Boston, and is served by the Boston and Maine and other rlys. It has a secure but rather shallow harbour, and its many industries include the manufacture of boots and shoes, for which it is an important centre. There are foundries, electrical machinery shops, and patent medicine, leather, and box factories. The city has a fine city hall. In Lynn is the former residence of Mary Baker Eddy, founder of Christian Science. Lynn dates from 1629, then known as Saugus, and received its present name in 1673, after King's Lynn, Norfolk, England. It became a city in 1880. Pop. 98,123.

**Lynn, RALPH** (b. 1882). British comedy actor. Born in Manchester, March 18, 1882, he first appeared on the stage at Wigan in 1900, and made his London debut in *By Jingo*, 1914. Achieving fame in *Tons of Money*, 1922, he became one of the most popular entertainers of his time in a series of farces at the Aldwych Theatre (*q.v.*), where his monocle, toothy smile, and vague but genial air endeared him to the public. In film versions of these farces he had an immense following. A long run rewarded his reappearance on the stage in *Is Your Honeymoon Really Necessary?* 1944. *Outrageous Fortune* was produced 1947.

**Lynn, VERA** (b. 1917). British entertainer. The daughter of a plumber, Vera Welch was born at East Ham, March 20, 1917, and sang at charity concerts as a child. She made her first broadcast as a singer with Joe Loss's dance band, and later joined that of Ambrose. During the Second Great War, the "forces' sweetheart" entertained troops in India and Burma, flying some 20,000 m. Broadcasts in person and of her gramophone records of sentimental songs brought her a huge fan-mail.

**Lynn Canal.** Inlet of Alaska. It extends N. from Admiralty Island for about 100 m., and bifurcates at its head into the Chilkat and Chilkot inlets. On the latter stands Skagway, and on the land tongue between the two is the small Chilkat village. The canal forms an important approach to the Klondike mining region.

**Lynskey Tribunal.** See N.V.

**Lynton.** Urban dist. and watering place of Devon, England, situated in the Lorna Doone country.

It stands on a cliff, 400 ft. above Lynmouth, a cliff rly. going from one to the other. It is 17 m. N.E. of Barnstaple. The church of S. Mary is an old building restored. From here coaches and cars go to places of beauty in the neighbourhood, of which Watersmeet and the Valley of the Rocks may be mentioned. Lynton and Lynmouth claim to be the most beautiful places in England. Pop. 2,100.

**Lynx** (Lat. *lynx*). Genus of the cat family. It is distinguished by its heavy build, short tail, tufted ears,

Lynx. Specimen of European species

and bearded cheeks. It occurs in many parts of Europe, in Tibet, and in North America. Two species are found in Europe. The Northern lynx is found in Russia and Scandinavia, and rarely in Central Europe. It inhabited England in the Pleistocene period, and its bones have been found in the N. counties. It is a forest animal, and an expert climber of trees. A fine specimen measures about a yard without the tail, which is about eight inches long. The thick and rather long fur varies in colour from grey to fawn, and in summer is spotted with black. In disposition savage, the lynx preys on birds and mammals, sheep and goats often being destroyed.

The Mediterranean lynx, found from Spain to Turkey, is a lighter and more handsome animal, the reddish coat being finely spotted and streaked. The Isabelline lynx of Tibet avoids the forests and lives among the rocks on open ground. It is paler in colour than the European species. The Canadian lynx, which is slightly smaller and ranges in colour from dark grey to almost white, is found in the forests, and preys mainly on hares and partridges. The bay lynx, reddish in colour, with large, black spots, occurs in the E and S. states of the U.S.A., varying greatly in colour and markings in different districts.

**Lynx.** One of the constellations. Situated between the Great Bear and Cancer, it is very faint, and

contains several well-known double stars. See Constellation.

**Lyon.** Old Scottish form of lion, used now in heraldry. The heraldic office for Scotland is called the Lyon Court, and its head is the Lyon king of arms. The office dates back to 1371, or earlier, and was named from the lion on the royal shield. The lord Lyon is assisted by three heralds, Rothesay, Ross, and Albany, and by three pursuivants, March, Unicorn, and Carrick. All arms or alterations thereon in Scotland must be entered in the Lyon court, where pedigrees are also recorded. The office is the Scottish equivalent of the Heralds' College in England, but is a government office, all its fees being handed over to the Treasury. The Lyon king of arms is registrar of the order of the Thistle. See Heraldry; Knighthood; Thistle.

**Lyonnesse.** Name of a legendary country. It was believed to have lain off the coast of Cornwall, and to have disappeared under the sea; according to another legend it included Cornwall. The name appears in the old county of Léon in Brittany. Cornish and Breton folklore is full of references to this lost land, which also serves as the scene of events described in the Arthurian legends. In it was Camelot, King Arthur's capital.

**Lyonnais.** Former county of France, also a province until the Revolution. The county extended along the right bank of the Saône and Rhône, from Villefranche to Condrieu below Vienne, with a small district on the left banks of both rivers around Lyons, the capital. It corresponds roughly with the S. half of the dept. of Rhône, with a small portion of Loire. The territory of the Gallic Segusii, it belonged in turn to the Burgundians, the Franks, the kingdom of Arles or Provence, from which it passed to the Empire, 1033, and became a possession of the archbishops of Lyons. Philip IV, the Fair, annexed it to France in 1312. The province of Lyonnais comprised the depts. of Rhône, Loire, Haute-Loire, and Puy-de-Dôme. See Lyons.

**Lyons** (Fr. Lyon). A city of France, fourth in respect of pop. (counting Algiers), and cap. of Rhône dept. It

Lyons arms

lies at the confluence of the Rhône and Saône, which divide the city into three main portions: the old town on the strip between

the rivers, the quarters of Les Brotteaux and La Guillotière on the left bank of the Rhône, and those of Vaise, Fourvière, and St. Irénée, on the hills lying on the right bank of the Saône; La Croix-Rousse lies between the river to the N. The town is a rly. centre of great importance, 317 m. from Paris *via* Dijon, has seven passenger stations and by its position on the two navigable rivers, lined with busy quays, has a large volume of waterway traffic.

Lyons is the seat of an archbishop and of an ecclesiastical as well as of a state university, both

between the First and Second Great Wars. Lyons is conveniently close to the coalfields of St. Étienne, and electrical power from the French Alps is also available.

In the narrow, old streets in the heart of the city, many medieval buildings survive. Near the Manécanterie, the school of the choir singers (10th cent.), the cathedral of S. Jean (12th to 15th cents.), with fine glass paintings, an astronomical clock, and a valuable treasure, stands out. S. Martin d'Ainay, a 6th cent. basilica, with additions of the 10th to 13th, and the Hôtel Dieu, a hospital founded

tions are famous. Its old established wealth and patrician society have produced an art, musical, theatre, and sports life second only to that of Paris. Much of its 20th cent. development was due to Édouard Herriot (*q.v.*), who, becoming mayor in 1905, gave his city an exemplary administration.

The history of Lyons has been chequered, often tragic. As Lugdunum, it was the capital of the Segusavian Celts, became a Roman colony in 43 B.C., later capital of Gallia Lugdunensis, was the birthplace of the emperors Claudius, Marcus Aurelius, and Caracalla; was burnt down by Septimius Severus in 197 A.D., after being Christianised by Saints Pothinus and Irenaeus; was made a bishopric, then, from the 5th cent., an archbishopric; fell first to the Burgundians, then to the Franks, forming the Lyonnais county which was, 1083, embodied in the German empire. When it asked for French protection, 1274, Philippe le Beau granted it urban rights. The 13th

of four faculties, and each with 3,000–4,000 students. Lyons has also a technical university, the école centrale Lyonnaise, and special colleges, etc., for colonial, agricultural, architectural, art, veterinary, and other studies. Among its six public libraries, the local one holds 450,000 vols., more than 1,000 incunabulae, and 5,000 MSS., among them the famous Codex Lugdunensis, illuminated French, Latin, and Persian MSS., and 25,000 engravings; among its museums, that of the history of textiles is unique: it holds 400,000 samples and the most complete collection of lace in the world. Other collections deal with zoology, botany, geography, painting, glyptics, numismatics, antiquities, colonies, industries (esp. silk), etc.

Lyons is generally counted the second industrial centre of France, noted chiefly for its silk manufacture. Introduced from Italy in the early 15th cent., silk has remained the staple commodity of Lyons, the trade being revolutionised by the loom invented by J. M. Jacquard (1752–1834). Such allied trades as hat-making, lace, etc., and nearly all other French industries are represented in Lyons and its suburbs. Furthermore, the city is an important financial centre, headquarters of the Crédit Lyonnais and other banks. The Lyons commercial fair, held twice yearly, was founded in 1916 as a challenge to the supremacy of that of Leipzig, and made rapid progress

in the 6th cent. by King Childebert, S. Bonaventure (14th to 15th), and S. Nizier (15th cent.) represent the Middle Ages; a town hall of 1646–55, with a 130-ft. belfry, and the arts palace, formerly a convent, of 1667, represent the Renaissance. The dominating pile, however, is Notre Dame de Fourvière (1872–84), a Romanesque basilica, on the 1,000-ft. Fourvière hill, with four Byzantine towers. From there—one of France's most famous centres of pilgrimage—and from the nearby "tour métallique," a tower in steel framework, there is a beautiful view over Lyons and its surroundings.

A number of impressive squares—place Bellecour, between the two rivers, place des Terreaux, with public buildings—and open spaces like the parc de la Tête d'Or, together with the green hills, the rivers, and their 30 bridges, the zoological and botanical gardens, and the widespread buildings of the fair contribute to make Lyons an attractive city. Its culinary attrac-

and 14th papal concilia were held there, 1245 and 1274; after being enriched by the immigration of Italian silk weavers, it suffered heavily in the Huguenot wars.

During the French Revolution Lyons revolted against the regime of terror, was stormed in 1793, partly destroyed, and 6,000 of its citizens were executed. Labour conflicts, etc., led to other severe military reprisals in 1831, 1834, 1840, 1849, and 1871. During 1814 and 1815 it was occupied by

Austrian forces. In Nov., 1930, a landslide wrought havoc in the sector built on the Fourvière hill.

During the Second Great War, Lyons was taken by the Germans June 20, 1940, but under the Franco-German armistice was in unoccupied France, under the jurisdiction of the Vichy govt. On September 22 the municipal council was suspended for the duration of the war, being replaced by a govt. commissioner. Its factories and rly. communications were bombed by the Allied air forces in the spring and summer of 1944, and on Sept. 3, 1944, it was liberated by the U.S. 7th army, the Germans having withdrawn after destroying all the Rhône bridges, including the 12th cent. Guillelière bridge, and all but two over the Saône. The dome of the Hôtel Dieu had been destroyed by fire, but the city was otherwise little damaged. Pop. 460,748.

**Lyons, COUNCIL OF.** Name given to two ecclesiastical assemblies at Lyons. At the first, held under Innocent IV, June 28-July 17, 1245, the emperor Frederick II was deposed. At the second, held under Gregory X, May 7-June 17, 1274, the temporary union of the Greek and Latin Churches was effected. In church history the councils of Lyons rank as the 13th and 14th ecumenical or general councils.

**Lyons, RICHARD BICKERTON PEMELL LYONS, 1ST EARL (1817-87).** British diplomatist. Son of

1st Earl Lyons, British statesman

Edmund, Lord Lyons, he was born at Lymington, April 26, 1817, and was educated at Winchester and Christ Church, Oxford. In 1839 he entered the diplomatic service, passed some years at Dresden, Florence, and Rome, and in 1858 was appointed ambassador to

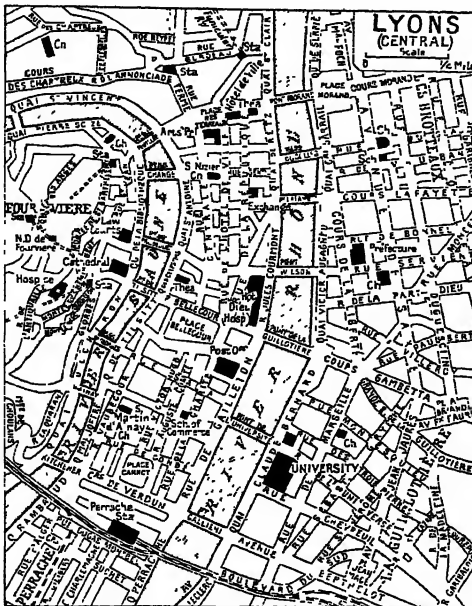

Washington. His attitude during the Civil War was firm, and he carried through with tact the negotiations regarding the Confederate envoys, Mason and Slidell. In 1865 he was transferred to Constantinople, and two years later to Paris. Accompanying the provisional government to Tours, he represented Great Britain while the Third Republic was being established. He resigned his post in Nov., 1887, and died Dec. 5. He had inherited a barony in 1858 and been made an earl in 1887, but both titles became extinct on his death.

**Lyons, EDMUND LYONS, 1ST BARON (1790-1858).** British sailor. Born at Burton, Hants, Nov. 29, 1790, he went to sea in 1803, and distinguished himself in engagements off the Dutch Spice Islands, 1810. The following year he seized

1st Baron Lyons, British sailor

Marrack, a feat carried out in excess of his orders, but ill-health forced his return to England in 1812, and two years later he retired. In 1828 he was sent to the Mediterranean, played a hand in the confused game of Greek politics, and in 1835 was appointed minister plenipotentiary at Athens.

Lyons, France. Pre-war plan of the great commercial city; most of the bridges were destroyed in 1944

Transferred to Berne, 1849, and in 1851 to Stockholm, he was recalled in 1853 and sent to the Mediterranean as second in command of the fleet dispatched on the outbreak of the Crimean War. In 1855 he succeeded Dundas in command of the fleet. Retiring in 1858, he died Nov. 24. For two years he had been a baron.

**Lyons, SIR HENRY (1864-1944).** British scientist. Born in London, Oct. 11, 1864, he was the son of a general who had governed Bermuda. Commissioned in the Royal Engineers, he was interested in geology, serving as director of the survey department of the Egyptian government from 1898 to 1909. Lyons's scientific work was important economically as well as geographically, and he became F.R.S., 1900. During the First Great War meteorology claimed his attention; he organized services for the British armies in France, and in 1918 was director of the Meteorological Office. After the war he assumed the directorate of the Science Museum, London, a post he held until 1933. He was knighted in 1926. He became first secretary of the international union of geodesy and geophysics, and later secretary of the international council of scientific unions. He was also president of the Royal Meteorological Society. Lyons died Aug. 10, 1944.

**Lyons, SIR JOSEPH (c. 1847-1917).** British business man. A Londoner, he was educated at a Jewish school. He studied art and had some success with water-colour drawings, but by chance his attention was turned to the subject of catering for the masses. With two friends, Isidore and Montagu Gluckstein, he began to cater for exhibitions, etc., and in 1894 the firm of J. Lyons & Co. opened its first tearoom. Others followed, both in London and in the provinces, and before Sir Joseph died his was the largest business of its kind in the U.K. Knighted in 1911, he was chiefly interested outside his business in the Territorial Force. He died June 22, 1917.

**Lyons, JOSEPH ALOYSIUS (1879-1939).** Australian statesman. Born at Stanley, Tasmania, Sept. 15, 1879, he became a school teacher, and was elected to the island house of representatives in 1909. He held government posts from 1914 and was premier of Tasmania, 1923-28. He became postmaster-general and minister for public works in the Commonwealth government, 1929-31. Then he founded the

Joseph A. Lyons,  
Australian statesman

United Australia party, and after leading the opposition, became prime minister in 1932 and was made a privy councillor. He represented Australia at George V's silver jubilee celebrations, at the Imperial trade conference in 1935, and at the coronation of King George VI in 1937. That year he began his third successive term as premier of the Commonwealth, an office he held until his death on April 7, 1939.

**Lyons' Inn.** Old London inn of chancery. It stood between Wych St. and Holywell St., Strand, existed in the time of Henry VIII or earlier, and was attached to the Inner Temple from 1581 to 1863, when it was pulled down, and the Globe and Opéra Comique theatres were built upon its site. The last vestige of the inn, which once had Sir Edward Coke as reader, disappeared with the two playhouses in 1902 during the construction of Aldwych (q.v.). Its history is associated with the murder of William Weare, a resident, by Thurtell and Hunt, in 1823, the theme of a mock Catnach ballad by Theodore Hook and a novel by Thomas Burke. See Holywell Street; Inns of Court.

**Lyra.** One of the constellations. Though a small group of stars, it contains the great and brilliant Vega, one of the most conspicuous stars of summer skies. Vega forms one of the points of an equilateral triangle, at the other angles of which are epsilon and zeta Lyrae. Zeta, beta, gamma, and delta of the constellation form a little rhomboid. These stars are all visual doubles. Lyra is close to the borders of the Milky Way, near Cygnus. The constellation is also remarkable for the ring nebula, Messier 57.

**Lyre.** Musical stringed instrument, used in ancient and medieval times. It consisted of a hollow box or resonator with two projecting arms support-

Lyre. Diagram explaining construction of Greek lyre. A. Resonator. BB. Horns or uprights. C. Cross-bar

ing a cross-bar from which about seven strings were stretched. The strings were plucked by the fingers or with a plectrum. The lyre was akin to the harp, but with fewer strings, and was a relation also of the lute, but without finger-board. The diagram will make these distinctions clear.

The shape of the lyre, which has differed in detail from time to time

Lyre. Restoration of lyre discovered at Ur (about 3,500 B.C.). It is decorated with mosaic and a bull's head in gold

Courtesy of Joint Expedition to Ur

without departing from its general principles, has been said to have been derived originally from the top of the skull and the horns of a bull or goat. See Greek Art.

**Lyre Bird.** Genus of birds (*Menura*) found in the forests of Australia. They gain their name from the extraordinary development of the tail in the males; the two outer feathers being curved in the form of the frame of a lyre, while the intermediate ones are slender and provided with few barbs, thus suggesting the strings. The several species vary in the colour of their plumage; all spend most of their time on the ground, in the denser parts of the bush, where they feed upon snails, insects, and worms. They seldom fly, but can run fast. See Birds, colour plate.

**Lyric** (Gr. *lyra*, a lyre). Name given to a poem, or form of poetry, so called since it was originally composed to be sung to, or accompanied on the lyre, as distinguished from forms more suited to declamation or recitation. The term, however, has long been applied to many types of verse which have few or none of the characteristics of song. Poetry sometimes spontaneous, sometimes meditative, often slow in movement and reflective in character, like many English sonnets, is in the absence of more exact terminology, usually described as lyrical. The ode, hymn, song, and some types of elegy and ballad are examples of true lyric, which commonly treats

of personal, patriotic, devotional, or amatory themes, in which the emotional, as distinct from the narrative element, is conspicuous.

In primitive periods, when dance, music, and song were closely associated, poetry was altogether choral, and in the refrain or chorus, still surviving in some modern songs, we have the germ of lyrical, as indeed of all poetry, which, like speech itself, is communal in origin. As individuality and civilization developed, the chorus fell silent, and poetry became more of a personal utterance. Broadly speaking, then, lyrical poetry is intimate, personal, subjective, descriptive of the joys, sorrows, hopes, and aspirations of the individual, and by the lyrical cry is meant the cry of the heart, of the more poignant emotions. In the more formal and elaborate modes, however, like that of Alexander's Feast or Wordsworth's Ode on Intimations of Immortality, it frequently develops themes in a rhetorical or philosophical spirit, while in some poems, like the

Lyre Bird. Male specimen of the Australian bird

Robin Hood Ballads or Scott's Rosabelle (Lay of the Last Minstrel), the subject is treated in the objective narrative manner.

In lyrics we have the choice and sublimated essence of poetry, the pure elixir, which in other poetic forms, like epic or drama, is in some degree mixed with foreign matter, rich, it may be, in interest, but of a different order, in which prosaic elements are still present. In this rapturous singing region those poets rank highest who, like Shelley, seem at times almost to have made good their escape from the world of common life.

Lyrical poetry, it may be said, most nearly approaches music itself, interpreting emotions hardly to be conveyed in articulate speech. It offers us little beyond itself, its own inherent interest, "whose peculiarity lies in the isolation of the pleasure it gives from life and social conditions." On the other hand, poetry which illuminates and interprets human experience, like that of Wordsworth, in whom the singing note is less clearly heard, but in whom we have a "noble and profound application of ideas to life," even if less purely lyrical, cannot be regarded as less, and by some minds will always be regarded as more, precious. The truth is, poetry has outgrown the early categories, and it is the especial glory of English literature, as displayed in the astonishing variety of its themes, that it has captured for lyrical poetry new territory and enlarged the kingdom of the imagination. *See English Literature; Poetry.*

W. McNeile Dixon

**Lyric Theatre.** London playhouse in Shaftesbury Avenue, W.1. It was opened Dec. 17, 1888, with a production of the comic opera *Dorothy*, and became the home of well-known musical comedies, e.g. *La Cigale*, 1890; *The Chocolate Soldier*, 1910; *The Girl in the Taxi*, 1912; *Lilac Time*, 1922. Among notable dramas presented here were *Autumn Crocus*, 1931; *Dangerous Corner*, 1932; *Tovarich*, 1935; *Amphitryon '38*, 1938; *The Winslow Boy*, 1946. The theatre seats 1,475.

**Lyric Theatre, HAMMERSMITH.** Playhouse opened Nov. 17, 1890. Though a suburban theatre, it became nationally famous under the direction, 1918-32, of Sir Nigel Playfair (*q.v.*), whose revival of *The Beggars' Opera* in 1920 ran for 1,463 performances. Other successes were A. P. Herbert's *Riverside Nights*, 1926, and *Tantivy Towers*, 1931. The Company of Four, a non-profit-making organization associated with the Arts Council, assumed control in 1945, and gave plays by European dramatists, Sartre, Molnar, and Cocteau. The theatre seats 800.

**Lys.** A river of France and Belgium. It rises in the Pas-de-Calais, between Boulogne and Lille, and flows mainly N.E. Between Aire and Armentières it crosses a flat, low plain, naturally a marsh, and finally joins the Schelde at Ghent. The middle section of the valley is one of the most densely peopled areas in the world. There are steel works at Isebergues in the

French section, while the towns lower down are noted centres of the linen industry. The Ypres canal joins the Yser with the Lys at Comines. Its length is 120 m., most of which is navigable.

The river was prominent throughout the First Great War, from the first battle of Ypres in 1914 to Oct. 16, 1918, when in the final battles the British reached the left bank, forcing a passage at Beveren a few days later. During the Second Great War there was fighting on the Lys in 1940. A lightning German advance had by May 21 made it necessary for the British and Belgians to fall back from their positions along the Schelde; the Belgians held a sector from Terneuzen to Ghent and thence along the Lys to Halluin, while the British on their right covered Lille and Douai. On May 24 the Germans breached the Belgian line on a front of 13 m. in the Courtrai area. The British, their left threatened and their hopes of closing the gap between themselves and the main French armies rapidly vanishing, retired to positions on the Lys between Merville and Comines, May 27-28, just as the Belgians asked for an armistice. The Germans made no attempt to stand on the Lys during the rapid advance of the British 2nd army from the Seine to Antwerp, Aug. 30-Sept. 4, 1944.

**Lysander.** Army cooperation aeroplane designed by Westland Aircraft, Ltd., for the R.A.F. The first specialised machine of its class, the Lysander equipped several first-line squadrons in Flanders and France, 1940, and later was adapted for such duties as landing agents and providing supplies for the underground movement in Europe. It was widely used as a target tug and for air-sea rescue. Fitted with a single Bristol Mercury or Perseus radial engine, the Lysander carried a crew of two at a maximum speed of 212 m.p.h. It had a slow flight and short take-off and landing run. The wing span was 50 ft.

**Lysander** (d. 395 B.C.). Spartan general and statesman. He rose to fame during the latter period of the Peloponnesian War (*q.v.*). As commander of the Spartan fleet, off the coast of Asia Minor, he ingratiated himself by skilful diplomacy with Cyrus the Younger, and received from him subsidies for the Spartans, which proved a factor in their triumph. In 405 B.C. his fleet defeated that of the Athenians at the battle of Aegospotami, which virtually brought the Pelopon-

nesian War to an end. In the following year he took Athens, destroyed the famous Long Walls, and established the rule of the thirty tyrants to keep in subjection the anti-Spartan democracy. In 396 he accompanied the Spartan king, Agesilaus, on his campaigns against the Persians in Asia Minor, and was killed in 395 at the battle of Haliartus in the Boeotian War.

**Lysander.** Character in Shakespeare's comedy, *A Midsummer Night's Dream*. In love with Hermia, he is forbidden to marry her by her father, who has selected Demetrius as a husband. Lysander knows that "the course of true love never did run smooth," but proves constant despite adventures by night in a wood near Athens, and all ends happily.

**Lysenko Controversy.** *See Genetics in N.V.*

**Lysias** (c. 459-278 B.C.). Greek orator, born at Athens, of Syracusan descent. The thirty tyrants took his property, and slew his brother, Polemarchus, 404. When the thirty were overthrown he impeached one of them, Erasthenes, in a brilliant speech. There are 34 extant speeches of Lysias, who was the first to introduce into oratory the plain straightforward language of everyday life, and was regarded as the model of the simple style of oratory. *See Greek Literature.*

**Lysimachus** (c. 360-281 B.C.). Macedonian general and king of Thrace. On the death of his master, Alexander the Great, in 323, he was made governor of Thrace and the country to the N., and assumed the title of king in 306. In the fighting which broke out among the successors of Alexander he was able, as a result of the successful battle of Ipsus in 301, to add to his dominions, obtaining control of a slice of Asia Minor. By 287 he was ruler of all the old kingdom of Macedonia, in addition to his Asiatic territories. Having killed his son, Agathocles, he incurred the enmity of Seleucus, king of Syria, who gained a victory at Corus, in Asia Minor, in which Lysimachus was killed.

**Lysippus.** Greek sculptor of the 4th century B.C. He belonged to the school of Argos of Sicyon. No authentic example remains of his 1,500 statues, mostly bronze, but there are many reproductions. He made a series of statues of Alexander the Great, who refused to employ any other sculptor.

**Lysistrata.** Comedy by Aristophanes. It appeared about 411 B.C., shortly before Peisander

arrived in Athens from Samos to put in practice an oligarchic policy, and represents a women's conspiracy to bring about peace. The war between Athens and Sparta having been renewed, Lysistrata, "disbander of armies," persuades the Athenian matrons to desert their husbands and refuse to return home until peace is again established. Confronted with this strike of wives, the men are rendered powerless: the women occupy the citadel, and bring the citizens to surrender.

**Lyskamm** OR SILBERBAST. A mountain of the Monte Rosa Group on the Italo-Swiss border. The E. peak has an alt. of 14,860 ft., and is ascended via the Lysjoch (14,030 ft.). The ascent is dangerous. The W. summit, 14,688 ft. in alt., is ascended from the Quintino Sella Hut (alt. 11,815 ft.). See Alps.

**Lysol**. Widely used disinfectant containing 50 p.c. by volume of cresol dissolved in water by the addition of soap made from a fixed vegetable oil and caustic soda or potash. In some places outside the U.K. Lysol is a proprietary term.

**Lysons, DANIEL** (1762-1834). British topographer. Born April 28, 1762, and educated at Bath grammar school and S. Mary Hall, Oxford, he became curate of Mortlake, then of Putney, and later succeeded to the living of Rodmarton, Glos., dying at Hempstead Court, Jan. 3, 1834. He is best known as the author of a valuable work on *The Environs of London*, 1792-96, of which a second edition appeared in 1811.

**Lysons, SAMUEL** (1763-1819). British antiquary. Second son of the rector of Rodmarton, Glos., he was born May 17, 1763, educated at Bath grammar school, and called to the bar in 1798. In 1803 he became keeper of the records at the Tower of London. An artist, he exhibited at the Academy, contributed etchings to his brother Daniel's *Environs of London*, and worked for many years on his *Reliquiae Britannico-Romanae*, containing *Figures of Roman Antiquities Discovered in England*, 1801-17. He died June 29, 1819.

**Lystra**. City of Lycaonia in Asia Minor, the modern Khatyn Serai. It was several times visited by S. Paul, and it was here that the people wished to offer sacrifice to him and S. Barnabas, supposing them to be incarnations of Mercury and Jupiter (Acts 14).

**Lyte, HENRY FRANCIS** (1793-1847). British hymn writer. Born at Ednam, Roxburghshire, June 1,

1793, he was educated at Portora, Ireland, and Trinity College, Dublin. Ordained in 1815, he was incumbent of All Saints, Lower Brixham, 1823-44. Popular among the fisher folk, he wrote songs for sailors, and founded a large Sunday school. Despite Poems Chiefly Religious, 1833, and The Spirit of the Psalms, 1834, he is chiefly remembered for the hymn, Abide with Me. This was written in late summer, 1847: Lyte died Nov. 20 at Nice. Praise my soul, the King of Heaven is also his.

**Lytham St. Annes**. British holiday resort. On the N.W. coast of Lancashire, at the mouth of the Ribble, 13 m. W. of Preston, it is reached by road, rly., or steamer. In 1922 the urban districts of Lytham and St. Annes were incorporated by Charter as a borough, of which the N. touches Blackpool. There are promenades and a pier, good bathing and golf, remedial baths, gardens, and facilities for riding and yachting. Pop. 30,000.

**Lythraceae**. Family of herbs and shrubs. They are natives chiefly of the tropics, but have a well-known European representative in the purple loosestrife (*Lythrum salicaria*). The leaves are opposite or in whorls. The family includes such plants as henna (*Lawsonia inermis*) and pomegranate (*Punica granatum*).

**Lyttelton**. Chief port of the district of Canterbury, New Zealand. It has a fine natural harbour, 10 m. by 2 m., encircled by steep hills tunnelled to give access to Christchurch, 7 m. to N.W. It has a large gravelling dock and exports wool and grain. Pop. 3,407.

**Lyttelton, GEORGE LYTTTELTON**, 1ST BARON (1709-73). British politician. He was born Jan. 17, 1709, at Hagley, his mother being one of the Temples of Stowe. Educated at Eton and Christ Church, Oxford, he entered the house of commons in 1735 for Okehampton,

being already one of the intimates of Frederick, prince of Wales. In 1755 he became chancellor of the

exchequer, but in 1756 he retired and was made a peer. An active politician until his death, Aug. 22, 1773, Lyttelton was regarded as an orator, and was a voluminous writer, but his influential position was due really to family connexions. His most ambitious works are *Life of Henry II*; and *Observations on the Conversion and Apostleship of S. Paul*, 1747. His successor was his son Thomas.

**Lyttelton, THOMAS LYTTTELTON**, 2ND BARON (1744-79). British politician. Born at Hagley, Jan. 30, 1744, he was the eldest son of the 1st lord. Educated at Eton and Christ Church, Oxford, he entered parliament for Bewdley in 1768, but was unseated in 1769. In 1773 he succeeded to the peerage, and was a constant speaker in the house of lords. Known as the Bad Lord Lyttelton, he pursued a vicious life notorious even in that age, but was regarded as a man of ability. On Nov. 24, 1779, being apparently in good health, he dreamed he was warned by a woman that he had only three days to live. On the 27th, at Hill Place, Epsom, he died just before midnight. It has been stated that he suffered from heart disease and took drugs. On his death the barony became extinct. It was revived 1794 in favour of an uncle, William Henry Lyttelton (1724-1808). A *Life of Thomas*, 2nd baron, by R. Blunt, came out in 1936.

**Lyttelton, GEORGE WILLIAM LYTTTELTON**, 4TH BARON (1817-76). British publicist. Eldest son of the 3rd Lord Lyttelton, of the second creation, he was born in London, March 31, 1817. Educated at Eton and Trinity College, Cambridge, he was bracketed senior classic in 1838. In 1837 he had succeeded to the peerage, and in 1846 was made under-secretary for the colonies, but his main interests were outside politics. He joined in founding the Anglican settlement of Canterbury, N.Z., a fact commemorated by the name of the borough of Lyttelton. He was an active supporter of the

Church of England, and during 1869-74 was chief commissioner of endowed schools. On April 19, 1876, in a melancholy fit he threw himself from a staircase, dying soon afterwards. Lyttelton married in 1839 the younger daughter of Sir Stephen Glynne, whose elder daughter on the same day married Gladstone. Of their eight sons, one became Viscount Cobham, and three others are noticed below.

**Lyttelton, ALFRED (1857-1913).** British politician and athlete. Born Feb. 7, 1857, the youngest

Alfred Lyttelton,  
British politician  
Russell

son of the 4th Lord Lyttelton, he was educated at Eton and Trinity College, Cambridge, and was called to the bar at the Inner Temple. After taking silk he became successively recorder of Hereford and of Oxford and chancellor of the diocese of Rochester. In 1895 he was returned to parliament as Unionist M.P. for Warwick and Leamington. He had acted as chairman of the Transvaal concessions commission in South Africa, and on his return in 1903 he was chosen colonial secretary. It was his lot to face the storm that arose about the employment of Chinese in the Transvaal. In 1906 he left office and lost his seat at Warwick, but was returned the same year for St. George's, Hanover Square, and kept the seat until his death, July 5, 1913.

If only of average ability as a politician, Lyttelton was a supreme athlete. At almost every ball game he was a master. At Eton and Cambridge he captained the cricket eleven, and he kept wicket for England against Australia. He played association football for England; rackets and football for Cambridge, and 1882-95 was amateur champion at tennis. He was twice married, first to Laura Tennant, then to Edith Balfour, who wrote his Life, 1917.

**Lyttelton, EDWARD (1855-1942).** A British schoolmaster. Born in London, July 23, 1855, the seventh son of the 4th Lord Lyttelton, he was educated at Eton and Trinity College, Cambridge. Like his brothers, he was a fine cricketer, and captained the university eleven. He began teaching in 1880 at Wellington College, and in 1882, after taking holy orders,

went to Eton. From 1890 he was headmaster of Haileybury until in 1905 he was chosen head of Eton. He resigned in 1916, and during 1918-20 was rector at Sidestrand, Norfolk. He wrote *Cricket, 1890; Character and Religion, 1912; Whither? 1931.* He died Jan. 26, 1942.

Edward Lyttelton,  
British schoolmaster  
Russell

**Lyttelton, SIR NEVILLE GERALD (1845-1931).** British soldier. Born Oct. 28, 1845, 3rd son of the 4th Lord Lyttelton, he went to Eton and Sandhurst, and was commissioned in the Rifle Brigade in 1865. He served against the Fenians in Canada, 1866, and in Egypt, 1882, before commanding a brigade in the Nile expedition, 1898, and a division in the S. African War. He was c.-in.-c. in S. Africa, 1902-04, being knighted in 1902. Next he was chief of the general staff, and during 1908-12 was c.-in.-c. in Ireland. Lastly he was appointed governor of Chelsea Hospital. His reminiscences were published in 1927, under the title *Eighty Years*. Died July 6, 1931.

**Lyttelton, OLIVER (b. 1893).** British politician. Eldest son of Alfred Lyttelton (q.v.), he was born March 15, 1893. Educated like many of his family at Eton and Trinity, Cambridge, he was in the army throughout the First Great War. A City business man, in 1939

Oliver Lyttelton,  
British politician

he was appointed controller of non-ferrous metals in the ministry of supply, but did not enter parliament until 1940, when he became Conservative member for Aldershot. In Oct., 1940, he became president of the board of trade, but relinquished this post in July, 1941, to go as minister of state to the Middle East. He was minister of production from 1942 until the dissolution in 1945.

**Lytton, EDWARD ROBERT LYTTON, 1ST EARL OF (1831-91).** British diplomatist and poet. Born in London, Nov. 8, 1831, son of the 1st Baron Lytton, he was educated at Harrow and Bonn, and began his diplomatic career in 1849 as private secretary to his uncle, Sir Henry

Bulwer, the British minister at Washington. He occupied positions in the embassies at Florence, Paris, The Hague, Vienna, Athens, Lisbon, and Madrid. In 1873 he succeeded his father in the barony; in 1876 he was appointed viceroy of India. On his resignation in 1880 he was created an earl. From 1887 he was again ambassador in Paris, where he died Nov. 24, 1891.

Known as an author by the pseudonym of Owen Meredith, he wrote *Clytemnestra and Other Poems, 1855; The Wanderer, a collection of lyrics, 1857; Lucile, a tale in verse, 1860; Glenavert or the Metamorphoses, a narrative poem, 1885; King Poppy, 1892.* His poetry is facile and cultured, but lacking in inspiration. He published two volumes of a biography of his father in 1883.

**Lytton, VICTOR ALEXANDER GEORGE ROBERT LYTTON, 2ND EARL OF (1876-1947).** A British administrator and author. Son of the 1st earl, whom he succeeded in 1891, he was born at Simla, Aug. 9, 1876, and educated at Eton and Trinity College, Cambridge. In 1901 he was assistant to the secretary for Ireland. Civil lord of the Admiralty, 1916, and under-secretary for India, 1920, he was governor of Bengal, 1922-27, during a period of unrest, and viceroy of India, April-Aug., 1925.

From 1927 he played a leading part in the work of the League of Nations Union. In 1932 he was chairman of the commission on Japan's occupation of Manchuria. As a result of the Lytton report, Japan was condemned by the League of Nations for having taken military action, and in 1933 she gave notice to quit the League. The earl's advocacy of internationalism was carried on in the United Nations Association, of which he was chairman at the end of the Second Great War. Lytton did much to promote social clubs, and was interested in town planning and in the arts, being president of the Royal Society of Literature. He wrote a biography of his grandfather, the 1st baron, 1913; *The Web of Life, 1938; Pundits and Elephants (autobiography), 1942; Love Incarnate, 1946.* Antony: *A Record of Youth, 1935*, commemorated his elder son, Viscount Knebworth.

1st Earl of Lytton,  
British diplomatist

killed flying in 1933. As his younger son was killed in action in 1942, a brother, Neville Stephen (b. Feb. 6, 1879), succeeded to the title when Lord Lytton died, Oct. 25, 1947.

**Lytton, EDWARD GEORGE EARLE** LYTTON BULWER-LYTTON, 1ST BARON (1803-73). British writer and statesman. Born in London, May 25, 1803, he was the 3rd son

*Lytton*

From a drawing by D. Laugée

of General Bulwer, of Wood Dalling, Norfolk, his mother being a Lytton of Knebworth, Herts. From private schools and tutors he proceeded to Cambridge, Trinity College and then Trinity Hall. A precocious child, he began to write verse at seven.

Of his many novels, which enjoyed a tremendous contemporary vogue, and some of which, like others among his works, were issued anonymously, the more notable are *Pelham*, 1828; *Paul Clifford*, 1830; *Eugene Aram*, 1832; *The Last Days of Pompeii*, 1834; *Rienzi*, 1835; *The Last of the Barons*, 1843; *Harold*, 1848; *The Caxtons*, 1849; *My Novel*, 1853; *What Will He Do With It?* 1858; *The Parisians*, 1873; *Kenelm Chillingly*, the same year and to some extent autobiographical. He wrote short stories, *The Haunters* and *The Haunted*, 1857; *A Strange Story*, 1862; also a prophecy of the future, *The Coming Race*, 1871. Of his plays, *The Lady of Lyons*, 1838; *Richelieu*, 1839; and *Money*, 1840, have been occasionally revived. His other works include *England and the English*, 1833; *Athens, Its Rise and Fall*, 1837.

At first a Liberal in politics, Bulwer was M.P. for St. Ives, Hunts, 1831, and Lincoln, 1832-41. He sat for Herts as a Conservative, 1852-66, and was colonial secretary, 1858-59, displaying much administrative insight and ability. Made a baronet in 1838, when he inherited Knebworth and adopted the name of Bulwer-Lytton, he was created a baron in 1866, a G.C.M.G. in 1870, and was twice lord rector of Glasgow university. In 1827 he married Rosina Doyle Wheeler (1802-82), by whom he had one son, Edward Robert (1831-91), the 1st earl of Lytton; and one daughter, Emma (1828-48). The marriage was opposed by his mother; husband and wife separated in 1836, and the story of their unhappiness is one of the most poignant in English literary history. He died at Torquay, Jan. 18, 1873, and was buried in Westminster Abbey.

Lytton revived the novel, and with Carlyle and Coleridge helped to introduce German scholarship to England. Despite the variety and volume of his work, he was a writer whose industry was as remarkable as his versatility. He lacked taste and was deficient in characterisation. He over-sentimentalised and over-moralised; his melancholy drifted into the tedious or approached the maudlin. But he knew how to fashion a plot, was a sincere student in letters and in the region of the occult, and in spite of all his defects there is much in his novels, speeches, essays, and correspondence that is of permanent interest and value. The first to give encouragement to Browning in print, he worked in and out of parliament for his fellow authors.

**W. F. Aitken**  
*Bibliography.* Works, 37 vols., 1873-75; Lives, T. Cooper, 1873; 2nd earl of Lytton, 1913; Letters to his Wife, 1884; A Panorama, M. Sadleir, 1931.

**Lytton, SIR HENRY ALFRED** (1867-1936). British actor. Born in London, Jan. 3, 1867, he was educated at S. Mark's College, Chelsea, and later joined the chorus of the D'Oyly Carte touring company, first appearing in

Sir Henry Lytton,  
British actor

Sullivan repertory. He played in all as many as 30 of these characters, but eventually was chiefly identified with the comedy parts originally played by Grossmith, e.g. Ko-Ko, in the *Mikado*; Jack Point in the *Yeomen of the Guard*. For 25 years from 1909 he appeared exclusively in these operas, reaching wide popularity. His impish sense of fun was admirably suited to their peculiar form. After his retirement from the D'Oyly Carte co., he appeared in pantomime at Birmingham. Knighted in 1930, he retired in 1934, the jubilee year of his first appearance. He published *Secrets of a Savoyard*, 1922; *A Wandering Minstrel*, 1933. Lytton died Aug. 15, 1936.

**Lytton, ROSINA DOYLE BULWER-LYTTON, LADY** (1802-82). Wife of the first Baron Lytton (q.v.). Born Nov. 2, 1802, at Ballywire, co. Limerick, daughter of F. M. Wheeler, she passed an early home life almost without restraint. When 10 she accompanied her mother on a long visit to Sir John Doyle, governor of Guernsey, with whom, during her mother's absence in France, she afterwards lived in London, becoming associ-

Rosina, Lady Lytton  
From a drawing by  
A. E. Chalon

ated with Lady Caroline Lamb and others of the Bohemian literary set. Her engagement to Bulwer was broken off three times before the marriage took place in Aug., 1827. Before the final separation she lived with her husband at Woodcot House, Oxon, at 36, Hertford Street, London, and at Berrywood Priory, Acton. Later she passed a wandering life at Bath, Paris, Florence, Geneva, Llangollen, and Taunton. In 1875 she took a small house at Upper Sydenham, where she died March 12, 1882. She was buried in the churchyard of S. John the Evangelist, Shirley, Surrey. She was the author of 13 novels, some poems, and a book of essays, *Shells from the Sands of Time*, 1876. Novels, include *Cheveley*, or the Man of Honour, 1839; *Budget of the Bubble Family*, 1840; *Bianca Capello*, 1842; *Behind the Scenes*, 1854; *Very Successful*, 1856; *The World and His Wife*, 1858; *Mauleverer's Divorce*, 1871.

**Lyublyana.** The fourth city of Yugoslavia is in this Encyclopedia spell Ljubljana.

THE Egyptian hieroglyph (c. 5000–4000 B.C.) corresponding most nearly to the letter M represented an owl: . The suggestion of horns and beak is traceable in every form of the letter throughout its evolution, and remains today. The simplified Egyptian hieratic form (3000–2000 B.C.) was . The early Phoenician (1000 B.C.) as well as the Semitic form carved on stone were more angular in character . The Hebrew name of the letter was *mem*, meaning waters, presumably from the suggestion of waves or ripples.

The earliest Greek forms retained the long tail , but otherwise the development into the classic Greek *mu*  is clear, the tail being retained in the minuscule . Even early Latin had the tail , but the classic Roman followed the classic Greek, adding only the usual serifs and other refinements. The condensed or perpendicular form M was introduced by medieval copyists, while the small m of modern typography is derived directly from the cursive pen form of the Roman capital letter.

**M** Thirteenth letter of the English and Latin alphabets. One of the labial consonants, its articulation is that of *b*, except that the breath passes through the nose, whence it is often called a labio-nasal. M always has the same sound, as in *mat*, *stem*. In words beginning with *mn*, derived from the Greek, as *mнемоника*, it is mute, though note *colum-nar* and *hym-nal*. It has considerable affinity with *n* (cf. *emmet* and *ant*), and with *b*, the latter being mute when combined with it finally (*numb*, *thumb*). As a symbol in Roman notation *M*=1,000, *M̄*=1,000,000. See *Abbreviations*; *Alphabet*; *Phonetics*.

**Maars.** In geology, hollows or depressions in the land surface formed by isolated volcanic explosions. The depressions are described as embryonic or abortive volcanoes, and, having in most cases become filled with water, they form roughly circular lakes. The name is derived from occurrences in the Eifel district of Germany, where they are known as *maare*, or crater-lakes.

**Maartens, MAARTEN.** Pen-name of the Anglo-Dutch novelist, Joost Marius Willem van der Poorten Schwartz (1858–1915). Born at Amsterdam, Aug. 15, 1858, he was educated in England and at Bonn

university, and for a time was a lecturer on law at Utrecht. He began, in 1889, the publication of a series of novels giving a realistic picture of life in contemporary Holland. They were published simultaneously in Dutch and English. His principal works are *The Sin of Joost Avelingh*, 1890; *God's Fool*, 1892; *The Greater Glory*, 1894; *Some Women I Have Known*, 1901; *My Poor Relations*, 1903; *Dorothea*, 1904; *Brothers All*, 1909; *Harmen Pols*, *Peasant*, 1910. He died at Doorn, Aug. 5, 1915.

**Maas** (Fr. *Meuse*). Dutch name given to that part of the river called *Meuse* in France and Belgium which flows through the Netherlands from a little S. of Maastricht to its mouth. It played an important part in the operations of the Second Great War. German parachutists seized the Moerdijk bridges (*q.v.*) when the Germans invaded the Netherlands on May 10, 1940, and so cut communications between the N. and S. provs. In 1944 the Germans stood along the right bank of the river from Blerik to its mouth, in Nov., the upper reaches being freed by the U.S. 9th army at the beginning of March, 1945; but the mouth only with the German surrender in May. See *Meuse*.

**Maassluis.** Town and port of the Netherlands, in the prov. of S. Holland. It lies 10 m. by rly. W. of Rotterdam, on the N. bank of the Nieuwe Waterweg, which joins Rotterdam with the North Sea. It is a centre of the herring fisheries.

**Maastricht.** A town of the Netherlands, capital of the prov. of Limburg. It lies on the left bank of the Maas, close to the Dutch-Belgian frontier, 19 m. by rly. S.S.W. of Hasselt. The rly. station is in the suburb of Wyk, on the right bank of the river.

Maastricht arms

There is a large volume of riverwise traffic to and from the docks of the town, and among the industries are paper, pottery, and earthenware, glass, and brewing manufactures. There is steam tramway connexion with Tongeren, Glons, and Maeseyck, and from the station to Vaals on the German frontier. Pop. 73,181.

The church of S. Servatius is a 6th century foundation. The 11th century church of Our Lady has been extensively restored and has fine Gothic cloisters. The *Stadhuis*, completed in 1664, with a clock-tower, stands in the middle of the *Groote Markt*.

Maastricht was the site of a Roman crossing of the Maas (*Trajectum ad Mosam*), and was the seat of some of the Frankish kings. Unsuccessfully rebelling against the Spaniards in 1576, it was recaptured by them in 1579, by Frederick Henry of Orange in 1632, by the French in 1673, in 1748 under Maurice de Saxe, and in 1794 under Kléber, but resisted a Belgian attack in 1830. The Germans captured Maastricht on May 11, 1940. The bridges over the Maas were blown up, but two bridges on the Albert Canal were left intact. The U.S. 1st army liberated Maastricht—first Dutch town to be freed—Sept. 14, 1944.

Maastricht, Holland. Town Hall, built 1658–64; on right, archways and street beneath the church of S. Servatius

**Maat.** An Egyptian goddess. Linked with Ra and Thoth, she personified physical and moral law, and as the goddess of truth was identified with the Greek Themis. Without temples or offering, she presided in the judgement hall of Osiris when souls were weighed. In figurines of bronze, lapis-lazuli, or glass, and in other representations, she wears an ostrich feather and is sometimes blindfold. Judicial officials were allegorically called priests of Maat.

**Mab, QUEEN.** Character in fairy and folk lore. By some writers, e.g. Ben Jonson (*The Satyr*) and Herrick (*Hesperides*), she is referred to as queen of the fairies; by others, e.g. Shakespeare (*Romeo and Juliet*, 1, 4) and Sir Walter Scott (*The Antiquary*), she is described as the fairies' midwife, who delivers men's minds of dreams. The word queen, in this connexion, is used to indicate, not a sovereign, but a woman or queen. Shelley makes his Queen Mab a ruler of men's thoughts.

**Mabinogion, THE.** Collection of 12 ancient Welsh tales, first published in an English translation by Lady Charlotte Guest in 1838. Mabinogion is derived from Mabinog, an aspirant to bardic honour. The tales comprise 11 prose pieces from *The Red Book of Hergest* (q.v.) and *Taliesin*, which is largely in verse. They are roughly divisible into four groups: 1, *Pwyll, Branwen, Manawyddan, and Math*, regarded as survivals of Celtic mythology; 2, *The Dream of Macsen Wledic* (Maxentius), and *Luudd and Llewelys*, old-world Welsh stories; 3, *Kilwhch and Olwen, The Dream of Rhonabwy, The Lady of the Fountain, Pederdur, and Geraint*, romances connected with the Arthurian cycle; and 4, *Taliesin* (q.v.).

**Mablethorpe and Sutton.** Urban district comprising the parishes of Mablethorpe, Trusthorpe, and Sutton-on-Sea, seaside holiday resorts on the coast of Lincs, England. There are rly. stations at Mablethorpe and at Sutton. The district, 13 m. E. of Louth, is the nearest holiday resort for the industrial centres in the East Midlands, and has developed rapidly, chiefly on account of its 6 m. of sands, good bathing, and bracing air. The beach is backed by promenades behind which are sand dunes, preserved as open spaces. At the lowest tides a submerged forest and a Roman villa are exposed. Pop. 5,650.

**Mabon** (Welsh, bard). Name given to William Abraham (q.v.).

**Mabuse, JAN GOSSAERT DE** (c. 1472–1532). A Flemish painter. Born at Maubeuge, or Mabuse, in Hainault, he probably studied under Quinten Matsys, and in 1503 was admitted to the guild of S. Luke, Antwerp. He was employed by Philip of Burgundy, and visited Rome with him in 1508, where he studied Leonardo and Michelangelo. At Mechlin, 1516, he painted Leonora of Austria, sister of Charles V, and in 1517 he decorated the castle of Duerstede for Philip. The chief works of his early pre-Italian period are *The Adoration of the Kings*, in the National Gallery, London, *Christ in Gethsemane*, and portraits of Philip the Fair and Joanna of Castile, at Brussels. Of his later works, the most important include a *Madonna and Child* at Brussels, *Virgin with the Grapes*, in Berlin, about 1509, S. Luke drawing the *Madonna*. He is usually thought to have been the first to introduce into the purity of Flemish painting that alien Italian note which, degenerating rapidly into rococo banality, led to its decline. He died Oct. 1, 1532.

**Mac** (Gael., son). Celtic prefix of common occurrence in Scottish and Irish names. It answers to Irish O', Norman Fitz, Welsh Ap, Semitic Ben, Ibn, and English -son. It is variously written—Macalister, MacAlister, M'Alister, McAlister. In this work the names of this kind are alphabetised as if the Mac were spelled out.

**Macabre.** French word meaning grisly, and especially associated with the *danse macabre*, or Dance of Death. It is perhaps so called because the tortures of the seven brothers referred to in 2 *Maccabees* 7 possibly formed the subject of the first pictures of the kind shown in Paris, a theory which accounts at least for the Latin name of the performance, *Chorea Machabeorum*. See Dance of Death.

**McAdam, JOHN LOUDON** (1756–1836). Scottish engineer. Born at Ayr, Sept. 21, 1756, he lived in

J. L. McAdam,  
Scottish engineer

as revictualler of the navy, he experimented in the making of roads, and came to the conclusion that

they should be constructed of successive layers of granite or greenstone, broken into small lumps. In 1815, surveyor-general of the Bristol roads, he employed the method he had invented which in time was generally adopted and called macadamising. He received £10,000 from parliament, was appointed surveyor-general of metropolitan roads in 1827, and died Nov. 26, 1836. *Consult* Life, R. Devereux, 1936.

**McAlester.** County seat of Pittsburg co., Oklahoma, U.S.A. The city lies 61 m. S.S.W. of Muskogee and has a rly. junction and an airport. Settled about 1885, it was incorporated in 1906. The state's biggest oilfields are near, natural gas is abundant, and coal mines employ many. Lumbering and woodworking, foundries and rly. workshops, and processes connected with cotton are other industries. Pop. 12,400.

**MacAlister, SIR DONALD** (1854–1934). Scottish scientist. Born at Perth, May 17, 1854, he was

Sir D. MacAlister,  
Scottish man of  
science  
Russell

educated at Aberdeen, Liverpool, and S. John's College, Cambridge, where he graduated as senior wrangler and first Smith's prizeman in 1877. He was mathematical master at Harrow, studied medicine at Cambridge and at S. Bartholomew's Hospital, London, and made researches in the physiology of heat production under Ludwig at Leipzig. As F.R.C.P., president of the general medical council, and the holder of numerous professorships, he became principal and vice-chancellor of Glasgow university in 1907, remaining until 1929. He edited *The Practitioner*, 1882–94, and was author of an English edition of Ziegler's *Pathological Anatomy*, 1883. He was made K.C.B. in 1908, a baronet in 1924, and died Jan. 15, 1934.

**Macalister, ROBERT ALEXANDER STEWART** (1870–1950). Irish archaeologist. Born in Dublin, July 8, 1870, he directed excavations for the Palestine Exploration Fund, 1900–09 and 1923–24. His work at Gezer was described in *Bible Side-lights from the Mound of Gezer*, 1906, and in exhaustive reports. He also wrote *A History of Civilisation in Palestine*, 1912; *The Philistines*, 1913. Works on Ireland including *Two Irish Arthurian Romances*, 1908, led to his

appointment as professor of Celtic archaeology at Dublin, a position he held until 1943. Later works dealt with early Irish history. He died at Cambridge, April 26, 1950.

**McAll, ROBERT WHITAKER** (1821-93). A British divine. Born in Macclesfield in 1821 and educated at London university, he became a Congregational minister, and had charge of churches in several towns until 1872. In that year he started the mission work at Belleville, a suburb of Paris, which developed into the McAll mission. He died at Auteuil, May 11, 1893. The Mission Populaire Évangélique de France—in short, the McAll mission—has stations in France, Algeria, and Corsica.

**McAlpine, SIR ROBERT** (1847-1934). British contractor, born at Newarthill, Lanarkshire, Feb. 13, 1847. Having served an apprenticeship as a brick builder, he set up in business and within five years he had established himself, his firm being responsible for the erection of large buildings in Motherwell, Hamilton, and other places. He built railways and public works, including the central underground rly., Glasgow, and the Glasgow sewage scheme. By 1918 the firm was known all over the world, and McAlpine was created a baronet. He died Nov. 3, 1934.

**Macao.** Portuguese colony at the S. extremity of the West River delta, China, 40 m. S.W. of Hong Kong. The area of the territory, including the islands of Taipa and Colôane, is about 10 sq. m. and the pop. 374,737. The Portuguese settled here in 1557, and until 1849

paid a tribute to China. In that year payment was refused and the Chinese authorities were expelled from the settlement, but it was not until 1859 that Macao achieved its complete independence. In 1887 China formally acknowledged Portuguese sovereignty.

Macao is administered by a governor with the assistance of a council and legislative chamber. It has played only a small part in the commercial life of the Far East, as few steps were taken to develop the colony, which, further, was completely eclipsed by Hong Kong. Its main trade consists of the transit of miscellaneous goods, mostly handled by Chinese merchants.

**Macaque.** Group of monkeys found in S. Asia, and including the Barbary ape occurring in N. Africa and on the rock of Gibraltar. All

the macaques are of stout build, with longish muzzles and rather large callosities on the buttocks. The tail may be long, short, or absent. They live in troops in the forests, where they lead a very active life, and feed upon almost anything eatable that they can find. The Rhesus monkey, in favour with organ-grinders owing to

its hardy constitution belongs to this genus, and is found throughout N. India, where it is protected by the Hindus. See Monkey.

**Macara, SIR CHARLES WRIGHT** (1845-1929). A British manufacturer. Born Jan. 11, 1845, at Strathmiglo, Fife, Scotland, he was educated in Edinburgh, and became a master cotton-spinner in Lancashire. A leading figure in the cotton industry, he was largely responsible for the Brooklands

agreement of 1893, which provided machinery for settling industrial disputes by negotiation. In 1894 he became president of the English federation of master cotton-spinners, and in 1904 of the international federation. He was actively concerned in social and industrial

reform, and wrote a number of books on the subject. A supporter of lifeboat work, he founded in 1891 the Lifeboat Saturday movement. He died Jan. 2, 1929.

**MacArdell, JAMES** (c. 1729-65). Irish engraver. Born in Dublin, about 1746 he came to London.

where one of his first plates was the humorous Teague's Ramble at Charing Cross, 1747, followed by many portraits from 1748 onwards. His engraving of Van Dyck's portraits of the sons of the duke of Buckingham, 1752, attracted much attention.

The year 1754 saw the appearance of the first of his series (38 plates) of prints after Sir Joshua Reynolds, Lady Charlotte Fitzwilliam, and the earl and countess of Kildare. Some of his best work was done from portraits by Van Dyck, such as the countess of Southampton, Lords John and Bernard Stuart. He interpreted Gainsborough, Cotes, Lely, also Rembrandt and Rubens. Plates of his own design include Quin as Falstaff and Garrick as Puff in Taste. He produced also a few etchings. His work had great influence on the engravers who followed him. He died in London, June 2, 1765.

**Macaroni** (Ital. *maccheroni*). A farinaceous food, made from a hard wheat, rich in gluten. After

Macaroni. Lengths of macaroni hanging over rods to dry in the sun

husking, the wheat is ground into flour which is kneaded into a paste. The dough is placed in a cylinder perforated at the bottom, and pressed (by a heavy plate which fits into the cylinder) through the perforations in tubes or strips according to the arrangement of the holes. The macaroni is then cut into lengths and hung over

Irish engraver  
Self-portrait

rods to dry. It becomes soft when boiled and swells a good deal, but retains its shape. Macaroni keeps for any length of time and is a nutritious article of food. The paste of macaroni is made into spaghetti, solid and cord-like, into vermicelli, which is finer than spaghetti, and into various small shapes such as stars, squares, letters, and crescents, used in soup. Formerly only made in Italy, where it forms a staple article of food, it is now also manufactured in the U.K., France and other countries.

**Macaroni.** Member of an English 18th century clique. They were so called from their introducing that Italian dish into England. Having imbibed Continental tastes and fashions while on the grand tour, a group of young men formed the Macaroni Club, of which C. J. Fox was a prominent member. The Macaronis were conspicuous for affectations and fantastic costumes. The chief features of their dress were large side curls with a knot behind, a very small three-cornered hat, tight short coat, flowered waistcoat, huge white neck-cloth, striped or spotted silk breeches adorned at the knee with bunches of ribbons, white silk stockings, and diamond-buckled shoes. They sometimes wore a hanger, or short curved sword,

Macaroni, as depicted in a print, early 18th century

From *English Costume*, J. Clinch, by courtesy of Methuen & Co., Ltd.

and carried tall tasselled canes. They disappeared before the end of the century.

**Macaronic Verse.** Ludicrous kind of verse written partly in Latin and partly in vernacular words with Latin terminations. The term is believed to have been

first employed by Teofilo Folengo (1491-1544), a dissipated Benedictine monk, who, under the pseudonym of Merlinus Coccaius, published a volume of *Macaronia* in 1517. An example in French literature is the burlesque ceremony of admission of Molière's *Malade imaginaire* to the degree of doctor of medicine. *Consult Specimens of Macaronic Poetry*, W. Sandys, 1831.

**Macaroon.** Name given to a biscuit usually composed of sugar, white of egg, and ground almonds, though sometimes including coconut. The word is a variant of macaroni. *See* Biscuit.

**MacArthur, DOUGLAS** (b. 1880). U.S. soldier and administrator. Born Jan. 26, 1880, in Little Rock barracks, Arkansas, the son of Lt.-Gen Arthur MacArthur, he graduated from West Point in 1903. Commissioned in the engineer corps, he was gassed and wounded in action and promoted from major to temporary brig.-gen. during the First Great War. Made a maj.-gen., Jan., 1925, he was the youngest holder of that rank in the U.S. army. During 1922-25 he was in the Philippines, became commander Philippine dept. 1928, and U.S. chief of staff, with the rank of full general on Nov. 21, 1930. During the next five years he reorganized U.S. defences, enlarged the army air corps, and mechanised the army.

In Oct., 1935, at the request of President Quezon of the Philippines, he relinquished his post in the U.S.A. to become military adviser to the Philippine govt., which appointed him, June 19, 1936, F.M. of the Philippine army. Retiring from the U.S. army Dec., 1937, he continued to act as head of Filipino military and constabulary services. In July, 1941, he was recalled to active service as a lieutenant-gen. and given command of U.S. and Filipino forces in the Philippines.

On Dec. 19, 1941, he was restored to the rank of full gen., and, although his forces in Luzon were inferior to the invading Japanese in numbers and material, he slowed down their advance, withdrawing with a mixed force of some 47,000 to

Bataan pen., W. of Manila. There, lacking air support and receiving no reinforcements, supplies, or ammunition, his men beat off attack after attack, maintaining their position for a month after, on Roosevelt's orders, he had left Bataan, March 11, 1942. His appointment as c.-in.-c. of the newly constituted S.W. Pacific area was announced from his Australian h.q., April 19.

Towards the end of Sept., 1942, Australian and U.S. forces of his command began in New Guinea the counter-offensive against the Japanese in his area. In the campaign that followed (described under Pacific War) he led his forces in person in many of their hazardous landings: e.g. on Los Negros in the Admiralty Is., Feb. 29, 1944; on Morotai in the Moluccas, Sept. 14; on Leyte, Oct. 20, 1944, and Luzon, Jan. 9, 1945, in the Philippines; on Labuan, June 10, and Balikpapan, July 1, off Borneo.

MacArthur, who had been promoted one of the first four generals of the army at the creation of that rank Dec., 1944, was made, Aug. 4, 1945, commander of U.S. army forces in the Pacific and, after Japan's surrender, supreme commander for the Allied powers in Japan, where he arrived by air Aug. 30, and set up his h.q. at Yokohama. Chief signatory for the Allies at the surrender ceremony, Sept. 2, 1945, on board the U.S. battleship Missouri in Tokyo Bay, he became virtual dictator of Japan, inaugurating changes of constitution and administration with the object of creating in that country a form of government akin to that of a western democracy. He was created G.C.B. (hon.), 1943, and received the congressional medal of honour and other U.S. and foreign decorations.

**MacArthur, MARY** (1880-1921). Maiden name of Mrs. W. C. Anderson, a champion of the cause of women workers. Born at Ayr, Aug. 13, 1880, she was educated at Glasgow and in Germany. After serving as a clerk in her father's business she became an organizer of shop assistants, was secretary of the women's trade union league, and formed the national federation of women workers. Under the conditions created by the Trade Boards Act, 1909, she organized the chain workers of Cradley Heath, thereby improving the condition of women workers in the Black Country. She did much work in Bermond-

Douglas MacArthur, U.S. soldier and administrator

sey, at the invitation of Queen Mary became hon. secretary of the central committee of women's unemployment during the First Great War, and had a share in promoting the Wages (Temporary Regulation) Act. In 1911 she married W. C. Anderson (d. 1919), Labour M.P. for Attercliffe. She died Jan. 1, 1921.

**Macartney, GEORGE MACARTNEY, 1ST EARL (1737-1806).** British diplomatist and administrator. He was born May 14, 1737, educated at Trinity College, Dublin, and studied in the Middle Temple. Sent to Russia in 1764, where he successfully concluded a commercial treaty, he became chief secretary for Ireland, 1769-72, and was afterwards governor of the Caribbee Islands, and of Madras. Created an earl in 1792, he was sent as the first British ambassador to Peking, where he was graciously received, but a resident embassy not being conceded by China he returned in 1794, becoming two years later governor of Cape Colony. His health failed and, resigning in 1798, he died May 31, 1806. *Consult* Our First Ambassador to China, H. M. Robbins, 1908.

**Macartney, CHARLES G. (b. 1886).** Australian cricketer, born June 27, 1886. An all-round player for New South Wales, he first came to oppose England in 1909, succeeding as a slow left-hand bowler. On the 1912 tour he scored 2,207 runs. By 1921 he had so developed his individual style of batting that he headed the Australians' averages in England with 58, playing an innings of 345 against Notts. At 40 "the governor-general" still took the eye among the tourists of 1926, when his batting average was 53 (for test matches 94) and his wickets cost less than 18 runs apiece.

**Macartney, SIR SAMUEL HALLIDAY (1833-1906).** Anglo-Chinese official. Born near Castle Douglas, Kirkcudbrightshire, May 24, 1833, he studied medicine at Edinburgh university, and graduating M.D. in 1858, entered the army medical department, serving in India and China, 1859-62. He joined the Chinese service in 1863, came into closer relations with Li Hung-Chang, was in charge of the arsenal at

Nanking, 1865-75, and was secretary to the Chinese legation in London, 1877-1906. Given mandarin rank by the Chinese government, he was made K.C.M.G. in 1885. He died June 8, 1906.

**Macas.** Town of Ecuador, in the prov. of Chimborazo. It stands on the Marona river, one of the headstreams of the Marañon, 150 m. S. of Quito. It is built in a valley between two Andean ridges, and is mainly occupied in stock raising and the cultivation of cocoa and tobacco. Pop. 7,000.

**Macassar.** Capital and seaport of Celebes, Indonesia. It lies in the S.W. of the island, at the mouth of the river Gowa. Already in the 16th century it was an entrepot for the spices of the Moluccas. During the 17th century it was the capital of a kingdom of the same name. There was a Portuguese factory here before the Dutch E. India Co. established its suzerainty over the kingdom in 1667. Exports today include

**Macassar Strait.** Channel of the Pacific Ocean. Situated between the island of Borneo and Celebes, it connects the Celebes Sea on the N. with the Java Sea on the S. In Jan., 1942, this strategically important seaway was the scene of a seven-day battle between U.S. and Netherlands warships and aircraft and a large Japanese convoy, escorted by cruisers and destroyers. The convoy was sailing S. with troops and munitions when it was intercepted by allied aircraft on Jan. 23, and a running fight ensued, which continued until Jan. 29. The Japanese losses were 34 ships sunk or badly damaged, with about 25,000 casualties.

**Macauley, THOMAS BABINGTON, BARON (1800-1859).** British historian. He was born at Rothley Temple, Leicestershire, Oct. 25, 1800, but spent most of his early youth at Clapham, whither his father Zachary Macaulay (q.v.), the son of a Scottish Presbyterian minister, had retired after making a modest fortune as a West Indian and African merchant. After a private school education the young Macaulay entered Trinity College, Cambridge, in 1818. As a boy he had shown extraordinary precocity, writing an epic at ten and a universal history at twelve. His reading was amazingly wide, and everything he read he remembered. Almost incredible stories are told of his power of memory, which he retained all through life. Except in mathematics, for which he had a profound distaste, Macaulay's career at Cambridge was a brilliant one crowned with a fellowship at Trinity in 1824.

Meantime the fortune of Zachary Macaulay had shrunk to small dimensions, largely as the result of philanthropic activities, and at 25 Thomas became the chief support of his family. The publication of his famous essay on Milton in The Edinburgh Review was the first effort that brought him fame. The editor, Jeffrey, was particularly struck with the originality of Macaulay's style. The connexion thus begun with the great Whig journal was continued for some twenty years.

Literature chiefly claimed his attention, but he was at the same time turning his mind in the direction of politics. In 1830 he entered parliament as member for Calne, and soon established a reputation as an orator by his speeches in favour of the Reform Bill. In 1833 he was member for Leeds, and in 1834 he

1st Earl Macartney.

Lord Macaulay, British historian  
After Sir Francis Grant

Macassar oil, pearls, rice, rubber, and tortoiseshell. The Japanese landed near Macassar Feb. 10, 1942, and occupied the town from Feb. 13 until the general Japanese surrender in the N.E.I. Sept. 9, 1945. Pop. 20,000.

**Macassar Oil.** Vegetable oil used in pharmacy, so called from the district of Macassar, where it is made. The oil is obtained from the fruit of the *Stadmannia suderoxylon* or *Schleichera trijuga*. The plant yields as much as 70 p.c. of oil, which is used extensively in perfumery. The once extensive use of the oil for the hair brought into use the antimacassar.

accepted the position of legal adviser to the supreme council of India, with a salary of £10,000 a year. It was chiefly the necessity of providing for his family, whom he dearly loved, that determined this decision. It was by his advice as chairman of the committee of public instruction that European literature and science were made the basis of higher education in India. He also took the leading part in drawing up the penal code. Macaulay's four years' stay in India is reflected in his Indian essays on Clive and Warren Hastings, and it was when abroad that he wrote most of the popular *Lays of Ancient Rome*, published in 1843. In 1839 he was elected member for Edinburgh, and became successively secretary for war and paymaster-general of the forces.

In 1848 appeared the first two vols. of his *History of England* from the Accession of James II, upon which he had been at work for some time. It was his intention to bring it down to a time "within the memory of men still living," but he failed to get farther than the closing years of the reign of William III. The second two volumes appeared in 1855 and the fifth posthumously in 1861. The work enjoyed amazing popularity from the first. Rejected for Edinburgh at the general election of 1847, Macaulay was again elected in 1852, and in 1857 he was raised to the peerage. Two years later, Dec. 28, 1859, he died in London, and was buried in Westminster Abbey.

Macaulay cannot be classed among the greatest historians. Thanks to his extensive reading and prodigious memory he possessed a wide knowledge of many subjects upon which he constantly drew for illustration, often with the happiest effects, but he was not profound. His general outlook, too, was biased by his Whig sympathies, which on occasion led him into misrepresentation of facts, if not into positive inaccuracies. A conspicuous example of his lack of impartiality is to be found in his treatment of Marlborough. Again, he has a tendency to sacrifice absolute truth to the desire for effect, yet with all its faults his *History* will always be read for its brilliant style. As a lucid and picturesque narrator of events Macaulay is almost unsurpassed, e.g. in the famous "third chapter," describing England in 1685. In some respects he is at his best in his many essays on literary and historical subjects. The essay on Robt. Montgomery's

poems (1830) is one of the most devastating pieces of literary criticism ever penned.

**Bibliography.** Works, coll. by his sister, Lady Trevelyan, 8 vols., 1866; Albany edn., 12 vols., 1898; *Life and Letters*, G. O. Trevelyan, 2 vols, 1876; *Lives*, J. Cotter Morison, 1882; A. S. G. Canning, new ed. 1913; A. Bryant, 1932.

**Macaulay, ROSE.** A British novelist and essayist. She published her first book, *Abbots Verney*, in 1906 and established her reputation as a satirist with *Potterism*, 1920. In a series of witty, incisive novels she exposed the follies of her time. The best known were *Dangerous Ages*, 1921; *Told By An Idiot*, 1923; *Orphan Island*, 1924; *Crewe Train*, 1926; *Keeping Up Appearances*, 1928; *Going Abroad*, 1934. She also wrote a scholarly study of Herrick and his times in *They Were Defeated*, 1932. Two anthologies, *The Minor Pleasure of Life*, 1934, and *Personal Pleasures*, 1935, were successful. Her books of literary criticism included *John Milton*, 1933; *The Writings of E. M. Forster*, 1938; and *No Man's Wit*, 1940.

**Macaulay, ZACHARY** (1768-1838). Scottish philanthropist. Son of a Scottish minister, and the father of Lord Macaulay (q.v.), he was born May 2, 1768. At 17 he left his father's manse in the W.

Macaw Tree. Head of leaves with nuts

Highlands, and went to Jamaica, where he worked on a sugar plantation, of which he finally became manager. On his return to England he joined Wilberforce and others who were working to suppress the slave trade. Governor of Sierra Leone, 1796-99, he did much to remedy the appalling

conditions there. He was one of the founders of the anti-slavery society (q.v.) 1823. He died May 13, 1838. *Consult* *Life and Letters*, by Viscountess Knutsford; Z. Macaulay, C. Booth, 1934.

**Macaw.** Name given to various genera of South American parrots, noted for their gorgeous plumage and large size. Some are nearly 3 ft.

Macaw, a South American parrot

long, including the tail; the prevailing colours are red, blue, and yellow. There are about 14 species of typical macaws, found from Mexico to Paraguay. They feed in flocks upon fruits and nuts, and make their presence known by deafening cries. They are hardy in captivity, readily become tame, and will sometimes learn to talk. *See* *Beak*; *Birds*; *Parrakeet*.

**Macaw Tree** (*Acrocomia sclerocarpa*). Tree of the family *Palmae*, native of South America. It attains a height of about 40 ft., with a spreading head of large leaves divided into slender leaflets, 1 ft. in length, which, when young, are eaten as a vegetable. The yellowish flowers are produced at the base of the leaves. The hard shells of the nuts are made into ornaments, and from the kernels a thick yellow oil is pressed.

**Macbeth** (d. 1057). King of Scotland. Nephew of Malcolm II, and ruler of Moray, he married Gruoch, granddaughter of the king of Alban, and became King Duncan's commander-in-chief. He slew Duncan in 1040, succeeded him on the throne, was defeated by Siward earl of Northumbria, in 1054, and was slain by Duncan's son, Malcolm Canmore, at Lumphanan, Aug. 15, 1057. *See* *Scotland*; *History*. *Consult* *History of Scotland*, H. Boece, 1527; *Chronicle of Scottish History*, R. Holinshed, 1578; *Celtic Scotland*, W. F. Skene, 1876-80.

**Macbeth.** Tragedy by Shakespeare. Macbeth and Banquo, generals of King Duncan of Scotland, meet three witches who predict that Macbeth shall be king. Incited by his wife, he murders Duncan and assumes the crown. Before the murder he sees a dagger in the air; after it, he imagines a voice that cries "Sleep no more!

Macbeth does murder sleep." Less a hardened villain than a prey to "vaulting ambition that o'erleaps itself," Macbeth next hires two murderers, who kill Banquo. Having consulted the witches again, Macbeth is told that he shall never be vanquished till Birnam wood come to Dunsinane, his castle. His wife, the supreme evil woman in Shakespeare, falls ill, walks in her sleep, talking of the blood on her hand, and dies. Macbeth, observing that the invading English army with Malcolm, eldest son to Duncan, is carrying boughs cut from Birnam wood, perceives the significance of the witches' predictions and abandons hope, to be killed in single combat by Macduff, a thane whose wife and children he had caused to be murdered.

Macbeth was written in 1605 or 1606, and first published in the 1623 folio. Shakespeare was indebted to Holinshed, and may have consulted Reginald Scot's *Discoverie of Witchcraft*, 1584. This comparatively short tragedy contains 1,993 lines, including 158 of prose, 1,588 of blank verse, 118 pentametric rhymes, 129 short-line rhymes. No play contains greater poetry, while the imagery derived from animal life and nocturnal phenomena is notable. In theatrical tradition the play is unlucky and must not be quoted from.

Modern revivals in London were by Irving and Ellen Terry (Lyceum, 1888); Forbes-Robertson and Mrs. Patrick Campbell (Lyceum, 1898); Bouchier and Violet Vanbrugh (His Majesty's, 1909); Ainley and Sybil Thorndike (Prince's, 1926). Others who have essayed the part of Macbeth include John Gielgud, Charles Laughton, Laurence Olivier, Ernest Milton, Donald Wolfitt, Michael Redgrave. A modern dress version was staged by Barry Jackson at the Court Theatre, 1928.

**McBride, Sir Richard** (1870–1917). Canadian politician. Born at New Westminster, B.C., Dec. 15, 1870, he was educated at Dalhousie university, Halifax. A barrister, he entered the provincial legislature of British Columbia in 1898, became leader of the Conservative party, and was premier from 1903–15, then agent-general for the province in London. Knighted in 1912, he died Aug. 6, 1917.

Sir Richard McBride,  
Canadian politician  
Elliott & Fry

**MacBride, SEAN** (b. 1904). Irish politician, born Jan. 26, 1904, in Dublin. Son of an Irish patriot executed 1916, and of Maud Gonne, famous in connexion with the Irish independence movement, as a youth he led an I.R.A. brigade in the civil war. After the I.R.A. was declared illegal, he continued his activities with it, and was frequently in trouble with the police. Later, he studied law at Dublin university. Regarding Eamon de Valera as insufficiently nationalist, MacBride founded the reactionary party *Clann na Poblachta*, and in 1947 was elected to the Dáil at a Dublin by-election. In the general election of 1948 his party secured 10 seats, and he was appointed minister for external affairs in Costello's coalition govt.

**McCabe, JOSEPH** (b. 1867). British author. Born Nov. 11, 1867, he was educated at S. Francis's College, Manchester; S. Anthony's, Forest Gate, London; and Louvain university. He became a Franciscan monk in 1883, a priest in 1890, and rector of Buckingham College in 1895. Leaving the Church in 1896, he earned distinction as a rationalist author and lecturer. He wrote *Twelve Years in a Monastery*, 1897; *Modern Rationalism*, 1897; *The Twilight of the Gods*, 1923; *The Splendour of Moorish Spain*, 1935; *History of the Popes*, 1939; *Testament of Christian Civilization*, 1947.

**Maccabees**. Later name of the Hasmonaeans or Asmonaeans, an illustrious Jewish family. In the latter part of the 2nd century B.C. they overthrew Syro-Hellenic tyranny and established a race of priest-kings. Their story begins with Mattathias, an aged priest, who, when ordered to offer sacrifice to the pagan deities at Modin, near Jerusalem, killed the Syrian commissioner, slew a Jew who was about to obey the order, and, with his five sons—John, Simon, Judas, Eleazar, and Jonathan—fled to the mountains. Thus began the successful revolt against the attempt of Antiochus Epiphanes to wipe out Jewish religion and Jewish customs.

After the death of Mattathias, he was succeeded by Judas, the greatest of the brothers, who was called Makkabi or Maccabaeus (Heb. *maggabah*, hammer), Jonathan, and Simon. The race, which gradually degenerated, ended with Mariamne, by whose marriage with Herod (*q.v.*) the dynasty passed to the Idumaeans line of the Herodians. The history of the family is tragic as well as

heroic, the climax of tragedy being reached when Herod murdered Mariamne and their two sons.

*Die Makkabäer* (The Maccabees) is the title of an opera by Rubinstein, 1875. See Gezer; Hyrcanus; Jews; Judas Maccabaeus.

**Maccabees, BOOKS OF**. Four books of the O.T. Apocrypha. Of these 1 and 2 Maccabees, especially the former, are valuable historical works. 1 Maccabees covers the period of Jewish history from the accession of Antiochus Epiphanes to the death of Simon (175–135 B.C.), i.e. the period in which Judas and his brothers waged their struggle for liberty. 1 Maccabees was written originally in Hebrew or Aramaic by a Palestinian Jew between about 100 and 80 B.C. 2 Maccabees covers part of the same ground (174–161 B.C.), but is of less historical value. The author explains that he wishes to delight and profit his readers, and his book has been described (H. T. Andrews, *The Apocryphal Books*) as a tract in favour of unity based on the events of the Maccabean war. The work seems to have been written by an Alexandrian Jew between 60 B.C. and A.D. 1.

3 Maccabees is of the nature of an historical romance, and is not really concerned with the Maccabean age at all. The scenes of the story are Jerusalem and Alexandria in the reign of Ptolemy IV Philopator (222–204 B.C.). The author seems to have been an Alexandrian Jew, but his date is uncertain: 4 Maccabees is philosophical, in the Stoic sense, rather than historical, and is not really Maccabean. It is a homily, sermon, or lecture addressed to the Jews. The author seems to have been a Hellenistic Jew, who wrote immediately before or after the beginning of the Christian era. 1 and 2 Maccabees are regarded as canonical by the R.C. Church. See Apocrypha.

**McCallum, Sir Henry Edward** (1852–1919). British soldier and administrator. Born Oct. 28, 1852, he became private secretary to Sir William Jervois, governor of the States Settlements, in 1874. He was colonial engineer, Penang, 1880, and surveyor-general of the Straits Settlements in 1884. He was governor of Lagos, 1897; of Newfoundland, 1898; of Natal, 1901; and of Ceylon, 1907, resigning in 1912. He was knighted in 1898, and died Nov. 24, 1919.

**Maccalube, LE.** Name given by Sicilians to mud volcanoes, particularly to that situated 4 m. W. of Aragona, near Agrigento.

This hill, 135 ft. high, is formed of limestone and clay, and is studded with small cones, 18 ins. to 36 ins. high, filled with mud and emitting sulphuretted hydrogen.

**McCardie, Sir Henry Alfred** (1869-1933). A British lawyer. Born at Edgbaston, July 18, 1869, he was called to the Bar by the Middle Temple in 1894. In October 1916, he was appointed a judge of the King's Bench division without having taken silk. His outspoken and unorthodox comments on the sociological aspects of his cases attracted much attention and criticism. Among his cases were the libel action brought by Sir Michael O'Dwyer against Sir Sankaran Nair arising out of the Amritsar incident; the murder trials of Henry Jacoby and Ronald True; and the *Place v. Searle* case in 1932, which brought him into conflict with Lord Justice Scrutton. He shot himself after an attack of influenza, Apr. 27, 1933. *Consult Life*, G. Pollock, 1934.

**MacCarthy, Desmond** (b. 1877). British literary critic. Born at Plymouth, he was educated at Eton, and Trinity College, Cambridge.

Desmond MacCarthy,  
British writer

He became dramatic critic to *The Speaker* in 1904, edited *The New Quarterly*, 1907-10, and founded and edited *Life and Letters*, resigning his editorship in 1932. One of the foremost literary critics of his day, he regularly contributed to *The New Statesman* and *The Sunday Times*. His publications included *The Court Theatre*, 1907; *Remnants*, 1918; *Portraits*, 1931; *Criticism*, 1932; *Experience*, 1935; *Drama*, 1940. He published a biography of Leslie Stephen in 1937.

**McCarthy, Justin** (1830-1912). Irish author and politician. Born in Cork, Nov. 22, 1830, he early became a reporter on the *Cork Examiner*. In 1853 he joined the staff of *The Northern Daily Post* at Liverpool. In 1855 he married Charlotte, daughter of W. G. All-

Justin McCarthy  
Elliott & Fry

man (d. 1879). His first contribution to the London press was an article on Goethe's ballads in *The London Quarterly Review*. In 1860 he became gallery reporter, in 1861 foreign editor, and during 1864-68 was editor of *The Morning Star*. He then spent three years in the U.S.A. Political writer on *The Daily News*, 1872-97, he was a member of parliament from 1879 to 1900, and chairman of the Irish Parliamentary Party, Nov., 1890-Jan., 1896. In politics a Home Ruler, he lost health and wealth in the political struggles of his time. He died April 24, 1912.

His literary work includes *Lives of Sir Robert Peel*, 1891; *Leo XIII*, 1896; and *Gladstone*, 1898; *A History of Our Own Times*, 1879-97 and 1905; *A History of the Four Georges and William IV*, 1884-1901; *Reign of Queen Anne*, 1902; *Portraits of the 'Sixties*, 1903; *The Story of an Irishman*, 1904; *Reminiscences*, 1899; and several novels.

**McCarthy, Justin Huntly** (1860-1936). Irish author and politician. The son of Justin

McCarthy (v.s.), he was educated at University College School and University College. A contributor to newspapers and magazines, his books include *A History of England under Gladstone*, 1884; *An Outline of Irish History*, 1883; translations of Hafiz, Omar Khayyám, and the *Arabian Nights*; several plays, including *The Candidate*, 1884; *My Friend the Prince*, 1897; and *If I Were King*, 1901; and a number of novels. He sat in the house of commons as a Nationalist, 1884-92. He died March 20, 1936.

**McCarthy, Lillah** (b. 1875). British actress. Born at Cheltenham, Sept. 22, 1875, she was educated there, and made her first appearance on the stage in 1895. The following year she made her London debut in *The Sign of the Cross*. Her greatest successes were achieved in Shakespearean drama, and in the plays of Barrie, Galsworthy, and Shaw. She created the part of Ann Whitfield in *Man and Superman* (q.v.), 1905, and played in Granville-Barker's productions of *Twelfth Night*, and *A Winter's Tale*, 1912. After appearing with Matheson Lang in *The Wandering*

J. H. McCarthy,  
Irish author

*Jew*, and *Blood and Sand*, 1921, she retired from the stage for over 10 years, reappearing for a single performance of *Iphigenia in Tauris*, 1932. She published *My Life* (autobiography), 1930, and *Myself and My Friends*, 1933. She married, 1920, Sir Frederick Keeble.

Lillah McCarthy,  
British actress

**McCay, Sir James Whiteside** (1864-1930). Irish-born Australian politician and soldier. Born at Ballynure, Antrim, Dec. 21, 1864, he was educated at Melbourne university, and became a barrister. He entered the house of representatives of the Commonwealth parliament in 1901 and was minister for defence, 1904-05. In the First Great War he commanded the 2nd Australian infantry brigade in Gallipoli, 1915, and the 5th division in Egypt and France. Later he was in command of the Australian forces in Great Britain and, during 1920-22, business adviser to the Commonwealth government. Created K.C.M.G. in 1918, he died Oct. 1, 1930.

**Macchi**. Italian aircraft manufacturers, notable since the First Great War. Macchi were the designers of the racing seaplanes that won the Schneider trophy in 1921 and 1926 and set up world's speed records culminating in Agello's 440 m.p.h. in 1934. In the Second Great War, the Macchi C.200 and subsequent developments were the outstanding fighter aircraft of the Italian air force.

**McClellan, George Brinton** (1826-85). An American soldier, military writer, and politician.

Born at Philadelphia, Dec. 3, 1826, he was commissioned from West Point in 1846. He served as a lieutenant in the Mexican War, and was promoted captain for his services.

After the war he was an instructor at West Point, and leaving in 1855, was sent to Europe to study European military affairs. He published *Armies of Europe*, 1856, resigned from the army in 1857, and took up railway work. On the outbreak of the civil war he was made major-general of militia in April, 1861, but was almost im-

G. B. McClellan,  
American soldier

mediately promoted to regular major-general. He dispersed the Confederates at Philippi in June. After the first defeat of Bull Run he was made commander-in-chief of the Federal armies, Nov., 1861.

During the winter 1861-62 he did good work in organizing the army of the Potomac, but his plan for the spring campaign did not meet with approval. He was allowed to carry it out, but relieved of the supreme command. On Pope's defeat at Centerville, McClellan was reinstated and sent to oppose Lee's advance into Maryland in Sept. He defeated Lee at the battle of Antietam, but Lincoln, still distrusting him, adjudged his pursuit lacking in vigour, and replaced him by Burnside. He never commanded again.

At the presidential election of 1864 McClellan appeared as a candidate, putting forward the policy of negotiating with the Confederates, but was badly defeated, and went to Europe until 1868. After his return, he wrote much. He died at Orange, Oct. 29, 1885. He was a brilliant writer and speaker, a good organizer, and not without military genius; but he was too kind-hearted for a great leader, and lacked the tact to make him a successful politician. *Consult* Gen. McClellan, P. S. Mickie, 1901.

**Macclesfield.** Mun. borough and market town of Cheshire, England. It stands on the little river Bollin, 18 m. S. of Manchester and 166 m. from London, with which it has rly. connexion. The chief church is S. Michael's, largely rebuilt in the 18th century and restored in 1900; it has two old chapels and other objects of interest. The town has a town hall, infirmary, and public library. The grammar school dates from the 16th century. West Park and Victoria Park are public recreation grounds; in the former are the old market cross and the stocks. Macclesfield gives its name to a county constituency. The chief industry is silk manufacture; others are cotton-spinning and the making-up trade. The chief suburb is Sutton.

Macclesfield became a corporate town in the 13th century, but was probably important earlier. It had walls in the Middle Ages. During 1832-85 it sent two members to parliament. Its earlier industry was the manufacture of buttons,

introduced in the 16th century. The first silk mill was built about 1750. The town has fairs and markets, May Fair lasting a week. Barnaby holidays are held for a week from June 20. The wild moorland district on the Derbyshire border is called Macclesfield forest. The Macclesfield Canal joins a canal at Marple with the Grand Union Canal at Lawton. It is 29½ m. long. Market days, Tues. and Sat. Pop. 34,902.

**Macclesfield, EARL OF.** English title borne by the families of Gerard and Parker, the latter still holding it. Charles Gerard (c. 1620-94) belonged to a Lancashire family and fought for Charles I during the Civil War. In 1645 he was made a baron, and during the Commonwealth was in France, being one of the intimates of Charles II. On that king's restoration he was rewarded richly for his loyalty, and

Macclesfield, Cheshire. Tower and west front of the parish church of S. Michael Frith

in 1679 was made earl of Macclesfield. His fall from favour was due to his friendship with Monmouth; but he won the favour of William of Orange, whose supporter he remained until his death in 1694. His son, Charles, the 2nd earl, was sentenced to death for conspiracy, but was pardoned in 1687. The title lapsed in 1702.

A successful lawyer, Thomas Parker (c. 1666-1732), was the founder of the present line of earls. He became lord chief justice and then lord chancellor, being made a baron in 1716 and an earl in 1721. Later he was impeached for corruption and was fined £30,000. The chief seat of the family is Shirburn Castle, Oxfordshire. The earl's eldest son is called Viscount Parker.

**McClintock, SIR FRANCIS LEOPOLD** (1819-1907). British Arctic explorer. Born at Dundalk, July 8,

Sir F. L. McClintock, British explorer

1819, he entered the navy in 1831. Appointed to the Arctic expedition under Sir James Ross in 1848, he was in 1850 first lieutenant of the *Assistance*, sent for the relief of Sir John Franklin. Promoted commander on his return, in 1852 he commanded the *Intrepid* in Belcher's Arctic expedition. In 1857 he was given command of the *Fox*, fitted out by Lady Franklin, and sailed on another expedition in search of Sir John. In the N.W. of King William's Land he discovered convincing proofs of Franklin's death. Returning in 1859, he was knighted. Rear-admiral in 1871 and vice-admiral in 1877, he was in command of the North American and West Indian stations (1879-82), and became admiral in 1884. He died Nov. 17, 1907. He published an account of the discovery of Franklin's remains in *Voyage of the Fox in Arctic Seas*, 1859. *Consult* Life, C. R. Markham, 1909.

**McClintock Channel.** Strait in the Arctic Ocean, between Prince of Wales Island and Victoria Island, British N. America. Through Melville Sound and Banks Strait, to the N.W., it communicates with Beaufort Sea.

**McClure, SIR JOHN DAVID** (1860-1922). British educationist. Born at Wigan, Feb. 9, 1860, and educated at Owens College, Manchester, and Trinity College, Cambridge, in 1891 he was appointed headmaster of Mill Hill school, which he brought into the front rank. He was knighted in 1913, and died Feb. 19, 1922.

**McClure, SIR ROBERT JOHN LE MESURIER** (1807-73). A British Arctic explorer. Born at Wexford, Ireland, Jan. 28, 1807, he studied at Eton and Sandhurst and entered the navy in 1824. In 1848 he accompanied Sir James Ross's expedition in search of Sir John Franklin,

Sir R. J. McClure, British Arctic explorer

was promoted commander on his return in 1849, and in 1850 commanded the *Investigator* on an

Arctic voyage undertaken by way of Bering Strait. He explored Banks Land, spent two years (1851-53) on the ice, and after many vicissitudes was rescued by the *Resolute* and returned to England in 1854. He was knighted and promoted captain upon his return, and was voted £10,000 by the house of commons for having discovered and successfully negotiated a North-West Passage. He was promoted rear-admiral in 1867 and retired as vice-admiral in 1873, dying Oct. 17 of the same year.

**M'Clure, SAMUEL SIDNEY** (1857-1949). U.S. editor and publisher. Born at Frossess, An-

trim, Feb. 17, 1857, of Scottish - French parentage, he was taken at the age of nine to Indiana by his widowed mother. He worked his way through Galesburg College,

S. S. M'Clure,  
American editor

Illinois. Editor and manager of *The Wheelman*, Boston, Mass., 1882-83, he was associated with the *De Vinne Company*, New York, 1883-84, and in 1884 established the first newspaper syndicate in the U.S.A. In June, 1893, he founded *M'Clure's Magazine*, which he edited. By publishing *Ida Tarbell's* investigation of the *Standard Oil Co.*, *M'Clure's Magazine* started the "muckraking" reform movement in American public life. The rapid increase of its sales to 250,000 a month involved *M'Clure* in heavy debt as advertisement rates on the magazine had been based on an estimated circulation of 40,000. He published his autobiography in 1914. Among his other books was *The Achievements of Liberty*, 1935. He died March 22, 1949.

**MacColl, DUGALD SUTHERLAND** (1859-1948). Scottish art critic and artist. Born March 10, 1859, he was educated at *University College, Oxford*. He studied art at the *Westminster School of Art* and the *Slade school*, and was successively art critic of *The Spectator* and *The Saturday Review*, editor of *The Architectural Review*, and lecturer on the history of art at *University College, London*. He was keeper of the *Tate Gallery* 1906-11, then until 1924 director of the *Wallace Collection*. He was awarded the *James Tait Black memorial prize* in 1945 for his book on *Wilson Steer*. He died Dec. 21, 1948.

**MacColl, MALCOLM** (1838-1907). British cleric. Born at *Glenfinnan, Inverness-shire*, he was educated at *Trinity College, Glensalmond*, and in *Naples*. Ordained, 1859, he became rector of *S. George's, City of London*. He was canon residentiary of *Ripon* from 1884 to 1907, and died April 5 of the latter year. He was an intimate friend of *Gladstone*.

**McCormack, JOHN** (1884-1945). Irish-born American singer. Born at *Athlone*, June 14, 1884, he studied under *Sabbatini* at *Milan*, and first appeared as a concert singer in 1907. He made his debut the same year at *Covent Garden* in *Cavalleria Rusticana*, and was chosen by *Weingartner* to sing the part of *Don Ottavio* in *Don Giovanni* at the *Salzburg festival*. His success there established him as one of the foremost tenors of the day. Associated with *Tetrazzini (q.v.)* in many operatic performances, he also appeared with *Melba* in *La Bohème*. He made his debut in the U.S.A., 1910, later joining

John McCormack,  
American singer

**McCormick, CYRUS HALL** (1809-1884). American inventor. He was born at *Walnut Grove, West Virginia*, Feb. 15, 1809, the son of a farmer. He invented a grain-cutting machine in 1831, and later set up at *Chicago* a factory for large-scale manufacture of mechanical harvesters. He died May 13, 1884.

**McCormick, ROBERT RUTHERFORD** (b. 1880). American newspaper proprietor. He was born in *Chicago, Ill.*, on July 30, 1880, and graduated from *Yale university* in 1903. After studying law at *Northwestern university* he was admitted to the *Illinois bar* in 1907. In 1910 he became associated with his cousin, *Joseph Medill Patterson*, as co-editor and publisher of the *Chicago Tribune*, being president of the *Chicago Tribune Co.* Under their able direction the *Tribune* enormously increased its circulation and advertising, becoming one of the most influential newspapers of the *Middle West*.

It was staunchly Republican and consistently anti-British. After service in the *First Great War*, *McCormick* and his cousin started the illustrated *Daily News* in *New York* in 1921. *McCormick* used his military title and was commonly known as *Colonel McCormick*.

**McCormick, WILLIAM PATRICK GLYN** (1877-1940). British ecclesiastic. Born at *Hull*, June 14, 1877, he was educated at *Llandaff cathedral school, Exeter school*, and *S. John's College, Cambridge*. Ordained in 1900, he was curate of *All Saints, Shooter's Hill*, then became acting chaplain to the forces in *S. Africa*, where he was appointed vicar of *S. Patrick's, Johannesburg*. After serving in the *First Great War* (he was awarded *D.S.O.* in 1917) he became vicar of *Croydon*, 1919, and succeeded *H. R. L. (Dick) Sheppard* as vicar of *S. Martin-in-the-Fields* in 1927. "Pat" *McCormick* was a popular preacher and broadcaster. He died Oct. 17, 1940. His publications included *Be of Good Cheer*, 1930; *Starting Afresh*, 1939.

Rev. Pat McCormick,  
British ecclesiastic

**McCosh, JAMES** (1811-94). Scottish-American philosopher and educationist. He was born at *Carskeoch, Ayrshire*, April 1, 1811, and educated at *Glasgow* and *Edinburgh universities*. The publication of his *Method of the Divine Government*, 1850, secured him the professorship of logic and metaphysics at *Belfast*. Going to *America*, he was president of the college at *Princeton*, 1868-87, where he died Nov. 16, 1894. His chief works are: *The Intuitions of the Mind*, 1860; *The Scottish Philosophy*, 1874; *The Realistic Philosophy*, 1887.

**McCracken, ESTHER HELEN** (b. 1902). British playwright, *née Armstrong*, now *Mrs. M. Campbell*. Born July 25, 1902, she spent eight years with the repertory company in *Newcastle-on-Tyne*. Her first comedy, *Quiet Wedding* (*Wyndham's Theatre, London*, 1938), achieved outstanding success, a screen version appearing in 1941. A sequel, *Quiet Weekend*, came on at the same theatre in 1941. No Medals, 1944, was a comedy of the "home front" in wartime, and *Cry Liberty*, 1950, a forthright satire on bureaucracy.

**McCracken, Sir Frederick William Nicholas** (b. 1859). British soldier. Born Aug. 18, 1859, he was educated at Sandhurst, and joined the 49th Foot in 1879. He was adjutant of the 1st Berks Regiment, 1883-85, and served in Egypt, Suakin, and on the Egyptian frontier before he gained the D.S.O. in the S. African War. He commanded the 7th infantry brigade, 1912-14, the 15th Scottish division, 1915, and an army corps, 1917-18. He held the Scottish command in 1918-19. Knighted in 1917, he was then promoted lieutenant-general.

**McCreery, Sir Richard London** (b. 1898). A British soldier. He was born Feb. 1, 1898, and educated at Eton and Sandhurst. He served in France during the First Great War, commanded the 12th Lancers, 1935-38, and was promoted major-general in 1943 and lieutenant-general in 1944. Chief of staff to Alexander in the Middle East 1942-43, he commanded the 10th corps in Italy at Salerno and during the long difficult advance to Cassino; he also planned and executed the crossing, and the simultaneous landing N. of the Garigliano in Jan., 1944. He was appointed to command the 8th army, in succession to Sir Oliver Leese, Nov., 1944. He was G.O.C.-in-C., British forces in Austria from July, 1945, until in March, 1946, he was appointed to command the B.A.O.R. From 1948 he was British Army representative on the U.N. military staff committee. McCreery was created K.C.B. in 1943.

**McCudden, James Byford** (d. 1918). British airman. He went to France at the start of the First Great War as a mechanic attached to the R.F.C. He gained the M.M. in Sept., 1916. Soon afterwards commissioned, he won the M.C. and bar, D.S.O. and bar, and in March, 1918, the V.C. Up to that month McCudden, who had reached the rank of major, had accounted for 54 enemy planes (42 definitely destroyed). He was flying to France to take command of a squadron when he was killed, July 8.

Derek McCulloch,  
British broadcaster  
and writer

**McCulloch, Derek Ivor Breasbur** (b. 1897). British broadcaster and writer. Born at Plymouth, Nov. 18, 1897, he was educated at Croydon high school, and served in the First Great War

in the infantry and R.F.C. He joined the B.B.C. as an announcer, became popular as "Uncle Mac" of the Children's Hour, and in 1933 was placed in charge of that programme. He also published several books, including *Gardening Guyed*, 1931; *Travellers Three*, 1936; *Cornish Adventure*, 1937. Severely wounded in the First Great War, losing the sight of one eye, he also lost a leg as the result of a road accident in 1938.

**McCulloch, John Ramsay** (1789-1864). A British economist. Born March 1, 1789, at Whithorn, Wigtownshire, he was educated in Edinburgh and became a lawyer's clerk there. In 1817 he became associated with The Scotsman, and soon made a reputation as a writer and lecturer on economics. During 1828-32 he was professor of political economy in the university of London; then comptroller of the stationery office from 1838 until his death, Nov. 11, 1864. His books include *A Dictionary of Commerce and Commercial Navigation*, 1832; *Statistical Account of the British Empire*, 1837; *Literature of Political Economy*, 1845. He edited *Smith's Wealth of Nations*, 1828, and *Ricardo's Works*, 1846.

**MacCunn, Hamish** (1868-1916). British composer. Born at Greenock, March 22, 1868, he was

Hamish MacCunn,  
British composer  
Elliott & Fry

trained at the Royal College of Music, London, and was professor of harmony at the Royal Academy of Music, 1888-94. His overture, *Land of the Mountain and the Flood*, performed at the Crystal Palace in 1887, first brought him into notice, and he followed it up with a succession of works, the chief being the cantatas *Lord Ullin's Daughter* and *The Lay of the Last Minstrel*, and the operas *Jeanie Deans* and *Diarmid*. He died Aug. 2, 1916.

**MacDiarmid, Hugh** (b. 1892). Scottish poet and writer. Christopher Murray Grieve was born at Langholm, Dumfriesshire, Aug. 11, 1892, and educated at Edinburgh university. A champion of dialect, he was a founder of the Scottish centre of the P.E.N. club and of the Scottish Nationalist political party. His volumes of poetry include *Sangschaw*; *Stony Limits*; *Hymns to Lenin*; *The Birlinn of Clanranald* (from the Gaelic). In prose he wrote on the con-

temporary social and political scene in Scotland. In 1950 he was granted a civil list pension of £150 per year. *Lucky Poet*, an autobiography, appeared in 1943.

**Macdona, Charles** (1860-1946). Irish theatrical manager. Born in Dublin, he made his first appearance on the stage at Edinburgh in 1884 and his London debut in 1887. In 1921 he formed his own company, The Macdona Players, who became celebrated for their performances of Bernard Shaw's plays. He presented revivals of *Diplomacy* and *The Wandering Jew*, produced *On the Rocks* at the Cambridge Theatre in 1934, and appeared as Polonius in *Hamlet*. He died Nov. 15, 1946.

**Macdonald**. Oldest of the Scottish clans. It is said to be of Pictish origin and have been founded by a descendant of Somerled of the Isles (Gaelic, *Somhairle*, i.e. Samuel), who became powerful as thane of Argyll in the 12th century. By his marriage to a daughter of Olave the Swarthy, king of Man and the Isles, he added the heritage of the last-named to his own possessions. He was slain in battle at Renfrew in 1164, and left four sons. The clan has included the MacDonalds of the Isles and Sleat, Clanranald, Glengarry, Keppoch, Staffa, and the MacIans of Glencoe. MacDonell is a variant.

**Macdonald, Sir Claude Maxwell** (1852-1915). British soldier and diplomatist. Born June 12, 1852, and educated at Up-pingham and Sandhurst, he entered the 74th Highlanders in 1872. Ten years later he went to Cairo as military attaché, and saw some fighting.

Sir Claude M. Macdonald, British soldier  
Elliott & Fry

In 1887 he was acting agent and consul-general at Zanzibar, and as commissioner in S. Nigeria in 1891 took part in the Brass River expedition. In 1896 he went to Peking as envoy extraordinary and plenipotentiary, remaining in that capacity until the Boxer rising and the siege of the legations, June-Aug., 1900, when he commanded the defence. For this he received the K.C.B., and was soon afterwards appointed ambassador at Tokyo, remaining until 1912. He died Sept. 10, 1915.

**Macdonald, Etienne Jacques** Joseph Alexandre (1765-1840). French soldier. Born at Sedan,

Macdonald,  
Duke of Taranto,  
French soldier  
After David

Nov. 17, 1765, he belonged to a Jacobite family exiled in the cause of James II. He entered an Irish regiment in the service of France, but in 1789 left this to join the revolutionary army. By 1796 he was commanding a division. In 1797 he was made governor of Rome.

Macdonald later served in Switzerland, and in 1809 was given a command in Italy. For his considerable share in the victory of Wagram he was made a marshal, and created duke of Taranto. He served in Spain, was very prominent in Napoleon's concluding battles, and in 1814 went over to the Bourbons. He died Sept. 7, 1840.

**Macdonald, FLORA** (1722-90). Scottish Jacobite heroine. She lost her parents early, and was brought up by relatives, the Clanranald family, being adopted later by Lady Macdonald of Skye. In 1746 she assisted in the escape of Prince Charles Edward after Culloden, for which she was arrested and sent to London, where she was detained but kindly treated. When released under the Act of Indemnity in 1747 she was presented with £1,500 by her admirers. In 1750 she married Allan Macdonald of Kingsburgh, emigrating with him to N. Carolina in 1773. During the War of American Independence Allan was made brigadier-general in the British forces, and Flora accompanied him on service until he was taken prisoner of war. By his advice she returned to Scotland, 1779. She died at Kingsburgh, March 5, 1790. See Culloden; *consult* Life and Times of Prince Charles Edward, A. C. Ewald, 1886; *Life of Flora Macdonald*, A. MacGregor, 1901.

A. Ramsay

**MacDonald, GEORGE** (1824-1905). Scottish novelist and poet. Born at Huntly, Aberdeenshire, the Howglen and Rothieden of his novels, Dec. 10, 1824, he was educated at King's College, Aberdeen, and Aberdeen University. He was a Congregational minister at Arundel from 1850 to 1853, but retired in the latter year and devoted himself to literature, frequently, however, occupying pulpits as a lay preacher. He edited *Good Words for the Young*, 1870-72, received a civil list pension of £100 in 1877, and died at Ashstead, Surrey, Sept. 18, 1905.

A voluminous writer, whose style expressed a charming personality, his first work, *Poems and Essays*, was published anonymously in 1851. *Phantastes*, a Faerie Romance in prose, 1858, was the first of his works to attract general notice. His poetical output consisted of two large volumes, 1893. Ruskin declared his *Diary of an Old Soul* to be one of the three great religious poems of the 19th century. He was the author of the well-known *Where Did You Come From, Baby Dear?* and *That Holy Thing*. His story books for children include *Ranald Bannerman's Boyhood*, 1871, *At the Back of the North Wind*, 1871, and *The Princess and the Goblin*, 1872. Of his novels, some are of a spiritual and mystical character, such as *David Elginbrod*, 1862; others, such as *Alec Forbes of Howglen*, 1865, are notable for their presentation of Scottish life and character. *Consult* Life, J. Johnson, 1906; anthology, ed. C. S. Lewis, 1945.

**Macdonald, SIR HECTOR ARCHIBALD** (1853-1903). Scottish soldier. Born at Rootfield, Urquhart, April 13, 1853, of humble parentage, he was assistant in a draper's shop for a few years, and in 1870 enlisted in the Gordon Highlanders, so distinguishing himself in the second Afghan War (1879-80) that he was recommended for a commission by Lord Roberts. His great qualities as a soldier had already earned for him the nickname of *Fighting Mac*. In 1883 he joined the Egyptian constabulary, was subsequently transferred to the Egyptian army, and became noted for his skill in training native troops. The Egyptian brigade which he commanded at the battle of Omdurman, 1898, was chiefly responsible for the victory.

Sir Hector Macdonald,  
Scottish soldier  
Lafayette

James MacDonald  
Elliott & Fry

In 1899 Macdonald was sent to South Africa to take command of the Highland brigade. In May, 1902, he was given the command of the troops in Ceylon, but in the following year a grave charge was brought against him. He returned to London, but was ordered by the war office to submit himself to a court of inquiry in Ceylon, and on his way thither shot himself in Paris, March 25, 1903. There is a memorial tower at Dingwall, Ross-shire, completed 1907. During the First Great War there were absurd rumours that Macdonald, still alive, held a German command.

**MacDonald, JAMES RAMSAY** (1866-1937). British statesman. Born at Lossiemouth, Morayshire, Oct. 12, 1866, he was educated at the village school there. He went to London in 1884 intending to study for the teaching profession, maintaining himself meanwhile as a clerk. Becoming private secretary to an Irish politician, he also began to make his way as a journalist. He joined the Independent Labour Party in 1894, and unsuccessfully contested Leicester in the election of 1895. It was largely through his efforts that the trade unions agreed to collaborate in the I.L.P., a move which led to the formation of the Labour party in 1900. MacDonald, as secretary, drafted its constitution.

He was again defeated in the 1900 election, but was returned in 1906, becoming leader of the party in 1911. Opposing Great Britain's entry into the First Great War, against the majority of his party, in 1917 he publicly supported a revolutionary movement on Russian lines; as a result the National Seamen's and Firemen's union refused to allow him to sail when he wanted to visit Russia. He was also unable to attend an international peace meeting at Stockholm, as a passport was refused. His resulting unpopularity cost him his parliamentary seat in 1918, and he did not return until 1922, as M.P. for Aberavon. By this time his firm opposition to the Communists had restored his popularity within the party, of which he resumed his leadership, thus giving him also the leadership of the opposition. As a result of the 1923 election, he became, with Liberal support, the first Labour prime minister (Jan.

J. Ramsay MacDonald,  
British statesman

MacDonald, GEORGE (1824-1905). Scottish novelist and poet. Born at Huntly, Aberdeenshire, the Howglen and Rothieden of his novels, Dec. 10, 1824, he was educated at King's College, Aberdeen, and Aberdeen University. He was a Congregational minister at Arundel from 1850 to 1853, but retired in the latter year and devoted himself to literature, frequently, however, occupying pulpits as a lay preacher. He edited *Good Words for the Young*, 1870-72, received a civil list pension of £100 in 1877, and died at Ashstead, Surrey, Sept. 18, 1905.

1924), taking over the foreign secretaryship as well. His ministry was short-lived, as he was defeated in Oct. on an opposition motion calling for an inquiry into the dropping of a charge of sedition against a communist pamphleteer. MacDonald narrowly retained his seat in the subsequent election, in which the Conservatives were returned to power.

In 1929 he was elected M.P. for Seaham Harbour, and again became premier, though again of a minority government. The rise of unemployment, together with the decline of trade, forced MacDonald in 1931 to put before his colleagues drastic measures of retrenchment, based on the findings of the May committee. These, especially the proposal for an unemployment "means test" (*q.v.*), were unacceptable to the majority of the cabinet, who refused their support. MacDonald found the Conservatives and most Liberals ready to support an all-party government, which he formed in Aug., 1931, though the number of his Labour supporters (henceforward called National Labour) was very small. A general election in Oct. returned this "National" government with a huge majority, but the new house was predominantly Conservative and MacDonald's position was therefore somewhat anomalous. The opposition of Labour members was particularly fierce towards the man they accused of "selling the pass."

After a visit to Washington to discuss the British debt to the U.S.A., he showed many signs of overstrain. His speeches became noticeably more vague and evasive. It was at this period that Winston Churchill termed him "the boneless wonder." This overstrain, coupled with eye trouble, led MacDonald to resign the premiership to Baldwin in 1935, in exchange for the office of lord president of the council. A big shock followed in the 1935 election, when he lost his seat by 20,000 votes. He remained in office, however, and was elected in Feb., 1936, for the Scottish universities. In May, 1937, he resigned from office, and later set out for South America, but died on the voyage, Nov. 9, 1937.

At his best, MacDonald was a persuasive orator and a prolific political writer. His tenure of the foreign secretaryship in 1923 was considered generally successful. It fell to him to set many precedents on the first advent of Labour to government, and this he contrived to do with appreciable tact and

dignity. His wife, Margaret Ethel Gladstone (d. 1911), whom he married 1896, profoundly influenced his career. A pleasing memorial to her stands in Lincoln's Inn Fields. *See* Independent Labour Party; Labour Party. *Consult* Lives, H. A. Tiltman, 1929; M. A. Hamilton, 1931; L. M. Weir, 1938; Lord Elton, 1939.

**MacDonald, JEANETTE** (b. 1907). American film actress and singer. Of Scottish-Irish descent, she was born at Philadelphia, June 18, 1907, educated there, and made her debut on the stage in revue, when a child. Her powerful soprano voice attracted attention, and she made a success in the New York production of *Irene*, 1920. She entered films under the auspices of Lubitsch who directed *The Love Parade*, 1929, in which she played opposite Maurice Chevalier. She scored success in a series of musical films, in which she played opposite Nelson Eddy, *e.g.* *Rose Marie*, 1936; *Bitter-Sweet*, 1941. Other films included *San Francisco*, 1937; *Smilin' Through*, 1942; *Cairo*, 1943, and *Three Dancing Daughters*, 1948.

**Macdonald, SIR JOHN ALEXANDER** (1815-91). Canadian statesman. Born in Glasgow, Jan. 11, 1815, he went as a child to Canada, where he was called to the bar in 1836, and in 1844 became a member of the legislature. He was attached to the Conservative party. In 1847 he joined the government as receiver-general, and after six years in opposition was attorney-general of Upper Canada from 1854 to 1857, when he became prime minister of the two Canadas.

Canada was passing through a critical stage, and Macdonald's solution of the many difficulties was federation of the various provinces. When in 1867 the federation was accomplished, Macdonald was knighted and became the first prime minister of the new union.

From 1867 to 1874 he was prime minister, and he returned to power in 1878, remaining premier until his death, May 29, 1891. He was also influential in promoting the building of the Canadian Pacific Rly. A supreme manager of men and groups of men with contending interests, he did much to develop the resources of the north-west, and throughout his career upheld the connexion with Britain.

Sir John Macdonald, Canadian statesman

**MacDonald, MALCOLM** (b. 1901). British politician and administrator. Younger son of J. R. MacDonald (*q.v.*), he

Malcolm MacDonald, Scottish politician and administrator

was born at Lossiemouth, Morayshire, and educated at Bedales school, and Queen's College, Oxford. He entered parliament in 1929 as the Labour member for Bassetlaw, and was parliamentary under-secretary, dominions office, 1931-35, becoming a privy councillor in 1935. He was dominions secretary in 1938 and was appointed minister of health in 1940. He went to Canada in 1941 as U.K. high commissioner, and was, 1946-48, first governor-general of the Federation of Malaya and Singapore. In 1948 he became U.K. commissioner-general in S.E. Asia. On the death of his father he became leader of the small National Labour party; but he did not stand for re-election in 1945.

**Macdonald, SIR WILLIAM CHRISTOPHER** (1831-1917). Canadian philanthropist. Born at Glenaladale, Prince Edward I., the son of a president of the legislative assembly of the island, he made his fortune in Montreal in the tobacco business. He devoted large sums to the promotion of education, founding the Macdonald agricultural college at Ste. Anne de Bellevue, Quebec, at a cost of about £1,000,000, and making munificent donations to McGill university, Montreal, and the Ontario agricultural college. He was knighted in 1898, and died June 11, 1917.

Sir W. C. Macdonald, Canadian philanthropist

**Macdonell, ALESTAIR** (c. 1725-61). Scottish Jacobite. The thirteenth chief of Glengarry, he

became an officer in the Royal Scots Regiment, then in the service of France. In 1744 he went to Scotland on a Jacobite mission, and in the following year was captured

Alestair Macdonell, Scottish Jacobite

at sea while bringing assistance to Prince Charles Edward, then in Scotland. Some time after his release he appears to have acted as a spy upon the prince, signing his dispatches to the English Government with the sobriquet of "Pickle," a name which Andrew Lang made familiar by his book *Pickle the Spy*. He kept closely in touch with the Jacobite party on the Continent and betrayed many of its members, but never seems to have been suspected. He succeeded to the Macdonell estates in 1754, and died Dec. 23, 1761.

**Macdonnell, ARCHIBALD GORDON** (1895-1941). British writer. Born Nov. 3, 1895, and educated at Winchester, he became one of the leaders of the younger school of satirical writers, his best-known work being *England Their England*, 1933, in which the incongruous and scholarly appreciations were delightfully mingled. Napoleon and His Marshals, a serious historical study, was a notable early work. His other books included *A Visit to America*, 1935; *Lords and Masters*, 1936. A frequent broadcaster in the B.B.C. Empire service, he died at Oxford, Jan., 1941.

**Macdonnell, JAMES** (1842-79). Scottish journalist. Born at Dyce, Aberdeenshire, April 21, 1842, a member of an old Highland family, he was educated at Bell's school, Inverness, and at the parish schools of Duftown and Rhynie. After a period on the staff of various Scottish newspapers, he joined the *Daily Telegraph* in 1865, serving as special correspondent in France, 1870-71; and was a leader-writer on *The Times*, 1875-79, making a special study of constitutional problems and French politics. He died in London, March 2, 1879. His valuable but unfinished sketch of contemporary French politics, *France since the First Empire*, was edited by his widow and published 1879.

**Macdonnell Range.** Mountain range of Australia, in the Northern Territory. It lies along the tropic of Capricorn, and its elevation causes rainfall, which is drained away by many streams, mostly terminating abruptly in the dry lowland. The overland telegraph crosses the range N. of Alice Springs. The Arltunga goldfield at the E. end became famous in 1903.

**Macdonogh, SIR GEORGE MARK WATSON** (1865-1942). A British soldier. Born March 4, 1865, he entered the Royal Engineers in 1884. He became general staff officer, War office, in 1912 and was

promoted major-general for services in the field in the early months of the First Great War, being in charge of military intelligence from 1915 to 1918. In the latter year he was promoted adjutant-general, and in 1919 lieutenant-general. He was knighted in 1917, retiring from the army, 1925. In 1933-34 he was president of the federation of British industries. He died July 10, 1942.

**Maddougall, WILLIAM** (1822-1905). Canadian statesman. Born at Toronto, Jan. 25, 1822, he entered the Canadian parliament in 1858, and held various government posts. In 1866 he was minister of Marine during the Fenian troubles, and was sent to London with other delegates to confer with the imperial authorities on questions which had arisen between the several North American possessions. In 1868 he became the first lieutenant-governor of Rupert's Land. He died May 29, 1905.

**McDougall, WILLIAM** (1871-1938). British psychologist. A native of Lancashire, he studied medicine and later became reader in mental philosophy at Oxford and at University College, London. He was subsequently professor at Harvard university, 1920-27. McDougall's main importance lay in his perception of the essential connexion between physiology and psychology, his doctrines being expounded in many books, of which the most important were *Body and Mind*, 1911; *The Group Mind*, 1920; *Outline of Psychology*, 1923; *Energies of Man*, 1932. In these he showed himself an opponent both of the Freudian and Pavlovian schools. He died Nov. 28, 1938.

**MacDowell, EDWARD ALEXANDER** (1861-1908). An American composer. Born at New York, Dec. 18, 1861, he studied piano-playing in Europe, and obtained a teaching appointment at Darmstadt conservatoire, where Liszt helped to introduce him to public favour. Returning to the U.S.A. in 1888, he settled in Boston. He became professor of music at Columbia university, 1896, but resigned in 1904, and died Jan. 24, 1908.

MacDowell's compositions include the Indian suite, several orchestral symphonic poems, songs,

and choruses, and a great number of highly popular piano pieces, of which the best-known are probably *Moon Pictures*, *Woodland Sketches*, *Sea Pieces*, and *Fireside Tales*. *Consult Life*, J. F. Parte, 1922.

**McDowell, IRVIN** (1818-85). American soldier. Born at Columbus, Ohio, Oct. 15, 1818, he was educated at West Point. He first saw service in the Mexican War, and during the Civil War was in command of the army of the Potomac. His defeat at the first battle of Bull Run in 1861 led to his being superseded by McClellan. As a corps commander he was subsequently engaged at the battle of Cedar Mountain and the second battle of Bull Run. He died at San Francisco, May 4, 1885.

**Macduff, Burgh** and seaport of Banffshire, Scotland. It stands on the Moray Firth, at the mouth of the Deveron, 46 m. N.W. of Aberdeen. It has a rly. station. Across the Deveron is Banff, a bridge connecting the two. Its harbour, with, in addition, a basin and a slipway, constructed in the 20th century, has facilities for shipping. Apart from the fisheries, the industries are connected with shipping, boat-building, engineering, agriculture, etc. Macduff was a fishing village named Doune before the superior, the duke of Fife, renamed it Macduff, the family name. It was created a burgh of barony of regality in 1783. The town is a favourite summer resort; an open-air swimming pool and an 18-hole golf course at Tarlair are elements in its popularity.

**Macduff, Thane** or earl of Fife. A semi-legendary figure of the 11th century, he is mentioned by early Scottish historians as having conspired with Malcolm Canmore to overthrow the usurper Macbeth. Threatened by Macbeth, he fled to England, and although his castle was destroyed, the tale that his wife and children were massacred has no foundation in fact, although it was utilised by Shakespeare for dramatic purposes. By his aid Malcolm defeated Macbeth at Lumphanan in 1057.

**Mace** (Fr. *Masse*). Heavy-headed staff or club, formerly much used in close combat, particularly to protect the king's person, and frequently borne in battle by

Mace of the House of Commons. The staff was made in 1649, and the head, with royal initials and symbols, was added at the Restoration

ecclesiastics, to whom the sword was a forbidden weapon. It is now a symbol of authority, *e.g.* the mayoral mace. The mace of the house of commons is the emblem of the Speaker's authority as the servant of the house, and is removed from its place on the table when the Speaker leaves the chair and the house goes into committee, or rises or when the sitting is suspended. It was the mace to which Cromwell was referring when, as alleged, he exclaimed "Take away that bauble," thereby dismissing the Long Parliament.

**Mace.** Fleishy, inner covering, or aril, of the nutmeg, which, dried in the sun, is used as a spice. When fresh it is a bright red, but on drying it fades to a brown. It is very aromatic, and contains both an essential and a fixed oil. *See* Nutmeg.

**Mace, JEM** (1831-1910). British pugilist. He was born at Beeston, Norfolk, April 8, 1831. He suddenly acquired fame by beating Bob Brett, 1860; and then the holder of the championship, Sam Hurst, June 18, 1861. As champion of the ring, a title he held intermittently until his retirement in 1871, he won a contest, and lost another, with Tom King; afterwards occurred his battles with Joe Goss, of which he won two, the other being drawn. He died Nov. 30, 1910.

**Macedonia.** In ancient geography, country of S.E. Europe, situated N. of Hellas, properly so called. It was bounded S. by Thessaly and the Aegean Sea, E. by Thrace, and W. by Illyria. The chief rivers were the Lydias, Strymon, and Axios (Vardar); the chief towns Edessa, Pella, Pydna, Philippi, Potidaea, and Thessalonica, the two first being in succession the capital, while Thessalonica is well known in connexion with S. Paul. Macedonia was famous for its salt, gold, and silver mines, and for its vineyards. The people, although regarded by the Greeks as semi-barbarians, were undoubtedly of Hellenic race. They spoke the Greek language, and had probably stayed behind in the north during the advance of the rest of the Greeks southwards.

Some of the earlier kings endeavoured to improve the conditions of the country, patronised Greek men of learning, and introduced Greek culture, but it was not until the reign of Philip II (359-336 B.C.) that Macedonia became important, reaching the climax of its greatness under his successor, Alexander the Great. At his death

(323) the Macedonian empire included Macedonia, Greece, Thrace, Asia Minor, Syria, Egypt, Babylonia, Assyria, part of modern Persia, Afghanistan, Baluchistan, and Central Asia. Under the Diadochi, or successors of Alexander, these possessions were contested among various claimants. After a period of civil wars, Antigonus Gonatas established himself firmly on the throne of Macedonia in 278. Later its kings came into collision with the Romans. After the battles of Cynoscephalae, 197; Pydna, 168; and the futile rising of the pretender, Andriscus, 148, also defeated at Pydna, Macedonia in 146 became a Roman province. After the division of the empire into E. and W., in A.D. 395, Macedonia became one of the divisions of the prefecture of Illyricum. It was settled by Slavs in the 6th

Macerata, Italy. Church of S. Maria delle Vergini, built 1573, outside the city walls

century, and in the 13th century it was formed by the Crusaders into the kingdom of Thessalonica, which was bestowed upon Boniface of Montferrat. In the 15th century, with the rest of Greece, it came into the power of the Turks.

In current usage the name is applied to an area in N. Greece and S. Yugoslavia, bounded roughly by the Crna Gora to the N., the Albanian frontier mts. to the W., the river Mesta to the E., and S. by a line following the river Vistritza to reach the sea at Mt. Olympus. Salonica is the chief town; in the Yugoslav part, Bitolj (Monastir), Skoplje (Uskub), and Nish are important. Tobacco is the main crop.

Macedonia has always been a centre of unrest. Turkish until

the Balkan Wars 1912-13, it was then divided between Bulgaria, Greece, and Serbia; the Bulgarian portion was ceded to Greece after the First Great War. The German invasion of Greece, April 6, 1941, took place through Macedonia, which was overrun within a few days. Bulgaria immediately annexed the E. of the country, but at the end of the war the boundaries reverted to those of 1940. Communist disturbances broke out in 1944 in Macedonia, where civil war raged from 1946 to 1949. *See* Greece in N.V.

**Maceio** or **MAÇAYO**. Seaport of Brazil, and capital of the state of Alagoas. It stands on a small peninsula between the sea and the Lagoa do Norte, on which its port Jaraguá is situated. Cotton goods and machinery are manufactured; there is an American meat packing house; and a trade is carried on in sugar, rum, castor-oil seed, hides, and skins. Maceio has rly. and highway connexion with Pernambuco, 130 m. N.E. Pop. 129,105.

**Macerata.** Province of the Marches, N.E. Italy. Bounded N. by Ancona, S. by Ascoli Piceno, E. by the Adriatic Sea, and W. by Perugia, it is traversed by spurs of the Apennines, and watered by the rivers Potenza and Chienti. It covers 1,070 sq. m.

**Macerata.** City of Italy, in the Marches, capital of the prov. of Macerata. It stands at an alt. of 918 ft., between the rivers Chienti and Potenza, 17½ m. by rly. W. of Porto Civitanova. Enclosed by ancient walls and towers, it has a cathedral, and several handsome churches, a well-stocked library, a medieval town hall, and several ancient palaces. The small university dates from 1290. The chief industries are the manufacture of glass and chemicals. Macerata was founded after the destruction of Ricina by Alaric, in 408. The city was captured undamaged, July 1, 1944, by the British 8th army. Pop. 26,708.

**Maceroni, FRANCIS** (1878-1846). Anglo-Italian soldier and inventor. Born in Manchester of Italian and English parents, July 25, 1878, he went to Italy in 1803, entered the Neapolitan army, rose to colonel's rank, saw active service, and in 1814 became aide-de-camp to Murat, king of Naples, who sent Maceroni on a diplomatic mission to

Francis Maceroni, soldier and inventor

England. He settled there on Murat's fall, and invented a steam road car, which plied between London and Brighton in 1834, and propounded plans for asphalt paving, street lighting, and flying machines. Maseroni died July 25, 1846. *Consult his Memoirs, 2 vols., 1838.*

**McEvoy, AMBROSE** (1878-1927). British painter. Born at Crudwell, Wilts, Aug. 12, 1878, he studied at the Slade, where he met John and Orpen. His early interiors with figures were influenced by Dutch masters, but he later developed a personal style in landscape and portraiture. In portraits he was most successful with women, e.g. the duchess of Marlborough, the countess of Wimborne. He is represented at the Tate, London, and the Luxembourg, Paris. A.R.A. from 1924, he died Jan. 4, 1927.

**Macfarren, SIR GEORGE ALEXANDER** (1813-87). British composer. He was born in London,

Sir G. A. Macfarren,  
British composer

March 2, 1813, entered the Royal Academy of Music in 1829, and was appointed professor of harmony there in 1837 and principal in 1875. He did much to raise the standard of British orchestration, and was a voluminous and scholarly composer. Conductor at Covent Garden for 30 years, from 1845, he was then appointed professor at Cambridge. He became totally blind in 1865. He was knighted in 1883, and died Oct. 31, 1887. His principal works are *The Devil's Opera*, 1838; *May Day* (cantata), 1857; *Robin Hood*, 1860; the oratorios *The Resurrection*, 1876, and *King David*, 1883.

**Macgill, PATRICK** (b. 1890). Irish writer, born in Donegal. From 12 to 19 he did odd jobs on farms and as a navy. Having published a volume of verse, *Gleanings from a Navy's Scrap Book*, he joined the *Daily Express*, and in 1912 received an appointment in the library at Windsor. With the London Irish in the First Great War, he saw much service on the western front, about which he wrote *Red Horizon*, 1916; *The Brown Brethren*, 1917. A strikingly realistic novel of labouring life was *Children of the Dead End*, 1915. Other stories were *The Rat-Pit*; *Sid Puddiefoot*, 1926; *Una Cassidy*, 1928; *The House at the World's End*, 1935. A play, *Suspense*, was acted in 1930.

**McGill University.** Canadian university. It owes its origin to property left by James McGill of Glasgow, who died in Montreal in 1813. It was incorporated in 1821 and 1852. Many benefactions have been received from citizens, including Sir W. Macdonald and Lord Strathcona.

The university consists of McGill, the original college in Montreal, the Workman building, the Macdonald colleges for physics, engineering, chemistry, and mining, the old and new medical buildings, and the Royal Victoria College, Victoria, opened in Montreal in 1899, is the women's department; it was built and endowed by Lord Strathcona. Macdonald, at St. Anne de Bellevue, is devoted to agriculture. McGill has large libraries, laboratories, an observatory, a farm, hospitals, and a medical museum. It is specially famed for its teaching of engineering and medicine. Music, teaching, household science, and commerce are other departments. Four theological colleges in Montreal are connected with the university, which has residential facilities for both men and women. It is under a board of governors, who unite with members of the staff to form the corporation.

**Macgillcuddy's Reeks.** Group of mts. in co. Kerry, Eire. They lie to the W. of Killarney, and include Carrantuohill (the inverted reaping hook), 3,414 ft., the highest summit in the country; Beenkeragh, 3,314 ft.; Caher, 3,200 ft.; Curraghmore, 2,695 ft.; Feabrah, 1,894 ft.; Brassel, 1,888 ft.; and Drishana, 1,490 ft. In the basin between the Reeks and the Mangerton group are the famous lakes of Killarney. The ascent of Carrantuohill is an exacting climb, but the summit, composed of shingle, commands magnificent views.

**McGovern, JOHN** (b. 1887). Scottish politician. He was born Dec. 13, 1887, and served his apprenticeship before becoming a master plumber in 1909. He entered parliament in 1930 as I.L.P. member for Shettleston, Glasgow. During 1931-33 he was arrested and imprisoned for offences committed in the name of free speech during demonstrations

by the unemployed, and made a protest in the house of lords during the king's speech against the failure to restore unemployment relief and end the means test. In 1934 he led a Glasgow-to-London hunger march. He retained his seat in the elections of 1945 and 1950, resigning from the I.L.P., however, in Nov., 1946, and joining the Labour party in 1947.

McGill University, Montreal. Part of the medical building  
Courtesy of Canadian Pacific Rly.

**McGowan, HARRY DUNCAN**

**McGOWAN, 1ST BARON** (b. 1874). A British industrialist. He was born in Glasgow, June 3, 1874, and joined Nobel's explosives company in 1889, becoming managing director in 1918. President of Imperial Chemical Industries in 1926, he became chairman on the death of Lord Melchett in 1930, and was also managing director until 1938. His other interests were banking and insurance. He received a knighthood in 1918 and was raised to the peerage in 1937.

**Macgregor, JOHN** (1825-92). Scottish traveller, known as Rob Roy. The son of a soldier, he was

John Macgregor,  
Scottish traveller

born Jan. 24, 1825. After education at Trinity College, Dublin, and Trinity College, Cambridge, he became a barrister. His time was mainly passed in travel, a notable feat being a journey in his canoe, Rob Roy, over the waterways of Europe, this being something of a pioneer undertaking. His writings include *A Thousand Miles in a Rob Roy Canoe*, 1866. He travelled also in America and other continents. Macgregor was interested in work among boys, being associated with Lord Shaftesbury in philanthropy, and was a member of the first London school board. He died July 16, 1892. *Consult Life, E. Hodder, 1894.*

**Mach, ERNST** (1838-1916). An Austrian physicist. He was born Feb. 18, 1838, at Turas in Moravia. Professor of mathematics at Graz, 1864, of physics at Prague, 1867, and finally at Vienna from 1895 to 1901, Mach was the leading

exponent in his day of physical psychology, and developed a theory about man's relation to his surroundings which had a bearing on Einstein's principle of relativity. Analysis of Perceptions, 1886, was perhaps the best known book by Mach. On retiring he was made a member of the Austrian house of peers, dying Feb. 9, 1916. See Mach Number.

**Machado, BERNARDINO** (1851-1944). A Portuguese statesman. Born July 28, 1851, at Rio de Janeiro, he went to Portugal and in 1882 entered parliament. A republican, he was a member of the government after the revolution of 1910. Prime minister when the First Great War broke out, he declared that in all circumstances his country would be sympathetic towards her old ally, Great Britain. Machado became president in 1915, but in a revolution two years later was arrested and exiled. He was again prime minister in 1921, president 1925-26, and exiled 1927. He died April 29, 1944.

**Machado, MANUEL** (1874-1947). Spanish writer. Educated at Seville university, he joined his brother Antonio (d. 1939) and J. R. Jimenez in a literary movement which stirred the national spirit at the beginning of the 20th century. He brought out arrangements of plays by Lope de Vega, and produced a play (in collaboration with his brother), *Desdichas de la Fortuna*, 1926. He will probably be remembered most by his Andalusian poetry, one of his finest pieces being a sonnet to de Falla. He died in Madrid early in 1947.

**Machaerodus** (Gr. *machaira*, sword; *odous*, tooth). Extinct genus of cats. Known as sabre-toothed tigers, they had enormous upper canine teeth, 8 to 10 ins. in length. Fossil remains are found in Pleistocene strata in Europe and America, and show the creature to have been about the size of a tiger. The teeth were probably used as stabbing instruments.

Machaerodus. Reconstruction of this prehistoric member of the cat tribe

**Macheath, CAPTAIN.** Chief male character in *The Beggar's Opera* (q.v.), by John Gay. He is a highwayman, but the action is chiefly concerned with his audacious amours in and out of jail, specially with Polly Peachum and Lucy Lockit. Among his songs are the well-known "How happy could I be with either!" and "When the heart of a man is depressed with cares."

**Machen, ARTHUR** (1863-1947). British writer. Born at Caerleon Mon, March 3, 1863, Arthur Llewellyn Jones-Machen was educated at Hereford. *Eleusinia* (1881) was his first book, followed by *The Anatomy of Tobacco*, 1884, and *The Chronicle of Clemendy*, 1888. Later works included two volumes of autobiography, *Far-Off Things*, 1922, and *Things Near and Far*, 1926, as well as much macabre fiction, the most noteworthy examples of which were *The Great God Pan*, 1894, and short stories in the mood of R. L. Stevenson's *New Arabian Nights*, these being eventually collected in *The House of Souls*, 1930. In *Hieroglyphics*, 1923, he outlined his artistic creed. With Benson's company 1900-02, he played Shakespearian roles. He later joined the staff of the *Evening News*, retiring from journalism after the First Great War. He died at Beaconsfield, Dec. 15, 1947.

**Machete.** Knife of Spanish origin, much employed by the native races of Central and S. America. It has a characteristic long, thick blade, and is used as a tool as well as a weapon. *Pron.* Mah-chay-tay.

**Machiavelli or MACCHIAVELLI, NICCOLÒ DI BERNARDO DEI** (1469-1527). Italian author and statesman. Son of a jurist, and member of an old Tuscan family, he was born at Florence, May 3, 1469. His learning was acquired chiefly by private study. In 1498, four years after the expulsion of the Medici and the foundation of the Florentine republic, he became secretary to the Ten, a chancery combining the duties of war office and ministry for home affairs. He brought to his work an ardour inspired by admiration for old Rome. He was employed on several diplomatic missions, conceived an admiration for the unscrupulous but successful methods of Cesare Borgia, and held office until the Medici returned in 1512. He was then involved in the downfall of his patron, the Gonfalonier Soderini, and was cast into prison,

accused of complicity in an attempt to restore the republic, put to torture, but soon after set free.

Believing that some form of republican government might be built up under the Medici, he declared his readiness to serve them, but, except in slight matters, his assistance was not sought. He

Niccolò Machiavelli,  
Italian author

From a painting by Santi di Tito

retired to his villa near San Casciano, seven miles from Florence, where he wrote *Il Principe* (*The Prince*), and his *Discorsi* (*Discourses on the First Decade of Titus Livius*). In 1520 he produced his *Arte della Guerra* (*Art of War*), and was commissioned by Giulio de' Medici (later Pope Clement VII) to write his *Istorie Fiorentine* (*History of Florence*). He wrote also several comedies, including *La Mandragola*, a picture of the men and society of his time, and perhaps the finest comedy of the Italian stage. When the Medici were once again banished from Florence, Machiavelli was disappointed in his hope of office, and died June 22, 1527, leaving four sons and a daughter by his wife, Marietta Corsini. He was buried at Santa Croce, where in 1787 a stately cenotaph was erected to his memory.

Machiavelli's fame rests upon *The Prince* and the *Discourses*, related books concerning respectively principalities and republics. His main theme, illustrated by references to the rulers of his own time, is the supremacy of the secular state. He regarded the state as the supreme end, and all means to preserve it as justified. Morality had nothing to do with the matter, and the ruler must be both lion and fox. The world he

regarded as always the same; man growing neither better nor worse.

For four centuries Machiavelli's name has been used as a term of reproach, largely because of misunderstanding. In Elizabethan literature alone hundreds of references connect him with the Evil One. Butler, in *Hudibras*, erroneously derived Old Nick from Niccolò. But Machiavelli did not scoff at private virtue; it was his intention merely to separate ethics from political science. The Prince was never published by the author, with the result that its text is debatable. But there is no division among critics as to the precision and clarity of its style, which has been compared with that of the clinical lecturer, or as to Machiavelli's mastery of the subtle irony of the literal statement. Several editions and translations exist. See Italy: Literature; Sovereignty.

**Bibliography.** Trans. of principal prose works, C. E. Detmold, 1861; *Life and Times*, P. Villari, 1877-82, popular ed. 1904; *Pioneer Humanists*, J. M. Robertson, 1907; *Life*, G. Prezzolini, Eng. trans. 1928; *Machiavelli*, J. H. Whitfield, 1947.

**Machicolation** (O.Fr. *macher*, to crush; *coulis*, groove). Term used in fortification. In medieval

fortresses it was the provision of an overhanging parapet with holes through which molten lead, stones, etc., could be dropped upon the attacking forces. Such loopholes provided also protection from missiles aimed to drop on the defenders. The word is sometimes used for loopholes constructed in fortifications for downward fire, and also for ornamentation in imitation of the original machicolation. The machicolis was a contrivance used in medieval times for casting stones down upon the enemy.

**Machinability.** The capacity of a material to withstand such mechanical finishing operations as bring it to desired standards of surface finish, size, and shape. No standard test is acceptable generally, because many variable factors must be measured. Usually the process which a material must stand: (a) cutting with a shaped

cutter; (b) abrasion with hard particles of various sizes embedded in various kinds of matrices; (c) localised forming, with shaped formers or rolls, which causes the material to flow into the desired forms. See Grinding.

**Machine-Gun.** Automatic gun giving a continuous volume of fire by a single pressure on the trigger. It thus has a fire-power equivalent to that of a number of men armed with single-shot weapons.

The first attempts to devise automatic discharge of missiles in rapid succession from the same weapon were made long before the invention of fire-arms, and were inspired by the difficulty of breaking the ranks of massed pikemen, infantry's then defence against the cavalry charge. The ordinary missile weapon lacked range, was inaccurate, and was slow in delivery. Early in the 5th century B.C., Dionysius of Syracuse introduced the polybolos, a weapon resembling a cross-bow which fired a succession of arrows fed to it by force of gravity. At the battle of Hastings some of the English archers used bows designed to discharge more than one arrow at a time. Soon after the introduction of gunpowder in the 14th cent., the Italians introduced the *orgue*, a crude form of machine-gun. It consisted of ten iron tubes mounted side by side and fired by a single lock and quick match which ignited the charges of all the barrels in rapid succession. It was first used at the battle of Piccardina, 1467. A somewhat similar device, the *ribaudequin*, so-called from the laughter-like noise of its fire, consisted of twenty arquebuses connected to a combustion box common to all; it was used with devastating effect by the Venetians at the battle of Ravenna, 1512.

In 1718 James Puckle, a Londoner, patented a revolver-gun consisting of a single barrel having at the breech a revolving cylinder with nine chambers. Each chamber contained a bullet and charge of gunpowder and was aimed with the breech by turning a crank. When one cylinder or magazine had fired its nine chambers, it was replaced by another fully loaded and primed. The inventor stated that the shapes of the chambers and of the bullets could be varied, so that square bullets could be used against heathens and round bullets against Christians. Puckle's machine-gun was the first with a single barrel; it included

also elevating and traversing screws and a tripod mounting, features which became accepted parts of heavy machine-guns. The weapon proved inefficient and does not appear ever to have been used in action.

About the middle of the 18th cent. a French artillery officer designed a machine-gun having three rows of ten barrels, each barrel 44 ins. long with a bore of .75 in. At the breech of the gun was a plate having a chamber for each barrel, and in the rear of the chambers was a percussion box with which each chamber was connected. A hammer, falling by gravity, struck a percussion cap which ignited the powder in the combustion box, which in turn ignited the powder in the barrel chambers, so firing all 30 charges simultaneously. A specimen of this gun is preserved in the rotunda at Woolwich arsenal.

#### Early Automatic Weapons

In 1854 Sir John Lille invented what was called an automatic rifle battery. It had twelve barrels in two rows and behind each barrel was a chambered cylinder similar to that of a revolver, half the cylinders being 10-chambered, half 20-chambered. Each chamber held a bullet, charge, and percussion cap, and the weapon was fired by turning a handle, which caused the cylinders to revolve and a series of hammers to fall, striking the percussion caps. In 1860 Dr. Joseph Requa, an American, introduced his rapid-fire gun, consisting of 25 barrels laid flat on a platform. This weapon was used during the American Civil War, being mounted on a fort at Charleston, S. Carolina.

All these early machine-guns proved impracticable owing to the problem of reloading the discharged barrels. The best that could be achieved was the rapid discharge of a number of barrels, after which fresh charges had to be rammed home in each barrel, so exposing the crew to enemy fire. Moreover, the weapons were inaccurate and too cumbersome for the firer to change target during discharge.

With the invention of the breech loader and the percussion cartridge, the latter containing missile, propellant, and percussion charge, the machine-gun became a practicable weapon. The first breech-loading machine-gun firing cartridge rounds was the mitrailleuse invented by a Belgian officer, Capt. Fafschamps, in 1851, and introduced into the French army

Machicolation. Sectional diagram of gallery built out of a window to permit of downward fire

1869. The mitrailleuse consisted of 37 barrels assembled round a central axis and contained in an iron tube similar to the barrel of a field gun. It was loaded by a magazine in the form of an iron plate drilled with 37 holes, with a 13 mm. cartridge inverted in each hole corresponding with the position and number of the barrels. The gun was fired by the turning of a handle, one revolution discharging all the rounds in the magazine. The maximum rate of fire was 12 magazines a minute, i.e. 444 rounds. Mitrailleuse guns were first in action at the battle of Saarbrücken, opening engagement of the Franco-Prussian war, Aug. 2, 1870, but owing to faulty tactical use had little effect on the outcome of the engagement. At the battle of Gravelot later in the same month, the mitrailleuses were better sited and inflicted heavy losses on the German infantry.

As a reply to the mitrailleuse, the Germans developed the field machine-gun, which had 24 barrels mounted in four parallel rows of six and fired 300 rounds a minute to an effective range of 1,000 yds. But the loading mechanism was too complicated, and, like those of the mitrailleuse, the barrels became overheated and warped in their frames after only a short period of fire.

#### The Gatling Gun

The first really practicable machine-gun was invented by Dr. Gatling (*q.v.*), of Chicago, in 1862. This gun consisted of 6-10 rifle barrels fixed at equal distances round a central axis and mounted on a field-gun carriage. Each barrel was complete with bolt, firing pin, extractor, and ejector. Placed above the barrels was a gravity drum containing the rounds to be fired. The gun was not fully automatic since a crank had to be turned, causing the barrels to revolve round the central axis; but the actions of inserting a round, closing the breech, releasing the sear of the firing pin, firing, opening the breech, extracting and ejecting the empty case, and inserting a new round were performed automatically during the revolution of the barrels. As the uppermost barrel passed under the drum a round dropped into its breech; as it passed to the next position the cartridge was pushed home and fired on reaching the lowest position below the drum. When the barrel passed up on the left side of the central axis the empty case

was extracted from the breech, and as it moved farther up was ejected.

First used in the American Civil War, the Gatling gun fired 350 rounds per min. It was introduced into the British and other European armies, but suffered from two serious defects: the movement of the barrels, caused by the turning of the crank, rendered it inaccurate, while the cranking itself had to be carefully timed: if the handle were revolved too fast, the rounds dropping from the drum missed the centre of the breech and jammed. The Gatling was first used by the British in the Zulu war of 1879.

Other multiple-barrelled machine-guns were the Nordenfeldt and Gardner. The Nordenfeldt had from 3 to 10 rifle barrels mounted in a single row and was gravity fed from ammunition chutes. The Gardner gun was somewhat similar, but an improved loading action made fewer barrels necessary and increased firing rate to 357 rounds a min.

All multiple-barrelled machine-guns suffered from excessive recoil and required a heavy mounting; consequently they were nearly as cumbersome in the field as artillery pieces. They were usually sited with the field artillery, but were much more vulnerable than field guns. Moreover, none of these weapons was truly automatic; that is, a considerable amount of hand-work was required in loading, while manual work was essential to turning the crank or other device upon which fire depended. On the other hand, they proved useful weapons on warships as secondary armament for beating off torpedo-boat attacks. During the period 1880-1900 most British warships had batteries of Gatlings, Gardners, and Nordenfeldts ranging from .303 to .45 in. in calibre.

#### Hiram Maxim's Invention

The first true machine-gun, a single-barrel weapon requiring merely the pressing of a trigger to eject a stream of bullets, was invented by Hiram Maxim in 1885. In the Maxim gun, the force of recoil generated by a portion of the explosion when the initial round is fired impinges on a baffle fitted to the barrel, forcing it to the rear; it is then returned to the forward position by a heavy coil spring. The breech-block is connected to the barrel by a series of levers, so that by means of the reciprocating motion it ejects the spent case, cocks the hammer,

feeds in a new round, and fires it. The fabric or clip belt, holding 250 rounds, is automatically fed into the side of the breech block, each recoil of the gun pulling the belt through for a distance of one round. As finally developed for firing .303 ammunition, the Maxim fired 600 rounds per min. to an effective range of 2,500 yds. It weighed 60 lb. and its tripod 48 lb.

#### Developments of the Maxim

Maxims were adopted by the British army in 1889 and first used in the Matabele war of 1893. The gun was also used with devastating effect against the charges of Ghazis at the Malakand pass in the Chitral expedition of 1895, and by Kitchener in the Sudan campaign of 1896. A later development of the Maxim, the pompom, which had a calibre of 1.45 in. and fired steel shells weighing 1 lb., was used by the Boers in the S. African war. Neither the .303 Maxim nor the pompom proved particularly successful in the Boer war, chiefly owing to the fact that both types were mounted on heavy wheeled carriages and used tactically as field artillery. Mounted on tripods and used as an infantry weapon, Maxims were used by the Russians in the Russo-Japanese war, 1904-05, and did heavy execution until the Japanese infantry was equipped with the Hotchkiss (*q.v.*) which, gas-operated and air-cooled, had originally been designed for the French colonial army in N. Africa.

As the result of the lessons learned from this campaign in Manchuria, the Germans equipped their infantry with the Maxim and retained it as their principal machine-gun throughout the First Great War. At the outbreak of that war every British infantry battalion was equipped with two tripod-mounted Maxims, every cavalry unit had two Vickers machine-guns. The Vickers had been used on a small scale during the S. African war as a cavalry weapon, being lighter than the Maxim. It weighs 36 lb. without its mounting and fires 600 rounds a min. to an extreme range of 2,900 yds. Eventually every British infantry company was provided with two Vickers or Maxim guns. It was found, however, that the ordinary machine-gun, although a deadly weapon in defence and for laying a barrage to cover attacking infantry, was too heavy when it had to be carried forward by advancing troops. Accordingly, a number

of light machine-guns were developed, of which the most successful was the Lewis, adopted by the British army late in 1915. The Lewis gun weighs 26 lb. and is worked automatically by the pressure of the gas, resulting from the explosion of the charge, assisted by a return spring. When the trigger is pressed, a backward and forward movement, with the ignition of a cartridge at the end of each forward movement, continues until the magazine is empty. The gunner may fire either single or continuous shots up to the full capacity of the pan-shaped magazine, which holds either 47 or 97 rounds. The gun is air-cooled and can be fired from the shoulder in the prone position or from the hip when moving forward. The barrel is provided with a small, permanent bipod.

With the development of air warfare the machine-gun proved itself an ideal weapon both for mounting on aircraft (see Air Fighting: Armament) and as a ground defence against low-level air attack. The first airborne machine-guns were single or twin Lewis guns fitted to Scarfe rings and mounted on the Martinsyde Scout late in 1915. Thereafter the machine-gun became the fighter aircraft's offensive and defensive weapon, and at the outbreak of the Second Great War the number carried by a single aircraft had increased to the eight Browning guns mounted in the wings of the Spitfire. Machine-guns also proved the ideal armament for armoured vehicles, and although these were eventually mounted with shell-firing guns equivalent in calibre to field artillery pieces, the machine-gun continued to be fitted to them as secondary armament.

Between the First and Second Great Wars the machine-gun underwent further changes, the general tendency, as far as the infantry weapon was concerned,

being towards lightness; a demand necessitated by the increased mobility of infantry. One of the most notable light machine-guns for infantry work was the Bren, with which a proportion of British infantry was equipped at the outbreak of the Second Great War, and which eventually became the standard British infantry machine-gun. Modified and lightened versions of the Vickers and Browning were also extensively used. The principal German machine-gun of the Second Great War was the M-G.15, which weighed 26 lb. and fired standard 7.92 mm. small arms ammunition at the rate of 900 rounds a min., 75 rounds being contained in the double-drum magazine. The standard Italian machine-gun was the Brega, which weighed 25½ lb. and fired 256 ammunition at 1,000 rounds a min. Both the M-G.15 and the Brega were recoil operated.

All types of machine-guns were adapted for anti-aircraft work during the Second Great War. In most cases they were mounted in pairs or fours, pressure on a single trigger firing all guns simultaneously. In the case of water-cooled guns, the water jackets were removed for A.A. work, cooling being by air flow over the barrel. Even in the case of the original water-cooled infantry machine-gun, water-cooling is frequently dispensed with: when the barrel becomes overheated it is replaced by a spare. From the machine-gun firing ordinary small-arms ammunition was developed the heavy machine-gun (or cannon) firing shells.

One machine-gun can deliver a volume of fire equal to that of 30 riflemen, while occupying 1/10th of the space needed for 30 men, and requiring only 1/10th of that number, or less, to handle it. As a defensive weapon, the machine-gun is easily concealed, and after

it opens fire is difficult to detect, particularly since the introduction of smokeless powder and the fitting of condensers to absorb the steam from water-cooling systems. Provided it has been sited in a strong emplacement, it is difficult to destroy by artillery or air bombardment and, manned by a resolute crew, takes heavy toll of the advancing infantry. Even in the Second Great War well-protected and carefully sited machine-gun posts were capable of delaying armour. The essentials of the successful defensive use of machine-guns are: abundant supply of ammunition; concealment; reservation of fire until a target of sufficient importance presents itself; and accurate knowledge of all ranges in the area operated across. As an offensive weapon, the machine-gun is most effectively used to give flanking fire to advancing infantry and to deliver overhead fire to drive the defence to cover between the forward infantry rushes. In both offence and defence, machine-gun fire is most effective in short bursts rather than as continuous fire. See Arquebus; Browning Gun; Infantry; Ordnance; Tactics, etc.

David Le Roi

**Machine Gun Corps.** Former unit of the British army. Raised in Oct., 1915, in view of the increasing tactical importance of the machine-gun in warfare, the corps amalgamated into a single unit the machine-gun companies then attached to brigades. It was divided into infantry, cavalry, heavy, and motor branches. With the introduction of machine-guns into the ordinary infantry platoon (1921), the corps was disbanded. A bronze statue of David designed by Derwent

Machine Gun Corps badge

Machine-Gun. Diagram of Bren machine-gun, British light automatic weapon of the Second Great War

Wood was unveiled at Hyde Park Corner on May 10, 1925, as a memorial to the corps, with the inscribed quotation: Saul hath slain his thousands, and David his ten thousands.

**Machine Tools.** Metalworking or woodworking tools driven by mechanical power. Examples are: (metalworking) lathes, planers, milling machines, drill presses; (woodworking) circular saws, band saws, planing machines, moulding machines, mortising machines. It is computed that British industries use machine tools worth about £30,000,000 annually. Light machine tools include some which are really mechanised hand tools, such as electric or pneumatic drills, nut-runners, or small circular saws. These the workman guides by hand, the gain over hand tools being in speed, accuracy, and absence of fatigue. Bench tools include drill presses, punches, die presses, etc., in some of which the operation may be entirely automatic, or semi-automatic.

Lathes (*q.v.*) range from a tiny one used by watchmakers to a gigantic machine which needs an entire shop for its accommodation and may be more than 60 ft. in length. This last would be used for machining heavy forgings such as engine crankshafts. Planing machines have a similar range.

**Mach Number.** In aeronautics, the ratio of aircraft speed to the speed of sound under the same atmospheric conditions. It is named after the Austrian physicist Ernst Mach (*q.v.*), and is expressed as a decimal. The instrument called a machmeter was evolved to register the Mach number.

**Machpelah.** Locality in Hebron, Palestine. Here in a double cave on the hillside is the traditional burial place of Abraham and other Jewish patriarchs (Gen. 23). Above the cave rises the Mahomedan mosque of El Khulil (the friend, *i.e.* Abraham). The summit of the hill commands a fine view of the Vale of Mamre. See Abraham; Hebron.

**Machynlleth.** Urban dist. and market town of Montgomeryshire, Wales. It stands on the Dovey, 13 m. by rly. N.E. of Aberystwyth, and is a quiet holiday resort. Here in 1402 Owen Glendower declared himself prince of Wales and held a parliament. Until 1894 the place was a borough, and it formerly made woollen goods. Market day, Wed. Pop. 1,892.

**M'Ilwraith, Sir Thomas** (1835–1900). Australian statesman. He was born at Ayr, Scotland, edu-

cated at Glasgow university, and became a civil engineer on the government rlys. in Victoria in 1854. In 1868 he entered the legislative assembly of Queensland and was minister of public works, 1874–79, and premier, 1879–83. In 1888 he formulated a programme for a national party and once more assumed the premiership. A long dispute with the governor regarding the prerogative of mercy was settled in favour of M'Ilwraith. In 1890 he joined Griffith in defeating the government and became treasurer. He was again premier in 1893, after which he retired. Knighted in 1882, he died in London, July 17, 1900.

**Macintosh, Charles** (1766–1843). British chemist and inventor. Born Dec. 29, 1766, he early took an interest in science, and at 20 entered a sal ammoniac manufactory. In 1786 he took up the manufacture of sugar of lead, in 1797 he opened the first Scottish alum works, and two years later was the inventor, with Charles Tennant, of bleaching powder, out of which a large fortune was made. Macintosh invented a process of conversion, by the use of carbon gases, of malleable iron to steel, which was much quicker than the concentration process then in use. He worked out the hot blast process in conjunction with Neilson. But despite his important researches in chemistry, Macintosh's name is inevitably linked with the invention of waterproof fabrics, for which he took out a patent in 1823. Elected F.R.S. in that year, he died July 25, 1843.

**MacIvor, Flora.** Character in Scott's novel *Waverley*, devoted, like her brother, Fergus, to the Jacobite cause. A friend of Rose Bradwardine, she refuses the suit of Edward Waverley, and after her brother's execution retires to a convent in Paris.

**Mack, Karl** (1752–1828). Austrian soldier, in full Freiherr Karl Mack von Leiberich. Born Aug. 25, 1752, he entered the army in 1770, and served in the short war of the Bavarian succession and against the Turks, holding a position on the staff. In and after 1792 he fought against France, chiefly in the Netherlands, and rose to be field-marshal. In 1798 he was put in command of the troops of the king of Naples, but he could do nothing with them and was made prisoner by the French, soon escaping. Having been appointed quartermaster-general, he led the army assembled in Bavaria to oppose the French. The campaign

was badly conducted, and ended in the surrender of Mack and a large force at Ulm, Oct. 20, 1805. He died Oct. 22, 1828. See Ulm. Campaign of.

**Mackail, Denis George** (b. 1892). British novelist. Born June 3, 1892, son of J. W. Mackail (*v.i.*),

Denis Mackail,  
British novelist

he was educated at St. Paul's and Balliol College, Oxford. His first novel, *What Next?* 1920, was succeeded by a number of light, entertaining publications, notable for their humour and adroit characterisation, *e.g.* *Greenery Street*, 1925; *The Fortunes of Hugo*, 1926; *The Flower Show*, 1927; *Summer Leaves*, 1934; *Back Again*, 1936; *Life with Topsy*, 1942; *Our Hero*, 1946.

**Mackail, John William** (1859–1945). A British scholar. From Balliol College, Oxford, he entered the board of education. A brilliant classical scholar, he was professor of poetry at Oxford, 1906–11; president of the Classical Association, 1922–23; and of the British Academy, 1932; also professor of ancient literature in the Royal Academy. His books include *Latin Literature*, 1895, an outstanding critical manual; the standard *Life of William Morris*, 1899; a notable verse translation of Homer's *Odyssey*, 1903–10; *Classical Studies*, 1925; *Studies of English Poets*, 1926; *The Approach to Shakespeare*, 1930; *The Sayings of Christ*, 1938. In 1935 he received the O.M., and he died Dec. 13, 1945.

J. W. Mackail,  
British scholar  
*Elliott & Fry*

**Mackay.** Port of Queensland, Australia. It stands on the Pioneer river, 598 m. N.N.W. of Brisbane, to which it is linked by the main rly. Its harbour facilities have been improved at a cost of £250,000. Exports include sugar, timber, coffee, copper, gold. Pop. 12,600.

**Mackay, Alexander Murdoch** (1849–90). A British missionary. Born at Rhynie, Aberdeenshire, Oct. 13, 1849, and educated as an engineer, he was employed with engineering firms in and near

Berlin. In 1876 he offered his services to the Church Missionary Society, who sent him to work as a lay missionary and mechanic in Uganda, where he remained from 1878 till his death, Feb. 8, 1890.

**MacKay, CHARLES** (1814-89). A Scottish journalist and song writer. Born at Perth, March 27, 1814, he

was educated at the old Caledonian Asylum, Hatton Garden, and at Brussels. Assistant sub-editor of the Morning Chronicle, 1835-44, and editor of the

Glasgow Argus, 1844-47, he was editor of the Illustrated London News, 1852-59, and special correspondent of The Times in New York 1862-65. He died in London, Dec. 24, 1889.

His fame rests chiefly on songs, especially Cheer, Boys, Cheer, of which 400,000 copies were circulated in his lifetime; There's a Good Time Coming, and Tubal Cain. His songs appeared in collected form in 1859 and 1868. He edited collections of Jacobite and Cavalier ballads; compiled One Thousand and One Gems of English Poetry, 1867, and One Thousand and One Gems of English Prose, 1872; and wrote a History of the Mormons, 6th ed. 1857. He also interested himself in Celtic lore and language. Marie Corelli (q.v.) was his illegitimate daughter.

**Mackay, HUGH** (1640-92). A Scottish soldier. The son of Hugh Mackay of Scourie, Sutherland, he entered the English army in 1660. He served in France, his regiment being one of those sent to assist Louis XIV in his wars, and was afterwards in the service of Holland. He refused to return when James II asked for his aid, but was one of the chief generals in the force brought to England by William of Orange. Sent as commander-in-chief to Scotland, he built Fort William and, in spite of his defeat at Killiecrankie, July 27, 1689, reduced the Highlanders to some kind of order. Afterwards he served against the Jacobites in Ireland, being largely responsible for the victory at Aughrim. Mackay was killed at Steinkirk when leading his division in the hottest part of the battle, July 24 (o.s.), 1692.

**Mackay, JOHN WILLIAM** (1831-1902). American financier. Born in Dublin, Nov. 28, 1831, he went

to New York as a child. Proceeding to California in 1851, he amassed money by mining, and discovered the great Bonanza vein in the Comstock lode, Nevada. He part-founded the Bank of Nevada in San Francisco. In competition with the Western Union Telegraph company he organized the Commercial Cable co. in 1884, cheapening the cost of cabling to Europe, and forming later the Postal Telegraph company. He died in London, July 20, 1902.

**Mackaye, PERCY** (b. 1875). American dramatist and poet. Born, New York, March 16, 1875, he was educated at Harvard and Leipzig. After the production (1903) of his comedy, The Canterbury Pilgrims, he devoted himself to writing and to lecturing at universities on the drama. His publications include 13 volumes of poetry; many plays, including Jeanne d'Arc, a tragedy, 1906; Anti-Matrimony, a satirical piece, 1910; A Thousand Years Ago, 1914; ten volumes of masques, and four of grand opera libretti. He became president of the Pan-American Poets' League of N. America, and received a national testimonial on his 70th birthday.

**McKeesport**. Industrial city of Pennsylvania, U.S.A., in Allegheny co., it stands at the junction of the Youghiogheny and Monongahela rivers, 15 m. S.E. of Pittsburgh, and is served by rlys. and airports. It is in the Pittsburgh iron and steel district and a retail market for the Pennsylvanian and West Virginian bituminous coal and gas fields. "Tube City" produces steel tubes, pipes, sheet steel, etc.; there are also meat packing plants. Pop. 55,355.

**McKell, WILLIAM JOHN** (b. 1891). An Australian politician. Born at Pambula, N.S.W., Sept. 26, 1891, he was educated at a state school in Sydney before serving his apprenticeship as a boilermaker and becoming financial secretary of the Boilermakers' Union. At 25 he was elected to the N.S.W. legislative assembly, and in 1920 was minister of justice for the first of several terms. He was called to the bar in 1925, and carried out financial missions to London and New York in 1927. On May 16, 1941, he became Socialist premier and treasurer of his state. In 1947 he was named governor-general of the Commonwealth in succession to the duke of Gloucester.

**McKenna, MARIE** (b. 1892). Belgian nurse, born Marthe Cnockaert, who acted as British secret service agent in the First Great War. While serving, 1915-17, in

a German military hospital at Roulers, she reported German troop movements, helped British prisoners to escape, and effected destruction of German ammunition dumps, etc. She was awarded the French and Belgian Legions d'Honneur, and was mentioned in Haig's despatches. For her nursing work she received the German iron cross. In 1932 she published the story of her adventures, I Was a Spy, later made into a British film. She wrote several other books on spies and spying.

**McKenna, REGINALD** (1863-1943). A British politician and banker. Born July 6, 1863, son

Reginald McKenna,  
British politician  
Russell

of a London merchant, he was educated at King's College, London, and Trinity Hall, Cambridge, where he rowed in the university eight. He was called to the bar in 1887, but forsook the law in 1895 when he became Liberal M.P. for N. Monmouthshire. He was financial secretary to the Treasury, 1905-07, and then joined the cabinet as president of the board of Education. First lord of the Admiralty in 1908, he successfully supported its demand for more dreadnoughts.

He was home secretary from 1911 until made chancellor of the exchequer in Asquith's war-time coalition ministry of 1915. Though normally a stern free-trader, he increased the duties on tea, sugar, coffee, and other imported commodities, taxed entertainments and matches, and imposed the so-called McKenna duties on imported motor cars, watches, etc. He left office with Asquith in Dec., 1916, and in the 1918 election lost his seat. From 1919 McKenna was chairman of the London Joint City and Midland (now Midland) Bank, and in 1928 published Post-War Banking Policy. This last Gladstonian Liberal died Sept. 6, 1943.

**Mackennal, SIR BERTRAM** (1863-1931). Australian sculptor. Born in Melbourne, he was a son of a Scottish sculptor who had emigrated. Coming to England in 1883, he entered the R.A. schools, but soon went to Paris to study. During 1889-91 he was engaged on the decoration of the government house at Melbourne. His Circe, 1893, exhibited at the Salon and the R.A., won public recognition. Among later works were statues of Queen Victoria for Lahore,

Blackburn, and Australia; a portrait bust of Sarah Bernhardt; the Earth and the Elements, and Diana, two imaginative pieces bought by the Chantrey bequest for the Tate Gallery; coinage designs for George V (the sculptor's initials being faintly discernible at the base of the king's neck); the national memorial to Gainsborough: the house of commons war memorial; and memorials to Edward VII in London, Calcutta, Melbourne, and Adelaide. He was knighted in 1921, made R.A. next year, and died Oct. 10, 1931.

**Mackensen, August von** (1849–1945). A German soldier. The son of a land agent in Saxony, he

August von Mackensen, German soldier

was born Dec. 6, 1849. Educated at the Torgau gymnasium and the university of Halle, he entered the army as a private in 1869. By 1898 he was A.D.C. to the Kaiser

and by 1908 was general of cavalry and commander of the 17th army corps. When the First Great War broke out, he was prominent in the second attack on Warsaw.

In reality generalissimo of all the Austro-German forces in the S., Mackensen carried out the great drive in 1915 against the Russians which began with the Dunajetz battles and ended in the reconquest of nearly all Galicia. He then cooperated in the campaign that compelled the evacuation of Warsaw by the Russians. Made a F.M., he overran Serbia, and led the army that subjugated Rumania by Jan., 1917. Remaining there until the armistice of 1918, he was in effect dictator. He retired in 1920, but lived until Nov. 8 1945.

His third son, Everhard von Mackensen (b. Sept. 24, 1889), served on the general staff in the First Great War, and as a corps and army commander (col.-gen.) in the Second. Captured in Italy, he was tried in 1946 by a British tribunal as a war criminal and, with Lt.-Gen. Maeltzer, found guilty of being concerned in the murder of 335 Italians (see Ardennine Caves). The sentence, death by shooting, was commuted to life imprisonment, July 5, 1947.

**Mackenzie.** River of Canada. It has its source in the headwaters of the Athabaska river, issuing from the Yellowhead and Athabaska passes of the Rocky

Mountains. As the Athabaska it enters Athabaska Lake, which it leaves as the Slave river, and after 20 m. is joined by its great tributary, the Peace river. Entering the Great Slave Lake, it emerges thence as the Mackenzie, and is navigable onwards to its outlet, through a wide delta by Fort Macpherson, at Mackenzie Bay, a distance of 1,120 m. Its direction is almost continuously N. Never less than 2 m., in some places it attains a width of 3 to 4 m. The lower river is frozen in winter from Nov. to May; as the ice melts first in the upper waters the lower course is flooded in the early summer. The total length is 2,500 m., and the basin area 682,000 sq. m. Other tributaries are the Liard, Great Bear, and Peel. Fish abound in the Mackenzie, and its valley and banks contain coal-seams, salt deposits, petroleum, natural gas, and tar-springs. See Athabaska; Peace; Slave.

**Mackenzie.** Name of an area of Canada that had, 1895–1911, the status of a district. Named after the explorer mentioned below, it was part of the territory purchased by the Dominion from the Hudson's Bay Co. It lies between the Arctic Ocean on the N. and Alberta and Saskatchewan on the S. To the W. is Yukon and to the E., Keewatin. Mackenzie is now a division of N.W. Territories. See North-West Territories.

**Mackenzie, Sir Alexander** (c. 1755–1820). British explorer, born at Inverness. He entered service

Sir A. Mackenzie, British explorer After Lawrence

of the North-West Fur Company of Canada in 1779 and speedily gained a knowledge of topography. In 1789 he was dispatched from Chippewyan, Lake Athabaska, on an expedition to explore the unknown N.W., in the course of which he discovered the outlet of the river which bears his name, and penetrated to the Arctic Sea. In 1792 he set out to reach the Pacific, and after nine months of exceptional hardship succeeded and returned to Chippewyan. In 1801 he published an account of his explorations. He was knighted in 1802 and died near Dunkeld, Perthshire, March 11, 1820.

**Mackenzie, Alexander** (1822–92). Canadian politician. Born near Dunkeld, Jan. 28, 1822, he

emigrated to Canada when 20. At first he worked as a mason, but later set up for himself as a builder at Sarnia, Ont., and became interested in local politics. In 1861 he entered the legislature of Canada as a Liberal. In 1867 he was sent to the Dominion house of commons, where he led the opposition, being simultaneously treasurer of his own province. When Macdonald's government was defeated at the general election of 1873, Mackenzie became the Dominion's second premier, but in 1878 was driven from power by the advocates of a policy of protection. He resigned the party leadership in 1878, but remained in the house until his death at Toronto, April 17, 1892.

**Mackenzie, Sir Alexander Campbell** (1847–1935). Scottish musician. Born in Edinburgh,

A.C. Mackenzie Russell

Aug. 22, 1847, he was the most distinguished of a family of Scottish musicians extending over four generations. He studied the violin in Germany, but in 1862 returned to the Royal

Academy of Music, soon gaining the king's scholarship. After living some years in Florence, he was appointed principal of the R.A.M. in 1888 and retired in 1922. For several years he conducted the concerts of the Philharmonic Society in London. He was knighted in 1895, and died April 28, 1935. His most successful works are those national in character like *The Cottar's Saturday Night*, Scottish rhapsodies, Scottish piano concerto, and the overture *Britannia*.

**Mackenzie, (Edward Montague) Compton** (b. 1883). British writer. Son of Edward, and brother of Fay Compton (q.v.), he was born at W. Hartlepool, Jan. 17, 1883, and educated at S. Paul's school and Magdalen College, Oxford.

Compton Mackenzie, British writer

He made his reputation as a novelist with *Carnival*, 1912 (dramatised the same year), and achieved popular success with *Sinister Street*, 1913–14; *Guy and*

Pauline, 1915; Sylvia Scarlett, 1918, and a sequel, Sylvia and Michael, 1919. During the First Great War he was military control officer at Athens, 1916, and director of the Aegean intelligence service, 1917. His experiences in Greece inspired *Extremes Meet*, 1928; *Gallipoli Memories*, 1928; *First Athenian Memories*, 1932, and *Greek Memories*, 1932 (withdrawn after prosecution under the Official Secrets Act, but reissued in 1940). Other novels included *Extraordinary Women*, 1928; *The Darkening Green*, 1934; *The Four Winds of Love: The East Wind*, 1937; *The South Wind*, 1937; *The West Wind*, 1940; *West to North*, 1940; *The North Wind*, 1944; *North to East*, 1945. Later publications included *The Vital Flame*, 1946; *Whiskey Galore*, 1947.

Rector of Glasgow university, 1931-34, he was literary critic to the *Daily Mail*, 1931-35, and edited *The Gramophone*. He had a passionate devotion to islands, and purchased and lived on Herm (Channel Islands) before the Second Great War, later residing on the Isle of Barra, Hebrides, until 1947.

**Mackenzie, Sir George** (1836-91). A Scottish lawyer. Born at Dundee, he became king's advocate in 1677.

Sir G. Mackenzie,  
Scottish lawyer  
After Kneller

An adroit lawyer and man of letters, he ruthlessly pursued the Covenanters, applying the law relentlessly and ingeniously, and boasting that he had never lost a case for the king. But although so harsh in the discharge of his duties and overbearing in temperament that he became known as Bloody Mackenzie, he nevertheless observed the strictest legal formality. In his *Vindication* he defended the use of torture as a means of obtaining evidence; and he employed it with savage thoroughness. He inaugurated the period of persecution known in Scotland as the Killing Time. He died at Westminster, May 8, 1691, and was buried in Greyfriars churchyard, Edinburgh. *Consult* Sir George Mackenzie, King's Advocate, his *Life and Times*, A. Lang, 1909.

**Mackenzie, Henry** (1745-1831). A Scottish writer. Born in Edinburgh, and educated there, he first took up the law as a profession. His chief interest, however, was in literature, and during his long

life he was intimate with all the literary celebrities of his time. The *Man of Feeling*, 1771, written under the influence of Sterne, enjoyed great vogue in its time. It furnished the nickname by which its author has ever since been known. Mackenzie, who was one of the first

Henry Mackenzie,  
Scottish writer

to recognize the genius of Burns, died Jan. 14, 1831.

**Mackenzie, Sir James** (1853-1925). British physician. Educated at Edinburgh university, and Vienna, he was in practice at Burnley from 1879 till 1907. In 1907 he settled in London as a consulting physician, and made a European reputation by his work and writings. In 1915 he was knighted and elected F.R.S. His writings include *The Study of the Pulse*, 1902; *Diseases of the Heart*, 1907; *The Future of Medicine*, 1919. He died Jan. 26, 1925. *Consult* Life, R. McNair Wilson, 1926.

**Mackenzie, Sir Morell** (1837-92). British surgeon. Born at Leytonstone, Essex, July 7, 1837, he took his M.D. degree at the London University, 1862, and winning the Jacksonian prize of the Royal College of Surgeons in 1863, with an essay On the Pathology

Sir Morell Mackenzie

of the Diseases of the Larynx, devoted the rest of his professional life to that study. He helped to found the hospital for diseases of the throat in King Street, Golden Square. In 1887 his diagnosis of the illness of the German crown prince, later Emperor Frederick III (*q.v.*), roused international controversy. Mackenzie wrote *Frederick the Noble*, 1888. He was knighted in 1887. A pioneer of the use of the laryngoscope in England, his most important work is *Manual of Diseases of the Throat and Nose*, 2 vols., 1880-84. He died Feb. 3, 1892. *Consult* Lives, H. R. Haws, 1893; R. S. Stevenson, 1946.

**Mackenzie, Samuel** (1785-1847). British painter. Born Dec. 28, 1785, he worked as a herd-boy and as a superintendent of stonehewers in the N. of Scotland. At the age of 25, when he was em-

ployed by a marble-cutter in Edinburgh, he came under the influence of Raeburn, and studied portrait-painting in his studio. The dukes of Gordon and Roxburgh commissioned a number of works from him, and Lord Brougham was among his sitters. He was one of the original members of the Scottish Academy, and exhibited regularly from 1829 to 1846, showing mainly portraits. A man of wide culture, he died in Edinburgh, Jan. 23 1847.

**Mackenzie, Sir Thomas** (1854-1930). Scottish-born New Zealand statesman. A native of Edinburgh, he was educated at Otago, N.Z. He entered the legislature in 1887, and held various government posts, being prime minister in 1912. Later he was high commissioner in London, retiring in 1920. He was knighted in 1916, represented his country at the peace conference, 1919, and in 1921 joined the New Zealand legislative council. He died Feb. 14, 1930.

**Mackenzie, William** (1791-1868). British surgeon. Born April 29, 1791, the son of a muslin manufacturer, he was educated at Glasgow grammar school and university, and studied medicine in Glasgow, London, and on the continent. He specialised in ophthalmic surgery, was one of the founders of the Glasgow eye infirmary, 1824, and in 1843 was among the surgeons who received the newly instituted fellowship of the Royal College of Surgeons of England *honoris causa*. In 1838 he was appointed surgeon-oculist to the queen in Scotland. His *Practical Treatise on the Diseases of the Eye*, 1830, was the standard text-book until the invention of the ophthalmoscope in 1851, revolutionised the diagnosis and treatment of intraocular disease. He wrote several other treatises on the surgery of the eye. He died at Glasgow, July 30, 1868.

**Mackenzie, William Lyon** (1795-1861). Scottish-born Canadian politician. Born near Dundee, March 12, 1795, he emigrated to Canada in 1820. In 1824 he started a paper, *The Colonial Advocate*, in order to focus the discontent felt in Upper Canada at the arbitrary acts of a small controlling clique.

Meanwhile, in 1828, Mackenzie had been elected to the legislature,

William L. Mackenzie,  
Canadian politician

but he was expelled and, in spite of repeated re-elections, was not allowed to sit until 1834, when his party secured a majority in the house. Defeated in 1836, Mackenzie began to advocate republican doctrines, and spoke of securing his ends by force, founding for this purpose a new paper, *The Constitution*. He was soon in touch with the rebels in Lower Canada, and in Nov., 1837, he set up a provisional government. Collecting a force, he marched towards Toronto, but this rising was soon crushed, and he fled to the U.S.A. In 1839 the U.S.A. authorities put him on his trial, and he was sentenced to imprisonment. In 1849 he returned to Canada, and in 1851 re-entered the legislature but resigned in 1858, and died Aug. 29, 1861. *See Canada; consult Life and Times, C. Lindsey, 1862, abridged ed. 1909.*

Mackerel. Specimen of the fish which forms a staple article of food  
*Ozley Graham*

**Mackerel.** Fish of the family Scombridae, which, including the tunny, are all distinguished by their rounded bodies, very small scales, and the form of the dorsal fins. They are found in most parts of the world, three species occurring in Europe, including the common mackerel (*Scomber scombrus*). It varies in length from 14–18 ins. and is readily recognized by its bluish-green back, barred with black, and its silvery under-side. Its range extends from Norway to the Canaries and includes the Mediterranean.

Around the British coasts the mackerel migrates in a remarkable manner. In winter it is found in the Atlantic at some distance from shore; but about May it approaches the land in large schools, and is abundant off the Cornish coast until July. It reappears in Sept. for about a month, but is virtually absent from Nov. till the following spring. Off the E. coast of England the schools appear in May–June, and again in Sept.–Oct. It is believed that the spring visit is for the purpose of spawning, and the autumn one for pursuing swarms of fry.

The food of the mackerel in spring consists mainly of minute crustaceans, but in autumn of young sprats, pilchards, and sand eels. Spawning takes place in the spring and early summer, the

female depositing from 300,000 to 650,000 eggs, which float at the surface of the sea. These hatch in about a week, according to the temperature of the water; and it is believed that the fish become adult at about three years. Mackerel fishery is conducted in seine and drift nets, and the catch is often enormous. *See Fish; Fisheries.*

**Mackerel Sky.** Name popularly applied to a sheet of high cloud consisting of small globular masses or white flakes arranged in patterns. In weather lore a mackerel sky is associated with changeable weather, but it has really little significance as an aid to forecasting. *See Cloud.*

**Mackinac.** Island and city of Michigan, U.S.A., in Mackinac co. The city, which is c. 250 m. N.W. of Detroit, stands on the N.E. shore of Mackinac Island, and was chartered as a city in 1900. Pop. 500.

The island, 3 m. long and 2 m. wide, lies at the N.W. end of Lake Huron at the entrance to the Straits of Mackinac, a navigable channel 4 m. wide connecting Lakes Huron and Michigan, and separating the upper and lower pens. of Michigan state. Formed of rock, free from swamps, and naturally beautiful, the island is a popular summer resort; 95 p.c. of it is a state park. The principal Great Lakes steamers serve it. No motor cars are permitted on the island.

A British garrison occupied Fort Mackinac on the mainland in 1761. The fort was removed to the island in 1780–81, becoming the defence stronghold of the North-West Territory. The British captured it in 1812, withdrawing only after the conclusion of the treaty of Ghent, Dec., 1814. John Jacob Astor's American Fur co., which had a monopoly of the fur trade in the Great Lakes region, was centred here 1817–34. *Pron. Mack-in-aw.*

**McKinley, Mount.** Peak of the Alaskan range, loftiest in N. America. On the Sushitna-Kuskowim divide, it rears to an alt. of 20,464 ft.

**McKinley, William** (1843–1901). President of the U.S.A. Born at Niles, Ohio, Jan. 29, 1843, of Scottish-Irish descent, he fought in the Civil War, and after being called to the bar, 1867, settled

for the rest of his life at Canton, Ohio. Republican member of congress 1877–91, as chairman of the ways and means committee (1890) he passed the protectionist tariff known as the McKinley Act. Having twice served as governor of

*W. McKinley*

Ohio, he was elected to the presidency in 1896, defeating W. J. Bryan, who stood as a Democrat. McKinley had modified his financial opinions, and in this contest appeared as an opponent of Bryan's free silver policy and a supporter of the gold standard.

The chief events of his term were the war with Spain, the annexation of Hawaii, and the settlement of the control of Samoa. Re-elected in 1900, he was shot, Sept. 6, 1901, by Czolgosz, a Polish-American anarchist, at the Pan-American Exposition at Buffalo, and died on Sept. 14. During his presidency relations between Great Britain and the U.S.A. had been cordial, while the participation of American forces in the expedition which went to Peking to suppress the Chinese Boxers in 1900 marked its first appearance as a world power. Theodore Roosevelt, vice-president, stepped up to the White House on McKinley's death. *See Buffalo (city); Spanish-American War; consult Lives, J. W. Tyler, 1901; E. T. Roe, 1913.*

**Mackintosh, Sir James** (1765–1832). A British philosopher and historian. Born at Alldourie on Loch Ness, Oct. 24, 1765, he attended lectures at King's College, Aberdeen, and studied medicine at Edinburgh. Having graduated in 1787, he removed to London, but abandoned medicine for the law, and was called to the bar in 1795. In 1791 he had published a justifi-

Mount McKinley. The snow-clad peak in central Alaska, near the Arctic circle

cation of the French Revolution, *Vindiciae Gallicae*, in reply to Burke, for which the national assembly gave him the title of a French citizen. In 1803 he defended Peltier, a French refugee charged with having labelled Napoleon.

*James Mackintosh*  
After Laurence

During 1804–11 he held important positions in Bombay, and then as a Whig entered the house of commons. He was professor of law at the East India College, Haileybury, 1818–24. He died May 30, 1832. A representative of the Scottish school of philosophy, in his *Dissertation on the Progress of Ethical Philosophy*, 1831, Mackintosh advocated a modified form of utilitarianism. He also wrote *History of the Revolution in England*. *Consult* Life, R. J. Mackintosh, 1836.

**Macklin, CHARLES** (c. 1697–1797). Irish actor and dramatist, whose real name was McLaughlin. After some years with a strolling company, he made his first appearance at Drury Lane, under the name of Mechlin, as Brazen in *The Recruiting Officer*, Oct. 31, 1733.

*Charles Macklin*  
C. 1733

He was the original Colonel Bluff in Fielding's *Intriguing Chambermaid*, and took the part of Squire Badger in the same author's *Don Quixote* in England. He acted at The Haymarket and Covent Garden, also in Dublin, and achieved enormous success as Shylock, Peaschum, Polonius, and Iago were among his other parts, which also included Sir Archy McSarcasm and Sir Pertinax McSycophant in his own farce, *Love à la Mode*, 1759, and comedy, *The Man of the World*, 1781. Notorious for his quarrels and lawsuits, he retired in 1789, and died July 11, 1797, being buried in S. Paul's, Covent Garden. Macklin was an excellent comedian, who set his face against "gagging," an excellent if exacting teacher, and a capable stage-manager.

**MacLagan, WILLIAM DALRYMPLE** (1826–1910). British prelate. Born in Edinburgh, June 18, 1826, the son of a doctor, he was educated

at the university there and entered the Indian army in 1847. Leaving in 1852, he went to Peterhouse, Cambridge, was ordained in 1856, and after serving as a curate was made vicar of S. Mary's, Newington, in 1869, and of S. Mary Abbots, Kensington, 1875–79. Next he was made bishop of Lichfield, and in 1891 archbishop of York. He died Sept. 19, 1910. MacLagan wrote the hymn, *The Saints of God*. *See* Life, F. D. How, 1911.

**Maclaren, ALEXANDER** (1826–1910). British divine. Born in Glasgow, Feb. 11, 1826, he began his ministry at Portland Chapel, Southampton, in 1846. Ten years later he was called to the pastorate of Union Chapel, Manchester, where the eloquence of his preaching made his name widely known, together with his works on biblical subjects. In 1905 he presided over the Baptist congress. He died May 5, 1910.

**Maclaren, ARCHIBALD CAMPBELL** (1871–1944). English cricketer, born in Manchester, Dec. 1, 1871. From a preparatory school at Elstree he went to Harrow, where he made his name as a cricketer. In 1890 he began to play for Lancashire, and in 1894 was made captain. He was a member of the team that went to Australia in 1894–95, and captain of those that went in 1897–98 and in 1901–02. In England he played against the Australians in five of their tours, being captain in 1899, 1902, and 1909. The score of 424 made by him at Taunton against Somerset in July, 1895, stands as a record in English first-class cricket. He died Nov. 17, 1944.

**Maclaren, IAN** (1850–1907). Pseudonym of John Watson, Scottish author and divine. Born at Manningtree, Essex, Nov. 3, 1850, and educated at Stirling grammar school and Edinburgh university, he entered the

ministry of the Free Church of Scotland at Edinburgh. During 1875–80 he was minister at Logiealmond and at S. Matthew's, Glasgow. In 1880 he went to

Sefton Park Presbyterian Church, Liverpool, which for 25 years, through his preaching and personality, was one of the most influential of its denomination in England. In 1894 Watson published *Beside the Bonnie Brier Bush*, which brought him fame as a delineator of Scottish life and character, though critics charged him with sentimentality and idealisation. The same faults are to be found in *The Days of Auld Lang Syne*, 1895, and *Kate Carnegie*, 1896. Watson also wrote on theological subjects under his own name, notably *The Mind of the Master*, 1896, an unorthodox study of Jesus Christ. He died at Mount Pleasant, Iowa, May 6, 1907.

**MacLaurin, COLIN** (1698–1746). Scottish mathematician. Born at Kilmodan, Argyllshire, and educated at Glasgow university, he took his degree in mathematics at 15, and in 1717 was made professor of mathematics at Marischal College, Aberdeen. In 1719 he was made a fellow of the Royal Society, and in 1725 professor of mathematics at Edinburgh. In 1740 he was awarded, with Bernoulli and Euler, the French Academy prize for a dissertation on the tides. He took part against the Young Pretender, 1745, in the organization of the defences of Edinburgh, and as a result of privation died at York, June 14, 1746.

MacLaurin was one of the most brilliant mathematicians of the 18th century, ranking next to Newton. He wrote on curves, the motion of fluids and attractions, and was the author of the important theory in the differential calculus known by his name, by means of which a function of one variable may be expanded in terms of ascending integral powers of the variable. He published *Geometrical Organica*, 1735 (in *Philosophical Transactions*); *Treatise on Fluxions*, 1742, in defence of Newton against Bishop Berkeley; and an unfinished *Treatise on Algebra*, 1748.

**MacLay, JOSEPH PATON MACLAY, BARON** (b. 1857). British shipowner. Born Sept. 6, 1857,

Baron MacLay,  
British shipowner  
Russell

he was educated at Glasgow, and entered the shipping industry, ultimately becoming head of MacLay and MacIntyre, shipowners of Glasgow. In 1916 he was

appointed shipping controller, and occupied this post until its abolition in 1921. He was a member of the war cabinet in 1918. Macley was created a baronet in 1914 and a peer in 1922. He held several civic offices in Glasgow.

**Maclean, Sir Donald** (1864–1932). British politician. The son of John Maclean of Tiree, he was trained as a solicitor and began to practise in London. In 1906 he was elected Liberal M.P. for Bath. In 1910 he was returned by Peebles and Selkirk, and in 1911 he was made deputy chairman of committees. All the Liberal leaders lost their seats at the general election of 1918, and he was chosen as leader by the remnant of the party in parliament, discharging the duty until the return of Asquith to parliament in 1920. In 1916 he was made a privy councillor, and in 1917 he was knighted. He died Jan. 15, 1932.

**Maclean, Kaïd Sir Harry Aubrey de** (1848–1920). British soldier. Born June 15, 1848, he entered the army and, stationed in Gibraltar in 1876, he crossed to Morocco, was introduced to the sultan Mulai Hassan, and entered his service, becoming instructor

Kaïd Maclean,  
British soldier  
Downey

to the Moroccan army and principal counsellor of the sultan. Adopting Moorish habits and customs, he remained loyal in his British sympathies, and in 1901 was knighted for his services to the empire. In 1907 he was captured by Raisuli, and remained a prisoner until ransomed for £20,000 seven months later. He died at Tangier, Feb. 4, 1920.

**MacLeish, Archibald** (b. 1892). American poet. Born May 7, 1892, and educated at Yale, he was instructor in government at Harvard, 1919–21, and from 1923 to 1930 devoted himself to literature. Editor of *Fortune*, 1929–38, he became librarian of congress in 1939 and during 1944–45 he was assistant secretary of state. His publications included *The Happy Marriage*, 1924; *Nobodaddy*, 1925; *The Hamlet of A. MacLeish*, 1928; *Conquistador* (awarded Pulitzer prize), 1932; *A Time to Speak*, 1941; *A Time to Act*, 1943. Of his radio verse dramas the best-known included *The Fall of the City*, 1937; *Air Raid*, 1938.

**McLennan, John Ferguson** (1827–81). Scottish sociologist and anthropologist. Born at Inverness, October 14, 1827, he studied at Aberdeen and Cambridge, was called to the Scottish bar, 1857, and became parliamentary draughtsman for Scotland, 1871. His *Primitive Marriage*, 1865, in which he first discussed the custom of exogamy, inaugurated modern research into the evolution of kinship and marriage. This and other essays were collected under *Studies in Ancient History*, 1876. McLennan died June 14, 1881.

**MacLeod, Scottish clan.** It was divided mainly into the MacLeods of Lewis, the branch of Torquill, and the MacLeods of Harris, the branch of Tormod; both branches tracing their ancestry to a remote Laigh the Strong. There were other branches, the MacLeods of Raasay, in Inverness-shire; Cadboll and Glennies, in Ross-shire; and Dunvegan, on the W. coast of Skye. See *Clan*; *Dunvegan*. *Pron.* Mac-loud.

**MacLeod, Fiona.** Pen-name under which William Sharp (*q.v.*) wrote a number of Celtic romances.

**MacLeod, Henry Dunning** (1821–1902). British economist. Born in Edinburgh, March 31, 1821, the son of Roderick MacLeod, M.P., lord-lieutenant of Cromarty, he was educated at Edinburgh academy, Eton, and Trinity College, Cambridge, and in 1849 was called to the bar. His main interest was in economic questions, and he had already, in 1847, framed a successful and popular scheme of poor law relief, first employed on his father's estate, and then elsewhere in Scotland. His writings began with *The Theory and Practice of Banking*, 1856. In 1858 appeared his *Elements of Political Economy*, which, like the earlier work, went into several editions. He started a *Dictionary of Political Economy* and wrote *The Theory of Credit*, 1889–91. He died July 16, 1902.

**MacLeod, John James Richard** (1876–1935). Scottish physiologist. Born near Dunkeld, Perthshire, Sept. 6, 1876, he was educated at Aberdeen and at Leipzig university. From 1901 to 1903 he held the Mackinnon research scholarship of the Royal Society, and from 1903 to 1918 was professor of physiology at Cleveland, Ohio, subsequently occupying similar positions at Toronto university and at Aberdeen. His most important work was on the nature of the control of the metabolism of carbohydrates in the animal body,

and, together with Dr. Banting, with whom he shared the Nobel prize for medicine in 1923, he achieved fame as one of the discoverers of insulin. Elected F.R.S. in 1923, he was a member of the medical research council, 1929–33. He died at Aberdeen, March 16, 1935. His numerous works include *Practical Physiology*, 1903; *Diabetes*, 1913; and *Carbohydrate Metabolism and Insulin*, 1926.

**MacLeod, Norman** (1812–72). Scottish divine and author. He was born at Campbeltown, Argyllshire, June 3, 1812, and was educated at Glasgow and Edinburgh. Minister at various Scottish churches from 1838 to 1872, he became chaplain to Queen Victoria in Scotland in 1857. Editor of *Good Words*, 1860–72, he was the author of numerous sermons, travel sketches, and stories, including *Reminiscences of a Highland Parish*, 1867. He died June 16, 1872, at Glasgow, where his memory is perpetuated by a statue and by the MacLeod Memorial Missionary Institute.

Norman MacLeod,  
Scottish divine

**MacLise, Daniel** (1806–70). A British painter. Born at Cork, Jan. 25, 1806, the son of a Scotsman,

Alexander McLeish, he entered a bank, which he left soon after to become a student at the Cork Institute. He early attracted attention by a pencil drawing of Sir Walter Scott in a Bookshop at Cork, 1825, now in the Victoria and Albert Museum. He practised portraits, mostly in pencil, until able to proceed to London, where he entered the R.A. schools in 1828 and gained a gold medal for his *Choice of Hercules*, 1831. He was elected A.R.A., 1835, and R.A. in 1840. MacLise was one of six artists chosen to paint decorations for the house of lords, and began work on the two gigantic historical paintings, *The Meeting of Wellington and Blücher After Waterloo*, finished 1859, and *The Death of Nelson*, finished 1864.

In 1866 he declined the presidency of the Royal Academy. He drew and painted many portraits,

After E. M. Ward, R.A.

including one of his friend, Charles Dickens, 1839, now in the National Portrait Gallery, and one of John Constable. He illustrated books, such as Moore's Irish Melodies. His chief pictures are Malvolio and the Countess, 1840, and The Play Scene in Hamlet, 1842, both in the Tate Gallery; Puck Disenchanting Bottom (R.A.), 1831; Snap Apple Night (R.A.), 1833; Merry Christmas in the Baron's Hall, National Gallery of Ireland. He died at Chelsea, Apr. 25, 1870. *See* ill. Ainsworth, W. H.; Campbell, T.; Caxton. *Consult* Memoir, W. J. O'Driscoll, 1871; The MacLise Portrait Gallery, W. Bates, 1883.

**Macmahon, Marie Edmé** PATRICE MAURICE (1808-93). French soldier and politician. Born at Sully, Loiret, June 13, 1808, he was a member of a family exiled from Ireland for its loyalty to James II. He entered the army in 1827, and saw service in Algeria. He commanded a division in the Crimean War, and in Italy was responsible for the victory of Magenta, being made a marshal and duke of Magenta as a reward. During 1864-70 he was gov.-gen. of Algeria.

Marshal Macmahon,  
French soldier

In the Franco-Prussian War he held a high command, but he was defeated at Wörth, and driven back to Toul. He then took charge of a new force, which he led to Sedan, only, however, to be wounded and taken prisoner. Released at the peace, he was given the task of crushing the communist rising. In May, 1873, he became president of the republic, in succession to Thiers. By no means a convinced republican, he was suspected of favouring a restoration, and was too conservative for many of his countrymen. A crisis in 1877 was not made less acute by his unyielding attitude, and after another crisis in 1879 he resigned. He died Oct. 17, 1893.

**McMaster University.** Educational establishment at Hamilton, Canada. Founded in 1887, it was endowed by W. McMaster (1811-87). It sprang from a union of the Baptist college at Toronto with a college at Woodstock. A Baptist university, it specialises in training men and women for evangelistic and missionary work, but there are no religious tests for students. In 1880 Woodstock College was separated from it, but Brandon Col-

lege, Manitoba, is affiliated to it. The university has a large library, laboratories, and residential halls for men and women. Originally established at Toronto, the university was transferred to Hamilton in 1930.

**Macmillan, Hugh Pattison** MACMILLAN, BARON (b. 1873). British lawyer. He was born Feb. 20, 1873, and educated at Edinburgh and Glasgow universities. He became an advocate in 1897, and took silk in 1912. In 1924 he became lord advocate for Scotland in the

Lord Macmillan  
British lawyer

Labour ministry, and was made a privy councillor. He acted as chairman of a series of commissions, including the coal-mining industry dispute, 1925; the British Pharmacopoeia, 1926; finance and industry, 1929, which issued the much-discussed Macmillan report; income-tax law codification, 1930; and Canadian banking, 1933. He was a lord of appeal in ordinary, from 1930 to 1939 and from 1940 to 1947; during 1939-40 he was minister of Information, the first to hold that position in the Second Great War, during the difficult formative months of the ministry, when it was the target for much criticism. Among many positions he occupied were chairman of the Pilgrim trust; member of the Carnegie trust for the universities of Scotland; chairman of the court, University of London, 1929-43; chairman of C.E.M.A., 1941-42, and a trustee of the British museum, Soane museum, and national library of Scotland. He received a life barony in 1930.

**Macmillan, Daniel** (1813-57). British publisher. Born at Upper Corrie, Arran, Sept. 13, 1813, he

Daniel Macmillan,  
British publisher  
After L. Dickinson

was educated at Irvine, and after an apprenticeship to a bookseller moved, in 1831, to Glasgow. Two years later he obtained employment at Cambridge. In 1843 he set up in business with his brother, Alexander (1818-96), as a bookseller in London, shortly afterwards returning to Cambridge. There, in 1843, he began publishing books of a religious and scientific nature. Success induced him to extend his field, and in

1855 he published *Westward Ho!* followed two years later by *Tom Brown's School Days*. He died June 27, 1857. *Consult* Life, T. Hughes, 1882; Life of Alexander Macmillan, C. L. Graves, 1910. *See* Macmillan & Co. Ltd.

**Macmillan, Harold** (b. 1894). British politician. A member of the publishing family, he was educated at Eton and Balliol, and served in France during the First Great War. He was A.D.C. to the governor-general of Canada, 1919-20, but resigned to devote himself to politics, and became Conservative M.P. for Stockton-on-Tees in 1924. He was defeated in 1929, but re-elected in 1931, retaining the seat until 1945. He was parliamentary secretary to the ministry of Supply from 1940 to 1942, and was then appointed under-secretary for the Colonies. In Dec., 1942, he was sent as minister-resident to French N. Africa, where a confused situation had developed after the assassina-

Harold Macmillan,  
British politician

tion of Darlan, and remained there until 1945. In Dec., 1944, he visited Athens in an effort to effect an agreement between the Greek government and the E.A.M. Air minister in the "caretaker" government of 1945, he lost his seat at the general election. Elected the same year by Bromley at a by-election, he retained the seat in 1950. Among his publications are *Reconstruction: A Plea for a National Policy*, 1933; *The Middle Way*, 1938; *Economic Aspects of Defence*, 1939.

**McMillan, Margaret** (d. 1931). British educationist. Born in New York, she spent her childhood in Inverness, and was educated there and in Switzerland. A member of the Bradford school board, 1894-1902, she pioneered the cause of physical education, and successfully campaigned for medical inspections in schools. Among the school clinics started by her is the Deptford health centre, the largest in the U.K. In 1914 she founded the first open-air nursery school. She also founded Rachel McMillan college for training infants' teachers as a memorial to her sister.

Margaret McMillan,  
British educationist

She was made C.B.E. in 1917, and C.H. in 1930. She died March 29, 1931. In June, 1947, a Margaret McMillan memorial fund was opened by the prime minister. *Consult* Life, A. Mansbridge, 1932.

**Macmillan & Co., Ltd.** British publishing house founded at Cambridge, 1843, by Daniel and Alexander Macmillan. For a short time there was a branch in Aldersgate Street, but the London business proper was founded in Henrietta Street, Covent Garden, in 1858. Removal to Bedford Street took place in 1863, larger premises near being taken in 1872, and the present premises in St. Martin's Street were occupied in 1897, two years after the formation of the limited company. With educational and theological works as leading features, the names on the Macmillan lists, from F. D. Maurice, Lewis Carroll, and T. H. Huxley to Hardy, Kipling, Yeats, represent all branches of literature. *Consult* The House of Macmillan, C. Morgan, 1943.

**Macmurray, JOHN** (b. 1891). Scottish philosopher. He was born at Maxwellton, Kirkcudbrightshire, Feb. 16, 1891, and educated at Robert Gordon's College, Aberdeen, Glasgow university and Balliol, Oxford. Macmurray served in the First Great War and was appointed lecturer in philosophy, Manchester university, 1919. He was fellow, classical tutor and Jowett lecturer in philosophy, Balliol College, 1922-28, and Grote professor of philosophy of the mind and logic, London university, 1928-44. Macmurray became professor of moral philosophy in Edinburgh university in 1944. His published works include *Freedom in the Modern World*, 1932; *Philosophy of Communism*, 1933; *Reason and Emotion*, 1935; *The Clue to History*, 1938; *Challenge to the Churches*, 1941; *Constructive Democracy*, 1943.

**Macnaghten, SIR MELVILLE LESLIE** (1853-1921). British administrator. Born June 16, 1853, he was educated at Eton, and in 1889 became chief constable of the criminal investigation department, Scotland Yard. He represented the police on the committee appointed by Asquith to inquire into the identification of criminals, 1893-94. He was chief of the criminal investigation de-

Sir Melville Macnaghten, British administrator  
*Elliot & Fry*

partment, 1903-13. Knighted in 1907, he published *Days of My Years*, 1914. Died May 12, 1921.

**MacNaghten Rules.** See *Insanity*.

**MacNalty, SIR ARTHUR SALUSBURY** (b. 1880). British physician. He was educated at S. Catherine's and Corpus, Oxford, and University College hospital, London, being a medical inspector of the local government board, ministry of Health, 1919-35, and chief medical officer to the ministry of Health and board of Education, 1935-41. In 1941 he was appointed editor-in-chief of the official medical history of the Second Great War. MacNalty was honorary physician to the king from 1937 to 1941, and was knighted in 1936.

**Macnamara, THOMAS JAMES** (1861-1931). A British politician. Born in Montreal, Aug. 23, 1861, son of a private soldier, he was educated at Exeter and London, and taught in provincial elementary schools, 1876-92. Appointed editor of *The Schoolmaster* in 1892, he became president of the National Union of Teachers in 1896. He was elected to the London County Council in 1894, and in 1900 was returned as Liberal member for N. Camberwell. He was parliamentary secretary to the local government board, 1907-8; transferred to the admiralty, he was parliamentary secretary, 1908-15, and financial secretary from that year until 1920, when he became minister of Labour until 1922, when he left office with Lloyd George, of whom he was a staunch supporter. He remained an M.P. until 1924, and died Dec. 3, 1931.

**Macnaughtan, SARAH** (d. 1916). British novelist. Daughter of a J.P., she spent much of her early life in visiting all parts of the world. She had experience as a nurse in the Balkans, and in the South African War, having already achieved some success with her first novel, *Selah Harrison*, 1899. On the outbreak of the First Great War she went with a hospital unit to Antwerp, and in 1915 with the Red Cross to Russia, but returned with broken health and died in London, July 24, 1916. Her many stories included *The Fortune of Christina*, 1901; *A Lame Dog's Diary*, 1905; *The Expensive Miss Du Cane*, 1907; *Peter and Jane*, 1911.

**McNaughton, ANDREW GEORGE LATTA** (b. 1887). Canadian soldier. He was born at Moosomin, Sask., Feb. 25, 1887, and educated at Bishop's College school, Lennoxville, and McGill university, where

he was senior demonstrator in electrical engineering before serving in the First Great War.

A. G. L. McNaughton, Canadian soldier

On returning to Canada in 1919 he was put on the committee for the reorganization of the military forces, becoming deputy chief of the Canadian general staff in 1922. Promoted major-general in 1929, he was chief of the general staff for six years, and was appointed to lead the 1st division which came to Great Britain in Dec., 1939. McNaughton was given command of the 1st Canadian army in 1942 but resigned next year owing to ill-health. Retiring as general in 1944, he was minister of national defence, and represented Canada on the U.N. atomic energy commission and the security council, 1948. He was made C.H. 1946.

**MacNeice, LOUIS** (b. 1907). A British poet. Born in Belfast, Sept. 12, 1907, he was educated at Marlborough and Merton College, Oxford.

Having lectured in classics at Birmingham university, 1930-36, and then in Greek at Bedford College, he was from 1941 a writer of feature programmes for the B.B.C. His early poetry, while always clever, had sometimes a brittle quality, but depth had come when he published *The Earth Compels*, 1938, and *Autumn Journal*, 1939. Of his poetic dramas, *Christopher Columbus* was broadcast on the 450th anniversary of the discovery of America, Oct. 12, 1942; and *The Dark Tower* in 1946. His verse trans. of Goethe's *Faust* was broadcast 1949. MacNeice collaborated with W. H. Auden in *Letters from Iceland*, 1947.

**McNeile, CYRIL**. Real name of the author of *Bulldog Drummond* (*q.v.*) and other stories of adventure, better known under his pen-name of Sapper (*q.v.*).

**McNeill, JOHN** (1854-1933). A British evangelist. Born July 7, 1854, at Houston, Renfrewshire, son of a foreman quarryman, he was a railwayman before deciding in 1877 to study for the Presbyterian ministry. After training at

Louis MacNeice, British poet

Edinburgh and Glasgow universities he was ordained in 1886. He acted as evangelist with D. L.

John McNeill,  
British evangelist  
Haines

Moody in Aberdeen in 1892, and conducted successful missions in Great Britain and throughout the world. He was minister of Christ Church, Westminster Bridge Road, London, in

1908, and in 1910 moved to Free S. George's Presbyterian Church, Liverpool. He died April 19, 1933.

**MacNeill, JOHN GORDON SWIFT** (1849-1926). Irish jurist and politician. Born in Dublin, March 11, 1849, and educated there and at Christ Church, Oxford, he was called to the Irish bar in 1876. In 1909 he was given the chair of constitutional law in the national university. As Nationalist M.P. at Westminster from 1887 to 1918, he became an authority on procedure. His motion disallowing the votes of the directors of the Mombasa rly. defeated the Unionist government in 1892. He procured the abolition of flogging in the British navy, established the principle that cabinet ministers should not direct public companies, and was largely responsible for the Titles Deprivation Act, 1917. Author of *Constitutional and Parliamentary History of Ireland*, 1917, he died Aug. 24, 1926.

**Macon.** American naval airship constructed as a sister ship to the Akron (*q.v.*). Launched April 21, 1933, 17 days after the loss of the Akron, the Macon was a helium-filled ship of similar size and design, and carried five aeroplanes. She crashed into the sea, as a result of structural failure, Feb. 12-13, 1935. Two lives were lost (of 83).

**Mâcon.** A town of France. Capital of the dept. of Saône-et-Loire, it stands on the right bank of the Saône, 45 m. N. of Lyons. The chief buildings are the large modern church of S. Pierre and the hôtel de ville. The cathedral of S. Vincent, a fine 13th century building, was partly destroyed at the Revolution. The industries include the manufacture of watches, casks, and vats, and a trade in Burgundy wine. A town before the Roman invasion of Gaul, Mâcon became the seat of a bishop before 700. It had its own line of counts, and before 1477 was part of the duchy of Burgundy. The bishopric was suppressed in 1790. Pop. 21,073.

**Macon.** City of Georgia, U.S.A., the co. seat of Bibb co. It is on the Ocmulgee river, at the head of navigation. 88 m. S.E. of Atlanta, and is served by the Southern and other rlys. and by steamers, and an airport. It is the centre of the Georgia peach industry, and other fruit and vegetables are grown there. Its industries include cotton mills, furniture factories, and rly. workshops. It is the seat of Mercer university. A city since 1832, it has a pop. of 57,865.

**MacPherson, AIMEE SEMPLE** (1890-1944). American evangelist, born in Ontario, Canada, Oct. 9, 1890. Her mother was in the Salvation Army, and she herself began to preach at 17. Her first husband, a Scottish evangelist, took her to the East; on his death she returned to the U.S.A., where she became head of the Elim Four Square Gospel Alliance. The basis of her teaching was divine healing through baptism; her followers underwent total immersion, and she led pilgrimages to perform this rite in the waters of the Jordan. The Angelus temple built for her in Los Angeles cost 1½ million dollars. She was several times married and divorced, and in 1926 disappeared for some weeks in somewhat disreputable circumstances; but in the eyes of her millions of followers she was never discredited. Known to the newspapers as the Hot Gospeller and to converts as Sister Aimee, she died in Oakland, Calif., Sept. 27, 1944.

**Macpherson, JAMES** (1736-96). Scottish author. Born at Ruthven, Kingussie, Inverness-shire, Oct. 27, 1736, he was educated at Aberdeen and Edinburgh universities. After experience as a bookseller's assist-

ant and a schoolmaster, and encouraged by John Home, he brought out in 1760 a volume entitled *Fragments of Ancient Poetry Collected in the Highlands*. This was followed by two epic poems, *Fingal*, 1762, and *Temora*, 1763, purporting to be translations from a Gaelic poet named Ossian. A heated controversy arose concerning their origin, Samuel Johnson being among those who regarded them as forgeries. While the problem is still an open one, competent critics admit the existence of a Fingal-Ossian legend, but agree that Macpherson's work contains only fragments of Gaelic, that he liberally edited his originals, and interpolated passages of his own.

Macpherson's poems, which display a genuine love of nature in her wilder aspects, played a definite part in the romantic movement, influencing Goethe, Schiller, and Byron, among others, and they were the favourite reading of Napoleon. His prose works include *Original Papers Containing the Secret History of Great Britain from the Restoration till the Accession of George I.*, 1775. He was agent to the nabob of Arcot in 1779 and M.P. for Camelford, 1780-90, and died Feb. 17, 1796.

**Bibliography.** *Journey to the Western Highlands of Scotland*, S. Johnson, 1775; *Inquiry into the Authenticity of Ossian*, ed. M. Laing, 1807; A. Clerk, 1870; W. Sharp, 1897; *Life and Letters*, T. B. Saunders, 1895; J. M., an Episode in Literature, J. S. Smart, 1905.

**Macquarie.** A river of New South Wales. A tributary of the Darling-Murray system, it is 590 m. long. Its basin, a rich pastoral region, contains the important centres of Bathurst, Wellington, and Dubbo. See Darling River.

**Macquarie.** Island of the S. Pacific Ocean, administered by Tasmania. It is 20 m. long by 3 m. wide. Sea elephants and king penguins are numerous. The island is a meteorological station, and a rescue station for shipwrecked mariners.

**Macquer, PIERRE JOSEPH** (1718-84). French chemist. Born in Paris, Oct. 9, 1718, he was one of the first to free chemistry from the shackles of the old alchemical formulae. Writing on the properties of aluminium, sulphate of ammonia, and oxidation, he also showed that arsenic was metallic. He died in Paris, Feb. 15, 1784.

**Macquoid, KATHARINE SARAH** (1824-1917). British author. Born in London, Jan. 26, 1824, she lived for some years in France. In 1851 she married the artist, Thomas R. Macquoid. Her first novel, *A*

Mâcon, France. Façade of the cathedral of S. Vincent

Bad Beginning, 1862, was published anonymously and met with considerable success, and thereafter she produced books almost up to her ninetieth year. She died at Tooting, June 24, 1917. Her books include *Hester Kirton*, 1864; *Patty*, 1871; *A Ward of the King*, 1898; and *Molly Montague's Love Story*, 1911. She also wrote numerous travel books, illustrated by her husband.

**Macramé** or **MACRAMI** (Turkish, *magrama*, towel, napkin). Lace-like trimming of knotted thread. Of considerable antiquity, the art was originally confined to a plain plaited fringe, woven into a geometrical pattern, and was chiefly carried on by poor children in the schools and convents along the Genoese Riviera. Towards the middle of the 19th century more elaborate designs were introduced. Genoese macramé often formed part of wedding trousseaux, and many of these were exported to S. America and California. As a domestic industry, it obtained, with woolwork and needlework, some vogue in Great Britain during the 19th century. Macramé lace has great durability.

**Macready, SIR CECIL FREDERICK NEVILL** (1862–1946). British soldier and administrator. Born May 7, 1862, a son of W. C. Macready (v.i.), he went to Marlborough and Cheltenham, and was commissioned into the Gordon Highlanders, 1881. He served in the South African War, and in 1909 commanded an infantry brigade. He was knighted in 1912. Adjutant-general in France, 1914–16, he was at the War office, 1916–18. On leaving the War office, having reached the rank of general, he became commissioner of the metropolitan police, and dealt with the police strike in August, 1918. He was c.-in-c., Ireland, 1920–22, and he retired in 1923, receiving a baronetcy. He published *Annals of an Active Life*, 1924. He died Jan. 9, 1946.

**Macready, WILLIAM CHARLES** (1793–1873). British actor. Born in London, March 3, 1793, the son of an Irish actor-manager, and educated at Rugby, he made his first appearance at Birmingham as *Romeo*, 1810. After acting with Mrs. Siddons, and Dorothy Jordan in the provinces, he made his first appearance in London at Covent Garden, Sept. 16, 1816, as *Orestes*, in *The Distressed Mother*. In 1819 and 1820 he rose to the front rank with his performances of *Richard III*, *Coriolanus*, *Hamlet*, and *Virginius*, in *Sheridan Knowles's*

tragedy of that name. Leading actor at Drury Lane, 1823–36, he acted in the U.S.A. in 1826–27, and in Paris, 1828.

Manager of Covent Garden, 1837–39, he there produced Lytton's *The Lady of Lyons*, playing opposite Helen Faucit who was also his leading lady at The Haymarket, 1839–41, where he scored great successes in the title rôle of

*W. C. Macready*

Lytton's *Richelieu*, and as Alfred Evelyn in Lytton's *Money*. From Dec. 27, 1841, to Jan. 14, 1843, he was manager of Drury Lane, where he made his final appearance as *Macbeth*, Feb. 26, 1851. He died at Cheltenham, April 27, 1873.

An actor of great talent, painstaking and conscientious almost to a fault, who did much to purge the Shakespearian drama from Restoration alterations and interpolations, Macready had a magnificent voice and a graceful carriage. Tennyson praised him in a sonnet and Talfourd styled him the most romantic of actors. He was a careful student of the classics, and showed generous traits in his private life. See *Acting. Consult Reminiscences*, 1875; *Diaries*, 1833–51, ed. W. Toynbee, 1912; *Lives*, W. Archer, 1890, and W. T. Price, 1895; *Macready as I Knew Him*, Lady Pollock, 1885.

**Macrinus, MARCUS OPILIUS SEVERUS** (164–218). Roman emperor 217–218. Born of obscure parents in Mauretania, he became prefect of the praetorian guards, instigated the murder of the emperor Caracalla, and ascended the throne. After his disastrous Parthian campaign, the soldiery proclaimed Elagabalus emperor. Macrinus, defeated near Antioch, was captured and put to death.

**Macroon.** Market town and urban dist. of co. Cork, Eire. It stands on the river Sullane, 24 m. by rly. W. of Cork. It is the terminus of a branch line, but passengers are carried on to Kerry by coach or motor. There is a castle, built probably in the 12th century and restored later. Surrounding country is studded with remains of feudal and religious edifices. The town has a trade in grain and dairy produce. Market day, Sat. Pop. 2,230.

**MacRory, JOSEPH** (1861–1945). Irish ecclesiastic. Born at Ballygawley, Tyrone, he was educated

at S. Patrick's seminary, Armagh, and at Maynooth College. Ordained in 1885, he became professor of Sacred Scripture and Oriental languages at Maynooth in 1889. In 1915 he was consecrated bishop of Down and Connor, and from 1928 was archbishop of Armagh and primate of All Ireland. Made a cardinal the following year, he was papal legate to the national eucharistic congress in Melbourne, 1934. Eloquent both in the pulpit and on the platform, he died at Armagh, Oct. 13, 1945.

**Macrostructure.** The structure of a section of any metal or alloy viewed with the naked eye or under low magnification. No special apparatus is needed. A section of the sample is cut and roughly polished. The surface is etched with suitable reagents,

Macrostructure. Macrograph of an alloy steel forging for the rotor of a pump in a jet turbine engine

usually acids, rather more deeply than for micro-examination. Different constituents or crystals in different states are selectively etched and so a pattern or structure is revealed. In this way the flow lines of a forging can be seen. In a casting, the order or method of solidification can be deduced from a study of the crystal structure, any non-metallic inclusions or flaws being clearly revealed. A variation of this is taking sulphur prints on a steel sample to determine the distribution of the sulphides. Recently a method of micro-cum-macro-examination has been developed.

**MacSwiney, TERENCE JAMES** (1880–1920). An Irish politician. Born in Cork, March 28, 1880, and

educated at the Christian Brothers' school in that city, he graduated while engaged in business, and became a teacher. He was a pioneer of Sinn Féin in the south, but the Volunteer movement claimed his chief attention, and as an organizer of that force he came under police supervision. After the rebellion of Easter, 1916, he was deported to England, where he was imprisoned. Yet at the general election of 1918 he was elected unopposed for Mid Cork, and chosen as a city councillor.

After the murder of lord mayor MacCurtain, MacSwiney was elected to fill the vacancy, and in 1920 was arrested by the military and sentenced by district court-martial to two years' imprisonment for having a secret police cipher under his control, and for possessing seditious documents. He went on the hunger-strike which was terminated by his death in Brixton prison after 74 days on Oct. 25. The body was removed to St. George's R.C. cathedral, Southwark, and on Oct. 28 was taken, the coffin wrapped in Sinn Féin colours, by road to Euston, escorted by English police and Irish volunteers and pipers. From Holyhead the body was taken direct to Cork, and there buried in S. Finnbarr's cemetery.

**McTaggart, JOHN M'TAGGART ELLIS** (1866-1925). British philosopher. Educated at Clifton and Trinity College, Cambridge (where he was lecturer, 1897-1923), he established himself in the front rank of contemporary European philosophers. His theories were developed from Hegel's idealism; indeed McTaggart and Bradley may claim to have established neo-Hegelianism. Among the most brilliant logicians of his day, McTaggart exerted influence mainly as a teacher. He wrote *Studies in Hegelian Dialectic*, 1896; *Studies in Hegelian Cosmology*, 1901; *Commentary on Hegel's Logic*, 1910. He died Jan. 18, 1925.

**McTaggart, WILLIAM** (1835-1910). Scottish painter. Born Oct. 25, 1835, at Aros, Argyllshire, he studied art in Edinburgh in 1852. In 1859 he was elected A.R.A. and in 1870 R.A. (of Scotland). In 1878 he was made vice-president of the Royal Scottish Water Colour Society, and he died near Edinburgh, April 2, 1910. McTaggart painted with feeling and imagination scenes of Scottish country life, sea pieces, and portraits. His works include *The Pressgang*, 1865; *A Ground Swell*, Carradale, and *The Fishers Landing*, 1878;

*On the White Sands*, 1880; *The Coming of S. Columba*, 1895; and *The Emigrants*.

**MacWhirter, JOHN** (1839-1911). Scottish painter. He was born at Slateford, near Edinburgh, March 27, 1839. Educated at Peebles, he entered the school of design in Edinburgh, and in 1854 exhibited his first picture at the R.S.A. Elected A.R.S.A. in 1864, he exhibited for the first time at the R.A. in 1865. He became A.R.A. in 1879 and R.A. in 1893. His paintings include representations of scenes in the Scottish Highlands and the Italian Alps. He died in London, Jan. 28, 1911. One of his pictures, *June in the Austrian Tirol*, is in the Tate Gallery; his *Constantinople* and the *Golden Horn* is in the municipal gallery, Manchester.

**Madagascar.** Island in the Indian Ocean, belonging to France. It lies off the E. coast of Africa, the

Madagascar. Map of the island off the East Coast of Africa

Mozambique Channel separating it from the mainland, about 250 m. away. Its area is estimated at 241,094 sq. m. Extreme length from N. to S. is 980 m.; from E. to W. extreme breadth is 360 m. It includes S. Marie and several other islands off the coast. Antananarivo is the capital and the only large town. Tamatave is the chief port, others being Majunga, Diego Suarez, and Tuléar.

The island is mountainous, especially in the centre and E., but less so in the W. Two great plateaux which cover much of it are separated by a low ridge. There

are many extinct volcanoes, Ankaratra being nearly 9,000 ft. high. The coastline is largely unbroken, save on the N.W., and there are consequently few bays or good harbours, except that of Diego Suarez, where is a govt. dry dock. The longest river is the Mangoka. There are lagoons on the E. side, but few lakes. The climate is tropical.

Of a pop. est. at 4,000,000, only a few hundreds are Europeans; there are also a few Hindus and Chinese. Of the native Malagasy races the most numerous are the Hovas, who number about a quarter of the whole. The Betsileo, Betsimisaraka, Tanala, and Sakalava are others. Each has its own tongue, but that of the Hovas is generally used.

The country is administered by a governor-general, assisted by a consultative council. An assembly of Europeans and natives is chosen by electoral colleges. There is an elaborate system of administering justice; at its head is a court of appeal, and there are courts in four principal towns and in the various provinces and districts. The revenue is obtained from a poll-tax, and taxes on land, houses, and cattle. There are also import duties, while the government owns the postal and telegraph services. Education is compulsory up to 14, and all children learn French. In the capital is a school for the study of native medicine.

The chief occupation of the people is agricultural. The main crops are rice, potatoes, maize, haricots, tapioca, sugar, coffee, cocoa, and hemp. Forest trees yield valuable timber, e.g. mahogany, ebony, and rosewood. India-rubber, copal, and other gums are plentiful, as is graphite. Bark for tanning is another export. Six million head of cattle are kept, hides being exported and meat preserved. Gold, copper, lead, iron, and corundum are found. The island has 16,000 m. of roads, but only four rlys.

#### Flora and Fauna

During the long period since the separation of the island from the mainland a great differentiation has taken place in the wild life of the two, and they are now mostly quite unlike. The mammals of Madagascar are few and small, though fossil and semi-fossil remains of a hippopotamus show that some of the larger African beasts came so far E. before the insulation. Mammals peculiar to Madagascar are the lemurs, including the true lemurs, the Indris and the Cheirogale, and the allied aye-

aye (*q.v.*). Endemic carnivora include two species of *Cryptoprocta*, *C. ferox* being like an enormous weasel 3 ft. long; while tenrecs (*Centetes*), the largest 12 to 16 ins. long, tailless, and with a long, flexible snout, and several allied genera represent the insectivores. Among the native birds nearly 100 species are peculiar to Madagascar, as also are between 20 and 30 species of chameleons and numerous insects.

The flora is abundant, varied, and specialised. Several plants have become well known as curiosities of vegetation, such as the "traveller's-tree," which provides for the thirsty by collecting large supplies of water in the sheaths of its leaves. The lattice-leaf is a veritable wonder, and among the economic plants peculiar to Madagascar are landolphia, producing rubber, the raphia-palm, and the beautiful evergreen tree *Astrapeia wallichii*.

**HISTORY.** Madagascar was discovered in 1500 by a Portuguese navigator, and was long known as the isle of St. Lawrence. It was then peopled by a number of tribes at first independent of each other, with settlements of Arabs.

#### Growth of French Power

About 1700 the French established military posts on the island, but it was not until well into the 19th cent. that they really began to take possession. At the time of the Napoleonic Wars they surrendered their posts on the island, and in 1811 Tamatave was temporarily occupied by the British. King Radama, who began to reign in 1810, allowed Christian missionaries to enter the island, but after his death in 1828 they were expelled, the native Christians persecuted, and Europeans and their wares excluded. In 1861 missionaries and traders were readmitted.

In 1865 Great Britain and France agreed to respect the independence of Madagascar, which, under Ranavalona II, a queen who began to reign in 1868, had a fairly strong army, and a system of administration directed by Europeans. It was thought by the British that steady support of the Hovas rule would be the best policy. The French, however, soon took up a different attitude. In 1840 they had obtained a protectorate over a small chieftain, but it was more or less dormant until 1878. They then renewed their claim, and in 1883 sent an ultimatum to the queen. The demands were refused, and Tamatave was bombarded and taken. The war lasted until 1885, when the French obtained Diego Suarez

and a certain control over the foreign policy of the island. In 1890 the protectorate of France was recognized by Great Britain, but it needed another war to make the natives accept it. In 1895 the capital was entered by French troops, and on Aug. 6, 1896, Madagascar was officially declared a French colony.

After the defeat of France in June, 1940, Madagascar remained under Vichy control until on May 5, 1942, British forces landed in Diego Suarez bay on the N. with the object of forestalling a possible Japanese occupation of the island, which would have imperilled Allied lines of communication with the Middle and Far East (the Mediterranean being closed). The gov.-gen. offered resistance, but Diego Suarez was captured by the 8th. The gov.-gen. showing no disposition to enter into an arrangement with the U.N., a further landing was made at Majunga, Sept. 10. Antananarivo fell Sept. 23, and hostilities ceased Nov. 5. Gen. Legentilhomme (*q.v.*) arrived in the island in Jan., 1943, and took over responsibility as high commissioner for Fighting France. See Malagasy.

**Bibliography.** Fifty Years in Madagascar, J. Sitree, 1924; Native Races of Africa and Madagascar, Sir J. Frazer, 1938; The Drama of Madagascar, Howe, 1938; Across Madagascar, Chapman, 1943.

**Madam Butterfly.** Opera in 3 acts by Giacomo Puccini. Produced at La Scala, Milan, Feb. 17, 1904, it received a lukewarm reception; revised by the composer, it was performed at Brescia three months later. The first London performance was given at Covent Garden in 1905, with Destinn as Cho-Cho-San (Butterfly), Caruso as Pinkerton, and Scotti as Sharpless. The opera, one of the most popular in the modern repertory, is notable for the intensity of its emotional appeal, *e.g.* the love duet and the aria One Fine Day.

The libretto by Luigi Illica and Giuseppe Giacosa, was derived from an American magazine story by John Luther Long which, dramatised by Belasco as *Madame Butterfly*, was a sensational success in New York in 1899, and in London the following year.

**Madame Bovary.** Novel by Gustave Flaubert. Its writing occupied the author more than four years, from the beginning of 1852 to May, 1856. It appeared in the *Revue de Paris* the same year, and achieved little more than a *succès de scandale*, a charge of immorality

being brought against author and publisher. Both were acquitted, and the novel appeared in book form in 1857. It marked the beginning of a new school of objective realism, and its influence on such writers as Daudet and Zola was far-reaching. It tells with masterly detachment the story of the sentimental, unsatisfied wife of an unromantic country doctor.

**Madame Sans-Gêne.** Nick-name of Thérèse Figueur (1774-1861). Born at Talmay, Côte d'Or, daughter of a grain merchant, at the age of 19 she was enrolled in a cavalry regiment and saw service at Hohenlinden, Toulon, Austerlitz, Jena, and Waterloo, had four horses shot under her, and was a prisoner at Lisbon and Southampton. In 1818 she married Clément Sutter, a dragon, and, left a widow, died in poverty Jan. 4, 1861. She is sometimes confused with La Maréchale Lefebvre, duchess of Dantzic, through the play by Victorien Sardou and Émile Moreau, produced at the Vaudeville, Paris, Oct. 17, 1893. In the title-rôle of this play Gabrielle Réjane (*q.v.*) made one of her most successful and brilliant impersonations.

A three-act comedy, with a prologue, adapted by J. Comyns Carr from the French play, was produced at The Lyceum, London, April 10, 1897, Henry Irving taking the part of Napoleon and Ellen Terry the title-rôle. The Duchess of Dantzic, a romantic opera in three acts on the same theme, by Henry Hamilton, with music by Ivan Caryll, was produced at The Lyric, Oct. 17, 1903; and an opera, *Madame Sans-Gêne*, by Umberto Giordano, at the Metropolitan Opera House, New York, Jan. 25, 1915.

**Madang.** A seaport of New Guinea, formerly known as Friedrich Wilhelmshafen. It stands on Astrolabe Bay, in the N.E. of the island, and was the commercial capital of the German protectorate, Kaiser Wilhelms Land, occupied in Oct., 1914, by an Australian force. (See Papua.) In Japanese hands from the beginning of 1942, Madang was on a coastal motor road constructed by the enemy. It was recaptured, April 24, 1944, by the Australian 7th div. after an advance straight over the 5,600 ft. range (see Shaggy Ridge) lying close to the coast. The harbour is protected by several islands, on one of which, Beliao, is a hospital for Europeans. It exports copra, trepang, mother-of-pearl, and gold. Pop. (white) 208.

**Madariaga y Rojo, SALVADOR DE** (b. 1886). Spanish scholar and diplomatist. Born at Corunna, July 23, 1886, he was educated at Madrid and Paris, and from 1911 to 1916 was technical adviser to the Spanish N. rly. and from 1928 to 1931 was professor of Spanish studies at Oxford. With the establishment of the Spanish republic in 1931, he was appointed ambassador to the U.S.A., and ambassador to France, 1932-34. Chief Spanish delegate to the League of Nations, 1931-36, he was minister of education in the Lerroux cabinet, 1934. His books include a comparative study of Shelley and Calderon, 1920; *Anarchy or Hierarchy*, 1937; *The World's Design*, 1938; *Columbus*, 1939; *Spain*, 1943; *Rise (1946) and Fall (1947) of the Spanish-American Empire*.

**Maddaloni.** Town of Italy, in the prov. of Naples. It stands in a plain 17 m. by rly. N.N.E. of Naples. Crowned by a castle and a church, it has a fine palace of the Caraffa family, a college, and an institute for soldiers' sons. Weaving and quarrying are the chief industries. Close to the town there is a famous aqueduct, about 20 m. long, built by Charles III. of Naples between 1753 and 1759 to bring water to the gardens of Caserta.

**Madden, SIR CHARLES EDWARD** (1863-1935). British sailor. He joined the navy in 1875, and served during the Egyptian war, 1882. He specialised in the torpedo, and was staff officer of the Vernon torpedo school-ship, 1893-96. Made naval assistant to the controller of the navy in 1905, he was naval assistant to the first sea lord, 1906. In the following year he was captain of the Dreadnought and chief of staff, Home Fleet, and in 1910-11 junior sea lord. Rear Admiral, 1911, he successively commanded the first division Home Fleet, the third cruiser squadron, and the second cruiser squadron. He was appointed chief of staff to Admiral Jellicoe, Aug. 4, 1914. In 1917 he was appointed second in command of the Grand Fleet, and from 1919 to 1922 was commander-in-chief Atlantic and Home Fleets. Vice-admiral, 1916, admiral, 1919, he became admiral of the fleet, 1924. Knighted, 1916, he was created a baronet in 1919, and awarded £10,000. In 1927 he became first sea lord. He died June 5, 1935.

**Madder.** A dye stuff originally produced from various species of plant, *Rubia tinctorum* in Europe and *R. cordifolia* in Asia being the most important. The colouring

principle, alizarin, occurs in the root as a glucoside which on fermentation is decomposed. Alizarin is yellow in colour, but on combination with a suitable mor-

dant, such as alum, gives red to purple tints which are fast to light. The use of madder for dyeing cloth appears to have been known to the ancient Egyptians and until the introduction of synthetic dye-stuffs madder was extensively cultivated in France and Holland. Large quantities were imported to England from Mediterranean areas. See Alizarin.

**Madeba Map.** Mosaic map of Syria, Palestine, and Egypt, forming the pavement of a 6th century Byzantine church at Madeba, Moab. The oldest geographical map known, it was discovered by Father Kleophas in 1896. Although mutilated, 49 sq. yds. remain, depicting Jerusalem, the Holy Sepulchre, the Dead Sea with boats, Jordan and Nile, palm-trees and animals. See Peutinger Table.

**Madeira.** Wine made of grapes grown in the Madeira Islands. A fortified wine of full body and fragrant bouquet, yet soft, mellow, and elegant, it owes its properties partly to soil, but chiefly to the peculiar process of artificially maturing it. Normally containing from 16 to 20 p.c. of alcohol, it improves by keeping. There are two sorts, the "dry" or pale, and the sweet, rich type.

**Madeira.** Portuguese island in the Atlantic Ocean off the coast of N.W. Africa. It is a mountainous island of volcanic origin 35 m. long by 12 m. wide. The culminating point of the island is the Pico Ruivo, alt. 6,057 ft. A central range, averaging 4,500 ft. high, traverses the island; its lateral ridges, forming deep gorges, end in precipitous cliffs, 1,000 ft. to 2,000 ft. in alt.; between them are the bays which shelter the chief villages.

The central part is a large plateau or amphitheatre, the Curral das Freiras. The climate is mild and salubrious; the mean temperature is 65° F.

The N. part of the island is extremely fertile, but irrigation has to be practised, as most of the streams

dry up during summer. In the lowlands guavas, mangoes, coffee-, orange-, lemon-, banana-, and fig-trees flourish, and the fruit is exported, while the wine is famous.

Madeira Islands.

Map of the island group off the north-west coast of Africa

All cereals and most European vegetables are grown. Other exports are sugar, arrowroot, honey, wax, cane, and wicker goods, straw hats, and lace. A cog rly. ascends to the village of Monte at an elevation of 2,000 ft. The roads are very steep, and *carros*, covered conveyances, running on sledges and drawn by oxen, are largely used, as also are mules. The people are of somewhat mixed descent—mainly Portuguese with some Moorish and Negro blood. Education is extremely backward. The capital and chief port is Funchal (*q.v.*) on the S. coast.

Madeira (Port., timber) was discovered in the 14th century, first settled in 1419, and occupied by the British 1807-14. Pop. 250,124. *Consul* Madeira, Canary Is., and Azores, A.S. Brown, 13th ed., 1927.

**Madeira.** River of Brazil, the chief tributary of the Amazon. Formed on the Bolivian boundary by the junction of the Mamoré (*q.v.*) with the Beni (*q.v.*), it flows N.E. through the state of Amazonas (*q.v.*) and discharges into the Amazon about 80 m. below Manaus after a course of some 900 m. from its confluence with the Mamoré, or, including the latter, 2,200 m. Navigable by ocean steamers to São Antonio Falls, a distance of 715 m. It was explored by the Roosevelt-Rondon expedition in 1914, and its chief affluent, the Rio Dúvida, was renamed Rio Roosevelt. At its meeting with the Amazon it is 2 m. in width, while its depth for 500 m. from its mouth varies from 27 ft. to 200 ft. Its

upper reaches are obstructed by rapids and cataracts. Its drainage basin is estimated at 425,000 sq. m.

**Madeira Islands.** Small group in the Atlantic belonging to Portugal. They lie about 440 m. W. of Mogador, on the Moroccan coast, and 670 m. S.W. of Lisbon. They consist of Madeira (*q.v.*), Porto Santo, 22 m. to the N.E., the only other permanently inhabited island, and the Desertas, three rocky islets 11 m. to the S.E., and have a total area of 314 sq. m. The islands rank as a maritime district incorporated in Portugal. Population 195,000.

**Madeleine, La.** Paris church dedicated to S. Mary Magdalene. It stands at the beginning of the Grands Boulevards, facing the Rue Royale. Modelled on the temple of Jupiter at Athens, and begun in 1764, when Louis XV laid the first stone, it was completed in 1843. It is 354 ft. long, 141 ft. wide, 98 ft. in height, is surrounded by a Corinthian colonnade, and has a Grecian façade raised high above

**Madeley.** Parish of Shropshire, England. It stands on the Severn, 7 m. N.E. of Much Wenlock, and is served by rly. It includes Ironbridge and Coalbrookdale, and has large ironworks and coal and ironstone mines. Market day, Sat. Another Madeley is in Staffs, near the Cheshire border; pop. 2,819.

**Madonna.** The Madonna del Granduca of Raphael, one of the master's most beautiful studies of womanhood; Pitti Palace, Florence. Top, right, head of the Madonna, from a painting by Botticelli; Uffizi Gallery, Florence. See text in next page

the boulevard and approached by 28 steps. The richly decorated interior contains some beautiful sculptures and other works of art. Napoleon wished to make the building a temple of glory; Louis XVIII restored it to its original purpose and gave it its name.

he organized was discovered, and he had to escape to the U.S.A., his supporters began the revolt; he returned and took the lead, and the rising proved successful. Madero was elected president, Oct. 1, 1911. He initiated reforms, but was unable to stamp out insurrection.

On Feb. 9, 1913, a new revolt started in the capital; ten days later Madero was arrested and on Feb. 23 murdered.

**Mad Hatter, THE.** Member of the famous tea party described in Lewis Carroll's story for children Alice's Adventures in Wonderland. See Mad Tea Party; also Alice's Adventures illus.

**Madhya Bharat.** Union of 20 formerly separate states of India, formed at Gwalior city, May 28, 1948; also called the united state of Gwalior, Indore, and Malwa, or the Malwa union. The states were: Alirajpur, Barwani, Dewas Senior and Junior, Dhar, Gwalior, Indore, Jaora, Jabua, Khilohpur, Narsingarh, Rajgarh, Ratlam, Sailana, Sitamau, Jobat, Kathiwar, Kurwai, Mathwar, and Piploda. The maharaja of Gwalior was installed as the first rajpramukh. The two capitals of the union are Gwalior (summer) and Indore (winter). Area 46,353 sq. m. Pop. 7,200,000. See names of individual states.

**Madhya Union.** Name given in 1949 to the state of India more familiar as Central Provinces (*q.v.*).

**Madison.** Capital of Wisconsin, U.S.A., also second largest city and co. seat of Dane co. Built on an isthmus between Lakes Mendota and Monona in the Four Lakes district, 81 m. W. of Milwaukee, it is served by rlys. and three airports. A leading educational centre, it has seven state and university libraries. The state university has 1,000 acres of grounds beside Lake Mendota; the imposing white granite capitol, in a wooded park, has a dome rising 285 ft., which in the U.S.A. is exceeded in height only by the Capitol at Washington. Industries include manufactures of machine tools, farm and hospital equipment, road and dairy machinery, and processed foods. There are rly. shops and limestone quarries. Madison was selected as capital in 1836 on the formation of Wisconsin Territory, and chartered as a city in 1856. Pop. 67,447.

**Madison, JAMES (1751-1836).** President of the U.S.A. Born at Port Conway, Virginia, March 16, 1751, he was delegate to the Revolutionary Convention, 1776; the Continental Congress, 1780-83; and the Philadelphia Convention of 1787, *James Madison*

Madras. Map of the largest Deccan state of the Indian Union

which was summoned to draw up a constitution.

After the publication of the terms, Madison, with two collaborators, wrote a series of 85 essays, published in book form as *The Federalist*. Democratic president in 1808, and re-elected in 1812, he died at Montpelier, Virginia, June 28, 1836. Consult *The Writings of James Madison*, 1900-10.

**Madison Square.** Area at the junction of Fifth Avenue and Broadway, New York City. On the E. side is the Metropolitan Life Insurance Co.'s building, with a 50-storey tower. Another tower overlooking the square is that of Madison Square Garden, one of the city's largest buildings devoted to amusement. The amphitheatre is used for horse shows and circuses, but it is chiefly known for the boxing matches staged there. It contains also a theatre, a concert hall and ballroom, a restaurant, and a roof garden.

**Madoc or Madog** (c. 1150-80). Traditional Welsh discoverer of

America. He was one of the young-  
 er sons of Owain Gwynedd (d. 1170)  
 and, on disputes as to the succession,  
 is said to have sailed to the west  
 in ten ships with 300 men. The  
 earliest mention of him is in a mid-  
 fifteenth cent. poem, and it was  
 about a century later that his voy-  
 age was associated with the dis-  
 covery of America. His story forms  
 the subject of Robert Southey's  
 long narrative poem, *Madoc*, pub-  
 lished in 1805.

**Madonna** (Ital., my lady).  
 Word specifically applied to any  
 representation of the Virgin in  
 Christian art. Such representations  
 date from the Catacombs, and the  
 Madonna was the dominating  
 theme in painting until the end of  
 the 17th century. The Italian  
 artists excelled in the treatment of  
 this subject; the Madonnas of  
 Raphael, Leonardo da Vinci, Ber-  
 nardino Luini, Titian, Botticelli,  
 and Giorgione being world-famous.  
 Murillo's Spanish Madonnas rival  
 the Italian in gracious beauty. In  
 addition to those illustrated on page

5389, other famous Madonnas illus-  
 trate various articles, e.g. S. Anne,  
 Art, Assumption, Byzantine Art,  
 Carpaccio, Francia.

**Mad Parliament.** Derisive  
 name given by the court party to  
 the parliament which met at  
 Oxford in June, 1258. The country  
 was roused to anger by the extra-  
 vagance of Henry III., and by the  
 favours he showed to his alien  
 friends, and the parliament, which  
 consisted only of barons, was re-  
 sponsible for the reforms known as  
 the Provisions of Oxford (*q.v.*).

**Madras.** State of India. It  
 occupies the major portion of the  
 Deccan peninsula, and comprises  
 three sections, a portion of the  
 Malabar coast on the W., the  
 whole of the Coromandel coast on  
 the E., and a considerable area in  
 the plateau S. of Hyderabad and  
 Mysore. The edges of the Deccan  
 plateau, the Eastern and Western  
 Ghats, meet in Madras in the  
 Nilgiri Hills. South of them the  
 Palghat Gap is a 16-m.-wide  
 break in the continuity of the W.  
 Ghats. The rivers of the Malabar  
 coast are short, and relatively un-  
 important. The main rivers of the  
 S. Deccan flow from the W. Ghats  
 across the peninsula; only the  
 lower courses of the Godavari and  
 Kistna, and the middle and lower  
 sections of the Cauvery, are in  
 Madras. None of the smaller rivers  
 is navigable, but nearly all are  
 used for irrigation. The Laccadive  
 Islands to the S.W. are adminis-  
 tered by Madras.

The whole of the state has a  
 hot climate; the W. has a regular  
 heavy rainfall, the monsoon; the  
 E. has somewhat uncertain rains  
 from the monsoon in the N., and  
 from the N.E. trades during the  
 cooler months in the S.; the inland  
 areas have scanty rain. On the lower  
 levels the temperature varies from  
 about 75° F. in Jan., the coolest  
 month, to about 88° F. in May,  
 the end of the hot dry season.

Beryl, corundum, graphite,  
 manganese, and mica are the chief  
 minerals, while gold, iron, copper,  
 lead, etc., are also found.

The fauna includes monkeys,  
 tigers, leopards, cheetahs, hyaenas,  
 wild dogs, wild pigs, wolves,  
 jackals, badgers, bats, porcupines,  
 elephants, gaurs (bison), various  
 species of antelope, anteaters,  
 humped domestic oxen or zebu,  
 numerous birds—peacocks, quail,  
 grouse, doves, etc.—snakes, tur-  
 tles, frogs, ants, wasps, bees, etc.

Palms, banyans, papaws, tam-  
 arinds, bamboos, tree ferns, san-  
 dalwoods, satinwoods, rosewood,  
 teak, and ebony trees are common;

the forests cover some 20,000 sq. m. The palms yield copra, jaggery, and betel nuts.

The chief languages are Telugu in the N.E., Tamil in the S.E., and Malayalam in the W., three of the principal Dravidian tongues. The animistic hill peoples are mainly pre-Dravidians; the majority of the most civilized folk are Dravidians. Eighty-nine p.c. are Hindus. Three main roads run from Madras city to Calcutta, to Calicut in Malabar, and to the boundary of Travancore. The Madras and S. Mahratta rly. and the S. Indian rly. connect the capital with the big centres in and beyond the province. The Buckingham Canal, a salt-water navigation canal, extends for 261 m. S. from Madras.

The chief crops are rice, grown on the deltaic lowlands of the E., the alluvial stretches of the W., and inland wherever sufficient water can be obtained, millets, both kambu and oholam, and ragi; the latter are the food grains of the peasantry. The sugar-canes, tobacco, tea, coconut palms, and rubber trees, pulses, spices such as pepper, ground-nuts, castor-oil plants, plantains, cover only a third of the cultivated area. Weaving on handlooms is a declining industry, although the fine cottons and silks, muslins and

satins excel in delicacy the product of European factories.

In addition to Madras city, towns with populations exceeding 100,000 are Madura, Trichinopoly, Coimbatore, Salem, and Calicut; those over 75,000 are Bezvada, Guntur, Mangalore, Tuticorin, Cocanada. There are also 16 towns each with a population exceeding 50,000.

The main events in the history of Madras date from the arrival of Vasco da Gama in 1498. In 1640 Fort St. George, the modern Madras city, was erected on behalf of the East India co.; by that date English, Portuguese, Dutch, and Danish factories were in existence, and French settlements followed in the next few years. In 1741 Duplex became governor of Pondicherry; five years later Madras surrendered to a French fleet under De Labourdonnais, and the conflict between French and English culminated in the victory of Wandiwash in 1760. In 1780 the first, in 1790 the second, and in 1799 the third Mysore wars were waged against Tippoo, who was slain at Seringapatam.

Tippoo's possessions were parcelled out. Kanara, Coimbatore, and Wynaad became British; the Nizam's portion, Anantapur, Bellary, Cuddapah, and Kurnool were

ceded to the British the next year, 1800. The province remained part of British India until the transfer of power in 1947. Banganapalle was merged in Madras state 1948. Area 125,807 sq. m. Pop. 49,341,000.

**Madras.** City of India, cap. of the state, and govt. h.q. during the cool weather. It is situated on the Coromandel coast, and its artificial harbour has helped to make it the fifth seaport of India and the chief port of the Deccan.

The city has grown up round Fort St. George, a trading settlement of the East India co. founded by Francis Day in 1640; the fort and S. suburbs were the European quarters, which now lie in Egmore, Chetpet, Kilpauk, etc.; N. of the fort lay Black Town which since 1905 has been called George Town and is now the commercial centre of the city. George Town and Triplicane are densely peopled, and the latter contains the chief Hindu temples. Napier, Robinson, and the People's Parks are the chief open spaces in addition to the island, an open space between two arms of the Cooum river, near the fort. The Marina, along the sea front, contains the Marine Aquarium and Madras University buildings. S. Thomé, S. George's, and the Roman Catholic cathedrals are historic buildings. S. Mary's is the

Madras, India. 1. Central station. 2. Hindu temple in the China Bazaar. 3. View from the roof of the Bank of India, showing the High Court with the Christian College on the right. 4. The High Court

earliest English church in India (1680), S. Andrews is the Scottish kirk (1821). The Observatory dates back more than a century; it sets the time for India and Ceylon, and issues weather reports and storm warnings. The memorial hall, museum, Connemara public library, and Victoria memorial building are notable edifices. Government house, first acquired by the East India co. in 1752, was the governor's residence until 1947, when it was made over to the government for the accommodation of the legislature.

Four main rlys. join the city with Calcutta, Bombay, Calicut, and Tuticorin. The harbour, which is entirely man-made, is unsafe during storms, and the port suffers somewhat from competition with the minor ports of the Deccan. Madras exports the produce of the state, chrome ore, cotton, oil seeds, and hides, and imports machinery, coal, grain, and timber. There are no great manufactures. Pop. 998,000. In the First Great War Madras was the only Indian city to come under enemy attack, when it was shelled by the German raider *Emden* in 1914.

**Madras, UNIVERSITY OF.** This university, founded in 1857, was formerly purely an examining body, but in 1923 it was reorganized as a teaching and residential university with control over the quality of the teaching given by the fifteen constituent colleges and the thirty-one affiliated colleges of the university in the province of Madras. Of the constituent colleges, six prepare candidates for degrees in arts and science, four in teaching, one in law, two in medicine, one in engineering, and one in veterinary science. The endowment funds amount to about £60,000.

**Madre de Dios** (Sp., Mother of God). River of S. America. Called by the natives Amaru-Mayu, and the chief affluent of the Beni (*q.v.*), it rises in the S.E. of Peru, flows N.E. through Bolivia, and empties into the Beni at Rivera Alta, not far from the confluence of the latter with the Mamoré. It has a course estimated at 900 m.

**Madre de Dios.** Department of S.E. Peru. It was created in 1912, and named after the river. Its capital is Maldonado. With an area of 58,827 sq. m., the estimated population is 4,950.

**Madrepore** (*Madreporearia*). An order of the Anthozoa consisting of the true corals. The polyps secrete carbonate of lime in the

form of stony plates against the folds of their skin and in a solid form below their base, thus causing them to rise. The madrepores are the principal builders of coral foundations. See Coral.

**Madrid.** Central prov. of Spain. It is bounded W. by Avila and Segovia, E. by Guadalajara, and S. by Toledo. Elevated and largely mountainous, the Sierra de Guadarrama running along its N.W. boundary, the climate is bleak and cold in winter and very hot in summer. Rainfall is deficient, ex-

cept on the heights; the S.E. part is the best watered and fertile, producing vines, fruit, cereals, oil, esparto, and vegetables. There are quarries of granite and freestone, and the mountains contain minerals, which, however, are not fully exploited. The forests in the N. and N.E. yield timber for building purposes, charcoal, and firewood. Agriculture and horticulture are the chief occupations. Beyond the capital there are few large towns, and the prov. is sparsely inhabited. Area 3,089 sq. m. Pop. 1,171,428.

## MADRID: CAPITAL OF SPAIN

Alfonso Lopez, Spanish Writer and Translator

*The history and physical features of the Spanish capital are here described. The Prado museum has its own entry, and the relationship of Madrid to the country as a whole is described under Spain*

The capital of Spain and of the prov. of Madrid, the city of Madrid stands on a plateau, at an elevation of 2,400 ft., surrounded by an extensive, arid plain, S. of the Guadarrama Mts., 41 m. direct N.N.E. of Toledo.

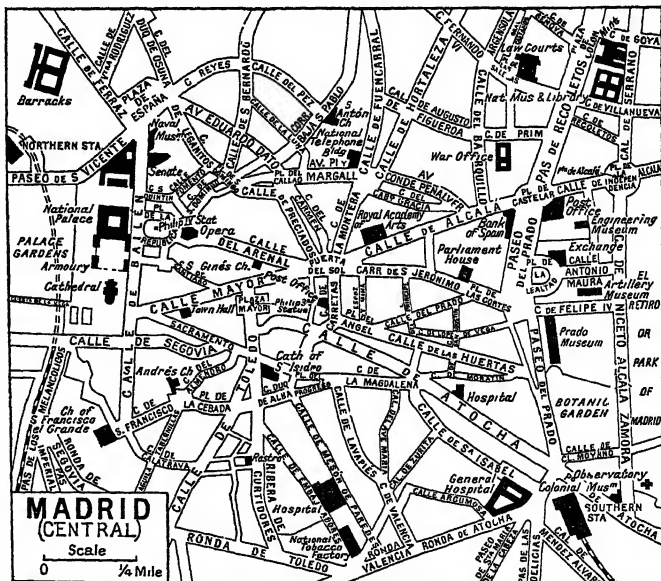

The Manzanares river, which is waterless during the summer, is spanned by several fine bridges. The centre of the peninsular rly. system, the city communicates with France by two lines and with Portugal by three. Madrid has the most variable climate of any town in Spain, and its death rate is high.

Exposed at different seasons to icy winds and scorching sun, the extremes of temp. are not only seasonal, but daily, the variation sometimes exceeding 50° in one day.

Almost surrounded by public parks and gardens, Madrid has many wide streets, large squares, avenues, and promenades; but in the older parts of the town the streets are narrow, dingy, and badly paved. The chief square, Puerta del Sol, is in the centre of the city and is the focus of activity. From it radiate ten streets, the finest being the Calle de Alcalá, which traverses the magnificent boulevard, del Prado, flanked by handsome squares, public buildings (including the Prado museum,

Madrid arms

Madrid. Plan of the central part of the Spanish capital, indicating positions of principal buildings

Madrid, Spain. 1. General post office, centre, and right, pharmacy, medical, and dentistry buildings respectively; in the background (right) are hospital blocks. 2. University city, in course of construction to the N.W. of the capital. 3. Avenida Margall, a shopping street. 4. General view of the city, with the national telephone building on the left

amous gallery of painting and sculpture, and the Academy of the Spanish language), and by botanical and other gardens. The chief park, the Retiro, lies to the E. of this district.

Debouching W. from the Puerta del Sol, the Calle del Arenal leads to the Plaza de Oriente (la Republica), the largest square, and to the royal palace. The square contains a beautiful fountain with bronze lions and the striking equestrian statue of Philip IV, surrounded by 44 other statues of Visigothic and Spanish kings. The palace, a massive six-storied building, 500 ft. square by from 80 ft. to 165 ft. high, faces the Plaza de Armas, with the Armoury, a world-renowned collection of arms and armour. In another open space rises the new cathedral, founded in 1883. To the N. of the palace are the ministry of marine with naval museum, and the senate; to the W., sloping to the Manzanares, are the palace gardens, themselves flanked with avenues, and connected by bridges with the Casa de Campo, an extensive park.

Another important street, running W. from the Puerta del Sol, is the Calle Mayor; it passes near the Plaza Mayor, a spacious square, with a famous equestrian statue of Philip III. This square was long used for ceremonies, tournaments,

bull-fights, executions, autos-da-fé, horse-races, etc. Here, in 1812, after the British entry into the city, the constitution of Cadiz was proclaimed. Here also occurred several riots, and the Federalists, in 1873, removed the statue from its pedestal. On the S. side of the Calle opens the Plaza de la Villa, with the town hall. The Carrera de San Jeronimo, running E. from the Puerta, leads past the Palacio del Congreso, or parliament house, through the Plaza de las Cortes to the Prado.

The building of the national library and museums, in the Paseo de Recoletos, contains one of the most important libraries in Europe, with over 1,000,000 vols.; the archaeological museum, containing prehistoric and ethnological objects; and the museum of modern art with an extensive collection of paintings and sculptures. In the Retiro or park of Madrid, with numerous fountains and statues, and a small zoological garden, is a colonial museum and library. The university, transferred from Alcalá de Henares to Madrid, 1836-37, has a valuable collection of books and MSS. A vast university city, to the N.W. of the capital, founded in 1928, was still in course of construction 20 years later.

The greatest development of Madrid dates from 1914. Since then

a great new artery, the Gran Vía, running from E. to W., and the new general post office, one of the largest and finest buildings in the Prado, have been completed; new parks and squares have been laid out; the Manzanares river has been canalised, and three underground rly. lines totalling 20 m. in length have been constructed.

The city contains 23 hospitals, many orphanages, asylums, and other philanthropic institutions; a chamber of commerce and industries, guilds, workmen's clubs and associations. The churches are of little antiquarian interest or architectural merit. San Isidro, the old cathedral, dates only from 1651. Among Madrid's many industries are the manufacture of tobacco, leather goods, furniture, fans, porcelain, glass, carpets, tapestry, carriages, chemicals, corks, soap, paper, plate, guitars, jewelry, confectionery, cards, perfumes, etc. There are works connected with iron, copper, and zinc. Its book and publishing trade is important.

Latin and Arab scribes mention Medina Majerit, as they called Madrid, as existing in the 10th cent. It was recaptured from the Moors in 1083. At first a frontier fortress and royal hunting-lodge, it became a residence of the kings. It received a charter in 1202, and the Cortes assembled there in 1309.

Philip II made it his capital in 1561. It had then only 30,000 inhabitants, but the city quickly grew, although up to about 1650 it presented but a poor appearance. Even up to the reign of Philip IV (d. 1665) Madrid was unpaved. The uprising of the people of Madrid on May 2, 1808, was the beginning of the Spanish War of Independence against Napoleon. Madrid was captured from the French by the Allies under Wellington in 1812. Its monasteries were suppressed in 1836. Rlys. were introduced in 1850, and an abundant water supply was laid on in 1858.

#### In the Civil War

When Gen. Franco led a rising of the Foreign Legion in Morocco, July, 1936, the Madrid garrison, like most of those in Spain, rose in revolt, July 17, but was overpowered, July 19, by a workers' militia raised by the govt. Franco's forces captured Badajoz, Irun, and San Sebastian, and advanced on the capital in a convergent attack of four columns (the "fifth column" being his sympathisers inside the city). The government moved to Valencia on Nov. 6, and next day the siege of Madrid began; it lasted until March 28, 1939, when the city surrendered. The defence was reinforced Nov. 8, 1936, by the International Brigade (*q.v.*). Fighting, heaviest during the first six months, wrecked the suburb of Carabanchel and much of the university city, but the rest of Madrid suffered lightly, although subjected to bombing by Italian and German aeroplanes as well as to artillery bombardment. The last remnants of Republican re-

sistance ceased shortly after the fall of Madrid; and on Oct. 18, 1939, Franco transferred his government from Burgos to the capital. He reopened the partly restored university city Oct. 12, 1943. Pop. (est. 1946) 1,171,428.

**Madrigal.** Musical composition with secular words, in contrapuntal style. It is used for voices in three or more parts, without separate instrumental accompaniment. Some madrigals had the label "Apt for viols or voices," indicating that the instruments could take the place of, or assist, the voices. The Netherlands school of composers was early in this field in the 15th century, when it was represented by Okeghem, Tinctor, Hobrecht, Josquin des Prés, and others. These were followed in the 16th cent. by Arcadelt, Verdelot, Waelrant, Willaert, and Orlando di Lasso. The Italian school, a little later than that of the Netherlands, included Festa, Palestrina, Anerio, Marenzio, Croce, the Gabriellis, Orazio Vecchi, Gastoldi, and others. In England the madrigal reached its climax in the Elizabethan and early Stuart periods, and was associated with the names of Byrd,

Morley, Weelkes, Este, Ford, Wilbye, Dowland, Benet, Hilton, and Orlando Gibbons. *See Music.*

**Madsen Gun.** Type of light machine-gun or automatic rifle, invented by a Danish engineer and named after the Danish war minister. The gun depends for its action on the recoil of the barrel. In appearance it is similar to an ordinary rifle, and may be fired from the shoulder, either as an automatic or for single shots. The barrel is fitted inside a perforated casing; the cartridges are fed in segment-shaped magazines, each holding 25 rounds; the magazine is clipped vertically to one side of the breech mechanism-chamber. *See Machine-Gun.*

**Mad Tea Party.** Episode in Alice's Adventures in Wonderland, by Lewis Carroll. Alice finds the Mad Hatter, the March Hare, and the Dormouse having tea, and their conversation, which reaches a kind of insane logic, has given rise to many quotable phrases and allusions. *See Alice's Adventures*, illus. p. 303.

**Madura.** Peninsula of Indonesia. It is situated to the N.E. of Java, being bounded to the S.

by the Strait of Madura. With some insular dependencies it formed a residency of Java; it was autonomous 1948-50, then became part of the republic of Indonesia. The Madurese are fishers and cattle rearers, who

speak a distinctive tongue. Area, 1,700 sq. m. Pop. 1,800,000.

**Madura.** District and town of India, in Madras state. The district is situated in the middle of the S. portion of the Deccan. To the W. are the Western Ghats; it is drained by the Vaigai river. The Periyar river flows down the Ghats to the Arabian Sea; a dam has been constructed, and the conserved water is led through a tunnel in the mountains to irrigate Madura. Of the total area, 60 p.c. is cultivable, but only three-quarters of this is tilled; the chief crops in cultivation are food grains, rice, and cotton.

Madura town is situated on the Vaigai. The capital of the ancient Pandyan kingdom, it is an historic town and a great religious centre. The great temple of Sundaeswara, with a hall of a thousand pillars, is the chief building. Brass vessels

Madura, India. Two of the ten magnificent carved gate towers of the temple of Sundaeswara, which covers an area of 25 acres

and cotton cloths are manufactured, and textile mills have been established. District: area, 4,883 sq. m.; pop. 2,444,600. Town: pop. 239,144. See India.

**Madvig**, JOHAN NICOLAI (1804-86). Danish classical scholar, born on the island of Bornholm, Aug. 7, 1804. He was professor of Latin language and literature at Copenhagen, 1829-48, and then minister of public worship and education until 1851. He then resumed his professorship, retiring in 1876, and dying Dec. 12, 1886. He had a European reputation as one of the foremost textual critics, especially of Cicero and Livy. His most important works were an edition of Cicero's treatise *De Finibus* (On the Chief Good), 1839, Latin Grammar, 1841, and a text of, and emendations to, Livy. The Constitution and Administration of the Roman State, 1881, written in a more conservative spirit than some previous works on the subject, was less favourably received.

**Maecander** (mod. Menderes). In ancient geography, river of Asia Minor. Rising near Celaenae (Dineir) in Phrygia, it flows W. with a sinuous course that has become proverbial, and after being joined by the Lycus (Churuk Su), traverses Caria, and discharges into the Icarian Sea. Meander, both verb and noun, is used literally and figuratively in reference to a winding course.

**Maecenas**, GAIUS CILNIUS (c. 68-8 B.C.). A Roman patron of letters. Of an old Etruscan family, he was a man of great wealth

and high culture, and became the intimate friend and adviser of the emperor Augustus. Virgil and Horace were two of many men of letters under great obligation to Maecenas, whose name has become a popular synonym for a generous patron of the arts and literature.

**Maeldun**. Hero of a series of ancient Irish tales narrated in the form of an account of a wonderful voyage. Maeldun is the son of Ailill of the sept of the Owens of Aran and a nun; he is brought up by a queen, friend of his mother, and arrives at man's estate before he learns the story of his birth and of how his father had

been slain. He sets out to find his father's murderer, and visits the most marvellous islands on his voyage. Tennyson tells some of the tales in his poem, *The Voyage of Maeldune*.

**Maelstrom** (Dutch *malen*, to whirl: *stroom*, stream). Strong tidal current in the channels S. of Moskenesø, an island in the Lofoten group, N.W. Norway. Formerly reputed to be a whirlpool which meant certain death to the mariner caught in its eddy, as in a tale by Poe, it is dangerous only at certain states of the tide when a N.W. wind blows fiercely.

**Maenad** (Gr. mad woman). In Greek mythology, one of the alternative names for the Bacchantes or frenzied female companions of the god Bacchus or Dionysus.

**Maerlant**, JACOB VAN. Flemish poet of the 13th century. He was probably born on the island of Voorne and died near Bruges, having been employed as parish clerk at Maerlant and later at Damme. He wrote romances after the fashion of the time, but soon struck a more serious vein and wrote scientific and historical books. One of the most learned men of his day, he was called the father of Dutch literature. His famous rhymed Bible, 1271, led him into trouble with the Church. In 1283 he began a voluminous work, which his death left unfinished, an edition of *The Mirror of History* by Vincent of Beauvais.

**Maes**, NICHOLAS (1632-93). Dutch painter. Born at Dordrecht, he was a pupil of Rembrandt. His

early work shows delicacy of feeling; two examples are *The Reverie* and *Grace*, in Rijksmuseum, Amsterdam. He then painted life-size figure subjects, such as *The Card Players*, in the National Gallery. Turning to smaller genre and portraits, during 1655-67 he produced

Nicholas Maes, Dutch painter

his best work in this direction, such as *The Dutch Housewife*, *The Idle Servant*, and *A Man's Portrait*, all in the National Gallery. The last part of his life was occupied with fashionable portraits. He died in Amsterdam.

**Maeshowe**. Largest prehistoric sepulchral mound in N. Britain, near the stone circles of Stenness, Orkney (q.v.). It is a truncated cone 36 ft. high, 92 ft. in diameter, with a 40-ft. ditch. A passage 54 ft. long leads from the W. to a chamber 15 ft. square, with a false-barrel roof of unhewn claystone slabs and three side cells. The walls bear Norse designs and 900 runes, scored (1152) by Viking pilgrims to Jerusalem.

**Maesteg**. An urban district of Glamorganshire, Wales. It stands on the Llyfnu river, 8 m. N. by W. of Bridgend, and is served by rly. Maesteg owes its existence to the development of the S. Wales coal-field. Pop. 25,552.

**Maestoso**. Italian term used in music, meaning in a stately or majestic manner. See Musical Terms.

**Maestricht**. For this town in the Netherlands the form preferred in this work is Maastricht.

**Maestrichtian**. In geology, a group of soft yellowish limestones containing fossil corals and bryozoa of Upper Cretaceous Age. The group is named from its occurrence near Maastricht in Holland.

**Maeterlinck**, MAURICE POLYDORÉ MARIE BERNARD, COUNT (1862-1949). Belgian poet, dramatist, and mystic. He was born at Ghent, Aug. 29, 1862, educated at the Jesuit college of S. Barbe, and studied and for a time practised law in Ghent. In Paris he came under the influence of Villiers de l'Isle-Adam (q.v.) and the symbolists. In 1889 he published a first volume of verse, *Serres*

Maurice Maeterlinck, Belgian poet  
Elliott & Fry

Chaudes (Hot-houses). Four plays followed in 1890, of which *La Princesse Maleine* was the subject of a notable eulogy in the *Paris Figaro* by Mirbeau. *Pelléas et Mélisande*, 1892, later formed the libretto for Debussy's opera. There followed *La Mort de Tintagiles*, 1894; *Monna Vanna*, 1902; *L'Oiseau Bleu*, 1909 (*The Blue Bird*); translations from Ford, Emerson, Novalis, and Ruysbroeck. In prose Maeterlinck wrote *Le Trésor des Humbles*, 1896; *La Sagresse et la Destinée*, 1898; *La Vie des Abeilles*, 1901; *Collected essays*, *Le Double Jardin*, 1904, and *L'Intelligence des Fleurs*, 1907; *La Mort*, 1913. His play, *The Burgomaster of Stilemonde*, 1920, dealt with Belgium under German occupation 1914-18.

He described his plays as written for marionettes, and his prose as verse in solution. As a rule his plays depend rather on mood than movement, suggestion of the event rather than its presentation; they are attempts to clothe mystical conceptions in concrete form. His chief absorption earlier was with the mystery of matters beyond life; but in the 20th century he showed a reaction from mysticism. The marks of his method have been described as parallelism, symbolism, suggestion, and the use of realistic means for romantic effects. In 1911 he was awarded the Nobel prize for literature. In 1914 his works were placed on the papal index. He was made a count in 1932, and died at his home in Nice, May 6, 1949. *Consult* *Life and Works*, J. Bethell, 1913.

**"Mae West."** Life jacket used by airmen in the Second Great War. Worn by all air crew, the jacket was coloured bright yellow to make it easily distinguishable from the air, and was inflated by the wearer. As it gave him a rather bulky appearance, it received the nickname of "Mae West," after the U.S. actress of that name with the well-curved figure. *See* *West, Mae*.

**Mafeking.** Town of Cape Province, S. Africa. It is 490 m. S.S.W. of Bulawayo, and 189 m. W. by N. of Johannesburg by rly. Here in an imperial reserve are the administrative h.q. and commercial centre of the Bechuanaland protec-

Mafeking, South Africa. Town Hall, opened in 1904; on the left is the Siege Memorial

By courtesy of the Commissioner for South Africa

torate. It was the starting point of the Jameson Raid, 1896. Pop. 5,081. A mile away is the native town on Molopo river. This is administered by Daralong chiefs, who are free from European control, and has a pop. of about 3,000.

**Mafeking, SIEGE OF.** Operation during the S. African War. Lasting from Oct. 13, 1899, to May 17, 1900, the defence of the little frontier town by Col. R. S. S. Baden-Powell aroused intense interest, and the news of its relief led to spontaneous wild jubiliations in London and elsewhere, bringing into common use for at least a decade the new verb "to maffick." The garrison consisted of 700-800 trained troops, assisted by a few hundred townspeople, while the Boer forces under Cronje numbered at first about 10,000, supplied with modern breech-loading guns. The attack was conducted on leisurely lines, and though the town was shelled with some persistency its

outer defences were pierced only once, May 12, and the affair resulted in the capture of 97 Boers. On May 1 the town was relieved by Col. Manon and Col. Plumer, who had joined forces. The casualties of the garrison were 35 killed, 101 wounded, and 27 prisoners. Boer losses were estimated at 300. What appealed most to the public at home was the air of high-spirited audacity with which Baden-Powell conducted the defence and organized the garrison. *See* *South African War*; *consult* *The Siege of Mafeking*, J. A. Hamilton, 1900; *Mafeking*, a Diary of the Siege, F. D. Baillie, 1900.

**Maffei, FRANCESCO SCIPIONE, MARQUESS OF (1675-1755).** Italian archaeologist and dramatist. Born

at Verona, June 1, 1675, he was author of the famous tragedy *Me-ropé*, produced at Modena in 1713, and translated into English in 1740. As archaeologist his greatest work was *Verona Illustrata*. He died in that city, Feb. 11, 1755.

**Mafia.** Name of a Sicilian secret society. Its origins are traced to the ill-disciplined forces of gendarmerie instituted in Sicily by Ferdinand IV in the early part of the 19th cent., and in general objects the body was similar to the Camorra. When the society was an organized whole, its members, known as Mafiosi, were admitted after trial of skill with the dagger, accepted a primitive code of honour, and were sworn to defy all established forms of justice. Their deeds partook of the nature of the vendetta. Reaching its highest pitch about 1860-70, the Mafia carried on robbery, smuggling, and murder; strongest in and around Palermo, it showed itself also in Italy, and attempts at suppression were made in 1874-75. In 1902 two Mafiosi were sentenced at Bologna to 30 years' imprisonment for murder. Outrages attributed to the Mafia, some of whose members were driven abroad, took place in the U.S.A., notably at New Orleans in 1890 and 1895. The society was broken up in 1928 by Mussolini and the prefect of Palermo. *See* *Camorra*; *Vendetta*.

**Mafia.** Island lying off the coast of Tanganyika Territory between Kilwa and Dar-es-Salaam. Formerly part of the territories of the sultan of Zanzibar, it was

Francesco S. Maffei, Italian archaeologist

"Mae West." Fleet Air Arm pilots in the life jackets which were given this nickname

occupied by Germany in 1890 and was captured by the British in Feb., 1915. The area is 178 sq. m. See Tanganyika Territory.

**Magadha.** Ancient kingdom of India. It lay S. of the middle Ganges in Bihar, the capital being first Rajgir near Gaya, and afterwards Patna. In the 4th century Magadha acquired the upper Ganges basin. Chandragupta (*q.v.*), founder of the Maurya dynasty, was the first in history to establish an Indian empire, conquering all the N. from sea to sea, and making the Hindu Kush his frontier against the Greeks. On the death of his grandson Asoka (*q.v.*), the empire decayed, and was destroyed 184 B.C.

**Magadi.** Lake in the S. centre of Kenya colony. It is connected with the Uganda rly., and contains enormous deposits of carbonate of soda. The lake is 30 m. long from N. to S., and forms a basin of internal drainage. See Alkali.

**Magalhães.** FERNÃO DE (c. 1480-1521). Portuguese navigator, more generally known as Ferdinand Magellan (*q.v.*).

**Magallanes.** Territory of S. Chile. It is all that part roughly S. of lat. 48°, above which lies Aysen. It includes all the islands of the W. and S. coasts, all of the coasts of the Strait of Magellan, half of Tierra del Fuego, and most of the Fuegian Archipelago. The narrow strip of mainland is mountainous and deeply indented; the islands are separated by deep channels and rocky coasts; and the fjords and glaciers resemble those of Norway. Coal, copper, and gold are found, and timber is felled. Foxes and other furred animals are bred. Area, 52,271 sq. miles. Estimated pop. 48,801.

**Magallanes.** Seaport town of Chile, capital of Magallanes territory. Formerly known as Punta Arenas (Span., sandy point), it stands on the E. coast of Brunswick Peninsula, in the Strait of Magellan, and is the most southerly town in the world. A coaling station and a port of call for ships passing through the strait, it is a distributing centre for S. Patagonia and the Falkland Islands. In the vicinity are coal, copper, and gold mines. Timber, wool, hides, frozen meat, and tallow are exported. The town has a British club, golf course, and facilities for ice sports. Pop. 33,130.

**Magangue.** Town in the N.W. of Colombia. Standing near the confluence of the Magdalena and Cauca rivers, it is the principal port for the products of the savannahs

of Bolivar dept., *e.g.* cattle, coffee, cheese, and fruit. Pop. 17,000.

**Magazine** (Arabic). A term, originally meaning store, now used in a military sense. It means:

(1) The chamber or reservoir of a rifle into which a number of cartridges can be placed, and from which they are automatically fed into the chamber singly.

(2) The removable clips, boxes, or drums, in which cartridges are placed for use in automatic pistols and rifles, and some machine-guns.

(3) The buildings in which explosives or ammunition are stored. These buildings are generally of special construction and subject to stringent regulations. They must be fireproof and provided with efficient lightning conductors, whilst no one is allowed to approach the site with matches, smoking materials, or a light or fire of any description. If the magazine contains bulk explosives, all persons entering the building must either change their shoes, or put on overshoes, so that grit will not be introduced. The construction of magazines is such that, in case an accidental explosion occurs, the main force will not be exerted in a lateral direction. Some are built underground.

(4) The compartments on board naval vessels where the ammunition is stored.

**Magazine.** Form of periodical literature intended to provide varied information and amusement. In general usage the term usually implies a monthly publication, but even so there is a clearly accepted distinction between the magazine and the serious review. At the same time, certain private periodicals are commonly spoken of as magazines, *e.g.* school magazines, parish magazines, and the journals of business houses. By analogy the varied feature pages of a newspaper are sometimes called magazine pages.

The history of the magazine may be said to begin with the publication of *The Gentleman's Magazine*, 1731. During the second half of the 19th century the magazine underwent a great transformation, due first to the growing vogue of the short story, and secondly to the development of process illustration. The turn of the century saw the peak of the illustrated magazine's popularity, with such periodicals as (*in Great Britain*) *The Strand*, *The Windsor*, *The English Illustrated*, *The Royal*, *Cassell's*, *Pearson's*, *Macmillan's*, etc., and (*in the U.S.A.*) *Harper's*, *Lippincott's*, *Munsey's*, etc., sup-

plying month by month, usually for sixpence, a generous assortment of popular information and high-class fiction for home and family reading, illustrated by photographs and by well-known artists in black-and-white. Many households took pride in an array of bound volumes of their favourite magazines, for at that period all advertising matter was rigidly excluded from the sequence of pages and was therefore denied permanence. There were also several famous magazines more specialised in their appeal, *e.g.* *The Quiver* (religion), *The Wide World* (adventure), *C. B. Fry's* (sport), *The Studio* (art), *The Bookman* (literature), as well as those for boys (*The Captain*), girls (*The Girl's Realm*), and younger children (*Little Folks*), and many others.

Later developments were the all-fiction magazine, and an increase in page size to accommodate more striking pictorial display and a more effective use of advertising matter. The principle of the "turn-over" was generally adopted, that device, to which the public gradually became accustomed, by which magazine features are continued at the back of the book among the advertisements. On the other hand, the pocket-size format also became popular during the 1930s, as seen in such publications as *The Countryman* and *Lilliput*. As the result of the paper shortage during and after the Second Great War, several magazines adopted the pocket size, *e.g.* *The Quiver*, *The Boys' Own*. Colour printing gave additional attraction to the appearance of many magazines. From America came new ideas in specialisation as seen in such ambitious publications as *Esquire* and *Fortune*. But the chief development between the two Great Wars was the great increase in the number and quality of magazines directly appealing to women readers. Such a periodical as *Woman's Journal* may be considered representative of the very best type of magazine production in which old traditions are successfully blended with up-to-date processes.

**Magdala** or **MAKDALA.** Fortress of Abyssinia. It stands about 150 m. S.E. of Gondar, on a plateau over 9,000 ft. high. This plateau, less than a mile square and protected by precipices, was fortified by the emperor Theodore. In 1860, having seized the British consul and other foreigners, he carried them off to Magdala and, in spite of repeated requests, refused to release them. An expedition was

therefore fitted out under Sir Robert Napier, and on April 13, 1868, the fortress was taken by storm. It was then utterly destroyed. Napier was created Lord Napier of Magdala. The fortress was afterwards rebuilt, and is now a position of strategic importance. Under Italian occupation, 1936-41, a motor road was built to link it with Dessie.

**Magdalen.** Small group of islands of N. America. They lie about 50 m. N. of Prince Edward Island in the Gulf of the St. Lawrence, belong to Quebec prov., and were known in early times as Les Îles Ramées. At low tide Amherst, Grindstone, Allright, Coffin, Goose, and East islands are connected by sand-bars. Entry and Deadman's are distinct islets. Except the latter, all contain red sandstone cliffs and hills. The people, mainly of French origin, chiefly depend on lobster fishing and canning. Coffin island, which curves round Pleasant Bay, is 35 m. long. The Bird Isles form a sanctuary for hosts of sea birds. Pop. of group, 13,300.

**Magdalena.** Largest river of Colombia, S. America. It rises in the S.W. of the republic, near the Pic de Azacar, at the junction of the Central and E. Cordilleras, flows N. through the Andean valley, and discharges into the Caribbean Sea by Barranquilla (q.v.), after a course of nearly 1,000 m. The area of its drainage basin is est. at 96,000 sq. m. It is navigable up to Honda, a distance of about 600 m., and a rly. for a short distance from there opens up another navigable stretch of 200 m. to Neiva, but the river is subject to drought.

**Magdalena.** Department of N.E. Colombia. It is bounded N. by the Carribbean Sea, E. by Venezuela, and W. by the river Magdalena. In the N. rises the Sierra Nevada de S. Marta; elsewhere are llanos, lakes, and swamps. Well watered and timbered, the dept. produces bananas, maize, coffee, coconuts, and sugar. The minerals include copper, gold, silver, and coal. Horses and cattle are reared on the grassy uplands. The chief industries are agriculture,

Magdalene College, Cambridge. Founded in 1542, it stands on the left bank of the river Cam

grazing, and mining. The capital is Santa Marta (q.v.). Area, 20,827 sq. m. Pop. 342,322.

**Magdalena Bay.** A bay of Mexico, on the Pacific coast of Lower California. It forms a magnificent harbour, about 40 m. long and 11 m. broad, and is a rendezvous of whalers and a place of naval target practice by U.S.A. warships. The bay is protected partly by Santa Margarita Island.

**Magdalen College.** College of Oxford university. It was founded in 1458 by William of Waynflete, bishop of Winchester, and was dedicated to S. Mary Magdalen. It was for a president, 40 fellows, and 30 scholars, who are called demies. The college is one of the richest and most celebrated in the university. It stands at the E. end of the High Street, and has a deer park and extensive grounds along the Cherwell, including Addison's Walk. The range of buildings includes the tower, on the top of which a Latin hymn is sung at sunrise on May Day; it is an Oxford landmark, and the chapel is famous for the beauty of the choral services. Among Magdalen men were Wolsey, Pole, Hampden, Addison, Gibbon, and Edward VIII. The old society of Magdalen Hall, formerly part of this college, is now Hertford College, details of which appear

Magdalen College, Oxford, arms

Magdalen College, Oxford. The tower, a well known landmark

The college was prominent in 1687, when the fellows refused to accept the R.C. president named by James II. There is a school for boys on the same foundation. Founded in 1480, this has modern buildings in Oxford, close to the Cherwell. The college choristers are educated

here. Another Magdalen College school, an offshoot of this, is at Brackley. See Demy; Oxford; consult Magdalen College, H. A. Wilson, 1899. Pron. Maudlen.

**Magdalene College.** College of Cambridge university. It originated in Buckingham College, originally a Benedictine hostel, which was named after Henry Stafford, 2nd duke of Buckingham. The college was granted by Henry VIII to Thomas, 1st Baron Audley of Walden, who by charter in 1542 refounded the hostel for a master and eight fellows under the title of the college of S. Mary Magdalene. The special treasure of the college is the Pepsian library, which contains the MS. of the famous diary. In addition to Pepys, members have included Cranmer, Ussher, Henry Dunster, first president of Harvard, Kingsley, Parnell, and A. C. Benson. Consult Magdalene College, E. K. Purnell, 1901. Pron. Maudlen. See illus. above.

Magdalene College, Cambridge, arms

**Magdalenian.** Late period of the upper Palaeolithic Age in Europe. In it the climate was cold, the reindeer, bison, and horse flourished, and the mammoth became extinct. The Crô-magnon race, ousting the Solutrian, became modified, and prehistoric art reached its zenith. The flint industry dwindled before the apter use of bone, as in borers, barbed harpoons, spear-throwers, and whistles. Named from the rock-shelter of La Madeleine, Dordogne, the stations extend from Kent's cavern to Russia. With the dominant race may have lived a shorter one which followed the retreating reindeer eastward, carrying with them the culture, still notable for its use of bone, which is preserved among the Eskimo. After

this a transitional (Azilian) period led to the Neolithic age.

**Magdeburg.** City of E. Germany. Capital of the former Prussian prov. of Saxony, it lay after the Second Great War in the Land of Saxony-Anhalt. It is on the left bank of the Elbe, 80 m. S.W. of Berlin. Until 1912 a fortress, Magdeburg up to the

Magdeburg arms

Second Great War was the centre of Germany's inland water transport, one of her most important rly. junctions, and an airport of the first rank. Magdeburg is mentioned in documents as far back as A.D. 805, but it was destroyed during the Thirty Years War except for the church of Our Lady (1070, rebuilt 1220-35) with fine old cloisters, the tower of S. Peter's, one timber-frame building, and the cathedral which, first built 955, rebuilt 1209 after a great fire, and finished only 1520, had two towers 343 ft. high, and contained the tombs of Otto the Great and his wife, Edith of England, and a monument by Peter Vischer of an archbishop. A fine equestrian statue of the 13th century, of Otto, decorated the Old Market.

Magdeburg was again almost completely destroyed during the Second Great War. A huge Krupp plant, the Gruson works—Germany's chief locomotive factory—motor, engineering, and instrument plants, sugar and chocolate factories, etc., and warehouses full of the products of the rich surrounding area—grain, sugar, seeds, foodstuffs and fodder, fertiliser and fuel—made it a target for Allied air attacks, and it was captured by the U.S. 9th army April 18, 1945, only after violent street fighting. It contained many important govt. offices, banks, clerical, scientific and teaching institutions, medical, technical, commercial, engineering and craft academies, museums, libraries, two permanent theatres, learned societies, etc.

Its history goes back to Carolingian days. Under Otto I it became the missionary centre for the Slavonic peoples. It was made an archbishopric in A.D. 963. In 1320 it was granted a constitution, subsequently a model for that of many other towns; its law and legal

procedure were among Germany's earliest and most important legal codes. Accepting the Reformation as early as 1524, and a member of the Schmalkalden league, it was in consequence banned and besieged; deprived of its privileges after surrender, Magdeburg was, after successfully resisting a siege by Wallenstein in 1629, assaulted, sacked, and burned by Tilly, May 20, 1631; 30,000 inhabitants perished during that fire. In the 1648 peace Magdeburg came, as a duchy, to Brandenburg, was rebuilt as a fortress which, however, without a shot, fell to Marshal Ney, 1806, was incorporated with Jerome Bonaparte's kingdom of Westphalia, and reverted to Prussia in 1814. It prospered, especially as a port, more than 5,000 vessels using it in an annual turnover of produce of between 1,000,000 and 1,500,000 tons. Pop. (1949 est.) 240,000.

**Magdeburg Hemispheres.** A device invented c. 1650 by Otto von Guericke of Magdeburg for illustrating experimentally that the atmosphere exerts pressure. The apparatus comprises a pair of hemispherical cups, usually of brass or copper, having edges which fit accurately one in the other. To one of the cups is fitted a cock, and a union for attaching to a screwed nipple on an exhausting pump. The edges of the cups are coated with grease and pressed together, and after exhausting the

Magdeburg, Germany. Pre-war view across the Elbe from the cathedral, looking towards the cathedral

air from the interior of the hemispheres and closing the cock, it is found that they can be parted only with considerable difficulty.

**Magdhaba.** Village of the Sinai peninsula, 100 m. E. of Ismailia and 20 m. S.S.E. of El Arish. In the First Great War it was a stronghold and base of the Turks in their invasion of Egypt. Bombed by British airmen in Nov., 1916, it was the scene of a Turkish defeat by Anzac troops and the Camel Corps, Dec. 23, 1916. Nearly the whole of the Turkish force was either killed or captured.

**Magee, WILLIAM CONNOR** (1821-91). Irish prelate. Born at Cork, Dec. 17, 1821, he was the son of a clergyman there, while his grandfather, William Magee (1766-1831) was archbishop of Dublin. Educated at Kilkenny and Trinity College, Dublin, he was ordained in 1844. Magee settled at Bath in 1848 and at the Octagon chapel made a reputation as a preacher. In 1860 he returned to Ireland as vicar of Enniskillen, and in 1864 became dean of Cork, holding also from 1866 the deanery of the Chapel Royal, Dublin. Bishop of Peterborough from 1868, he was early in 1891 appointed archbishop of York, but died almost at once, May 5. Magee was generally

William Magee, Irish prelate

regarded as one of the finest orators of his day. Consult *Life and Letters*, J. C. MacDonnell, 1896.

**Magellan, STRAIT OF.** Passage connecting the Atlantic with the Pacific, near the S. extremity of S. America. It takes a tortuous course between the Chilean mainland and Tierra del Fuego. Its E. entrance is between Cape Virgin on the N. and Cape Espiritu Santo, a projection of Queen Catherine's Foreland on the S., and it enters the Pacific at Cape Pillar. Its extreme length is 365 m., while its width varies from 2½ m. to 17 m. The only harbour is that of Magalanes or Punta Arenas, on Brunswick Peninsula. The strait was discovered by Magellan (*q.v.*) in 1520, and was thoroughly explored in 1826-36.

**Magellan, FERDINAND** (c. 1480-1521). A Portuguese navigator, whose real name was Fernão de Magalhães. In youth he was attached to the court, and in 1504 went to India with d'Almeida, the first viceroy. After expeditions to Malacca, Java, and the Spice Islands, he returned to Portugal in 1512 and served in a campaign in Morocco in which he was lamed for life. Discontented with his treatment by the king of Portugal, he entered the Spanish service in 1517, and two years later embarked with a fleet of five vessels

Ferdinand Magellan, Portuguese seaman

on a voyage to find a western route to the Spice Islands. Patagonia was sighted, and on Oct. 21, 1520, Magellan discovered the strait which bears his name.

The first to enter the Pacific, which he so named from the calm weather he encountered, he reached the Ladrões (otherwise the Marianne Is.), March 6, 1521, after his men had suffered terribly from scarcity and scurvy. He proceeded to visit the Philippine Islands, but in a fray with the natives of Mactán his party, attempting to convert the natives to Christianity, was beaten and Magellan was killed, April 27. After his death his fleet doubled the Cape of Good Hope and one vessel returned to Seville, having thus completed the first voyage round the world. *Consult* The First Voyage Round the World by Magellan, A. Pigafetta, Eng. trans., 1874; Life, F. H. H. Guillemard, 1890; Ferdinand Magellan, E. F. Benson, 1929.

**Magellanic Clouds.** In astronomy, name given to two cloud-like oval masses of thickly clustered stars and nebulae in the neighbourhood of the S. celestial pole. They are named after the navigator Magellan (*v.s.*) and resemble a portion of the Milky Way in appearance, though apparently unconnected with its structure. They are now known to be satellite galaxies of our Milky Way system. The large cloud is 14,000 light years across and 112,000 light years away; corresponding figures for the small cloud are 6,500 and 104,000.

**Magendie, François** (1783-1855), French physiologist. Born at Bordeaux, Oct. 6, 1783, he became professor of pathology in the Collège de France, 1830. An excellent experimenter, he demonstrated the motor functions of the anterior and the sensory functions of the posterior spinal roots. He also investigated the mechanism of deglutition and vomiting, and introduced into medical practice bromine, iodine compounds, strychnine, and morphine. In 1821 he founded the *Journal de Physiologie Expérimentale*. He died Oct. 8, 1855. A study of Magendie by J. M. D. Olmsted appeared in 1944.

**Magenta.** Town of Italy. In the prov. of Milan, it stands on the Ticino, 16 m. W. of Milan, with which it is connected by rly. It has some small manufactures, including silks, and gives its name to a colour discovered about the time of the battle (*v.s.*), and thence to the aniline dye more correctly known as fuchsine (*q.v.*).

**Magenta, BATTLE OF.** Fought June 4, 1859, between the Sardinians and the French on one side and the Austrians on the other. As soon as war broke out in May, the Sardinian troops were in position north of Alessandria, waiting for their French allies coming from Genoa. At Montebello and Palestro they beat back attacks, and thereupon the Austrians took their stand behind the Ticino near Magenta. By this time the French had come up and some of them crossed the river, and for a time the battle raged without definite result. The decisive move was made by Macmahon, who, without waiting for the consent of Napoleon III, crossed the Ticino higher up and appeared on the right flank of the Austrians. The latter fell back, and the battle ended almost without any move on the part of the Sardinians. The numbers engaged were about equal, 60,000 on each

side. Wauchope and some hundreds fell in a few minutes, and all was disorder. At dawn the guns got to work, while other battalions came up in support. The Boers were prevented from crossing a drift on the Modder by some cavalry and mounted infantry. The Gordon Highlanders made a fine attempt to get to the foe, and the Guards assisted in this movement, but it was impossible to secure a general advance. At nightfall the Boer guns began to play again, and Methuen withdrew his army to the Modder. The British lost nearly 1,000 men. The Boer losses were stated to be 70 killed and 250 wounded. *See* South African War.

**Maggiore.** Lake of N. Italy and S. Switzerland. The ancient Lacus Verbanus, it lies mainly between Piedmont and Lombardy. It is 38 m. in length, from  $\frac{1}{2}$  m. to  $5\frac{1}{2}$  m. in breadth; its maximum depth is 1,200 ft., and its area is 82 sq. m., while its surface alt. is 640 ft. Fed by the Maggia, the Tosa, or Toce, and the Ticino, which traverses it, its waters have a greenish hue at its upper end, while at the other extremity it is a deep azure. The N. arm, in the Swiss canton of Ticino, is called Lake Locarno.

Maggiore, North Italy. The lake seen from above Siresa, looking toward Isola Bella and the Alps

side; but the Austrians lost 10,000, including a number of prisoners; the French lost about 4,000.

**Magersfontein, BATTLE OF.** Fought between the British and the Boers, Dec. 11, 1899. A British force about 10,000 strong, under Lord Methuen, was advancing to the relief of Kimberley. It had fought three actions within a week, losing about 1,000 men, and had forced the crossing of the Modder. It was then reinforced by the Highland brigade.

In front was a semicircle of hills, but little appears to have been known about the Boers holding them. On Sunday afternoon, Dec. 10, in heavy rain, the force moved out to the attack. The main assault was entrusted to the four regiments of the Highland brigade under Wauchope. The brigade of Guards and a brigade of English infantry were behind.

After a rest the Highlanders, the Black Watch leading, renewed the advance. It was 1 a.m., and the men were moving in close order, when the Boers suddenly opened

and on its N. shore stands the picturesque town of Locarno (*q.v.*). Lofty mountains enclose the N. part, while to the S. the hills, covered with vineyards, slope gradually to the plain. Maggiore is noted for its beautiful scenery. Opposite Pallanza are the Borromean Isles (*q.v.*).

**Maggot.** Popular name for the larva of an insect, especially when white in colour and without legs. The term is not a scientific one, and has no definite limits of application. It is most commonly given to the larvae of flies, found in decaying animal and vegetable matter.

**Maghara.** Wadi N.W. of Jebel Serbal, near the W. Sinai coast of Egypt. A narrow valley between sandstone cliffs, its W. face is penetrated by galleries made by ancient Egyptian turquoise miners, who sculptured reliefs thereon, portraying their royal masters from the 1st dynasty down to Rameses II. From 1849 Macdonald attempted unsuccessfully to rework the mines. Petrie made a systematic examination of the remains in 1905.

**Magi.** Caste of learned priests in ancient Persia. An aboriginal Median tribe, they became predominant through their development of central Asian shamanism, practising exposure of the dead and next-of-kin marriage. The Rab-Mag of Jer. 39 was Nebuchadnezzar's chief magus; the contemporary Jerusalem sun-worship (Ezek. 8) attests their missionary activity, about 600 B.C., and the Behistun inscription mentions them. After their Aryan subjugation they acquired control of the Zoroastrian worship, contributing thereto its dualistic principle. They maintained their supremacy throughout the Sassanian empire, ultimately declining into unhonoured jugglers, whence the English word magic. The Magi of the Nativity story (Matt. 2) are popularly associated with much unhistoric tradition. See Three Kings: Simon Magus.

**Magic** (Gr. *magikē*, pertaining to the Magi). Form of attempting or pretending to control events by non-rational processes. It is based on a belief that man may secure the mastery of nature and the supernatural by means of appropriate rites, manual or oral.

The psychological attitude of primitive man towards his environment, seen and unseen, is a vague complex best described as magico-religious. Even in the lowest levels of culture all beliefs, with the practices and rites that give expression to them, are not necessarily magical. They sometimes recognize, more or less consciously, dependence upon rather than mastery of the unseen, and thereby stand upon the threshold of religion. If magic be defined as the power of the spell, and religion as submission to a higher power, the distinction between the two is that between spell and prayer.

When magic is countenanced by the community at large, its professed exponents are held in esteem so long as they are thought to be working for the general good. They may rise to social eminence, as in ancient Babylonia and Egypt, and from their superior capacity may attain the supreme power. Thus Dinka chiefs owe their position to their prestige as the tribal rain-makers; when this power fails, they may be deposed. But there often arises a suspicion, if not a certainty, that magical powers are being exercised for private ends, and this aspect of them leads to their being regarded as antisocial and condemned as illicit. Hence the distinction between white and black magic, the one beneficent, the other baleful.

It would seem that in the development of magical ritual act preceded word. The efficacy of the act is usually deemed to lie in the law of association. Hence the use of such terms as sympathetic, contagious, and imitative magic, as when an Australian blackfellow induces the death of an enemy by pointing a death-bone towards him, a Basuto youth acquires courage by eating a slain warrior's heart, or a seaman raises a wind by whistling. The magic of word or name—the spell or enchantment—rests on the notion that they partake of the substance of the person or thing denoted, a mode of thought especially rife among Semitic peoples.

In its beginnings magic was a genuine effort of the human mind to solve the riddle of luck. The magician should be conceived as exerting a power, not as practising an art. This mystic power of controlling the occult is conveniently called *mana*, a Polynesian word denoting the positive aspect of magic, its negative aspect being denoted by the more familiar Polynesian word *taboo*. When this potency is conferred upon inanimate objects they become fetishes, talismans, or mascots, and amulets or defensive charms.

In the workaday world there is a large realm of empirical practice which achieves results by rational processes, such as chipping a flint or weaving a mat. These acts, therefore, are not magical, and it is out of them, not out of the magical, that science emerged. Both magic and primitive religion are primarily concerned with the crises of life, and their ritual expression is intimately associated with the events of birth, reproduction, and decay. Hence the medicine-man merges into the witch-doctor when, to his crude pharmacy and surgery, he adds such magical mysteries as the pretended exorcism of a disease-demon, or the provision of a talisman to ensure childbearing. Magical rites may also be practised, either by the community, as in the Hopi snake-dance, or by the individual magician, for compelling rain, or increasing the fertility of cattle and crops. Much magic is defensive in purpose, as when one sorcerer seeks to counteract the malignant spells of another, or an amulet is worn to avert the evil eye. While divination resembles magic in employing non-rational processes, it differs from it in that its purpose in relation to the unknown is discovery, not control.

The tendency of advancing culture has always been to discredit,

and yet to fear, those magical arts which are practised by peoples on a lower cultural plane. The Malay is convinced that the jungle-dwelling Jakun possesses mysterious powers which cannot be aroused with impunity, and the peasantry in rural Britain still seek the aid of the gypsy in the greater crises of life. Magic dominated the emotional life of early Greece, and magical arts were attributed to Hecate and her offspring, Circe and Medea. The introduction of central Asian shamanism into Persia gave rise to the priestly caste of the Magi, who ultimately degenerated into mere jugglers. They bequeathed to Europe the word *magic* as denoting legerdemain and other forms of visual deception, still called conjuring.

At the beginning of our era magical arts came into conflict with Christian teaching, as recorded in the N.T. They comprised a farago of beliefs affected by neoplatonism and other philosophical speculations. Introduced into W. Europe through Byzantine and Saracenic channels, they developed new methods during the Middle Ages. Their mystic apparatus of wands, rings, mirrors, diagrams, symbols, and meaningless phrases were deemed by their exponents to be endowed with a potency which irresistibly ensured the attainment of their ends. See Obeah; Rain-making Customs; Voodoo; Witchcraft.

**Magic Circle.** A society of British conjurers, professional and amateur. It was founded in 1905 by Neil Weaver, Herbert Collings, and Ernest Adams. See Conjuring.

**Magic Flute** *THE*. English title of *Die Zauberflöte*, an opera composed by Mozart, first produced under his direction in Vienna Sept. 30, 1791. Considered the greatest of Mozart's German operas, it was composed for his friend Schikaneder, manager of the Vienna theatre, who also wrote the libretto. A "fairy" opera it combines the spectacle of a pantomime with the solemnity of ritual music, and met with instant success. It was given in England, in the original German, at Covent Garden in 1833, the first production in English was at Drury Lane in 1838. Goethe began, but did not complete, a libretto for a sequel. *Das Labyrinth*, by Winter, is a sequel.

**Magic Square.** Arrangement of numbers in the form of a square, which is divided on a chess-board pattern, so that the sum of the numbers in every row, in every column, and in each diagonal is the same. A familiar and historical example is the magic square in Albrecht Dürer's en-

graving of Melancholy, which is illustrated. In this the sum of the numbers in every row, every column, and each diagonal is 34.

It will be observed that the numbers used in this magic square are consecutive, and run from 1 to 16. If the integers are consecutive from 1 to  $n^2$  the square is said to be of the  $n$ th order. In such an example the sum of the numbers in any row, column, or diagonal is equal to  $\frac{1}{2}n(n^2 + 1)$ . Some magic squares are of considerable antiquity, and, engraved on silver or other metal, were worn as amulets, as indeed they are in the East to this day. Emmanuel Moschopolus, who died in Italy about 1460, wrote a treatise on them, and investigated their mathematical theory, and the astrologers of his time, and afterwards, were much impressed by these arrangements, the squares of the orders 3, 4, 5, 6, 7, 8, and 9 being associated respectively with the seven astrological planets, Saturn, Jupiter, Mars, the Sun, Venus, Mercury, and the Moon. In 1705 De la Hire translated the essay of Moschopolus and collected the various known theorems on them, and gave rules for the construction of magic squares of higher order than the second.

**Magilp** or **MEGULP.** An oil medium used by artists. It gives a smooth paint which works easily under the brush. It appears to have originated in the 17th century, is said to have been used by Claude, and certainly was by Reynolds and Wilkie. The formula varied, but it consisted essentially of mastic varnish and linseed oil or linseed oil varnish. Magilp lacks permanence and, especially if a quick drying varnish is used, cracks badly, so that its use is now condemned.

**Magnin, WILLIAM** (1793-1842). Irish author. Born at Cork, July 10, 1793, he was educated at Trinity College, Dublin, and 1823 went to London to pursue a liter-

ary career, contributing to Blackwood's Magazine, and to Fraser's Magazine, which he assisted in founding, and in which his Homeric Ballads appeared. His remarkable series of Shakespeare Papers, which appeared in Blackwood's during 1837, aroused considerable discussion. He contracted habits of intemperance, fell into debt, and in 1842 was imprisoned in the Fleet. He was released by the offices of Sir Robert Peel, but his shattered constitution gave way soon afterwards, and he died at Walton-on-Thames, Aug. 21. Magnin possessed a strong vein of native wit, which even in his most wretched circumstances never failed him.

**Magninot Line.** A system of fortifications covering part of the frontier of France. The original defence system was begun in 1929, under the direction of Maginot, French war minister, and was completed in 1936. The fortifications extended from Montmédy to Belfort; but in 1936 it was decided to continue the line to the English Channel in the N. and to Grenoble in the S., increasing the length from 250 to 600 m. The defences on the Franco-Belgian frontier were still unfinished at the outbreak of the Second Great War, and W. of Montmédy consisted of little more than field fortifications.

Much of the Maginot line was underground, only barbed wire entanglements, tank obstacles, and some block-houses being visible. Ahead of the line itself were strongpoints intended to hold up an attacker and force him to disclose his real objective. The defenders would then fall back to the main defences through underground passages.

Minefields, tank traps, and obstacles, all covered by concealed weapons, guarded the approaches to the line. The defenders were protected against surprise by an elaborate warning

system. Big forts were nothing less than underground barracks, with living quarters, hospitals, air-conditioning apparatus, and transport systems which included electric lifts. Some passages extended 20 m. behind the line, so that the forts could be re-occupied and reinforced undisturbed by the enemy.

Heavy guns were mounted in turret casemates, which were surrounded by machine-guns to prevent enemy troops from placing demolition charges against the upper works. By the use of panoramic telescopes the guns could be controlled as in a battleship. The cables of the telephone system were buried five metres (16½ ft.) deep in concrete slabs, and the exchanges were 50 metres (164 ft.) underground. Throughout the line the shelters were constructed far away from the casemates; and the underground galleries could be divided into sections by armour-plated doors. The German counterpart to the Maginot Line was the Siegfried Line (*q.v.*). By their breakthrough N. of Montmédy, the Germans outflanked the line in May, 1940, and finally took it in reverse, though in places the defences held out until the surrender of France in June. There

Maginot Line. Map of the system of fortifications covering the eastern frontier of France. It was begun 1929, under the direction of the war minister Maginot, and completed 1936, and was 250 m. in length

is little doubt that this line gave the French military leaders a false sense of security and impaired the offensive spirit of the army. The lessons of the German campaign in Poland were ignored; and the Maginot outlook was at least partly responsible for disaster. See Fortification.

**Magister.** In classical Rome, the name of various officials, both public and private, religious and secular. The most important were: *magister equitum* (master of the horse), the commander of the cavalry under a dictator (*q.v.*), by whom he was appointed; *magister militum* (master of soldiery), the name given after the time of Constantine the Great to the imperial generals and legates; *magister officiorum* (master of offices), chief of the civil service; *magister memoriae*, who communicated imperial decisions to the people. The name was also given to the heads of guilds, corporations, and priestly colleges, to municipal officials, to persons chosen by the creditors of an insolvent debtor to act in their interests, to the captain of a ship, and to the master of the ceremonies at a banquet. Each country village (*vicus*) and district (*pagus*) also had its magister. During the regal period the administration of the city was in the hands of a *magister urbis*.

**Magistrate** (Lat. *magistratus*). Official of Roman origin, mainly concerned with administering the law. In ancient Rome the magistrates during the republican period were divided into ordinary and extraordinary. The former included the consuls, censors, praetors, aediles, quaestors, tribunes of the plebs; the latter the dictator, master of horse, military tribunes with consular power.

Further distinctions were patrician magistrates, appointed after the auspices had been taken; and plebeian, appointed without auspices. The dictatorship, consulship, praetorship, and censorship were higher (*maiores*), the aedileship, quaestorship, and tribunate of the people lower (*minores*), magistracies. Curule magistrates—consuls, censors, praetors, and curule aediles—had the right to sit in a curule chair and to wear the *toga praetexta*, a white toga with purple border. Those magistrates who possessed the *imperium*—which they exercised, though with certain limitations, as the successors and representatives of the old kings—but not those who only had *poteslas*, or executive powers limited to their sphere of office,

were accompanied by lictors bearing the fasces. The order of magisterial rank was dictator, consul, praetor, master of horse, censor, aedile, quaestor.

In modern usage the word magistrate is applied to a large number of people who are publicly vested with authority to administer the law. Justices of the peace are commonly called magistrates, and the head of a republic, *e.g.* the U.S.A., is known as the chief magistrate.

Justices of the peace in England are chiefly unpaid magistrates appointed by the crown on the advice of the lord chancellor, and are divided into two great classes, county magistrates and borough magistrates. The former and older class were at first virtually police officers, and it was not till 1856 that the county magistrates were stripped of their character of police officials, and made purely judicial. Borough justices were first appointed in the reign of Charles I, and by the Municipal Corporations Act, 1835, they were to consist of the mayor, the recorder, and such other persons as the crown might appoint by commission. The mayor and ex-mayor are ex-officio borough magistrates. Paid magistrates are known as stipendiary magistrates, and are appointed on the petition of the council of a municipal borough to the home secretary. A stipendiary magistrate must usually be a barrister of seven years' standing, and can act alone, whereas two unpaid justices at least must act. In London all the police magistrates are stipendiaries, and the lord mayor and any alderman, sitting at the Mansion House or Guildhall, have all the powers of a stipendiary. See Justice of the Peace; Lictor; Quaestor; Recorder; Stipendiary.

**Magma.** In geology, term given to the molten or potentially fluid material from which igneous rocks (lavas, etc.) are derived. Magma differs from lava in that it contains dissolved gases and other volatile constituents which escape from the fluid when it solidifies or when it comes to the earth's surface and the pressure due to the load of overlying rocks is absent.

Magnas vary widely in chemical composition. Rocks derived from them show even wider variations, because as cooling progresses the magmatic fluid changes in composition as different minerals crystallise in turn, or as country rock is assimilated into it. The conditions under which magnas consolidate control the degree of crystallisation of the rock pro-

duct. Slow cooling at depth promotes complete crystallisation of the constituent minerals. This drives out the volatiles, which in consequence permeate the surrounding country rock, altering or metamorphosing them, and in places forming ore deposits. See Igneous Rocks; Lava; Metamorphism; Plutonic Rocks; Volcano.

**Magmatic Segregations.** Type of mineral deposit. They are formed by concentrating processes operating within a molten rock magma before appreciable crystallisation has taken place. Important deposits have been formed in this way, but the numbers are small compared with those arising out of later hydro-thermal activity (see Hydrothermal Deposits). Typical magmatic segregations include certain magnetite, chromite, and sulphide ore bodies. The enormous mass of magnetite at Kiruna in Sweden forms an entire hill-ridge and is considered to represent a segregation of solid magnetite that has been remelted and squeezed out into adjoining rock to form a solid dyke of iron ore. The magnetite crystallised early and sank to the bottom of the magma chamber. Similar gravity concentrations of early chromite crystallisations are found in Norway and elsewhere. Sulphide segregations (*e.g.* at Sudbury, Ont.) are slightly different; here the concentration was effected by the separation of a heavy sulphide melt which became immiscible with the parent magma and sank to the bottom.

**Magna Carta** (Lat., great charter). A document sealed by King John of England in 1215, securing national liberties. The misgovernment of John (*q.v.*) had become intolerable, alike to the barons, the clergy, and the commons of England. He had over-riden or sought to override all law, and in Jan., 1215, the barons demanded the confirmation of the old charter issued by Henry I, a charter promising to observe "the good laws of Edward the Confessor." It became evident that John intended to resist by force—also that he had not force enough. The barons, largely guided by the archbishop, Stephen Langton, who officially conducted negotiations on the king's behalf, revised their terms in a more stringent sense; and the king found himself compelled to accept them and to set his seal to the Great Charter on June 15, at Runnymede, near Staines.

Except for the one section providing for the immediate control of

the government, the "palladium of English liberties" aimed not at all at the making of revolutionary changes. It stated what Langton and the barons took to be the recognized and fundamental principles for the governance of the realm in accordance with oldestablished law and custom; it required king and barons alike to bind themselves to observe those laws and customs; it claimed that

lent to the U.S.A. for exhibition at the New York fair in 1939, and was retained in America, because of the hazards of returning it under war conditions, until 1946. Magna Carta, W. S. McKechnie, 1905, remains the authoritative study.

**Magna Graecia** (Lat., great Greece). Collective name given to the ancient Greek colonies in the S. of Italy, the chief being Tarentum, Croton, Sybaris, Rhegium.

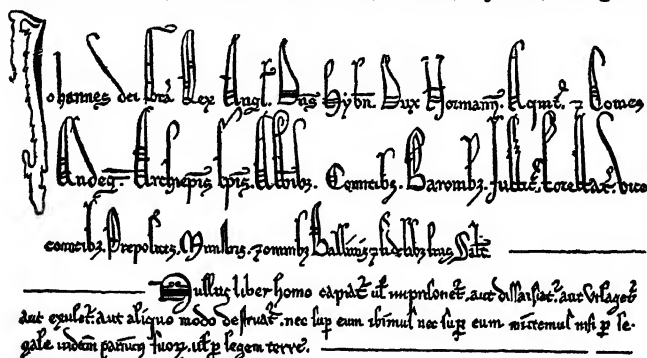

**Magnesia.** Oxide of magnesium,  $MgO$ . The name is also applied to the carbonate known commercially as *magnesia alba*. The oxide is produced when magnesium is burnt in air, but is usually prepared by heating magnesium carbonate. It is a white, light, amorphous powder used in the manufacture of firebricks, crucibles, etc., and in the manufacture of certain forms of limelight. It is also used in medicine as a laxative.

### Magnesian Limestone Series.

In geology, a group of limestones of Permian age (*q.v.*) in which magnesium carbonate is present in greater or less degree. The series occurs in G.B. as a well marked band running roughly N. and S. from Durham to Derbyshire, on the E. side of the Pennines. The rock, variable in quality, is quarried for building stone.

**Magnesite** (Lat. *Magnesia*, a place name). Mineral consisting of magnesium carbonate, constituting an important ore-mineral of magnesium. It may occur as rhombohedral crystals resembling calcite, or compact and amorphous, and varies in colour from white to yellow-brown. It is found in veins or irregular shaped masses in magnesium-rich rocks, such as serpentine or dolomite; also in hydrothermal veins. The most important known deposits are in the U.S.S.R., Austria, Manchuria, the U.S.A. A source of magnesium, magnesite is also used in making refractory bricks for special linings in certain metallurgical processes. Special plastic, quick-setting cements are made from prepared magnesite and magnesium chloride. Crude magnesite is the base for many magnesium salts, including Epsom salts. See *Magnesium*; *Magnesium Ores*.

**Magnesium** (Lat. *Magnesia*, a place name). Metallic element notable for its lightness. The metal was first isolated by Davy in 1808. Later Bussy and Bunsen obtained reasonable quantities by reduction of magnesium chloride with potassium, but for many years its only use as a metal was for photographic work, where the intense light emitted by the burning ribbon was, and still is to some extent, used for taking indoor photographs. From 1908 the Germans developed the magnesium-rich alloys, which since 1920 have taken a world-wide and important place in industry. The element, symbol Mg, falls in the second group of the Periodic Table, having two free valency electrons, as do beryllium, calcium, strontium,

**Magna Carta.** Facsimiles showing, top, three lines of the preamble and beneath them three of the 39th chapter, which guaranteed trial by jury

neither in the crown nor anywhere else did there lie any power or right to override them or to change them except with the common consent ; and it asserted the right of resistance in arms to such attempt to override or change them.

It laid down the principles that no man may be punished without fair trial; that punishment must be proportionate to the offence, and that justice may not be denied nor delayed, nor sold to any man. It affirmed, as generally recognized, certain feudal rights of lords over their vassals, and it claimed that demands beyond these might not be made without the sanction of the great council of the realm, duly summoned according to recognized form. This clause became the basis of the doctrine that the crown cannot impose additional taxation without the assent of parliament.

The British Museum possesses the original Articles of the Barons and two of the four surviving originals of the Magna Carta of 1215, the two others being at Lincoln and Salisbury. The Lacock abbey copy of Henry III's third reissue of Magna Carta, 1225, i.e. the final form as still in the statute book, was presented to the museum in 1945, and is an extremely beautiful document, with a nearly complete impression of the first great seal of Henry. The Lincoln copy of Magna Carta was

and Metapontum. The original colonies were mostly founded c.720-650 B.C., rose to great power and wealth, warred with each other and with the natives, and were decadent long before the Roman conquest in 271 B.C. *See* Greece.

**Magnesia.** Name of two ancient cities of Asia Minor. (1) *Magnesia ad Maeandrum*, a city of Ionia, situated at the confluence of the Lethaeus and Maeander, is said to have been founded by the Magnetes from Thessaly, destroyed by the Cimmerians (c. 725 B.C.), and rebuilt by the Milesians. It was specially famed for a temple of Artemis, of which there are considerable remains, and also of a theatre and gymnasium. (2) *Magnesia ad Sipylum* (mod. *Manissa*) was a city of Lydia, on the N.W. of Mt. Sipylus. Here Lucius Scipio Asiaticus defeated Antiochus the Great (190 B.C.) and put an end to the Seleucid kingdom of Syria. A few miles to the E. of the city is the so-called rock of Niobe (*q.v.*), which, however, probably represents Cybele, mother of the gods.

Magnesia was also the name of a peninsula and district on the E. of Thessaly. Magnesite is found in Euboea opposite here in great quantities, whence the English word magnet (lit., Magnesian stone). The word magnesia, its corruption manganese, and the derivatives magnesite, magnesium, magnetite are of similar origin.

barium, and radium. It has an atomic number of 12; atomic weight, 24.32; melting point, 651° C.; boiling point, 1,103° C.; specific gravity, 1.74; electrical conductivity, 37 (silver being 100); crystal form, close-packed hexagonal, with lattice constants  $a=3.2030$  and  $c=5.2002$  at 25° C.

#### Extraction Processes

Magnesium occurs in nature as the carbonate, magnesite  $MgCO_3$ , and as the double carbonate with calcium, dolomite  $MgCO_3 \cdot CaCO_3$ . Other less-used sources are carnallite  $KCl \cdot MgCl_2 \cdot 6 H_2O$ , Epsom salt  $MgSO_4 \cdot 7 H_2O$ , and the silicates, olivine and serpentine. An important source of magnesium, accounting for nearly a third of the world's output, is natural brines and sea water (containing one part of magnesium in 8,000 parts of water), where it occurs as the double chloride with potassium. There are two chief types of process for the extraction of the metal, although each has several variations. The older process involves the electrolysis of a bath of fused magnesium chloride or carnallite. In the U.S.A. magnesium hydroxide is precipitated from sea water by an emulsion of lime. After filtration, the hydroxide is converted back to the chloride by the action of chlorine, which is itself obtained as a by-product from the electrolysis process which follows. During electrolysis of the fused salt, chlorine is liberated at the anode, and molten magnesium at the cathode, where it floats to the surface and is periodically dipped out. The electrolyte, which must be kept heavier than the molten metal, is not pure magnesium chloride, which has a high melting point of 712° C. and a low electrical conductivity, but a mixture with other chlorides such as those of calcium and sodium.

Later processes are essentially thermal reductions, one group using carbon as the reducing agent and the other silicon. The carbon reduction process was developed at Radentheim in Austria, and was later carried out in the U.S.A. and Wales. A mixture of calcined magnesite and powdered coal or coke is fed continuously into an electric arc furnace. The resulting reaction produces gaseous magnesium and carbon monoxide, and the metal is chilled rapidly by fuel oil before it has time to reoxidise and form magnesium oxide. The oil prevents the fine magnesium powder from igniting spontaneously in the air and makes it safe to handle.

The silicon reduction process was devised by Pidgeon in the U.S.A. and involves the direct reduction of the magnesium present in dolomite by powdered ferro-silicon. The calcined dolomite is mixed with the ferro-silicon, pressed into pellets, and heated under vacuum at 1,200° C. in a retort. The magnesium is evolved as a vapour and crystallises in the cool end of the retort, leaving a residue of calcium silicate in the hot end. The commercial metal has a purity of at least 99.8 p.c., while that produced by the thermal reduction processes exceeds 99.98 p.c. magnesium.

Metal from the electrolytic process is often purified by remelting under a suitable flux, heating to 740° C., and adding up to one p.c. of manganese in some form or other. The melt is then allowed to cool about 70° C., when an iron-manganese complex solidifies and settles out, leaving a purer magnesium, which can be pumped off from the top. Anglo-American capacity to produce magnesium grew from 6,000 to 300,000 long tons per annum over a period of four years. Pure magnesium, which is a hard, white metal, is very stable in ordinary air, but is readily attacked by air containing salt spray. It is easily die-cast and can be rolled or extruded. An extruded rod would have an ultimate tensile strength of 12 tons per sq. in. and an elongation of 4 p.c.

#### Incendiaries and Signals

Magnesium alloys came into prominence during the Spanish civil war, when incendiary bombs dropped from German aircraft were of devastating effect. When the Second Great War started, magnesium production was increased for use in incendiaries, which absorbed more than half of the combined U.S.A.-British production, while magnesium continued to be used for flares, signals, flash bombs, and other applications where the vivid light from the powder was of value. At the same time the use of magnesium-rich alloys for engineering materials steadily increased.

Magnesium, which is only two-thirds of the weight of aluminium bulk for bulk, is not much used by itself as it is not very strong, not malleable at room temperatures, is brittle and easily corroded except by alkalis. But by alloying it with up to 12 p.c. of manganese, aluminium, and zinc in varying proportions, a series of alloys can be produced in cast or wrought form. These are much used for engine parts in aircraft and automo-

biles, particularly for heavy lorries, where their lightness and high strength are an asset. An alloy containing 8.5 p.c. aluminium, 3.5 p.c. zinc, and 0.5 p.c. manganese would have an ultimate tensile strength of 10 tons per sq. in. as cast, with an elongation between 2 and 8 p.c. and a Brinell hardness of 50 to 60; if this alloy is heat-treated by holding it at 370–450° C. for several hours, the tensile strength increases to 13 to 16 tons per sq. in. with an elongation of 6 to 14 p.c.

#### Other Magnesium Alloys

An alloy containing 0.2 p.c. aluminium, 0.2 p.c. zinc, 2.5 p.c. manganese, 0.2 p.c. copper, and 0.4 p.c. silicon, may be rolled into sheets, when it will have a tensile strength between 11 and 15 tons per sq. in. with an elongation of 4–10 p.c. Such a material might be used for fabrication of fuel tanks, as it could be readily welded by the argon-arc or a gas-welding process (see Welding). An alloy suitable for forging contains 11 p.c. aluminium, 2 p.c. zinc, 1 p.c. manganese, 0.4 p.c. copper, and 0.3 p.c. silicon, and has a tensile strength of 17–24 tons per sq. in. and an elongation of 5–12 p.c.

Molten magnesium burns unless protected by a flux of magnesium chloride, fluorspar, and magnesia. As it reacts violently to water, sand moulds are made containing a small amount of sulphur, which burns to form  $SO_2$  and so protects the magnesium. Various methods of protecting the alloys from corrosion have been devised, the most important being chromating, which involves treatment with alkali chromates or dichromates. The treated surface is a good base for varnishes or paints. Many aluminium alloys contain from 3–10 p.c. of magnesium. Magnesium wire is used for degassing radio valves, magnesium ribbon as an insulator in certain heating appliances. Magnesium is used as a deoxidiser in nickel alloys, copper, and brass. See Aircraft; Alloys; Aluminium; Metallurgy; Welding.

**Magnesium Ores.** Minerals worked for magnesium. These are numerous and occur in a variety of ways. Magnesite (*q.v.*), the carbonate, occurs in two commercial forms: as compact masses and veins in serpentine formed by the action of carbonated waters, *e.g.* in Greece; and as crystalline, or spathic, magnesite, in replacement ore-bodies in dolomite or limestone, resulting from the activity of ascending thermal solutions emanating from a deep igneous

source. There are large deposits of this type in the Urals, U.S.S.R.; Manchuria; Central Europe; the U.S.A.; and Canada. Dolomite (*q.v.*) is extensively used for refractory purposes, and most countries have abundant supplies.

Germany used to produce large quantities of magnesium metal from carnallite, magnesium chloride, occurring in the famous Stassfurt salt deposits (*q.v.*). Much of the American supply comes from magnesium chloride occurring in deep saline wells or is extracted from sea-water by a secret process. Brucite, hydrated magnesium oxide, is used in Canada and elsewhere, and is ideal for refractory and ceramic purposes.

Apart from the application of magnesias in special refractories and ceramics, magnesium and magnesium salts have numerous uses in paper manufacture, as a filler; in fertilisers; in glazes; in medicine (*e.g.* Epsom salt); as a source of carbon dioxide; in sugar refining, etc.

**Magnet** (Lat. *Magnesia*, a place name). A piece of a substance which, owing to a particular arrangement of the molecules of which it is composed, possesses or produces a field of magnetic force, which will attract or repel other magnets; attract iron, steel, and certain other substances; induce an E.M.F. in a conductor moving in its field; produce a mechanical force on a current-carrying conductor in its field; or, if suspended freely in space, align itself with the earth's magnetic field.

An electro-magnet consists of a straight, horse-shoe, or other shaped bar, magnetised by being surrounded with a coil carrying current, the magnetic flux or lines of force from the coil producing the particular condition of internal structure of the material which cause magnetic phenomena. A permanent magnet may be a natural one, such as lodestone, a widely distributed substance known from ancient times, or it may be a piece of hard steel or alloy which has been magnetised in one of various ways, *e.g.* by stroking with another permanent magnet or by surrounding it with a coil and temporarily converting it in to

an electro-magnet. While the soft iron, cast iron, or mild steel used for electro-magnet cores, however, retains very little magnetism when the exciting force is removed, the material of which a permanent magnet is made remains magnetic to a high degree.

Besides the hard carbon steel formerly in universal use, chromium steel and tungsten steel are used together with various alloys, of which the most spectacular in its results is one of iron, aluminium, nickel, cobalt, and copper, which has, weight for weight, more than 20 times the magnetic energy of carbon steel. These alloys are brittle, and so hard that grinding is the only possible method of machining.

The magnetising force required

Magnet. Crane, with magnet attached, hoisting a steel casting. Top, left, scrap iron handled by lifting magnet

by an electro-magnet to produce a certain intensity of magnetic field can be calculated from the consideration of the length of the magnetic path, and the characteristics of the material used; it is expressed in ampere-turns, the product of current and number of turns of wire in the coil. One ampere flowing through 1,000 turns will produce the same magnetising force as 20 amps. flowing through 50 turns, etc.

Magnets as used in dynamos, etc., are described under Electro-magnetic Machines. The lifting magnet used on cranes is like an in-

verted shallow dish with a central stalk on which is mounted the exciting coil, the poles being the stalk itself and the rim of the pot. A brass or other non-magnetic cover plate is fitted to exclude moisture and foreign matter (*see illus.*). Electro-magnets are used to operate switchgear, relays, and similar applications. A polarised magnet is an electro-magnet with a permanent-magnet core, so that the current in the coil tends to strengthen or weaken the normal field of the magnet, according to which way the current passes through the coil.

Another type of electro-magnet, the solenoid, has, instead of a fixed core, a short pole piece and a movable core free to slide in and out. When current is passed through the coil, the moving core is attracted inside the coil, the movement being utilised for various mechanisms where a very strong pull is required, *e.g.* 10,000 lb. at the end of a 2 in. movement.

**Magnetic Declination** or **MAGNETIC VARIATION**. Angle between the geographic and the magnetic meridians at any place. Only at places on the so-called agonic lines do compass needles point due N. and S. Elsewhere they point either E. of N., as over most of the Americas and Asia, or W. of N., as over most of the Atlantic and Indian Oceans, Europe, and Africa. The magnetic declination changes from year to year. At Greenwich it was easterly before 1660. In 1819 it was 24° 25' W.; in 1925 13° 10' W. In 1945 it was 10° W. at Abinger in Surrey, where observations of earth magnetism were made after 1925. Magnetic deviation is an error of the compass.

**Magnetic Equator**. Imaginary line passing round the earth close to the equator on which a magnetic needle shows no dip. The general inclination of the magnetic to the terrestrial equator is about 12°.

**Magnetic Field**. In magnetism, the name given to the sphere of influence of a magnet; *i.e.* where

Magnetic Field. Diagram showing the lines of force round the N. and S. poles of a bar magnet

its effect can be detected. *See* Magnetism.

**Magnetic Meridian**. Direction registered by the needle of a magnetic compass at any given point on the earth's surface.

**Magnetic Mine.** Sea mine used by the Germans in the Second Great War. A weapon from which the Germans expected much, the first magnetic mines were dropped by German aircraft near Shoe-burness on Nov. 2, 1939. They damaged much shipping before "degaussing" (*q.v.*) was perfected. Mines were fitted with a magnetic device that, actuated by a ship's hull, set off the detonator. *See* Mine.

**Magnetic Poles.** Name given to the two positions on the earth's surface to which the isogonic (equal declination) lines appear to trend or where terrestrial magnetism appears to be at a maximum. In their neighbourhood the dip needle is vertical, the horizontal component of magnetic force vanishes, and the magnetic compass ceases to take a fixed position.

In 1947 the N. magnetic pole's position was near Prince of Wales I. and Somerset I., N.W. of Boothia Pen., Canada. The S. magnetic pole is 155° 6' E. and 72° 25' S. in the Australian Antarctic dependency, S. of King George V Land. These poles are not points, but extensive areas. The N. and S. poles of a magnet are at its ends. *See* Magnetism; Pole.

**Magnetic Standard.** Term used in electrical engineering. The Hibbert secondary standard of magnetic flux for laboratory use consists of a permanent magnet and soft iron yoke of concentric form designed for permanence of magnetism. The yoke contains an annular gap at the top of one pole of the magnet, through which may be slipped a single layer coil mounted on a thin brass tube, so that the turns cut the magnetic flux and discharge a current through a search coil and ballistic galvanometer connected to it.

**Magnetism.** Science of magnets and magnetic forces. In a straight bar magnet the magnetic power of attraction is concentrated near the two ends, known as poles, and the centre of the magnet possesses no such power. Similarly, in a magnet bent into horse-shoe shape, where the two poles are close together, the curved part has only insignificant attractive power. If a bar magnet is broken in two, each part is a magnet with two poles. The properties of the magnetic poles can be further investigated by magnetising a light steel strip and suspending it on a pivot so that it can turn about its centre in a horizontal plane. It will point approximately N. and S., and is, in fact, a crude form of the mariner's compass.

If, now, two such needles are placed close together, it will be found that the two N. poles repel each other, and that the two S. poles likewise repel each other, but that the N. pole of either magnet attracts the S. pole of the other: *i.e.*, like poles repel, unlike poles attract. The interposition of a screen of wood, paper, etc., has no appreciable effect on the magnetic force.

If a magnet is dipped into iron filings, they will cling in masses round the poles. Further investigation shows that each tiny piece of iron has become a magnet, and that all the S. poles of the filings are turned towards the N. pole of the magnet and vice versa. A careful study of the iron filings clustering round the poles of a magnet shows that they arrange themselves in definite patterns when proper precautions are taken. If a sheet of stiff paper is laid over a magnet and covered with a uniform coat of iron filings, the filings are seen to arrange themselves in well-marked curved lines, which spread out from the poles in all directions (*see* Magnetic Field *illus.*). These are the lines of force, which show the direction of the magnetic force at any point.

#### The Magnetic Meridian

The direction in which a freely suspended horizontal magnetic needle points at any place on the earth's surface is called the magnetic meridian at that place. The compass does not point to the true N., but to what is called the magnetic N., and there is thus nearly always an angle, the declination angle, between the magnetic and geographical meridians at any place.

A compass needle suspended about a horizontal axis through its centre so that it is free to move in a vertical plane, and placed in the plane of the magnetic meridian, dips its N. pole at an angle to the horizontal which is called the angle of dip. This angle varies from place to place and from time to time. Its value at London in 1843 was 69°, in 1947 was 66° 45'.

The leading facts as to the mutual action of magnets and their behaviour under the influence of the earth's magnetism were known to William Gilbert (1540–1603); a great advance was made in the 19th cent. in the discoveries of the connexion between electricity and magnetism.

The atomic theory of magnetism is involved; but the enhanced magnetism of ferromagnetics can be accounted for by their particular atomic structure. The idea put

forward by Schuster in 1891 that every large rotating mass is a magnet was revived by Blackett who, from observations of the magnetic fields of the earth, the sun, and a star 78 Virginis, showed that the following relation between electro-magnetic and gravitational phenomena appears to be true:

$$M = \frac{\beta G \pm U}{c}$$

Where  $M$  is the magnetic moment of the rotating body,  $U$  is its angular momentum,  $G$  is the gravitational constant,  $c$  is the velocity of light, and  $\beta$  is a constant of the order of unity. *See* Dynamo; Electricity; Galvanometer; Magnet; *consult also* Papers on Electrostatics and Magnetism, W. Thompson (Lord Kelvin), 1872; Magnetic Induction in Iron and other Metals, J. A. Ewing, 1900; Electricity and Magnetism, S. G. Starling, 1924; Magnetism and Atomic Structure, E. C. Stoner, 1926; Applied Magnetism, E. C. Stoner and T. F. Wall, 1926.

**TERRESTRIAL MAGNETISM.** The discovery that the earth had a field with the directive property of a magnet is veiled in the mists of antiquity. The earliest reliable evidence dates from the 11th cent. A.D. and is credited to the Chinese encyclopedist Shou-Kua: "Fortune tellers rub the point of a needle with the stone of the magnet in order to make it properly indicate the south." The use of this property, in the form of the mariner's compass, appears to have been first made in W. Europe c. 1187. It has now been reasonably established that an easterly declination had been observed in N.W. Europe some years before Columbus's voyage to the W. Indies. Another century was to elapse before the character of the earth's magnetic field began to be appreciated. From experiments on the distribution of the direction of the magnetic force over the surface of a spherical piece of lodestone, William Gilbert of Colchester concluded that the earth itself acts like a magnet, and also that the magnetic influence proceeded from within, a hypothesis in direct contradiction to that of his contemporaries who maintained that compass needles were directed by the pole star. Later, Faraday introduced the conception of lines of force. It remained for Gauss to determine, early in the 19th cent., the type of field that most closely agrees with the actual one of the earth and to show how it could be expressed in mathematical terms.

The earth has been described as a huge but comparatively feeble magnet, the field of which extends far out into space and whose intensity weakens in proportion to the cube of the distance from the centre of the earth, *i.e.* it decreases by about 8 p.c. for every 100 m. Thus the magnetic field 4,000 m. overhead is still one-eighth as intense as that near the surface. Direct verification has yet to be made, but certain observations on the reception of radio waves reflected from the upper atmosphere bear out this theory.

As the earth's outer shell is not homogeneous, its magnetic behaviour is far from uniform; the distribution of magnetic forces near its surface may be regarded as consisting of the regular field, due to a uniformly magnetised sphere, with an irregular one superimposed upon it. The N. and S. magnetic poles are roughly 1,000 m. from the respective geographic ones (see Magnetic Poles). It follows that the magnetic axis is inclined at some  $10^\circ$  or  $12^\circ$  to the axis of rotation and, as the magnetic poles are not diametrically opposite each other, the straight line joining them passes about 750 m. distant from the geographic centre of the earth.

The magnetic field may therefore be pictured as innumerable lines of force parallel to the surface near the equator, bending and converging at the magnetic poles, where a freely suspended magnetic needle would point vertically because the horizontal component possesses zero value. The vertical component is usually denoted by *Z*; the horizontal by *H*; the declination, or variation as sailors term it, by *D*; the dip, or angle which the needle makes with the horizontal, by *I*; and the resultant total force by *F*. If the field were entirely regular over the surface of the earth equal values of these elements, excepting *D*, would be found around any circle of magnetic latitude. Irregularities, however, in some parts of the world greatly affect one or other component: *e.g.* in regions where

deposits of magnetic ores occur close to the surface, the field is often so disturbed as to produce minor local poles.

Portable instruments for the accurate measurements of declination and of the horizontal and vertical forces have been used in prospecting for minerals and oil. The results of these special surveys, carried out both at the surface and in mines, are normally interpreted in conjunction with other geological and geophysical

and the seven, totalling more than 250,000 miles of the Carnegie (U.S.A.), 1909-29. An aerial survey of the north polar regions by H.M. aircraft Aries, made shortly after the Second Great War, included the charting of magnetic elements.

Besides short period fluctuations in magnetic intensity, the earth's field undergoes changes which, though not necessarily at a constant rate, are continued gradually over very long intervals of time. This secular variation was described by Gellibrand, in 1634, as existing in the declination at London. In 1580 a compass needle there would have pointed to a position  $11^\circ$  E. of true N.; in 1660, almost exactly N.; in 1750,  $17^\circ$  W., in 1800,  $24^\circ$  W., in 1920,  $14^\circ$  W., in 1940  $10^\circ$  W. of N. Although the oval-shaped curve plotted from these points suggests a cyclic variation with a period of about 480 years, data from other stations indicate rather different periods; there is thus no certainty that the earth as a whole has any dominant true period; and though the positions of the magnetic poles are known to be subject to steady change, no generalisation can be made of their movement relative to the geographic poles. Secular changes of dip were noted also during the 17th cent. In the case of intensity, absolute measurements of which date from 1826, the long-period changes vary in different regions of the world, but the collective evidence is suggestive of a gradual decrease.

Various theories have been advanced to account for the earth's magnetism; these include the existence of a permanently magnetized core, a system of electric currents flowing within the earth around the axis, and magnetisation as a consequence of the earth's rotation. But the cause of the main field and its secular variation is so far unexplained.

The magnetic field at any place on the earth also shows a marked solar diurnal variation, which has a maximum range in summer and a minimum in winter, and a much smaller variation depending on lunar time; and the character of the traces may be quiet or disturbed. Large irregular disturbances or fluctuations (magnetic storms) tend to mask the regular quiet day changes. Magnetic storms may last for a few hrs. or several days and often begin abruptly. A magnetic disturbance recorded at Kew observatory on Sept. 1, 1859, is historic, for ou

Magnetism. Map showing isogonic, or lines of equal (westerly) magnetic declination, for the British Isles, 1942

information and up-to-date magnetic charts consisting of isomagnetic lines drawn through places possessing the same value for a particular element.

Lines of equal declination, or isogonics, are especially useful to those at sea, as such world-wide maps make it possible to interpret the compass direction at any point with fair accuracy.

The earth's magnetism is constantly changing and in order to supplement the measurements made at the relatively few magnetic observatories, series of surveys are made from time to time over closer networks of sites. Expeditions have probed into the uncivilized and unpeopled areas of the globe. Since the first magnetic survey at sea in 1700, world-wide cruises have been regularly undertaken, notable being the two of the Challenger (U.K.), 1872-76.

that occasion the solar observer Carrington noted that a bright eruption suddenly appeared on the sun's disk at approx. the same time as a disturbance on the magnetic records. The interpretation of that observation created much controversy, but it is now known that it was due to an outburst of ultra-violet radiation from the eruption area, with its almost instantaneous effect on the earth's field. Most magnetic disturbances occur some time after the solar phenomena. Disturbances are most frequent near the times of the equinox and in years of sunspot maximum; there is a tendency for recurrence at intervals of about 27 days. Magnetic storms are associated with prominent and widespread displays of aurora, the effect being most striking in the polar regions; they also produce a fading out of radio and, by causing large earth currents, interfere with telegraphic communication. Normal daily variations are primarily due to the existence of electric currents in the upper atmosphere which become very intense near the zones of maximum auroral activity during disturbances. One theory which explains the great increase in the ionisation of the upper conducting layers as being due to the emanation of radiations from the sun, is supported by studies of radio-wave propagation. See Compass; Electricity, Atmospheric; consult also The Earth's Magnetism, S. Chapman, 1936; Terrestrial Magnetism and Electricity, ed. by J. A. Fleming, 1939; Geomagnetism, S. Chapman and J. Bartels, 1940.

**Magnetite.** An ore-mineral of iron, iron oxide ( $\text{Fe}_3\text{O}_4$ ), containing up to 72 p.c. of that metal. It often contains small amounts of manganese, titanium, vanadium and nickel, aluminium and chromium. A member of the spinel group, it usually occurs as hard black grains or octahedral crystals. Magnetite is strongly attracted by a magnet and occasionally shows polarity (var. lodestone).

Magnetite is one of the most abundant and widespread of oxides; found as an accessory mineral in many igneous and metamorphic rocks; in meteorites; as a product of fumarolic activity; in sulphide vein deposits formed at high temp.; and as a residual mineral in alluvial deposits. The large magnetite ore-body at Kiruna, Sweden, is considered to have been formed as a segregation from a magma, whereas the Hungarian deposits were formed by contact

metamorphism during igneous activity. There are commercial deposits in Mexico, S. Africa, India, and elsewhere. The U.S.A. possess many large bodies of magnetite ore mainly formed in connexion with magmatic processes.

Magnetite is produced synthetically, as a preliminary to the manufacture of blister copper in the converter. The converter is charged with a low grade ore, which is made into magnetite by blowing. This forms an excellent refractory protective layer in the converter, so increasing its life. See Copper; Iron Ores.

**Magneto.** Electromagnetic machine for producing high-voltage sparks for petrol engine ignition. It consists of a small permanent-magnet dynamo with two windings on the armature—the primary with a small number of turns of comparatively thick wire, and the secondary with a large number of turns of thin wire. Each has one end earthed to the frame; the other end of the primary is taken to one side of the contact breaker; the other end of the secondary to a collector ring (see diagram).

As the armature rotates, the primary winding has an E.M.F.

rotates with the armature, one point being mounted on a rocker arm which, twice per rev., strikes a stationary cam, thus opening the points suddenly. The exact instant at which the opening occurs can be advanced or retarded slightly by altering the angular position of the cam.

A distributor, in the form of a rotating brush, is geared to the armature, connecting the collector ring to the various plugs so that they fire in the correct order.

A condenser is provided, connected across the contact-breaker points, to prevent excessive burning, and there is a safety-gap on the secondary circuit so that, if the magneto is disconnected from the plugs, the high voltage can discharge through this gap, instead of breaking down the insulation on the windings. The cut-out switch shown in the diagram, when closed, short-circuits the contact breaker, thus switching off the sparking, and stopping the engine.

Another inductor type of magneto has both sets of windings stationary, the necessary movement of the field flux being produced by the rotation of an irregularly-shaped soft iron rotor which alternately bridges and opens gaps in a magnetic circuit, thus flicking the flux from one path to another. causing it to cut the primary winding in the process, as if the winding were rotating in a stationary magnetic field.

For automobile work, the popularity of the magneto has declined in favour of the induction coil (q.v.), which is simpler, cheaper,

**Magneto.** Diagram showing the connections of a magneto for a 4-cylinder engine. See text  
By courtesy of Percival Marshall & Co.

induced in it (see Electromagnetic Machines) and, as it is normally short-circuited by the contact breaker points, a current flows in the primary winding. At the point of maximum intensity, the contacts open sharply, and the resulting kick, due to the collapse of the magnetic field caused by this current, induces an E.M.F. in the secondary coil which is high enough to jump the gap between the sparking plug points, and fire the charge in the cylinder.

The contact breaker consists of two points of tungsten or platinum alloy mounted on a plate which

and does not suffer from the disadvantage of giving a weak spark at low speeds (i.e. at starting).

**Magneto-electric Machine.** Machine for the generation of electricity by the rotation of a coil of wire in the field of a permanent magnet. See Dynamo.

**Magnetograph.** Instrument for obtaining continuous records of the variations of the earth's magnetic field. The pattern most widely used incorporates three magnets suspended delicately with their axes horizontal; the first lies along the magnetic meridian and indicates the declination, the

second is transverse to the meridian and responds to the fluctuations of the horizontal component of the magnetic force, and the third, which can turn about a horizontal axis perpendicular to the meridian, oscillates in sympathy with changes in the vertical component. Each of the magnets carries a small mirror which reflects a narrow beam of light from a fixed source on to a sheet of photographically sensitive paper wrapped round a drum rotating once in 24 hrs. Spots of light similarly reflected from stationary mirrors provide base-lines which make it possible to tabulate the traces. Other forms of the magnetograph have faster-turning drums; and an arrangement of prisms may be introduced into the optical system to return the recording light spot to the chart when the deflections would normally be too great to be registered. The separate magnetic instruments of the magnetograph are referred to as variometers.

**Magnetometer.** Instrument for obtaining determinations of the earth's magnetic field. The elements normally measured are declination, horizontal force, and dip or downward tilt of a freely suspended magnet. Other components can be calculated from these basic measurements which serve to calibrate the base-line values of the magnetograms, thus allowing the ordinates of the traces to be expressed absolutely.

**Magnetron.** An instrument used in wireless engineering. The magnetron is a special type of thermionic valve in which the flow of electron current from filament to anode is controlled by a magnetic field. During the rapid development of radar, or radio-location, between 1939 and 1945, probably the greatest technical achievements were the design and production of the magnetron valve, which made it possible to reduce radar emissions from a wavelength measuring several metres to one measured in centimetres. These centimetric emissions could be projected as beams, giving greater accuracy and range. See Radar.

**Magnificat** (Lat., it magnifies). First word of the Latin version, and so the title, of a canticle or hymn, My soul doth magnify the Lord, in the Book of Common Prayer. In the

Anglican church it is sung after the first lesson at evening prayer, in the R.C. church at Vespers; in the Eastern church at Lauds. It is the song sung by the Virgin Mary. S. Luke I, vv, 46-55. See Mary.

**Magnification.** Increase in apparent size. In optics, the magnification or magnifying power of a lens is the ratio between the apparent size of the image of an object and the apparent size of the object itself, seen without optical aid. It is equal to the ratio between the focal length of the objective and that of the eyepiece. It can therefore be increased indefinitely by using eyepieces of shorter and shorter focus. Though the image will thereby be magnified, however, it will become fainter and will not gain in detail.

**Magnitogorsk.** City of the R.S.F.S.R. Founded by Lenin, it is situated on the Ural river in the Ural industrial area, and has rly. connexion with Ufa to the W., Chelyabinsk to the N.E., and Orsk to the S. It lies near deposits of iron, manganese, bauxite, and petroleum. One of the largest steel-producing centres in the U.S.S.R., its metallurgical plants were considerably expanded during the Second Great War. Pop. (1939) 145,870.

**Magnitude.** In astronomy, magnitude signifies the brightness of a star or other celestial object. A star is said to be of the first, second, third, etc., magnitude, according to whether it is in the brightest, second brightest, etc., class. Sixth-magnitude stars can just be seen with the naked eye; they are 100 times fainter than stars of the first magnitude.

In geometry magnitude is used in the sense of dimensions, as length, area, volume.

**Magnolia.** Genus of trees and shrubs of the family Magnoliaceae. They are hardy and half-hardy flowering trees and shrubs of great beauty, some being natives of sub-tropical regions of Asia. Other species are found in the U.S.A., whence they were introduced to the U.K. in 1688. Among the two dozen species are varieties

which range in height from 2 ft. to 80 ft. The large tulip-shaped flowers are of every shade from white, through pink, to purple, and there are also kinds with yellow flowers. The perfume is exquisite. The hardy kinds prefer a shady spot

in a deep, rich, loamy soil, but the half-hardy varieties require an admixture of sand and a sunny spot in the greenhouse. Magnolias are propagated either by seeds or layering. The evergreen sorts should be pruned in spring, summer leafing kinds after flowering.

**Magnus** (Lat. great). Masculine Christian name. It is chiefly popular in Scandinavia and is also found in those parts of Scotland in which the Scandinavians settled, e.g., the Orkneys. There is an Irish form Manus.

There have been seven kings of this name in Norway. Magnus III, king 1093-1103, married a Swedish princess, thus ending a war between those countries. He conquered the Hebrides, Orkneys, Isle of Man, and Anglesey, but was killed fighting in Ireland. He is known as Barfod or Barefoot. Magnus VI, who reigned 1263-80, is chiefly known for his laws, hence his name of the lawgiver. He restored the Hebrides to Scotland in return for an annual tribute. S. Magnus was a jarl, or earl, in the Orkneys, murdered in 1115. A number of churches are dedicated to him as S. Magnus the Martyr. See Norway.

**Magnus, HEINRICH GUSTAV** (1802-70). German chemist. He was born in Berlin, May 2, 1802, and in 1831 was appointed lecturer in technology and physics at the university. In chemical research proper he discovered the acid of platino-ammonium which bears his name. An incessant worker upon electrolysis and induction of currents, he threw light on questions connected with the polarisation of heat and the expansion and absorption of gases. He died in Berlin, April 5, 1870.

**Magnusson, ARNI** (1663-1730). Norse scholar and historian. He was born in Iceland and educated at Copenhagen. Having published a Latin work on Icelandic history, he became in 1701 professor of history and Danish antiquities at Copenhagen. He was then commissioned to study and collect the ancient manuscripts of his native land, and there spent ten years, 1702-12, making an invaluable collection. He published Testamentum Magni-Regis Norvegie 1719. In the great fire of Copenhagen in 1728 many of his collected manuscripts were destroyed, but the remainder he bequeathed, on his death two years later, to the university, having founded a scheme for their publication.

**Mago.** Name of several Carthaginian generals. The most cele-

Magnolia. Flower and leaves

brated was the youngest brother of Hannibal, who assisted in the conduct of the second Punic war in Italy, Spain, and finally in Cisalpine Gaul, where he was heavily defeated by the Roman general Varus and died of wounds, 203 B.C.

**Magog.** Town in the S. of Quebec, Canada. In Stanstead co., it is on Lake Memphremagog, and the river Magog, and is served by C.P.R. Factories make butter and cheese, textiles, jute products, and hardware. Pop. 9,034.

**Magpie** (from *Mag*, Margaret, and Lat. *pica*, magpie). Genus of birds belonging to the crow family.

Magpie. Common British species

The common magpie is a familiar resident of the British Isles. The plumage is velvet black, with green and blue reflections, with the exception of the scapulars and underparts, which are white. The tail is long and graduated, and the feet and beak are black. It was formerly very common in Great Britain, but its numbers have been much reduced by the persecution of gamekeepers; while in Ireland it was supposed to have been introduced by the English out of spite in the 17th century. An animated bird, it feeds mainly on worms, snails, and insects. Its nest is a large structure of sticks and mud, domed above, with a hole at the side for entrance. See Crow; Jay; Eggs, colour plate.

**Magwe.** Division, dist., and town of Burma. The division comprises the area of the Irawadi valley between the confluence of the Chindwin and the head of the delta. The dist. lies E. of the Irawadi, and is the best cultivated section of the division, although only a fifth of the total area is tilled. Oilseeds are a much more extensive crop than rice. Here also are oilfields, the installations in which were destroyed when the Japanese overran Burma in early 1942. The town is a centre for river traffic on the left bank of the Irawadi. It was recaptured by British and Punjabi troops, April 21, 1945. Div. area, 17,576 sq. m.; pop. 1,905,809. Dist. area, 3,313 sq. m.; pop. 499,000. Town pop. 7,500.

**Magyar.** Dominant people of Hungary. Returned in 1910 as 10,050,600, or one-half the population of the old Hungarian kingdom, they furnished at that time three-fourths of the professional classes. They form the bulk of the pop. of the present republic, and were estimated in 1941 at 8,657,172 or 92·8 p.c. They are descended from Altaian mounted nomads of Turkic stock and militant disposition, who subdued an Ugrian people, took Ugrian wives, and adopted their language. In their westward migration from the upper Kama and Ob valleys through the Bashkir dist. between the Volga and the Urals, they halted for a time in the steppelands N. of the Caucasus, where some Indo-European contact occurred. At the end of the 9th century they crossed the Carpathians from the N.E. under Bulgar pressure, and came to a final halt in the Dacian and Pannonian plains. Here they again intermarried with those elements in the local population, formed of Avar and other ethnic remnants, which did not retreat before them into the uplands.

Aided by their conversion to Latin Christianity in the 11th century, they have more and more assimilated western culture, and have preserved their national identity from Slav absorption by the vitality of their Ugrian speech

Magyar. Peasants wearing national costume

and their adhesion to the Roman communion. Their fondness for horses and flocks and their disinclination for agriculture are ancestral. They have become an urban people, muscular, broad-

shouldered, of medium stature and regular features. Two types occur, one narrow-faced and long-headed, the other broad-headed, yellowish, with brownish-black hair and wide cheek-bones, but no Mongolian strain. The isolated groups of Szeklers in Transylvania may represent the least modified ancestral type. Their speech is allied to Vogulish and Ostyakish, interpenetrated with Turkish and other kindred elements.

Magyar music is the national music of Hungary. It derives its most striking characteristics from Oriental and Gypsy sources. Amongst these features are (1) a scale with two augmented seconds:

(2) striking rhythms, including a rat-tat effect similar to the Scotch snap, and irregular bar-groupings:

(3) turns and embellishments of all kinds:

Much use of Magyar musical idioms has been made by Haydn, Schubert, Liszt, Brahms, Joachim, and other composers. The chief Magyar dance forms include the Czárdás, with slow and quick movements alternated; the Kör-táncz or society dance; and the Kanasztáncz, a dance of the peasantry. The Rákoczy March, as arranged by Berlioz in his setting of Faust, is the piece of music of Magyar origin which is best known in W. Europe. See Hungary.

**Mahábaleshwar.** Hill station of India, in Bombay state. It is 4,500 ft. above sea level among the Western Ghats, 70 m. S.E. of Bombay, and during the monsoon receives heavy rainfall. It is a resort during Sept.-Oct. at the close of the monsoon. It was established in 1828, and contains the handsome Frere Hall, built in 1864. The spot is regarded with great veneration by the Hindus, as it stands at the source of the sacred river Kistna (Krishna). Distant 9 m. is the hill fort of Pratapgad, stronghold of the founder of the Mahratta empire.

**Mahábalipuram.** Temple site of India, on the E. coast 30 m. S. of Madras. The name is a Sanskrit form of Mammalapuram (city of

the great wrestler). Other designations are Mavalaram and the Seven Pagodas. According to tradition, five of these reputed temples are beneath the waves; the two on the shore are Vishnu and Saiva shrines.

South are several raths (*q.v.*) and other ancient records of archaeological interest. The faces of two

Mahabalipuram, India. Monolithic rath or temple carved in granite  
Frith

huge boulders of granite, about 30 ft. high, have been magnificently carved in bas-relief for a total length of 90 ft., to represent Arjuna performing religious ceremonies. These monuments date from the 7th century, and were ordered by the Pallava kings, whose capital was at Conjeeveram. There are cave temples which today shelter Hindu pilgrims who bathe in the sea on a special sacred new moon day which occurs only once in 30 years. At most seasons the sacred spot is usually deserted, but can be reached from Madras by a day's sail southward on the Buckingham Canal.

**Mahabharata.** Ancient epic of India. In it are related with legendary accretion the events of a great war which took place in N. India in the 2nd millennium B.C. The mass of legends and poetry concerning that time are supposed to have been put together at some unknown date into a single narrative, which continued to grow, until the complete work, as printed at Calcutta in the 19th century, contains over 180,000 lines. The story, which occupies a quarter of the whole, tells broadly of the strife of the powers of good and evil as represented by the Pandus and the Kurus respectively. The title Mahabharata signifies the epic of the Great Bharata nation; it has been described as the Iliad of Ancient India. A condensation of it in English verse by R. C. Dutt was published in 1898.

**Mahaffy, SIR JOHN PENTLAND** (1839-1919). Irish scholar. Born in Switzerland, Feb. 26, 1839, he was educated there and at Trinity College, Dublin, of which he became fellow in 1864. He filled a succession of offices in the university, being professor of ancient history, 1869-1900, vice-provost in 1913, and provost from 1914. In 1864 he was ordained, and he was knighted in 1918. President of the Royal Irish Academy, a member of the Irish convention, he was known as the General, on account of his varied knowledge. He was a cricketer, a marksman, and a musician. His writings are chiefly on ancient history: *Social Life in Greece from Homer to Menander*, 1874; *History of Classical Greek Literature*, 1880; *The Empire of the Ptolemies*, 1895; *An Epoch of Irish History*, 1903. Mahaffy died April 30, 1919.

**Mahalla-el-Kubra.** Town of Egypt. Situated on the Nile delta, it is some 60 m. S.E. of Rosetta and 70 m. N. of Cairo, and the centre of an extensively irrigated and fertile cotton growing district. Pop. 63,292.

**Mahan, ALFRED THAYER** (1840-1914). American sailor and naval historian. He was born Sept. 27, 1840, at West Point, where his father was a professor in the military academy. He entered the naval academy and was engaged in blockade work during the American Civil War. In 1883 he published his first historical study, *The Gulf and Inland Waters*. That year the idea of his famous works on the influence of sea power came to him while commanding the warship *Wachusett* on the S. American coast. In 1886 he was appointed president of the U.S. naval war college. He retired from active service in 1896, but in the Spanish-American War of 1898 he was a member of the U.S. strategy board. Rear-admiral 1906, he died in Washington, Dec. 1, 1914.

Mahan published in 1890 *The Influence of Sea Power on History, 1660-1783*, which immediately made him famous, and followed this with *The Influence of Sea Power upon the French Revolution and Empire*, 1892. These were his greatest books, though in 1911 appeared his admirable *Naval Strategy*, containing lectures de-

livered at the war college. His books may be said to have profoundly influenced modern history and turned the eyes of the progressive states to the sea. They were translated into every language, and were nowhere more carefully studied and applied than in Germany. His general argument was that sea power exerted such overwhelming pressure that the belligerent who did not possess it was doomed to defeat. His brilliant biographical study, *Nelson the Embodiment of the Sea Power of Great Britain*, 2 vols., 1897, developed this view.

**Mahanadi** OR MAHANUDDY. River of India, in the N. Deccan. It rises in the Bastar hills in the Central Provinces, at the E. end of the Satpuras, flows E., and after receiving affluents from the highlands of Chota Nagpur turns S. at Sambalpur, and then S.E. to reach the Bay of Bengal by an extensive delta which is exceedingly fertile. The Brahmani and Baitarani join the delta, of which the head is at Cuttack. The upper course is deep cut in the hard rock, and the river is useless for irrigation; during the rains the flood waters rise rapidly and pour a great volume of water into the sea. Boat traffic stops at Sambalpur. At Cuttack a dam across the river holds back a head of water for the canals of Orissa. The river pierces the line of the E. Ghats by a forested gorge, 40 m. long. Length 529 m.

**Mahanandā.** River of West Bengal, India. It rises in the Darjeeling dist. on the Himalayan slopes, and flows generally S. through Purnea and Malda dist. to the Ganges, near the head of the delta. Subject to freshets in its upper course, it is almost empty in the dry season near its mouth, but is navigable under favourable conditions to Kaliaganj in Purnea dist.

**Mahar.** Indian menial caste. Numbering over 3,000,000, mostly in W. and Central India, they are descended from aboriginal elements in the pre-Aryan population of the Berar and Nagpur lowlands. Corresponding to the N. India Chamars, they retain primitive beliefs thinly veneered with Hinduism. They are scavengers, village watchmen, boundary guardians, and public messengers.

**Maharaja.** Indian title meaning great king. It is applied to certain powerful rajas and others of high rank. The high priests of the Vallabhacharis, a Hindu sect, call themselves maharajas. The feminine is maharani. See Raja.

Alfred T. Mahan,  
American sailor

**Mahatma** (Skt., great soul). In India, name applied to certain men of saintly lives who have proved their purity and courage by enduring severe tests. By theosophists, it is used in a more specific sense. According to them, man has a physical, an intellectual, and a spiritual nature, and a mahatma is one who has reached perfection, his spiritual nature controlling body and intellect. M. K. Gandhi (*q.v.*), by reason of his asceticism, moral and physical courage, and spiritual ascendancy, was called mahatma.

**Mahāvamsa** (Pali, great chronicle). Early chronicle of Ceylon, written in Pali, giving the history and traditions of the island before the 4th century A.D. It was based on a yet earlier work of the same name. An edition of the first 20 chapters was published in Ceylon in 1837 by Turnour (1799-1843); in 1844 this was issued as vol. I of the entire text and translation with an essay by Turnour on Pali Buddhistical literature, but was not completed. *Consult* ed. by W. Geiger, London, 1908.

**Mahāvīra** (fl. c. 500 B.C.). Title (Skt., great hero) given to a wandering ascetic of the Nigantha sect, named Nāta-putta, also entitled Vaddhamāna, an Indian religious leader. A contemporary of Gautama Buddha, he taught in Bihar, and reformed the Jain religion, especially developing its metaphysical side. He ranks as 24th of the Tirthankaras or "con-

system of Buddhism. Some scholars distinguish by the term Hinayana (little vehicle) the earlier system, which was agnostic, ascetic, and egoistic, seeking personal salvation through the attainment of nirvana in this present life. The Buddha's personal teaching suffered gradual change when, after his decease, it encountered other religious systems and propensities. The foundation of Mahayana is traditionally attributed to the philosopher Nagarjuna, about A.D. 200, who compiled a treatise embodying the teaching of the Madhyamaka school, that all is illusion. A rival school, the Yogachara, taught that nothing exists but consciousness.

The ethical standpoint became broadened by the doctrine that nirvana is attainable less by self-concentration than by the altruistic practice of the six perfect virtues of a bodhisattva or future Buddha. These—compassion, morality, patience, energy, knowledge, contemplation—may be practised by

its immigrant peoples from central Asia. Although Brahmanism regained its hold upon Hindustan, Mahayana tenets led to Lamaism in Tibet, Foism in China, and Japanese Buddhism. Their imposing ritual and vigorous art, associated with spacious temples and images innumerable, made an irresistible appeal to vast populations to whom speculative mysticism offered no attraction. *See* Buddhism; Hinayana. *Consult* Outlines of Mahayana Buddhism, D. T. Suzuki, 1907.

**Mahdi** (Arab., one who is guided in the right path). Name of the Messiah expected by the Mahomedans. The mahdi must be a descendant of the prophet; he must be proclaimed mahdi against his will at Mecca at a time when there is strife after the death of a caliph; and his advent shall coincide with that of Anti-Christ, after whom Jesus will descend in Syria and the reign of righteousness be inaugurated. This is the orthodox view, but in Persia and Asia Minor there have been many pretenders to the title from the time of the first generation after Mahomet. According to the Shiah sect, the mahdi has already appeared in the person of Mohammed Abu-el-Kasim, the 12th imam, who is concealed in some secret place until the end of the world. The most notable of recent mahdis, and the one to whom the name is most generally applied, is Mahomed Ahmed (1843-85). During 1880-84 he proclaimed a mission to free Egypt from foreign yoke, and acquired an ascendancy over the Sudanese tribes. Gordon, sent to withdraw the British garrisons, was besieged in Khartum by Mahomed, and killed. The latter died in the same year. His tomb was destroyed by Kitchener's men in 1898. Restored, it was reopened in 1947. *See* Egypt; Gordon.

Mahdi Mahomed Ahmed

Mahdi. The mahdi's tomb at Omdurman as restored and reopened in 1947. Top, right, the tomb after it had been wrecked by the British in 1898

querors of self" of the present age, i.e. saints who have raised themselves by their austerities to superhuman rank, and are objects of worship. *See* Jainism.

**Mahayana** (Skt., great vehicle). Term denoting the later doctrinal

householders no less than by celibate monks. A third characteristic, the path of devotion, led to the deification of past Buddhas and of exalted future Buddhas. This brought the primitive agnosticism into line with the aboriginal beliefs both of pre-Aryan India and of adjacent lands, with their reliance upon divine beings and orders of demons of lower rank.

To these compromises is due the eager acceptance of Mahayana for a time in N.W. India, especially by

householders no less than by celibate monks. A third characteristic, the path of devotion, led to the deification of past Buddhas and of exalted future Buddhas. This brought the primitive agnosticism into line with the aboriginal beliefs both of pre-Aryan India and of adjacent lands, with their reliance upon divine beings and orders of demons of lower rank.

**Mahé**. Principal island of the Seychelles group, in the Indian Ocean. With an area of 55½ sq. m., it is covered with high granite mountains. The capital is Victoria on the N.E. coast, with a good harbour. There are good roads, and direct telegraphic communication with Mauritius, Zanzibar, Aden, and Colombo. Products are coconuts, cinnamon, patchouli, and essential oils. Colonised by the

French, Mahé was captured by the British in 1794. See Seychelles.

**Mahé.** French harbour in the Malabar district, Madras. It is situated on the Malabar coast, 4 m. S. of Tellicherry. The French settled here in 1725, and it is administered as part of French India by the governor and council of Pondicherry. Pop. 14,092.

**Mahi.** River of India. With the Sabarmati, it drains the W. portion of the Malwa plateau into the N. end of the Gulf of Cambay. One headstream rises in the Mahi Hills in S. Rajputana, the other flows N. from the Vindhya range in Central India, and the joint stream flows through Gujarat in Bombay prov. The estuary has a bore at spring tides, and the low bed of the stream makes irrigation difficult.

**Mahikantha.** Name of a states agency of India under British rule, in the Gujarat div. of Bombay. The area, 3,124 sq. m. in extent, is

dice, and each player is dealt a hand of 13. The object is to collect, by drawing and discarding, a hand consisting of four groups of three tiles each, either all of the same denomination (e.g. three north winds, or three 6 circles), or a suit sequence (e.g., a 2, a 3, and a 4, bamboos); also a single pair. The first player to succeed declares Mah Jongg and exposes his hand. As this will contain 14 tiles, the draw must always precede the discard. Three of a kind may be converted into four, which quadruples its value, and an extra tile drawn immediately so that the required combinations can still be formed; but a sequence can be only three (or six, or nine).

Instead of drawing in his turn from the wall, a player may claim the discard of his previous opponent to complete a sequence by calling "chow"; or the discard of any opponent, whether in turn

influence on his composition had a lasting effect. In 1883 he began his career as opera conductor at Cassel, holding appointments at important European opera houses. He was chief conductor at the Metropolitan, New York, 1907-09, giving there the first American performances of *The Bartered Bride*, and *Pique Dame*. He died in Vienna, May 18, 1911.

Of Mahler's nine symphonies the best known are the 8th (choral) and the 9th. They trace descent from Beethoven through Bruckner, but are marked by looseness of structure and unusual harmony. In *The Song of the Earth* (six poems from Bethge's *Chinesische Flöte*) for voices and orchestra, 1908, he achieved perfection of delicacy. His *Kinder-tenorlieder* are notable for supreme beauty of phrasing. He was a late romantic who also tried to put philosophical notions into music. There are lives and appreciations by Adler, 1916; R. Mengelberg, 1923; R. Specht, 18th ed. 1925; consult also *Memories and Letters*, A. Mahler, Eng. trans., 1946.

**Mahmud I** (1696-1754). Sultan of Turkey. He was the son of Mustapha II, and succeeded his uncle Ahmed III, who was deposed in 1730 by a revolt of the janissaries. He continued the war which Ahmed had waged with the Persians, and defeated several armies which Nadir Shah brought against him. He arranged a treaty with Nadir in 1736 for their mutual defence against Russia, which declared war on the alliance, and as a sequel he was forced to cede the Crimea. Successes on the Danube, however, permitted him to conclude an honourable peace at Belgrade in 1739. He died Dec. 13, 1754.

**Mahmud II** (1785-1839). Sultan of Turkey. Born at Constantinople, July 25, 1785, he was called

to the throne on the deposition of his brother Mustapha IV in 1808. He attempted to disband the corps of janissaries and undertook the reorganization of the army on

Gustav Mahler, Austrian composer

Mah Jongg. Typical hand of the winner of a round, made up of three groups of three of a kind (one converted to four), a suit sequence, and a pair

traversed by the river Sabarmati. Idar covered more than half the agency, the rest of the area being composed of very small states. All were merged in Bombay in 1948.

**Mah Jongg.** Ancient Chinese game for four players, popularised in England about 1924. It is played with 136 tiles, or pieces, four of each of the following 34 denominations: east, west, north, and south winds; green, red, and white dragons; numbers 1 to 9 each of three suits, generally known in England as bamboos, characters, and circles. There are eight super-numerary tiles called flowers and seasons, but as these do not affect the play, only the scoring, they are not normally used in China. The players are named after the four winds, the dealer on each round being E. and banker.

The tiles being arranged face downwards in the shape of a wall with four sides of 34 tiles each, the point of opening is determined by

or not, to complete three or four of a kind by calling "pung." As soon as his hand has been brought up to 14 tiles in any of these ways, it is his turn to discard again.

The round ends on a declaration of Mah Jongg or when the last 14 tiles of the wall are reached. The Mah Jongg hand is paid its full value by each opponent; other hands pay or receive their differences; E. always paying or receiving double. Scoring is complicated and somewhat capricious. Though there must be a large element of luck in drawing from the wall, a player may show judgement in calculating chances, and if the discards are played face downwards the game allows feats of concentration.

**Mahler, GUSTAV** (1860-1911). An Austrian composer. Born of Jewish parents at Kalischt, Bohemia, July 7, 1860, he studied at Vienna conservatoire, and in 1878 met Bruckner (q.v.), whose

Mahmud II, Sultan of Turkey

European lines. But the janissaries revolted. In 1809 he declared war against Russia, and in the campaign that followed he lost Bessarabia, Moldavia, and Wallachia. Then the Russian campaign of Napoleon in 1812 permitted him to conclude a favourable treaty with the tsar at Bukarest. He quelled a Serbian revolt in 1814, and suppressed the Greek rebellion of 1820-22, in which latter year he brought about a wholesale slaughter of the janissaries. His last years were overshadowed by the second revolt of the Greeks, the naval disaster of Navarino (1827), the Russian invasion of his territory in the same year, and the defection of Egypt under Mehemet Ali. Mahmud's ambitious schemes of reform were thwarted by the Egyptian war, and he was maintained only by Russian support in 1833. He died at Constantinople (Istanbul), July 1, 1839.

**Mahogany.** Term loosely applied by importers and cabinet-makers to the timber of various

wood is brownish-pink in colour, the red of new furniture being attained by staining. After many years in the manufactured state, it acquires a fine brown tint. It is much used for interior work in ships. In 1873 the tree was successfully introduced to India, Ceylon, and Mauritius. Among the spurious

mahoganies are *Ratonia apetalata* (bastard mahogany) of tropical America; *Khaya senegalensis* (African or Senegal m.) of W. Africa; *Soyimida febrifuga* (E. Indian m. or redwood) of S. India; and *Cedrela toona* (Indian m. and cedarwood), also of S. India. See Cabinet-making; Furniture.

## MAHOMEDAN ART & ARCHITECTURE

E. G. Harmer, Author, *The Story of Burmah*

*In this Encyclopedia there are also articles on other branches of art, e.g. Dutch, Gothic, etc. See Art; Arabian Architecture; Byzantine Architecture; Moors; also Istanbul, and other cities subject to Muslim influence; Alhambra; Arabesque; Mosque*

Mahomedan art is a term embracing the whole material outcome of the Islamic civilization. Unlike Buddhist art, which is always essentially religious, it is associated with every aspect of Muslim life. In each of the great regions which passed under Mahomedan domination local forms were utilised. But all bear the unifying impress due to the solidarity of Islam, upheld by the supreme obligation of the Mecca pilgrimage.

Mahomedan art, born in A.D. 622, the year of the Hejira, attended the triumphant progress of the Prophet and his companions, and from the outset manifested the tendencies which shaped its distinctive mould. Springing from the mutual impact of nomadism and sedentary conditions, its splendour and opulence were fostered by the pomp and luxury of caliph and ameer—made possible by the control of the sources of wealth—and by the spirit of emulation which sought to surpass the infidel civilizations around.

### Features of the Five Schools

The main schools of art resulting from the Islamic impulse are five: Syro-Egyptian, Moorish, Persian, Ottoman, and Indian. Each grew out of the soil, while drawing inspiration from the fountain-head. Each displayed close adherence to tradition and dependence upon trained craftsmanship rather than creative art. In W. Asia the Mesopotamian inheritance, with its vaulted brick edifices and mural faience, was interpenetrated by the Byzantine offspring of ancient Greece and Rome. In Egypt age-long traditions inherited in the Coptic crafts. In N. Africa the Romano-Berber tradition, in Spain the Romano-Iberian, still survived. Persia retained its Achaemenian memories, overlaid by Sassanian developments, and modified by central Asian and Chinese contact. Later on, Seljuk and Ottoman brought westward those new outbursts of nomadic energy before

which Byzantine degeneracy was destined to fall. In India similar impulses, Iranian and Turanian, introduced the great Muslim dynasties, whose alien ideals were engrafted upon the native zest for colour and floral ornament.

### Expression in Architecture

The decorative art of Islam, profoundly affected by the Koranic prohibition of images, rests ultimately upon its architectural achievement. The place of prayer set up by the Prophet when he reached Medina was an oblong brick enclosure open to the air, with a stone in the middle of the N. wall to mark the kibleh, or direction of worship, towards Jerusalem. In the 3rd year of the Hejira this was placed towards Mecca, the stone being transferred to the S. wall, and rows of palm branches along this wall sheltered the faithful at prayer. This primitive masjid, however, did not produce the mosque of later tradition, which emerged from the adaptation by the early caliphs of captured churches, notably at Jerusalem and Damascus. The Arab conquerors engrafted upon current architectural forms their own ritual needs, and by reconstructing or re-using Christian materials developed the mosque type. Thus arcaded aisles became liwans, pulpits became minbars, and forecourts became fountain-courts for ritual ablutions.

The history of mosque architecture is traceable from its beginnings in those of Amr and Ibn Tulun at Cairo, and those at Damascus, Kairwan, and Cordova, to the constructions of Kait Bey at Cairo, and the greater mosques of Ispahan, Samarkand, Konieh, Bursa, Istanbul, and Mogul India. The minaret, diverging from the Christian bell-tower by being used for vocal calls to prayer, passed out of the square plan, as at Aleppo and Rabat, to the cylindrical, such as the Kutb Minar at Delhi, and to composite designs.

Mahogany. Foliage and flowers of *Swietenia mahagoni*, Spanish variety

trees, but belonging properly to *Swietenia mahagoni*. This is distinguished as Spanish mahogany, a tall tree, member of the family Meliaceae, native of Central America and the W. Indies. It has a massive, buttressed trunk, glossy leaves divided into paired oval leaflets, and small reddish-yellow flowers in clusters.

The timber was introduced to Great Britain towards the middle of the 18th century, and became very popular for furniture, cabinet-making, etc., but in the reaction against all things Victorian it fell into temporary disfavour early in the 20th century. In nature the

Among the distinctive elements of Muslim architecture are the arching, which may be pointed, stilted and round, horseshoe, scalloped, or clover-leaved; slender shafting, suggestive of the ancestral tent-posts; open trelliswork, cupolas, and stalactitic pendants. Some of these elements were derived through Byzantine practice from Italian originals. They appear

Such are the incomparable Barkuk minbar at Cairo, the 13th century marble vase from Hamath at South Kensington, and the Jama mihrab at Fatehpur Sikri. Stone filigree work reached its zenith in India, as in the Sidi Sayyid mosque at Ahmadabad and upon the marble tomb-screen in the Taj. When secular buildings ignored the Koranic prohibition, as in the lion-fountain of the Alhambra, the result lacked the spontaneity of untrammelled sculpture. Where stone was lacking stucco lent itself readily to Muslim decoration, which reached remarkable levels

in the Alcazar and the Alhambra. Marble mosaic, borrowed from Byzantine craftsmen, was Muslimised in the same way. The inlay of pietra-dura at Agra and Delhi betrays Italian inspiration.

Effects of great distinction were created in wood panelling. Splendid examples are to be seen in Egypt. The Kait Bey minbar in the Victoria and Albert Museum is unsurpassed. Cairo was also the home of the turned lattice-work called meshrebiya. Wood was sometimes with ivory inlay.

The 12th century witnessed an astonishing outburst of decorative art as applied to metal. Mesopotamia still retained memories of ancient hammered work, and when the copper mines near the Tigris headwaters came to be exploited, the output was promptly utilised at Diarbekir and Mosul. Both here and in Persia methods of inlaying metal on metal, at first silver on bronze or iron, were skillfully practised. Damascus was especially addicted to gold inlay. Metal lent itself more readily than cloisonné enamel to arabesque. This metalwork became known in W. Europe through the returning Crusaders, especially in the domain of arms and armour. During the Renaissance, through the craftsmen attracted to Venice, Saracenic metalwork influenced the W. Simultaneous movements eastward led to such Indian developments as Biddery ware.

Nomadic art was at its best in the departments of weaving and leatherwork. The mural surfaces and pavements of permanent structures were replaced in nomadism by tent, curtain, and rug. Plain tapestry weaving, of Neolithic origin, became associated with knotwork in wool and silk. Central Asia produced plain fabrics

in buildings designed for secular as well as religious uses, such as madrasas or schools. Examples are the Alcazar and Giralda of Seville, Shah Jehan's palace at Delhi, the tombs of Timur at Samarkand and Sher Shah at Sahseram, and the Taj Mahal at Agra. Lofty portals, such as that of the Hasan mosque at Cairo, were developed in Persia and imitated in India, as in Akbar's triumphal gateway at Fatehpur Sikri.

The discouragement of images limited the freedom of sculpture in the round. Hence stone decoration relied mostly upon the treatment of flat surfaces with polygonal and arabesque design, or inscriptions of Koranic texts.

Mahomedan art exemplified in architecture and design. 1. Wooden pulpit, panelled and inlaid with ivory, Arabian, 15th century, Cairo. 2. Brass mosque lamp, c. 1468-96, Cairo. 3. Sultan Hasan Mosque, Cairo, built 1356-59. 4. Panel of tiles, from Senariyeh Mosque, Damascus, c. 1590

1 and 2 by courtesy of the Director, Victoria and Albert Museum

with geometrical motives as well as stylised animal and floral form. Knotwork enjoyed greater freedom of design, beautiful pictorial scenes of the chase and the garden being produced. The art became specifically Muslim when utilised for coverings of mosque floors. The individual "prayer-rug," with its mihrab-niche, is well known. Textile hangings on walls and posts were imitated in stucco, mosaic, and faïence.

The genetic relationship of Mahomedan pottery to weaving is best seen in the glazed tiles which—originating in ancient Persia, as in the famous Susa friezes—became another of Islam's contributions to mural decoration. They reached their zenith in the tiled walls of Istanbul, where they simulated silk carpet designs with remarkable fidelity. A variant of this art consisted in the use of cubical pieces of faïence for marquetry, rivalling marble mosaic in freedom and brilliance. Saracenic pottery was also important for ritual and domestic utensils, in part because the lustrous products of its kilns, dispersed from Spain through Majorca to Italy, gave to W. Christendom its medieval and Renaissance ceramic industries. Of equal interest are enamelled glass, notably Syrian mosque lamps, and carved rock-crystal vessels from Egypt. These forms of craftsmanship passed through Venice into the general stream of modern European art.

In the domain of painting, beautiful work was achieved in the illumination of copies of the Koran for the greater mosques, especially in Egypt. Emulous of Byzantine miniature painting, opulent effects were produced by blending gold, purple, and other brilliant hues in floral and interlaced patterns. The innate love of secular poetry and romance in Persia was conjoined with a regard for pictorial design, greatly accentuated by Chinese example. Hence arose a school of drawing and colouring of singular charm. Its influence penetrated to Mogul India, and resulted in those interesting works in landscape and portraiture which earned the encomiums of Reynolds, and rank among the choicest products of Islamic art. See *Alhambra*; *Arabesque*; *Arabian Architecture*; *Damascening*; *Mosque*.

## MAHOMEDANISM, OR ISLAM

David Cowan, Lecturer, School of Oriental Studies, London Univ. *The beliefs and history of Islam, popularly but inaccurately known in the West as Mahomedanism, are here explained. For other great religions of the world, see Buddhism; Christianity; Hinduism, etc. The Prophet's own life is told under Mahomet*

Islam is the religion propounded by the Prophet Mahomet (c. 570–632), although Muslims do not consider that it began with him. In their view it is the natural religion of humanity and was preached by all the prophets sent by God at varying periods to lead mankind to the right path. But later generations, through either wickedness or ignorance, corrupted the message of Islam and so Mahomet was sent as the Seal of the Prophets to fix the faith in its definite form.

When Mahomet began to preach in Mecca (c. 610) that city, an important centre on the trade route between Syria and S. Arabia, was the focal point of a people steeped in idolatry and barbarism and contained an ancient temple in which were kept 365 gods. In the Arabian peninsula itself communities of Christians existed in the Yemen and on the borders of Persia, while settlements of Jews were to be found in various places, the most important group being in Yathrib, later known as Al-Medina. In the neighbouring country of Persia Zoroastrianism was the prevailing faith and Christianity was professed by the inhabitants of Syria, Egypt, and Ethiopia, so that, even before the Prophet's time, certain thinking men in Arabia were alive to their spiritual degradation. The story of the Prophet's own life is told under Mahomet.

### Place of the Koran

From the age of 40 until shortly before his death, the revelations which he received, since the Prophet could neither read nor write, were written down or learned by heart by his followers and collected during the caliphate of Othman to form the Koran or, more correctly, Qur'an, which is the religious book of the Muslims containing not only directions for their religious life but also regulations for their secular affairs. It is written in a language which has no peer in Arabic literature, simple yet powerful, and has exercised a far greater influence in the development of the Arabic language than any other writing.

The religion of Islam, which means submission to God and His Divine Will, is summarised in the

two short sentences by which a Muslim (one who submits to God) testifies to his faith, and which every new convert pronounces publicly: "I bear witness that there is no deity but God and that Mahomet is the Messenger of God." The principal idea in Islam is strict monotheism, and it is repeatedly stated in the Koran that the worst of sinners are those who associate, even in the least degree, other deities with God.

### Articles of Faith

The Koran (2.177) lays down that a Muslim must believe in God, the last day, the angels, the books revealed by God, and in all the prophets of whom Mahomet is the last. Among these prophets are Moses and the other prophets of the Old Testament, and Jesus. Elsewhere in the Koran it is stated that every nation on earth has had a warner sent to it. The idea that a Muslim believes in predestination is erroneous and a more accurate translation of the word Qadar, which has been translated predestination, would be the law of God by which He rules the universe and which every Muslim must accept as immutable. Muslims believe in the finality of death, to be followed by a life to come in which everyone will be judged and rewarded according to their deeds on earth.

The practices or pillars of Islam enjoined in addition to the above article of faith are prayer, charity, fasting, and the pilgrimage to Mecca. A Muslim is commanded to say five daily prayers of differing lengths in a set form and preferably in the Arabic language, although it is permissible to say prayers in any other language. These are not detailed in the Koran, but the practice of the Prophet as related in the traditions is closely followed. Each prayer must be performed in a state of physical cleanliness achieved by ablutions of the hands, mouth, nose, face, and neck, forearms, head, and feet. The times of prayer are: when it is beginning to get light before the dawn, at noon, when the sun has half-way declined to the setting, just after sunset, and one-and-a-half to two hours after sunset. Each prayer, which is preceded by the call to

prayer (Azān) given by the Muezzin and consists of two parts, one said in congregation and the other alone, contains a certain number of ritual motions accompanied by a number of recitations of the Fātiḥah or opening chapter of the Koran and other portions, and ending with the words of greeting to right and left. The day of congregation with the Muslims is Friday, when they assemble in a mosque to hear a sermon given by the imam followed by a short congregational prayer led by the imam. During the year there are two festivals, the lesser on the first day of the month following the month of Ramadān, and the greater on the 10th of the month of the pilgrimage to Mecca, which day marks the culminating day of that great annual event. On each of these two occasions short congregational services are held, followed by a sermon on the importance and meaning of the day celebrated.

Charity is enjoined on the Muslim not only in the broad sense of doing good to his fellow-creatures but it is incumbent on him to spend one-fortieth of his capital every year for charitable purposes.

#### The Month of Ramadān

Fasting is also of great importance, and to this purpose one whole month of the year, the month of Ramadān, consisting of thirty days, is devoted. During this period no food or drink passes the lips from about two hours before sunrise until sunset. Smoking, too, is discontinued. As the Muslim calendar is a lunar calendar the month of Ramadān falls ten days earlier each year so that the Muslim is not spared the trial of fasting throughout the long and hot summer days. It is a very powerful discipline and a true test of the believer's will-power and stamina when it occurs in summer or in latitudes which enjoy a great deal of daylight.

The last pillar of Islam is the pilgrimage to Mecca, a very ancient custom of the Arabs going back traditionally to the time when the patriarch Abraham built a mosque in Mecca in thankfulness for God's remitting his proposed sacrifice of his son Ishmael. It is to be noted that the Muslims believe it was Ishmael, the ancestor of the Arabs, that Abraham was prepared to sacrifice, and not Isaac. It is the duty of the Muslim to go on pilgrimage to Mecca at least once in his lifetime if he can find the means to

Mahomedanism. The Ka'aba containing the sacred black stone, in the central court of the great mosque at Mecca. Each pilgrim walks three times round it

do so. In the first ten days of the pilgrimage month an immense host of Muslims of all colours and races from the farthest ends of the earth assemble in Mecca all dressed in the same garment, two unsewn white sheets, regardless of their rank or learning or other worldly differences. The ritual of the pilgrimage consists of circumambulating the Ka'aba or central edifice of the great mosque towards which all Muslims face when they say their prayers no matter where they may be, kissing the Black Stone, a traditional relic of Abraham's original mosque which is built into the eastern corner of the Ka'aba, running between Safā and Marwa, the march to Minā, and assembly on Mount 'Arafāt to hear the sermon. On the conclusion of these rituals animals are sacrificed and the flesh given to the poor. The main significance of the pilgrimage is that it brings together Muslims from all parts of the world to get to know one another and the particular problems that face them

in their various countries. After visiting Mecca for the pilgrimage the pilgrims generally travel N. to Al-Medinah where they visit the grave of the Prophet and the scenes of his success. Apart from the regular annual pilgrimage the Muslims can visit the holy places of Islam at any time. This is known as the lesser pilgrimage.

As regards the regulations of his daily life laid down by the Koran, a Muslim is forbidden by his religion to eat the flesh of the pig or any animal which has not been slaughtered in the name of God. Intoxicants are not approved of, and gambling and the exaction of usury are prohibited. Marriage is enjoined on all men who can marry and a Muslim is allowed to have as many as four wives provided he is sure he can treat them all alike. As a matter of fact, monogamy has become the rule rather than the exception in all Muslim countries. The old idea, long prevalent in Europe, that women were considered to be without souls is quite wrong. Divorce is permitted, although the Prophet is reported as having said, "With God the most detestable of all permitted things is divorce."

#### History Since Mahomet

On the death of the Prophet, isolated attempts were made by a few Arab tribes to regain their previous independence from the central authority and to indulge in a life of brigandage and lawlessness, but the energetic action of the first successor or caliph, Abū Bekr, soon put a stop to these and turned the unbounded energies of the desert Arabs into other channels. It was under the successors to the temporal and to a certain extent the spiritual power of the Prophet that the great expansion took place which carried Islam and

Mahomedanism. Marabouts of the Algerian Sahara in the third posture of the great prayer offered during the month of Ramadān

Mahomedanism. Natives of the Hazara district of the N.W. Frontier Province, Pakistan, at prayer during Ramadan. This is the month of the Mahomedan year when fasting from about two hours before dawn to sunset is compulsory. When Ramadan falls in the hot season, it is a severe disciplinary trial, as drink as well as food is forbidden.

the Arabic language to the Atlantic Ocean in the W. and to China in the E.

Within ten years of the Prophet's death the Arabs had subdued Persia, Syria, and Egypt, and within a hundred years their empire extended from Spain to central Asia. The two principal Arab dynasties which ruled this empire were the comparatively lax Umayyads (660-750), who made their capital in Damascus, and their successors, the 'Abbasides (750-1258), who transferred the seat of the caliphate to Iraq and founded the city of Bagdad. It was under the 'Abbasides that the four schools of theology and law appeared. These are the Hanafite, founded by Imam Abū Hanifa (d. 767), the Malikite, founded by Imam Mālik, the Shāfi'ite, founded by Imam al-Shāfi'ī (d. 819) and the Hanbalite, founded by Imam Ibn Hanbal (d. 855). These codes of law are based on differing interpretations of the Koran, but differences only in detail not in substance. Later, in addition to the Koran, the Sunna or Practice of the Prophet was accepted as an authority on points of conduct of the Muslim's life which are expressly indicated in their revealed book. This practice is contained in six canonical books of traditions considered as authoritative by orthodox Muslims. The best known of these collections is the one by Imam Al-Bukhara (d. 869) and the other five were compiled during the following half century.

The great disagreement which divides the Muslim world in two rests on the acceptance or non-acceptance of these six canonical books. Those who accepted the Practice (Sunna) of Mahomet as contained in these collections are known as Sunnis. The party (Shi'a) of 'Ali, cousin and son-in-law of the Prophet, on the other hand, reject the traditions handed down by his companions and substitute another of their own, in which 'Ali is the prominent figure. These are known as the Shi'ites and have their stronghold in Persia, though there are a number of additional communities scattered throughout the Muslim world.

#### Decline and Reform

After the disastrous Mongol invasions which destroyed the 'Abbaside caliphate in 1258 Islam in its widest sense ceased to be a temporal power, although the process of decay and disruption had begun some centuries before. Under the Ottoman Turks a faint reflection of the splendours of the early 'Abbaside period was achieved, but for some two or three centuries before the first real contact with Europe, occasioned by Napoleon's invasion of Egypt, Islam remained in a deep sleep. The process of awakening took some hundred years and it was not until towards the end of the 19th century that the Muslims became aware of the fact that they were living in a dead world and could not hope to compete with Europe intellectually and materially without reform of their religious and social

outlook. A movement of reform was inaugurated by the Egyptian Shaikh Mohammed 'Abduh (d. 1905) and his school under the influence of a religio-political reformer, Shaikh Jamāl-al-Dīn al-Afghānī.

Islam is and always has been a missionary religion, and continues to make many converts in Africa, Asia, and, to a small extent, in Europe. Actual figures of the number of adherents to this religion throughout the world are not available, but Muslim scholars put forward the figure of from 350 to 400 million, which does not seem to be an exaggeration. During the Second Great War the Muslim states became alive to the important position they held in the Old World, lying as they do across its most important artery, and possessing its principal source of oil. Whether they make worthy use of that realization is a question which can only be answered by history.

**Mahomet** or **MOHAMMED** (c.570-632). Prophet of Islam. He was born of the tribe of Koreish in Mecca. His father died before the child's birth, and his mother when he was six. He was cared for by his grandfather, who, though poor, was a leading citizen of Mecca, and, after his death, by his uncle Abu-Talib. At this time there were many Jews in Arabia, especially in Medina and N. of it, and Christianity had also penetrated into the country both from the Greek empire and from Abyssinia. The bulk of the Arabs were, however, idolaters, and worshipped the moon and planets as well as sacred stones. The chief centre of this worship was the Ka'aba (q.v.) at Mecca, at which an annual pilgrimage or fair was held. From Mecca also two caravans were dispatched, one to Syria in summer, and one to the Yemen in winter. Mahomet is said to have accompanied his uncle Abu-Talib on one of these trading expeditions to the N. at the age of 12, and again at 25 he repeated the journey as the agent of a rich widow of Mecca, who married him.

Mahomet, thus placed beyond the fear of want, turned to religion. His high reputation at this time among his fellow citizens is shown not only by the trust reposed in him in money matters and in affairs of religion, but in his fidelity to his first wife while she lived. He believed himself to be the recipient of revelations from God through the angel Gabriel. His wife, some of his kith and kin, and a few slaves were immediate converts, but the bulk of his fellow townsmen paid little heed to him. When he began to attack their religion, they replied with persecution. Under this persecution a number of Mahomet's disciples migrated to Abyssinia, but just as his mission appeared about to end in failure, help came from an unexpected quarter.

#### The Hejira

The city of Medina had long been distracted by a feud between its two Arab tribes, the Aus and the Khazraj. As a last resort they invited Mahomet, whose doctrines they had learned at the annual pilgrimage to Mecca, to come and keep the peace between them. Gradually his followers slipped away to the northern city, until Mahomet, his bosom friend Abu-Bekr, and his cousin Ali alone were left. On July 16, 622, the two former made their escape (*hejira*), and Ali soon followed.

Mahomet was now engaged in warfare against Koreish and the surrounding Arab tribes. He hoped for the conversion of the Jews, but, on their rebellion, he massacred one of the two Jewish tribes of Medina and expelled the other. He gradually extended his territory until, within eight years after he had left Mecca as a fugitive, he entered it as a conqueror. He died master of Arabia.

#### Prophet and Political Ruler

The public life of Mahomet is split into two halves so distinct that he seems to be in each a different person. In Mecca he was a prophet like one of the prophets of Israel. His sole aim was the conversion of his people from idolatry. The portions of the Koran composed at this time abound in glowing insistence on the unity of God, and in highly coloured descriptions of the Day of Judgement, the bliss of Paradise, and the terrors of hell. In this period Mahomet's proscription of the use of force and his patience under persecution are outwardly Christian, though the Koran shows that his inmost feelings were not so.

In Medina, on the other hand, he became a political ruler. The end in view, the conversion of Arabia, was still the same, but now the end justified any means. According to the statements of some authorities, assassination and murder in cold blood were recognized as legitimate; the conversion of chiefs was bought with presents of cattle; the loyalty of the most powerful converts was secured by numerous marriages; revelations were invented as occasion seemed to require. The fact remains that even his most intimate friends, such as Abu-Bekr, continued to believe in him to the last. The secret of his success lay in his urbanity. He became all things to all men and combated them with their own weapons. He never refused an invitation, and never departed from the severe simplicity of the Arab life. He was *princeps inter pares*, and shared in all the dangers and hardships of his followers. He preferred the reality to the semblance of power. He had one single aim throughout his life, and, though latterly by devious paths, he attained his goal.

The best source for the life of Mahomet would be the Koran, composed by himself during the last 23 years of his life, were not its language and allusions so cryptic as to be unintelligible without the aid of later bio-

graphies. Next comes the contemporary poetry of his adherents, especially his "court-poet," Hassan ibn Thabit, and of his enemies. The defect of this source is that much of it cannot be accepted as genuine. We are thus thrown back upon the four accepted biographies—that of Ibn Is-hak (d. 768), which has been preserved to us in the larger biography of Ibn Hisham (d. 833), and also in the general history of Tabari (d. 922); the book of Mahomet's campaigns by Wakidi (d. 822); and the lives of Mahomet and his companions by Wakidi's secretary Ibn Saad (d. 844). In addition to these there are books of traditions of Mahomet's "table-talk" and habits of life, of which the oldest is that of Malik ibn Anas, who died in Medina in 795, and the best known that of Bokhari, who died in Bagdad in 869. From these sources the general outline of Mahomet's life can be reconstructed with comparative certainty, though tradition varies as to the order of the later events. See *Hejira*; *Mahomedanism*.

**Mahón.** For details of this town in the Balearic Island of Minorca, refer to *Port Mahón*.

**Mahon**, CHARLES JAMES PATRICK (1800-91). Irish adventurer. Better known as The O'Gorman Mahon, he was born at Ennis, Clare, March 17, 1800, and represented it in parliament, 1847-52. He then travelled extensively, and served in the armies of Turkey and Austria. In 1862 he was fighting in Uruguay and espoused the Federal cause in the American civil war. Returning to Ireland in 1871, he supported Parnell (q.v.) and was elected member for Clare in 1879. He sat for Carlow from 1887 until his death in London, June 15, 1891. His life was written by Denis Gwynn, 1934.

**Mahon**, PATRICK (ex. 1924). British murderer. On April 10, 1924, Mahon met Ethel Duncan, and decided to rid himself of Emily Kaye, with whom he had been on intimate terms for a year. On April 12 he arranged for Emily to meet him at his bungalow at the

Crumbles, near Eastbourne. She was killed, probably by strangling, and her body locked in a bedroom, where it remained while Ethel Duncan was staying at the bungalow. After taking Ethel Duncan back to London, Mahon returned to the Crumbles, where he dismembered the corpse, burning or boiling the fragments.

Mahon's wife found a cloakroom ticket in his pocket and engaged a private detective to make investigations. At Waterloo station a bag was found containing a woman's bloodstained garment and a long knife. When Mahon arrived on May 2 to claim the bag, he was arrested. The police found bones on the shingle outside the bungalow, the rest of the body being packed in various receptacles. The trial began at Lewes on July 15. Mahon was hanged on Sept. 3.

**Mahony, FRANCIS SYLVESTER** (1804-66). Irish humorist. He was born in Cork and educated first for the Jesuit order. A brilliant scholar, under the pseudonym of Father Prout he did much to establish the success of Fraser's Magazine. He also contributed to Bentley's Miscellany, was Rome correspondent of the Daily News, 1846-47, and in later years, when he lived in Paris, was correspondent of The Globe. The Bells of Shandon is a well-known poem by him. He died May 18, 1866.

**Mahratta** or **MARATHA**. People in W. and Central India. Besides its stricter caste usage, the name also denotes loosely the medley of castes and tribes—such as Kunbis—speaking the 39 dialects of Marathi, which forms the S. group of Indo-Aryan languages. They number about 24 millions of whom a quarter are Mahrattas. Brahmans represent the fullest Aryan strain; the Kshattriya upper classes and the Sudra peasantry are aboriginals more or less definitely Aryanised, or descendants from non-Brahman camp-followers in the Mahratta armies.

The medieval Maharashtra kingdom occupied a triangle from Nagpur to the W. coast towns Daman and Karwar. The Mahratta power established at Poona by Sivaji in 1657 fell to pieces after his death in 1680, forming a loose confederacy, including Gwalior, Baroda, Indore, etc., long hostile to Great Britain. There were Mahratta units in the British Indian army; in 1921 the title of royal was conferred on the 117th Marathas in recognition of distinguished services during the First Great War. In 1922

the designation was changed to 5th Royal Battalion, 5th Mahratta Light Infantry. Mahratta Brahmin, e.g. G. K. Gokhale, played a prominent part in the Indian nationalist movement. See India.

**Mahratta Wars**. Four campaigns between the British and the Mahratta people of Hindustan. The first war, 1778-82, was fought over the succession of the peshwa, or chief, of the confederacy. There were two candidates, and Britain ineffectually intervened in favour of her own nominee, but conquered Gujarat and captured the strong fortress of Gwalior. The treaty of Salbai restored these conquests in 1782. The next campaign, begun in 1803, was undertaken to assist the peshwa, Baji Rao II, who was at variance with Sindia and Holkar, two powerful chieftains of the confederacy. The war is mainly notable for the skilful generalship of Wellesley, later duke of Wellington, who, at Assaye, Sept. 23, 1803, defeated Sindia against great odds. General Lake's actions at Farrukhabad and Laswari completed the British successes, and the Mahratta chieftains thereupon sued for peace.

The third war broke out in 1816, largely owing to Baji Rao II, who had grown impatient of the continual presence of the British in his dominions. The revolt was finally crushed in 1818, and the peshwa made a prisoner by Sir John Malcolm. The Mahratta confederacy was dissolved, and much of their territory fell into British possession. The last war was undertaken in 1843 to restore order in Gwalior, the province ruled by Sindia. The battle of Maharajpore, Dec. 29, 1843, fought against great odds by Sir Hugh Gough, practically concluded the campaign. See India; Sindia.

**Mahsud**. Pathan sub-tribe in S. Waziristan, N.W. Frontier prov., Pakistan. Occupying the mt. region between the Tochi and Gomal upper valleys, they hold the Gomal pass leading to the level Derajat plains W. of the Indus. They share the democratic temperament and Waziri speech of the S. Pathan peoples, but are wilder and more predatory than the N. Waziristan Waziris. Their three main clans are estimated to furnish 10,000 fighting men. In 1917-21 they were in a state of rebellion, and punitive operations were undertaken against them by the British. See Waziristan.

**Maia**. In Greek mythology, eldest of the Pleiades (*q.v.*). By Zeus she was the mother of Hermes.

**Maida**. Town of Italy, in the prov. of Catanzaro. It is 30 m. W.S.W. of Catanzaro on the main road to Pizzo. On the neighbouring plain Sir John Stuart, in command of a British force dispatched to assist the dispossessed Bourbons, defeated the French troops under Regnier, July 3, 1806.

**Maidanek**. Site, near Lublin, Poland, of a German extermination camp during the Second Great War. The camp was overrun by the Russians, July 24, 1944; they found there prisoners of war from the Polish armies of 1939, Russian prisoners, and citizens, some of them Jewish, of Poland, France, Belgium, Italy, the Netherlands, Czechoslovakia, Greece, Yugoslavia, Denmark, and Norway. A Russo-Polish commission of inquiry established that 1,380,000 corpses of people killed in the camp by shooting, gas, starvation, and torture had been burned in furnaces and on bonfires.

**Maida Vale**. London thoroughfare and district, largely residential. The thoroughfare is that part of Edgware Road which runs from the Gr. Union Canal to Kilburn. The E. side is in the bor. of Marylebone, the W. in that of Paddington. The name commemorates the battle of Maida.

**Maiden**. Instrument of execution formerly used in Scotland, and occasionally in the N. of England. In design it was not unlike the guillotine. A weighted blade moving in grooves was fixed to a frame about 10 ft. high. The blade was raised to the full height of the

Maiden. Scottish instrument of execution. Top, blade of maiden, preserved in Edinburgh

frame and then released, beholding the victim. It was first used in 1561. Its victims included the earl of Morton, beheaded in 1581, who is alleged to have been its inventor. A specimen is preserved in the museum of the Society of Antiquaries, Edinburgh. See Capital Punishment; Guillotine.

The word maiden is also used for first things of their kind, e.g. maiden speech in parliament and maiden voyage of a ship. A maiden over at cricket is an over in which no runs are scored off the bowler. In some parts of the N. of England a clothes-horse is also known as a maiden.

**Maiden Castle.** A prehistoric earthwork near Dorchester, Dorset, England. Begun in Neolithic times, the whole hill, 432 ft. high, and embracing 160 acres, was enclosed in the Bronze Age. There are three ramparts on the N. and four on the S. The entrance is guarded by trenches for enfilade defence. The name may denote a stronghold suitable for women. Inhabitants of the district lived there before 2000 B.C., practising

**Maidenhair Tree** (*Ginkgo biloba*). Tall tree of the family Ginkgoaceae, native of China. It

Maidenhair Tree. Stem and foliage

has broad, fan-shaped leaves, cloven at the summit and with notched margins. The male flowers, borne on a separate tree from that which bears female flowers and fruit, form a sort of catkin, consisting of numerous stamens seated on a long spike. The females consist of ovules only, at the summit of long stalks. When fertilised these develop into plum-like fruits; the seed is in a hard shell enclosed in a fleshy edible wrap.

**Maidenhead.** Market town and mun. borough of Berkshire. It stands on the right bank of the Thames, 24 m. from London, with a station on the main line. The town industries include brewing and art metal work, but it is now chiefly known as a boating centre. The bridge across the Thames dates from 1772. The corporation dates from the

Maidenhead arms

is due to the influence of the Morris dance and May games. She is often known as Queen of the May. In some ballads she is a lady of high degree, who assumed the name of Maid Marian when she joined her lover Robin in the greenwood. See Robin Hood.

**Maid of Honour.** Unmarried lady in personal attendance on a queen. In the British royal household the maids of honour are in the lord chamberlain's department, and are "in waiting" two or three weeks at a time. Usually daughters or granddaughters of peers, and styled "honourable," they take precedence between daughters of barons and wives of knights of the garter. On marriage they are granted a dowry by the queen, if she approves the match. A kind of cheese-cake made at Richmond, Surrey, is known as a "maid of honour." See Royal Household.

**Maid of the Mountains, THE.** Musical play, with libretto by Frederick Lonsdale and music by H. Fraser-Simson and J. W. Tate. First produced at Daly's theatre, London, Feb. 10, 1917, with José Collins as the star, it became one of the most popular musical comedies of its day and ran until Dec. 26, 1921, being played 1,352 times. Revivals included those at the London Hippodrome, 1930, and Coliseum, 1943.

**Maidstone.** Mun. borough and market town of Kent, also the county town. It stands on the Medway, mainly on the eastern side, 34 m. S.E. by road from London, and has two rly. stations. The chief church is All Saints, a large Perpendicular edifice, once a collegiate church. S. Peter's Church was originally the chapel of a hospital founded by Boniface of Savoy, archbishop of Canterbury. The 16th century grammar school is housed in a modern building. Its picturesque riverside front visible from Maidstone bridge, the old palace of the

Maiden Castle, Dorchester. Part of the prehistoric earthwork

agriculture and tending cattle and sheep. Traces of circular houses and baking pits have been found within the fortifications, also an armoury containing some 5,000 sling stones. The defences were demolished after the Roman conquest. Consult Maiden Castle, Dorset, R. E. M. Wheeler, 1941.

**Maidenhair Fern** (*Adiantum*). Herb of the family Polypodiaceae. Natives of tropical and temperate climates, they have delicate, much divided fronds. *A. capillus-veneris*, the common maidenhair fern, is a native of Britain, but now rare, and *A. pedatum* is common in the U.S.A. Given shade and moisture, they thrive under greenhouse treatment in a temperature of 60-70°, and require a soil chiefly of leaf-mould, loam, and sand.

time of Elizabeth, and the town had fairs in the Middle Ages and later. It is now governed by a mayor and council, which maintains a library, museum, and baths. There is a hospital. At White Waltham is a civil airfield. This was the headquarters of the Air Transport Auxiliary ferry organization in the Second Great War. Pop. 25,950.

**Maid Marian.** One of the chief characters in the later poems of the Robin Hood cycle. Her appearance therein

Maidenhead, Berkshire. Riverside road, with the Bath Road bridge across the Thames seen in the distance

archbishops still stands, while another building, a 16th century manor house, contains the museum,

Maidstone arms

art gallery, and free library. The archbishop's stables, now known as the tithe barn, houses a collection of ancient carriages. Other buildings are hospitals, the school of science and art, gaol, and barracks, and those used for county business. There are the ruins of a 14th century building, once a college for priests.

Maidstone is in the middle of the hop fields. It has also manufactures of agricultural implements, paper, food products, rope, beer, toffee, etc., also malting, quarrying, and engineering works. It is governed by a mayor and corporation.

Maidstone existed in Anglo-Saxon times. Penenden Heath, just outside the town, was from early times the place where the men of the county met, and where criminals were hanged. It is now a public recreation ground. Maidstone became an assize town, and was incorporated, in the 16th century. It was represented in Parliament until 1918, and from 1950 gave its name to a co. constituency. A rising of royalists here, in 1648, was crushed by Fairfax. It is the birthplace of William Hazlitt. Pop. est. 49,730.

**Maikop.** Town in autonomous area of Adigisk, R.S.F.S.R. It stands on the Bielaia, 65 m. S.E. of Krasnodar. It is the chief commercial centre of a district that produces a great quantity of oil, and is connected with Tuapse on the Black Sea by an oil pipeline. During the Second Great War the Russians, after destroying the oil wells, evacuated Maikop, Aug. 16, 1942, during the German drive for the Caucasian oil fields. On Jan. 30, 1943, Russian troops recaptured Maikop, the German offensive having failed. Pop. 67,302

**Maikov,** APOLLON NICOLAIEVITCH (1821-97). Russian poet. Born in Moscow and educated, with the intention of becoming an artist like his father, in St. Petersburg and Italy, he took to literature. His first volume of poems,

1842, was followed by epics on historical themes, Savonarola, The Queen's Confession, and others; and by two lyrical dramas, Three Deaths and Two Worlds, dealing with the struggle between the Greco-Roman and Christian worlds.

**Maillol, ARISTIDE JOSEPH BONAVENTURE** (1861-1944). French sculptor. Born Dec. 8, 1861, at Banyuls-sur-mer, Pyrénées-Orientales, he studied at Perpignan and worked in the studio of Cabanel and at the Beaux Arts. He abandoned painting for sculpture in 1900, first carving direct rather than modelling. Large statues in stone and bronze established his reputation; a one-man show in Paris, 1904, attracted attention to his static, three-dimensional work, influenced by early Greek, Chinese, and Egyptian forms. An important work was the monument to Cézanne at Aix-en-Provence, and his finest sculptures include many small terra-cottas. Examples are in the chief European and American galleries. He died as the result of injuries after a motor accident in Sept. 1944.

**Maimachin.** Chinese frontier town in Outer Mongolia. It faces Kiakhta, its counterpart on the Russian side of the border. The name signifies Chinese mart. Its once flourishing caravan trade has diminished since the advent of the Siberian and Manchurian rlys.

**Maimana.** Minor province of Afghanistan. Formerly a semi-independent Uzbeg state, on the border of Turkmen S.S.R., it has an area of 4,759 sq. m. Its chief town, Maimana, a road junction for Herat and Kabul, was a place of some importance before it was taken in 1874 by the Afghans, who massacred a large number of the inhabitants. It still has a trade in horses and fruits, and makes carpets.

**Maimansingh.** Dist. and town of Bengal better known as Mymen-Singh (*q.v.*).

Maillol. La Méditerranée, sculpture by Aristide Maillol in the courtyard of the Hôtel de Ville, Perpignan  
Photo, Vizzavona

**Maiming.** Term used in English law for the loss of a part of an animate creature's body necessary for fighting. In the case of human beings the word mayhem (*q.v.*) is more usual. The word maiming is more used in connexion with injuries to animals. Under the Malicious Damage Act of 1861 it is a felony to maim, *i.e.* permanently injure, or wound, any cattle, horses, or other domestic animal. Of a number of remarkable epidemics of cattle and horse maiming in the U.K. the most notorious is that known as the Great Wyrley outrages in Staffordshire, which began in 1903 and continued intermittently for many years; they were usually preceded by warning letters sent to the police.

**Maimonides, MOSES** (1135-1204). Jewish rabbi and philosopher. Born at Córdoba, March 30, 1135, he studied Aristotelian philosophy, medicine, and other sciences, among his teachers being Averroës. Driven from Spain by persecution, he settled in Egypt, became physician to Saladin, and lectured on philosophy at Cairo and also at Alexandria, where he founded a Jewish college. He died at Cairo, Dec. 13, 1204. In many works in Arabic and Hebrew he endeavoured to reconcile the claims of faith and reason. His independent thought and the boldness with which he rejected much Rabbinical tradition aroused hostility, though he was afterwards recognized as one of the greatest Jewish teachers. His chief work, first written in Arabic, The Guide to the Perplexed, was once used in European universities: Eng. trans. M. Friedlander, 3 vols., 1885.

Maidstone. Church of All Saints and old houses from the Medway  
Firth

**Main.** River of Germany, a tributary of the Rhine. It rises in two headstreams, the Red and White Main, in the Fichtelgebirge on the edge of the Bohemian plateau, and flows W. to join the Rhine at Mainz, after 300 m.

Its tribs. include the Tauber, Saale, and Regnitz; through the last it is connected by Ludwig's Canal (*q.v.*) and the Altmühl with the Danube. A plan to build a new canal link between the Main and the Danube, from Würzburg to Regensburg, was discussed in 1950. Navigation of the Main extends 240 m. above the town of Mainz, the portion between Mainz and Frankfort being canalised and specially equipped for assisting traffic up stream. Besides Mainz and Frankfort, the chief towns in the basin are Nuremberg, Würzburg, and Aschaffenburg. In the Middle Ages the lower valley formed part of an historic route N.E. from Mainz to Kassel and the Weser Valley for the North German plain.

**Main.** River of Antrim, N. Ireland. It enters Lough Neagh below Randalstown after a S. course of 30 m., and is noted for its salmon.

**Maine.** Name of one of the provinces into which France was divided before the Revolution. It lay between Normandy, Brittany, and Anjou, and its capital was Le Mans, both names being derived from that of a Gallic tribe, the Cenomanni. It began as a district round Le Mans corresponding to the diocese of that city, and was ruled in the 9th, 10th, and 11th centuries by counts, vassals of the counts of Anjou. About 1100 Maine was united with Anjou, then ruled by the Plantagenet family, and in 1154, when Henry II became king of England, it became an English possession. In 1204 it was retaken by the French king, Philip Augustus, and again it had its own line of counts, junior members of the royal family. Before 1500 it was definitely merged into the kingdom of France, and from about 1600 to 1789 it was a province. It is now covered by the departments of Sarthe and Mayenne.

**Maine.** Most north-easterly state of the U.S.A., and the largest in New England. It contains West Quoddy Head, the most easterly point in the country. Its area of 33,215 sq. m. is greater than that of Scotland. Maine is bounded N. by Quebec, New Brunswick, and the Bay of Fundy. The coastline is much indented, and including that of numerous islands, measures

2,379 m., with many good harbours. Augusta is the capital and Portland the chief seaport; other places are Lewiston, Auburn, Bangor, and Biddeford. Pop. 847,226.

Maine arms

Maine is mountainous in the N.W., the highest point being Katahdin, 5,350 ft.; ten other peaks exceed 4,000 ft. and hundreds are over 2,000 ft. One-tenth of the surface is covered with water, including 1,620 lakes; Moosehead being 35 m. long and from 2 to 10 m. wide. There are over 3,000 rivers and streams, those which provide water power including the Kennebec, Penobscot, Androscoggin, Saco, St. John, and St. Croix. Among wooded islands is Mount Desert. Maine is one of the chief summer holiday resorts of the U.S.A.

About 65 p.c. of the land area is forested, mostly coniferous, and lumbering is an important industry, the principal woods being white pine, spruce, birch, hemlock, balsam, oak, maple, cedar, ash, and beech. Maine is the chief producer of pulp and paper in the U.S.A. It is also first in potato output, and other crops are maize, which is canned, oats, buckwheat, and apples. The fisheries are valuable, there is shipbuilding at Bath, and cement, limestone, slate, sand, gravel, and granite are worked. Fish, fruit, and vegetable canning, and the manufacture of textiles and boots and shoes are industries. The state has 1,828 m. of rly., connected with the Canadian system. Two senators and three representatives are returned to congress. The university is at Orono.

It is believed that Sebastian Cabot visited the coast in 1496, and that Norsemen may have done so as early as 1000. English and French tried to found settlements in the territory; the Popham colony, established at the mouth of the Kennebec in 1607, would have antedated Jamestown as the first permanent English settlement in America had it survived. There were built the first church, block-house, and ship in America. In 1622 the council of New England granted to Sir Ferdinando Gorges and John Mason a great tract of land between Kennebec and Merrimac. Gorges established Gorgeana, now York, in 1641 as the first capital of the province and the first chartered city in America.

While England was under Commonwealth rule, Massachusetts took possession of the settlements in Maine, and the territory was formally incorporated in 1691. In 1820, as the result of agitation followed by a popular vote, it was again made a separate state.

The treaty of 1783, which gave the U.S.A. its independence, endeavoured to fix the state boundary with Canada, but the clause was ambiguous. In 1839 the N.E. boundary dispute nearly led to war between Great Britain and the U.S.A.; this was averted by the Webster-Ashburton treaty of 1842, but the agreement was not permanently successful, nor were those of 1846 and 1870. The boundary was finally settled by the Bryce-Knox treaty of 1910. In 1947 a severe drought throughout the state culminated in a series of disastrous fires which destroyed 110,000 acres of standing timber and property worth \$6,000,000, and rendered over 6,000 people homeless. The federal authorities declared Maine a distressed area. *Consult* Maine, Its History, Resources, and Government, G. Starkie, 1930.

**Maine.** Name of a U.S. battleship blown up in Havana harbour, Feb. 15, 1898, with a loss of 250 officers and men. The incident led to war between the U.S.A. and Spain. *See* Spanish-American War.

**Maine, Sir Henry James Sumner** (1822-88). A British jurist. Born in India Aug. 15, 1822, he was educated at Christ's Hospital and Pembroke College, Cambridge, being senior classic in 1844. In 1847 he was chosen regius professor of civil law at Cambridge, and

Sir Henry Maine, British jurist

in 1850 he became a barrister. Professor of jurisprudence at Oxford, in 1877 he was chosen master of Trinity Hall, Cambridge, in 1887 professor of international law, and he died at Cannes, Feb. 3, 1888.

In 1861 appeared Maine's *Ancient Law*, which is regarded as the starting point of the study of jurisprudence. He also wrote *Village Communities in East and West*, 1871, *The Early History of Institutions*, 1875, *Early Law and Custom*, 1883, and *Popular Government*, 1885.

**Maine de Biran, Marie François Pierre Gonthier** (1766-1824). French philosopher and

politician. Born at Bergerac, Nov. 29, 1766, he became a member of the bodyguard of Louis XVI, but after the king's death retired to his estate and gave up his time to study. As a royalist he took some part in politics before 1815, and after this was treasurer to the chamber of deputies. He died in July, 1824. As a philosopher, Maine at first held the sensualistic views of Condillac, but afterwards took up the theory of the exertion of power by an ego that wills, as opposed to a non-ego that resists, the object.

**Maine-et-Loire.** A dept. of France. Part of the old prov. of Anjou, it is roughly bisected by the Loire, other rivers, all in the Loire basin, being the Authion, Maine, Sarthe, Loir, Layon, and Moine. Rly. lines centre on Angers, the capital, the other chief towns being Baugé, Cholet, Saumur, and Segré. The country is generally hilly, except in the N.W., and there are slate, freestone, and granite quarries, and some coal deposits near Chalonnes. The agricultural products include wheat, barley, oats, hemp, and beet; nursery gardening and fruit growing are carried on; and the vineyards are of importance, the vintages of Saumur being well known. Area, 2,811 sq. m. Pop. 475,991.

**Mainotes.** Inhabitants of the Maina peninsula, formed by the ridge of Mount Taygetus between Sparta and Cape Matapan, in southern Greece. Although boasting Spartan descent, they probably include a Pelasgian substratum. In their inaccessible fastnesses they preserve a pastoral habit, with olive cultivation, and some survivals of pagan belief.

**Mainpuri.** Dist. and town of India, in the Uttar union, in the Agra division. The district is situated in the middle of the Ganges-Jumna doab, away from both rivers. Wheat, barley, millet, and sugar-cane are the chief crops; 55 p.c. is cultivated; 70 p.c. of the total area is cultivable. The rainfall is 32 ins. annually.

The town is on the trunk road, and has railway connexions with Cawnpore and Agra; there is considerable trade in cotton, indigo, and wooden articles inlaid with wire. Dist. area, 1,679 sq. m. Pop. 872,601. Town pop. 18,500.

**Main Street.** Novel by Sinclair Lewis. Published in 1920, it established its author's reputation as a satirist of small town life in America's Middle West, and pillories the parochial narrowness and gossip of a community whose

superficial intellectualism despises its own existence but is unable to achieve anything better. In Main Street, Lewis exhibits to the full his gift of satire in dialogue, and his remarkable powers of observation. He does not so much draw characters as dissect them in public on an operating table. Main Street became a text book for attacks on provincialism and the complacency of intellectually stagnant middle-class communities. The original of Gopher Prairie, as Lewis called the town he satirised, was Sauk Creek, Minn., his birth-place.

**Maintenance.** Feudal practice whereby knights and gentry entered into bond with more powerful barons to assume their badge, or livery, and to serve under their banner in war in consideration of support of their private interests and maintenance in their lesser quarrels. As a result, immense power passed into the hands of the barons, and was retained until the end of the 15th century. Statutes were passed against livery and maintenance, but these were virtually disregarded until revived and enforced by Henry VII. *See* Cap of Maintenance; Feudalism; Livery.

**Maintenance.** Term used in English law. It is a tort to maintain another in an action at law, i.e. to meddle officiously in a suit by assisting either party with money or otherwise. It is not illegal maintenance to assist a plaintiff or defendant who is a relative or connexion, or a servant, or out of charity. Still less is it illegal to help to pay the expenses of an action in which one has some actual interest, e.g. where a man is sued for trespass, and other citizens subscribe towards his legal expenses so that he can establish a right of way. What is sought to be prevented is officious inter-meddling, particularly where the object is to vex and harass the other party to the suit. Maintenance is also a criminal offence, punishable on indictment.

The most famous action in modern times was *Bradlaugh v. Newdegate*. Charles Bradlaugh (*q.v.*) had incurred penalties by not taking the oath required of members of parliament, whereupon Newdegate maintained a third person to sue Bradlaugh for these penalties. The action failed and Bradlaugh then successfully sued Newdegate for maintenance. Maintenance was a serious menace to the administration of the law in the 15th and 16th centuries when the support of litigants by power-

ful individuals often made it impossible to obtain justice. The court of star chamber under the Tudors did much to suppress it.

**Maintenance Order.** Order which by English law a wife may obtain from a magistrate's court. Under this order her husband is required to pay not more than £5 a week for her maintenance and not more than 30s. a week for that of each child under 16. Where the child is engaged in a course of education or training, the order may be extended until the child is 21. The court may make a separation order—i.e. a state order that the wife is no longer bound to live with the husband—but this is not now the usual practice, as it will put an end to any desertion of which the husband may have been guilty, and so may prevent the wife from later obtaining a divorce for desertion under the Matrimonial Causes Act, 1937. A wife can obtain a maintenance order only if she can prove some misconduct on the part of the husband. Applications for maintenance orders are domestic proceedings, and are heard in special courts with limited publicity.

**Maintenon, FRANÇOISE D'AUBIGNÉ, MARQUISE DE (1635-1719).** Second wife of Louis XIV. The

*Maintenon.*  
After P. Mignard

daughter of a Huguenot, she was born in Niort prison, Nov. 27, 1635, but on their release her parents took her to Martinique. She returned in 1645 to France,

where her beauty and wit soon attracted attention, and her marriage with Scarron in 1651 introduced her to intellectual circles. Scarron died in 1660, leaving his widow almost destitute, but she was granted a pension, and in 1669 was engaged by Mme. de Montespan to educate the children she had borne to Louis XIV. Called to court, she soon attracted the royal attention, and in 1678 Louis created her a marquise.

Mme. de Maintenon, as she was now styled, possessed an intelligence which established her high in Louis's favour. Mme. de Montespan was discarded in 1680, and after the queen's death in 1683 the new mistress ruled supreme. In 1684 Louis privately married her, and for the remainder of his life she exercised almost unlimited

power over him, being largely responsible for his zeal for orthodoxy. In 1715, on his death, she retired to St. Cyr, where she had founded a school for girls, and died there April 15, 1719. There are Lives by C. C. Dyson, 1909; H. C. Barnard, 1934.

**Mainwaring**, SIR HENRY (d. 1653). English sailor. A son of Sir George Mainwaring, he was educated at Brasenose College, Oxford, afterwards studying law in London. In 1611 he obtained a commission to deal with pirates in the Bristol Channel, but soon himself began to follow their practices. He made Mamora, in N. Africa, his base, and in the Resistance was soon feared by the Spanish traders and seamen, on whom he inflicted heavy loss. He refused to accept a high position in the Spanish navy, a bribe offered to induce him to abandon piracy, but when James I took up the matter he decided to yield. He returned to England, and in 1616 was pardoned. *Pron.* Manna-ring.

**Mainz** (Fr. Mayence). One of Germany's oldest cities, the capital of the *Land* of Rhineland-

Mainz arms

Palatinate. Situated on the W. bank of the Rhine, opposite its confluence with the Main, connected with Kastel, on the E. bank, by a modern bridge blown up in 1945, and with Wiesbaden's suburb Biebrich by another, likewise damaged, Mainz was, until 1919, an important fortress. A main junction on the rly. lines Paris-Saarbrücken-Berlin, Amsterdam-Cologne-Basel, Paris-Nuremberg-Vienna, etc., as well as of the Rhine steamship lines and, with Wiesbaden, of civilian air lines, its river port handled up to two million tons of goods per year; its

suburbs, Gustavsburg, Gonsenheim, Rüsselsheim, etc., were industrialised, with metal and engineering, wagon and motor building, chemical, dye, food preserve, sparkling wine, paper, and printing works; it was also an important gardening and agricultural centre, especially of the wine trade. The university, which existed from 1477 to 1803, was reopened 1946. Mainz also had a teachers' seminary, musical high school, municipal theatre, etc., and many galleries and museums, one being devoted to printing, the invention of Mainz's most famous son, Gutenberg. Pop. (1949 est.) 108,000.

Founded about the time of the birth of Christ by Drusus as a Roman castle, Moguntiacum, on the site of a Celtic and Teutonic settlement, Mainz was the strategic centre of all Roman actions against the German tribes. By the third century a walled town, captured and destroyed several times, had developed round this fortress. It became a bishopric and, in A.D. 747, S. Boniface's archbishopric, a dignity in which many famous men were to follow him: Hrabanus Maurus in the 9th, Hatto in the 10th, Willigis, who helped on the building of the cathedral, in the 11th, Conrad of Wittelsbach in the 12th, Diether of Ysenburg, founder of the (former) university in the 15th, Albrecht of Brandenburg in the 16th century. The archbishops were first primates of Germany, then from about 950 arch-chancellors, and from 1273 electors of the Empire, and power-

ful territorial princes. But for over 300 years the citizens of "Golden Mainz," rich and powerful in turn, struggled, often in sanguinary battles, for their liberties against their ecclesiastical overlords; winning their complete freedom and an elected govt. in 1244, they created, 1254, the league of Rhenish cities, soon affiliated to the Hansa. They lost their privileges again, to archbishop Adolf II of Nassau, in 1462.

After suffering heavily from French and Swedish conquest, during the Thirty Years' War, and again by several severe battles in the wars of the French Revolution, 1792 and 1797, Mainz was ceded to France by the peace of Campo Formio, 1797; the archbishopric was transferred to Ratisbon (Regensburg), 1803; a French bishopric in what became the capital of the dept. of Mont Tonnerre was created in 1802. Returned as a fortress of the German confederation to Germany in 1814, the city was joined to Hesse in 1816, and was garrisoned by Austrian, Prussian, and Hessian troops until 1866. Bishop Baron von Ketteler (1850-77) was an outstanding R.C. leader.

On account of its industries the city was bombed from the air by

the Allies on a number of occasions during the Second Great War. The cathedral of S. Martin (975-1490) was reduced to ruins; S. Christopher's (13th), S. Emmeran's, S. Stephen's, S. Quentin's (all 14th cent.), S. Joseph's, S. Peter's, S. Ignatius' (18th), the Holy Ghost hospital (1237), the electoral palace

(1627-1752), the house of the Teutonic order (1720-37) survived, but were badly damaged. The city was occupied by U.S. armour and infantry on March 20, 1945, with little opposition, German resistance W. of the Rhine having collapsed. The city lay within the French zone of occupation after the surrender.

**Mais**, STUART PETRE BRODIE (b. 1885). British writer and broadcaster. Born July 4, 1885, he went to Denstone and Christ Church, Oxford. From school-mastering he turned to literary criticism and was with various London

Mainz (Mayence). General view (1945) of the city on the Rhine. Top, house in which Gutenberg is said to have set up the first printing press

newspapers, 1918-31. Broadcasting on books and on places in the British Isles, he also made a tour of the U.S.A. for the B.B.C. in 1933-34, broadcasting his impressions. Mais wrote more than 60 books about his favourite authors and districts, several novels, and an autobiography, *All the Days of My Life*, 1937.

**Maisky, IVAN MIKHAILOVITCH** (b. 1884). Russian diplomatist. Born at Kirilov, Jan. 19, 1884, he

Ivan Maisky,  
Russian Diplomatist

attended an Omsk secondary school and St. Petersburg and Munich universities. Connected with revolutionary movements from the age of 15, he was several times arrested and twice exiled to Siberia; he lived also in Germany and England. After the 1917 revolution he joined the diplomatic service, and was chief of the press department of the commissariat for foreign affairs, 1922. Counsellor at the Soviet embassy in London, 1925-27, and in Tokyo, 1927-29; three years minister to Finland, negotiating a non-aggression treaty with that country; he was in 1932 appointed Soviet ambassador to Great Britain. Maisky carried through a Russo-British trade agreement in 1934 and the naval treaty of 1937. He signed pacts of mutual assistance with Poland and Czecho-Slovakia in 1941, and established diplomatic relations between his own country and Canada and S. Africa, 1942. Awarded the Order of Lenin in 1942, he became next year assistant commissar for foreign affairs in Moscow until 1946.

**Maison Carrée** (Fr., square house). Roman temple in the city of Nîmes, France. Among the finest survivals of Roman architecture, it is a rectangular building, 87 ft. by 45 ft., and of classic simplicity. Of its 30 Corinthian columns, each 29 ft. high, only 10 are disengaged from the walls, thus forming the prostyle, or porch, reached by a series of steps. The temple dates from the 2nd century at latest, and was dedicated to Gaius and Lucius Caesar, grandsons of Augustus. Used in turn as a church, warehouse, and stable, it was restored, 1824, as a museum. The temple probably stood in the forum of the old city. See Nîmes, *illus.*

Maison-Laffitte, France. View from the grounds of the historic château at Saint-Germain

**Maison-Laffitte.** Château and museum situated at Saint-Germain, France. It was designed in the 17th century by Mansart for René de Longueil, president of the parlement of Paris, and was known as the Château des Maisons, until it was acquired by the banker statesman, Jacques Laffitte, in 1818. Laffitte sold part of the grounds to enable the farm colony of the same name as the château to be started. The château has associations with the comte d'Artois, the comtesse du Barry, and Voltaire.

**Maisonneuve, PAUL DE CHOMEDY, SIEUR DE** (d. 1676). French administrator. He was born in Champagne, entered the army, and after serving in Holland, in 1641 led a religious expedition to Quebec. On May 14, 1642, he founded the town of Ville-Marie de Montréal (see Montreal), of which he was governor until 1665. Maisonneuve was sent back to France, where he died a disappointed man.

**Maistre, JOSEPH MARIE, COMTE DE** (1754-1821). French writer. Born at Chambéry, April 1, 1754, of a noble Savoyard family, he studied at Turin, and after holding posts in the civil service became a member of the senate of Savoy. When the French invaded and annexed the district he retired to Lausanne. Recalled to Turin, during 1802-12 he was Sardinian ambassador to St. Petersburg. Probably owing to his connexion with the Jesuits, he left Russia and returned to Turin, dying there Feb. 26, 1821. De Maistre was the founder of ultramontanistism, and a representative of the reaction against the materialism of the French illumination and against the Revolution. He upheld the temporal supremacy of the pope. Evil is a punishment, he thought, for original sin; war, the inquisition, and capital punishment are means of expiation.

**Maistre, XAVIER DE** (1763-1852). French writer. Born at Chambéry, a younger brother of

Joseph de Maistre, he served as a youth in the Piedmontese army. In 1799 he went to St. Petersburg, joined the Russian army, became a major-general, and married a Russian lady. He died at St. Petersburg, June 12, 1852. An

essayist of charm, he was a storyteller classed by Sainte-Beuve with Mérimée for the simple direct vigour of his style. His *Voyage autour de ma Chambre*, 1794, and its continuation, *Expédition Nocturne*, 1825, reminiscent of his temporary imprisonment at Turin, were influenced by Sterne. *Les Prisonniers du Caucase*, 1815, narrates personal experiences.

**Maitland.** Name of two places of New South Wales, Australia. East Maitland is a town on the right bank of the Hunter river, 120 m. by rly. N. of Sydney, and is a junction on the main line to Queensland for the North Coast rly. Originally a centre of an agricultural district, it has now largely developed coal production. There are brick and pottery works. West Maitland, 2 m. away, is connected with it by both tram and rly. Pop. of E. and W., 12,350.

**Maitland, SIR FREDERICK LEWIS** (1777-1839). British sailor. Born at Rankellour, Fife, Sept. 7, 1777, he took part in Howe's victory of the First of June, 1794, and was promoted lieutenant of the *Andromeda* in 1795. Two years later he joined St. Vincent's fleet in the Mediterranean, and while in command of the *Kingfisher* helped to capture enemy privateers. He served in the Egyptian expedition, 1801, and on July 15, 1815, when commanding the *Bellerophon*, received the surrender of Napoleon. During 1827-30 he commanded the *Wellington* in the Mediterranean, reaching flag rank in 1830. During 1832-37 he was admiral superintendent of Portsmouth dockyard, and then became commander-in-chief in the E. Indies and China. He died at sea, Nov. 30, 1839.

**Maitland, FREDERICK WILLIAM** (1850-1906). British historian. Born May 28, 1850, and educated at Eton and Trinity College, Cambridge, Maitland was a well-known scholar in international law, and was called to the bar at Lincoln's Inn in 1876. He devoted his time to the study of law and early institutions, and was soon recognized as perhaps the most original living authority on that subject. In 1884 he was made reader in English law at Cambridge, and four years later Downing professor of laws. His premature death, Dec. 19, 1906, was a severe loss to British scholarship.

F. W. Maitland,  
British historian

His greatest work is found in the *History of English Law*, 1895, written by him and Sir Frederick Pollock, and in *Domesday Book and Beyond*, 1897, which did more than any work of recent years to throw light on English society in the 11th and 12th centuries. He edited eight volumes for the Selden Society, which he helped to found, wrote *Justice and Police*, 1885, and *Township and Borough*, 1898, while his *Canon Law in England*, 1898, upset accepted theories. His lectures on the Constitutional History of England appeared after his death, ed. H. A. L. Fisher, who also wrote Maitland's life, 1910.

**Maitland, WILLIAM** (c. 1528-73). Scottish statesman. He is generally alluded to in history as

secretary Lethington, or as Maitland of Lethington. Having entered the service of the queen regent, Mary of Guise, he conceived a strong suspicion of French intentions regarding Scotland, and became a zealous advocate of an alliance with England. He was appointed secretary to Mary Queen of Scots, and addressed himself to the furtherance of a scheme by which England and Scotland might become united under Mary after the death of Elizabeth. Later he was superseded in Mary's confidence by Rizzio, but after the flight of Bothwell he tried to bring about a marriage between her and

Wm. Maitland,  
Scottish statesman

tions regarding Scotland, and became a zealous advocate of an alliance with England. He was appointed secretary to Mary Queen of Scots, and addressed himself to the furtherance of a scheme by which England and Scotland might become united under Mary after the death of Elizabeth. Later he was superseded in Mary's confidence by Rizzio, but after the flight of Bothwell he tried to bring about a marriage between her and

Norfolk. When this fell through he once more retired from court, and on his return was imprisoned in Stirling Castle. Later he became the acknowledged leader of the queen's party. Besieged by the English in Edinburgh Castle, he gave himself up, and died in prison at Leith, June 9, 1573.

**Maitreya** (Skt. *mitra*, friend). Future Buddha. Sometimes called the Buddhist Messiah, he is regarded as now living in the Tushita heaven, awaiting his earthly advent 5,000 years after Gautama Buddha attained to nirvana. In Tibet he is portrayed as a colossal bodhisattva, or Buddha elect, arrayed in priestly robes, and jewel-crowned. A lamaist temple in Pekin contains a wood image of the saint 70 ft. high; at Urga, Mongolia, is a gilt image 33 ft. high. In houses and shops his images represent a merry, obese priest, called by foreigners the laughing Buddha. See Buddhism.

**Maiwand, BATTLE OF.** Fought between the British and the Afghans, July 27, 1880. Under Ayub Khan an army of Afghans marched on Kandahar, from which fortress General Burrows with a small force issued to meet them, and attacked them at the village of Maiwand, 50 m. from Kandahar. Deserted by some of his allies, outflanked and seriously outnumbered, Burrows, after a hard fight, was obliged to fall back. His native troops broke in disorder, and the retreat became a rout. The honour of the day rested with the Berkshire Regiment, which covered the retreat and had ten officers and 275 men killed. See Afghan Wars.

**Maize** (*Zea mays*). Cereal, also known as corn, Indian corn, and mealies. One of the two most important cereals in the world, it equals if not surpasses rice in the total quantity of grain produced. A stout annual grass, it is in appearance quite unlike any of the wild or cultivated grasses of the U.K. Male and female inflorescences are separate, the male, called the tassel, being terminal, the female lateral and enclosed by subtending leaves, from between the apices of which the long stigmas, called silks, emerge at flowering time. After fertilisation the female inflorescence produces

the typical ear, which consists of the woody core or cob closely set with paired rows of grain. Maize is naturally cross-fertilised and loses vigour rapidly on self-fertilisation.

Like the potato and tobacco, it is a New World plant and probably originated primarily in Mexico or Central America. Thousands of varieties differ widely in vegetative and grain characters. Plant height may range from 2 ft. to 20 ft., and time between planting and maturity from 60 days to over 10 months. Having this wide variability, maize has proved particularly suitable as a subject for studies in heredity. It is also the first crop in which hybrid vigour has been exploited agriculturally, giving increases in great yield.

The British climate is unsuitable for cultivation of maize as a grain crop, but it is grown to some extent for fodder, the leaves and stems being cut green and fed to livestock or made into silage. Sweet corn, in which the unripe grain is used as a vegetable, is raised in gardens. The grain, poorer in protein than wheat, is a staple foodstuff in tropical countries, and vast quantities are also fed to livestock. Flour is prepared from the milled grain; the coarser grades are termed hominy, and the finer cornflour.

**Majestic.** British steamship. Originally the German liner *Bismarck*, she was taken over by the White Star line after the First Great War. Her displacement was 56,000 tons, length 958 ft., and average speed 23 knots. She was sent in 1946 to shipbreakers in the Firth of Forth. Earlier the name belonged to a British battleship of the First Great War, torpedoed by the German submarine U23 off Gallipoli, May 27, 1915.

**Majesty.** Title of honour. In England it became the official style for the sovereign in the reign of James I, though used earlier, the full form now being His Most Gracious Majesty and The King's Most Excellent Majesty. A king of Spain was styled His Catholic Majesty; of France, Most Christian and Catholic Majesty; of Portugal, Most Faithful Majesty; of Hungary, Apostolic Majesty.

**Majolica.** Name given to two kinds of ware. One is an Italian enamelled ware covered with an

Maize. Left, male flower and leaves; right, cob

opaque tin-enamel glaze which formed the surface for a painted design, and the other is a ware covered with a semi-fluid paste of white or cream colour on which designs were scratched with a point.

True or tin-glazed majolica was first produced successfully by Luca della Robbia about 1440. His enamel was composed of tin, copper, antimony, and other metals, and was fixed by firing in a kiln. His nephew made the process the foundation of a thriving industry. Deruta, near Perugia, was one of the first Italian towns to set up a workshop for majolica, and here, in the 16th century, the art attained its highest degree of excellence in style, design, and colouring. Faenza and Pesaro were other famous centres, and Castel Durante, near Urbino, produced wares finer than those of other factories, in that the clay found in the neighbourhood gave a better earthenware body. Sumptuous majolica was also produced at Urbino, Gubbio, and other towns in N. Italy. Every form of plate, dish, or vase is represented in majolica ware.

Early in the 16th century the lustre colours of Hispano-Moresque were introduced and utilised, especially by Giorgio Andreoli, a great lustre painter of Gubbio. Some of the most famous artists of the Renaissance designed for majolica ware, ornamented as this was with every kind of human and animal forms, Biblical and historical scenes. The form preferred by many connoisseurs is a large simple bowl covered with arabesque scroll work. Majolica is sometimes called *Raffaële* ware, because the designs of Raphael were used continuously from the 15th to the 18th century. Clever reproductions of old pieces fetch good prices, though not the sums paid for fine authentic pieces. See Della Robbia; Pottery.

**Major.** In the British Army, officer holding rank next above a captain and below a lieutenant-colonel, and thus the lowest grade of field officer. Majors command squadrons of cavalry, batteries of artillery, companies of infantry, R.E., R.A.S.C., W.R.A.C., etc., and hold grade II staff appointments; the second-in-command of a regiment, battalion, etc., is also a major. Promotion to the rank in peace time is automatic after a period

Majolica. Vases and plate of Wedgwood's majolica ware, with paintings by E. Lessore

varying according to the arm but usually 17 years. The president of a district court-martial or field general court-martial is normally a major. The equivalent rank in the Royal Navy is a lieutenant of eight years' seniority, and in the R.A.F. a squadron-leader. The badge of rank is a crown. The rank exists in the American and Italian armies, and existed in the German; in the French army the corresponding rank is commandant, the term major signifying a medical officer.

**Major** (Ital. *maggiore*, greater). Term in music referring to intervals of seconds, thirds, sixths, and sevenths, reckoned in the ordinary scale of their lower notes. Thus:

are major intervals because the notes D, E, A, and B occur in the scale of their lower note (C). The fourth and fifth from the keynote are termed perfect instead of major. The major scale and major triad take their names from their thirds:

Theoretically, there is a difference between the whole tones from 1st to 2nd, and from 2nd to 3rd, degrees of the major scale. C to D, above, is a major tone, D to E a minor tone. Similarly there is a theoretical difference between the size of such semitones as F to F sharp and F sharp to G. This difference is called a comma, but in practice it is ignored.

**Major** OR **MAIR**, JOHN (1469-1550). Scottish scholar. Born at Glegghornie, in West Lothian, he was educated at Haddington, Cambridge, and Paris. He lectured at the Sorbonne and elsewhere in

Paris, where he lived 1493-1518. Returning to Scotland, he lectured in the university of Glasgow, and in 1522 was transferred to St. Andrews. In 1525 he removed to Paris, but returned home in 1531 to become principal of St. Salvator's College, St. Andrews. George Buchanan and John Knox were among his pupils. Major is chiefly known by his history of

Greater Britain, written in Latin and published in 1521. It has been translated into English, with a biography of the author by A. J. G. Mackay, 1892.

**Major Barbara.** Comedy by Bernard Shaw, produced Nov. 28, 1905, at the Court Theatre, London. The hero of the play, a satire on indiscriminate philanthropy, is Undershaft, a great armament manufacturer, who, denouncing poverty as the worst of crimes, is responsible for the retirement of his daughter Barbara from the Salvation Army. In the original production the title rôle was played by Annie Russell; most noteworthy of actresses in revivals were Sybil Thorndike and Catherine Lacey, while Wendy Hiller played in the film version, 1941.

**Majorca** (Sp. *Mallorca*). Island in the Mediterranean Sea, belonging to Spain. Situated 115 m. S.S.E. of Barcelona, it is the largest of the Balearic Isles, being 60 m. in length by about 48 m. wide, with an area of 1,325 sq. m. The coast line is indented with many bays and harbours, and the surface is mountainous, a range of mts. running along the N.W., the culminating point being Puig Mayor, with an alt. of about 5,000 ft. The soil is fertile and the climate usually temperate. The island is generally well watered, and produces wine, oil, cereals, figs, oranges, and other fruits in abundance. There are many mineral and saline springs. Coal, iron, and cinnabar are mined, marble and slate are quarried, the marble of Santany being celebrated, while a number of semi-precious stones, including jasper, serpentine, agate, alabaster, and rock crystal are found.

Of the many stalactite caves, among the finest in Europe, the Cueva del Drach and the Cueva

Major. Badge of rank on shoulder strap

de Artá are the most remarkable. The most typical industry is the making of glazed pottery, especially majolica. Brandy is distilled, and silk is manufactured to a limited extent. Sheep, mules, pigs, and poultry are reared. There are about 50 m. of rly., linking Palma, the capital, with Manacor, Inca, La Puebla, Alcudia, and Felanitx. Many of the Spanish nobility have palaces in Majorca. At Miramar is the beautiful seat of the Archduke Ludwig of Salvator; at Valdemosa, George Sand wrote her *Spiridon* in 1838. The Albufera Morass, 5,000 acres in extent, in the N.E. of the island, was drained by a London company in 1865-70. The island was peopled by Moors when conquered by Jaime of Aragon, towards the close of the 13th century, and in 1343 it was taken over by Aragon. In the civil war, 1936-39, Franco's forces had a naval base at Palma. Pop. 272,450. See Balearic Isles.

**Major-General.** In the British army the lowest grade of general officer; and highest rank (replacing chief controller, 1950) in the W.R.A.C. A maj.-gen. commands a division; the chief of staff, deputy adjutant - general, deputy quarter-master-general, etc., of an army or equivalent h.q. also hold maj.-gen.'s rank. Promotion is by selection. The badge of rank is a crossed sword and baton, with a star above, worn on the shoulder-strap; red gorget-patches with a line of gold oak-leaves are worn on the collar, and the cap has a red band. The cap-badge is the crossed sword and baton surmounted by a lion and a crown and surrounded by a wreath of laurel. Oak-leaves on the peak of the cap were abolished during the Second Great War. The equivalent rank is rear-admiral in the Royal Navy and air vice-marshal in the Royal Air Force. The rank exists in the American, and existed in the German, army; the corresponding rank in the French army is *général de division*.

Major-general was the name given by Oliver Cromwell to the officers in command of the twelve administrative districts into which he divided England for his system of government by military police, established Oct., 1655.

**Majorian.** Roman emperor of the West, A.D. 457-461, whose full name was Julius Valerius Majorianus. Though owing his elevation to the barbarian Ricimer, Majorian was a sound ruler, being the author of measures for the relief of his subjects from the taxation by which they were sorely oppressed. He also passed laws for the protection of ancient monuments, the use of which for building material had become common. A great fleet which he sent against the Vandals was destroyed by them at Carthago Nova, whereupon he made peace. Majorian, owing to the jealousy of Ricimer, was forced to abdicate, and died five days later.

**Majority** (Lat. *major*, greater). Term used in several senses. The idea of the majority is at the root of representative institutions in Great Britain and the U.S.A., in which countries, with some exceptions, the receipt of a majority of votes cast means election, whether of one or of thousands. Similarly the votes of the majority, whether large or small, decide questions of legislation: for instance, the Act of Settlement, 1701, was passed by a majority of one. From politics the idea passed into business, differences of opinion about the conduct of public companies being usually decided by a majority, either of directors or of shareholders.

A majority is of three kinds. It may be, as in elections in the U.K., a majority over the next candidate, but not necessarily a majority of the votes cast; it may be a majority of the total votes cast; or, as is required in some cases, of all who are entitled to vote. The president of the U.S.A. requires a majority of the last kind for election. To avoid the results which follow from the first method, by which a candidate who receives only a minority of the total votes may secure election, electoral devices have been adopted, chief among them being proportional representation, introduced *e.g.* in the Netherlands by an electoral reform act of 1917. Sometimes a bare majority is insufficient—*e.g.* for acceptance of foreign treaties by the U.S. Congress a two-thirds majority is required. Similarly, in the assembly of the United Nations, a two-thirds majority is necessary, the effect of this being

sometimes to prevent action, even though a majority in favour of a particular course of action may exist. (See Proportional Representation; Representation; Second Ballot; Vote.) For details as to majority verdicts by juries, see under Jury.

To attain one's majority is to cease being a minor and to reach the full status of manhood. It is usually fixed at 21 years of age, but is sometimes 18 or lower. To obtain a majority is to reach the rank of major. To pass over to the majority, used euphemistically of death, is a phrase dating back to the days of Greece and Rome, and the great majority is also frequently used for the dead.

**Majuba Hill.** Eminence in Natal, at the N.E. end of the Drakensberg range. Its height is 7,000 feet. During the war between the British and the Boers in 1880-81, Sir G. Colley, in command of the former, decided to seize the hill. He took with him 500 men, and on the night of Feb. 27, 1881, the summit was reached and occupied. In the early morning, however, the tired

men were attacked by the Boers, who, after some hours of desultory firing, got to the summit and drove down the British. Colley was killed and about half his force lost. See South Africa.

**Majunga** OR **MOJANGA.** Province and town of Madagascar. The town is 230 m. N.W. of Antananarivo, on the N.W. coast at the mouth of the Ikopa river. It has some trade, especially in rubber from the neighbouring district, and there are meat preserving factories. Pop. 23,684.

**Makalla, MOKALLA, OR MUKALLA.** Chief harbour of the Hadhramaut, S. Arabia. It lies about 300 m. E. of Aden.

**Makaroff, STEPHAN OSSIPOVICH** (1848-1904). Russian sailor. Born at Kiev, he entered the navy

Stephan Makaroff,  
Russian sailor

as a boy and saw service in the war with Turkey, 1877-78. With intervals he was employed in hydrographic surveys during 1881-96, and in 1901 he made an Arctic ex-

Majuba Hill. Monuments to the fallen erected on the battlefield

pedition. Governor of Kronstadt, 1899-1904, on the declaration of war with Japan in the latter year he was given command of the Far Eastern fleet. He went down with his flagship, the Petropavlovsk, sunk by a mine off Port Arthur, April 13, 1904.

**Makart, HANS** (1840-84). Austrian painter. Born at Salzburg, May 28, 1840, he studied painting at Vienna and Munich. In 1869 the emperor Francis Joseph invited him to Vienna and in 1879 he designed a large allegory called Progress, in honour of the emperor. That year he became professor of historical painting at Vienna academy. He also decorated the Vienna museum of art. He died in Vienna, Oct. 3, 1884.

**Make-up.** Term for the application of powder, rouge, etc., to the face, neck, and hands by women. Between the First and Second Great Wars, social habits altered completely in the matter of make-up. Off the stage, this was previously not used overtly by respectable women except for a slight dusting of face-powder or a colourless nail-polish; moreover, such make-up was always "naturalistic"—intended to be taken for natural beauty. After about 1920 make-up came to be used by the majority of women, young and old, in nearly all classes. The cosmetic trade expanded enormously, while chemical research added new ingredients to the preparations available.

This revival of the ancient art of painting the face was accompanied by an almost equally ancient disregard for the actual appearance of the face under treatment. Instead of touching-up the face she had, a woman tried to paint on to her own the face she wished she had. If she admired the sophisticated, the Cleopatra, or the Juliet, the *femme fatale* or the sweet-Dolly-Daydream type, she strove to impose this upon her own features, which were sometimes intractably of a different nature.

This cult of beauty raised the general level of appearance, turned a good trade into a money-making industry, and proved health-giving in so far as it demanded personal hygiene of a sort once practised almost exclusively by the leisured classes, e.g. care and cleanliness of the skin, the hands, and the teeth.

The list of cosmetics which a woman who has the time and money can use is long and lengthens every day. Its cost varies, not so much because of the price of the ingredients, since even

good ingredients are not very expensive (though some perfumes used in cosmetics are), but because firms catering for luxury-loving clients put their products into expensive containers of china, glass, and quartz.

The purpose of the practice of make-up is an object of interest to moralist, philosopher, and sociologist. Whatever its basic purpose—probably the attraction of man—it reached in the 1940s a pitch at which it became virtually compulsory, women of all classes, from factory and office workers to those in society, being as reluctant to appear in public without their customary make-up as with unwashed hands or untidy dress.

One woman may use only powder and lipstick (or a variety of lipsticks each chosen to go with a particular costume, for indoor or outdoor wear, or to suit the degree of lighting expected). Another for her eye make-up alone may use several pots, brushes, and bottles; for her skin vanishing cream, foundation lotion, several shades of powder; and a range of colours in nail-varnish. "Vanity" cases, once the size of a cigarette-case, became much larger containers which were miracles of compression much indebted to plastics for their many little pots and phials. These cases might be neat and workmanlike or glittering and jewelled. Where the handbag of an older generation had a pocket for powder-box and lipstick, the luxurious vanity-case of the mid-twentieth century included a small space for money and latchkey.

Theatrical make-up is a specialised form, in which grease paints of various tints and powder are used to correct the effect of stage lighting or to conform to the age and appearance of the character an actor is representing. There are "straight" make-ups and "character" make-ups, and the latter may require the use of wig, crepe hair, nose putty, water dyes, etc. Make-up for the film or television camera is even more specialised, the strong lighting demanding a flattening or deadening of the natural colouring of the face in order to avoid any appearance of discoloration or unpleasant greasiness in the photographic image.

**H. Pearl Adam**

**Makhach Kala.** Seaport of the U.S.S.R. Capital of Daghestan A.S.S.R., it lies on the W. shore of the Caspian Sea, about 100 m. E. by S. of Grozny, on the Azov-Baku rly. There is an oil pipe-line between the port and Grozny, and

the oilfields provide the main employment for a pop. of 86,847.

**Making-up Trade.** Term used in two significations: the process of making up various cloths and materials into clothing; and the making up of large quantities of cloths, etc., into bundles of more convenient size for dispatch to the wholesalers in the textile trades.

The principal branches of the making-up trade concern tailoring, millinery, and dressmaking. Millinery and dressmaking, although together with mantle making they are sometimes carried on by the same employer, are distinct trades. They have similar conditions of labour, and are united by the bond of union in trades of dress, that is, the sewing-machine.

The making up of large quantities of cloths, etc., into convenient bundles for distribution to the wholesale trade in the U.K. is mainly confined to the manufacturing districts of Manchester, Leeds, Bradford, and parts of Scotland. The cloth is wound on to small boards, cartons, blocks, or cards, and is delivered in flat or round packages.

**Mako.** A town of Hungary, in Csanad co. It is situated near the Maros river, close to the Rumanian frontier, and is 17 m. by rly. S.E. of Hodmező-Vásárhely, and 19 m. E. of Szeged, with which it is joined by road and rly. Pop. est. 35,000.

**Makololo.** Section of the Basuto branch of the S. Bantu peoples in S. Africa. About 1823, under Sebituana, they trekked from the Vaal headwaters across the Kalahari and Bechuanaland, reaching the Zambezi about 1835. Driven N. by the Matabele, they subdued the Barotse, and imposed upon them their Sesuto speech. The Barotse virtually extinguished them in 1865. A party who accompanied Livingstone coastwards returned to the right Shiré bank, where two Makololo chiefs founded short-lived states. Themselves extinct, their speech is still the *lingua franca* of the upper Zambezi basin.

**Makran.** S. portion of the state of Kalat, Baluchistan, Pakistan, lying on the Arabian sea coast. The rivers, usually dry, are occasionally flooded, and the subsequent pools yield irrigation water. Fogs are frequent and mosquitoes abound. The chief crops are dates, the principal groves being at Panjgur and Keoh. Most of the people are Jats. When the boundary of Baluchistan was delimited, the W. of Makran was included in Persia Area, 23,269 sq. m.

**Makua.** Negroid tribes of the N. coastlands of Mozambique. Aboriginal clan-groups, allied to the Yao, they retain their racial and cultural characters unspoiled by Arab and Indian contact. Their main Bantu language—also called Moçambique or Tugulu—is spoken S. of the Lurio river. The N. Makua dialect extends to Rovuma river; W. Makua or Lomwe ranges to the Lujende valley. See Bantu; Negro.

**Mal** or **Malē.** Aboriginal tribe of cultivators in Madras, Hyderabad, and Bengal. Numbering over 2,000,000, they are short, dark, sturdy hillmen, whose customs have been veneered with Hinduism. Some are employed as village watchmen. In 1770 the British encountered them as predatory freebooters raiding from the foothills to the Ganges, and recruited from them a corps which became the Bhagalpur Rangers.

**Malabar.** Division of Madras state, India. It forms the portion of the Malabar coast strip N. of Cochin, S.W. of Coorg, and S. of S. Kanara. It lies W. of the Palghat gap. Only a third of the total area is cultivated. The rainfall averages 116 ins. annually. Rice is the only food grain, the other crops being coconuts, rubber, etc. There is a rly. from Madras to Calicut, which is the largest town, and up the coast to Mangalore. In 1922 the two Malabar states of Travancore and Cochin were transferred to control of the govt. of India. Area, 5,790 sq. m. Pop. 3,929,425. *Consult* Malabar and the Portuguese, K. M. Panikkar, 1930.

**Malabar Coast.** Southern half of the W. coast strip of the Deccan, India. It has an average width of 40 m., and lies between the seashore and the hills which are the scarped face of the Deccan tableland. The Malabar coast is in Madras, and is the S. continuation of the Konkan coast of Bombay; it is reached from the E. through the Palghat gap. The rivers are short, the soil is alluvial, and the rainfall heavy, so that two or three crops of food grains are obtained. There has been a great increase in the production of cultivated rubber and copra. The coast is fringed by a series of connected lagoons.

**Malacca.** A territory of the Federation of Malaya. The terr. is bounded N. by Nigri Sembilan and E. by Johore, and extends for 42 m. along the strait of Malacca N.W. of Singapore. It has a pop. of 236,087, and an area of 640 sq. m. Its capital, Malacca (pop. 45,010) is situated on the Malacca river, 154 m. N.W. of Singapore, with

which it has rly. connexion, as also with Tampin in Nigri Sembilan. It was captured by the Portuguese in 1511, by the Dutch in 1641, and by the British in 1795. Temporarily restored to Holland in 1818, it became a British possession in 1825 by exchange for Bencoolen in Sumatra. Malacca was formerly an independent country of S.E. Asia. It consisted of a long, narrow strip of land stretching S. from Siam. See Malaya, Fed. of.

**Malacca Bean** (*Semecarpus anacardium*). Alternative name for the Marking Nut Tree (*q.v.*).

**Malacca Strait.** Channel between the Malay Peninsula and the island of Sumatra, connecting the Indian Ocean with the China Sea. About 500 m. in length, it varies in width from 30 m. to 195 m. Both shores are low-lying and swampy.

**Malachi.** Minor prophet. Generally accepted as the author of the last book of the O.T., he may possibly have been a contemporary of Ezra and Nehemiah; but the name is in form identical with the Hebrew for "my messenger," and it may be a contraction of Malachijah, messenger of Jah. The writer deprecates the degeneracy of the priesthood and the general falling-off in religious observance, urges repentance, and declares that the Day of Judgement will come suddenly. He deals with the prosperity of the ungodly, and foretells the coming of another Elijah (John the Baptist) to prepare the way for the Messiah.

**Malachite** (Gr. *malachē*, malow). Bright green copper ore used to some extent as an ornamental material. Its colour is due to the presence of a basic carbonate of copper. The main deposits are in the copper mines of the Belgian Congo, the Urals, and in the S.W. of copper areas in the U.S.A. Smaller deposits occur in Cornwall, where copper minerals are present. Malachite has been used as a pigment, although it is highly poisonous.

Malacca, Federation of Malaya. The old Stadthouse, dating from the time when the town belonged to Holland

**Malachite Green.** Aniline dye prepared by the action of benzaldehyde upon dimethylaniline in the presence of hydrochloric acid or other condensing agent, and oxidation of the product, tetra-methyldiamidodiphenyl-methane. First described by Foster in 1877, it is used for dyeing and printing wool, cotton, silk, and artificial silk, being much faster on rayon than on natural fibres. It is also used for dyeing leather, straw, etc., and for coating paper.

**Malachy** or **MAELMAEDHOIGUA MORGAIR** (c. 1094-1148). Irish saint. Born in Armagh, he entered the monastery founded by Iomhar Ua-h-Aedhagan. Ordained priest in 1120, he became assistant to Bishop Kellach or Celsus; abbot of Bangor, co. Down; and bishop of Connor, 1124. He established the monastery of Ibrach; was archbishop of Armagh, 1132-36; and bishop of Down. Venerated for his sanctity and learning, he was appointed papal legate by Innocent II. He died and was buried at Clairvaux while on his way to Rome, Nov. 2, 1148. His life was written by S. Bernard. He was canonised by Clement III in 1190 and is commemorated on Nov. 3. Another Malachy, of Ireland, a Franciscan, flourished c. 1310, and another (Malachy Macaeth) was bishop of Elphin, 1307-12, and archbishop of Tuam, 1312-48.

**Malacology** (Gr. *malakos*, soft; *logos*, science). Branch of zoology which deals with the mollusca. Whereas conchology deals chiefly with the form and design of the molluscan shell, malacology is concerned with the anatomy of the entire animal upon which modern classification of the molluscs is based. Details of the nature of the radula, reproductive organs, and gills are particularly important. See Conchology; Mollusca.

**Malacopterygii.** Name given to a group of fishes which have the dorsal fin supported by soft rays instead of spines. The cod is a typical example.

**Malacostraca** (Gr. *malakos*, soft; *ostrakon*, shell). Sub-class of Crustacea, including all the more highly organized forms. The name is somewhat misleading to the student who considers its derivation, since this sub-class includes the hard carapace of the

crabs and lobsters, as well as the thin plates of the shrimps and wood-lice; but it was given originally as a comparative term, to distinguish the exoskeleton of these animals from the shell of the Mollusca. The body consists of twenty segments or somites, of which six compose the head, eight the thorax, and six the abdomen, segments 2 to 20 inclusive bearing a pair of many-jointed appendages, which are variously modified into antennae, jaws, walking legs, and swimming organs, according to their location. The larvae leave the egg in the zösea stage of development. The sub-class includes five divisions—Phyllocarida, Syncarida, Pterocarida, Hoplocarida, and Eucarida. See Crustacea.

**Malade Imaginaire, LE** (The Imaginary Invalid). Molière's last comedy, produced at the Palais-Royal, Paris, Feb. 10, 1673. The central character, Argan, a selfish hypochondriac, originally acted by the author, wishes his elder daughter to marry a doctor, so that he may always have one at hand. Acting, however, on his brother's advice, he pretends to be dead, discovers the designing hypocrisy of his second wife, and the devotion of his daughter, and consents to the daughter's marriage to her lover if the lover will become a doctor. The brother again comes to the rescue by persuading Argan to become a doctor himself, and the comedy ends with the burlesque ceremony of Argan's admission to the degree of M.D. The 17th cent. medical man is severely caricatured. For the ballet scenes the music was written by Charpentier.

**Maladetta** (Sp., cursed). Central and loftiest section of the Pyrenees. The range trends S. from the main chain, into the prov. of Huesca. Mt. Aneto, or Pic de Néthou, has an alt. of 11,168 ft. See Pyrenees.

**Málaga.** Maritime prov. of S. Spain. It is bounded N. by Córdoba and Seville, W. by Cadiz, E. by Granada, and S. by the Mediterranean, its coast-line being broken by the Bay of Málaga. Agriculture is the principal pursuit. The chief products are wine, oil, wheat, grapes, raisins, oranges, lemons, almonds, figs, esparto, sugar-beet, and cane. It contains much mineral wealth, including iron and lead, and there are numerous mineral springs. Scattered throughout the prov. are numerous flour-mills, distilleries, wine-presses, and oil factories.

Málaga, Spain. Panoramic view of the city; the cathedral, begun about 1528, was completed to its present state in the 18th century

Owing to the hilly nature of the province, transit is difficult. The coastal fisheries are important. Area, 2,813 sq. m. Pop. 715,674.

**Málaga.** Seaport and watering-place of Spain, capital of the prov. of Málaga. The ancient Malaca,

Málaga town arms

it stands at the mouth of the Guadalmedina river, 65 m. N.E. of Gibraltar, and 120 m. by rly. S. of Córdoba. Protected by hills, it has an excellent climate, making it comparable to the Riviera. Dominated by a ruined Moorish citadel, and the 13th century castle of Gibralfaro, the old town is crowded, its streets being narrow and the houses lofty; but the new suburbs are well built, and stretch into the surrounding country cultivated with vineyards and gardens. The Paseo de la Alameda is one of the finest thoroughfares.

The harbour of Málaga is deep and commodious, with several moles, and in it ships are protected from all winds. The river alternates from a dry watercourse to a swollen torrent. There are a cathedral (unfinished) with a lofty spire, an episcopal palace, opera house, bull ring, and hospitals, besides a park, pleasant promenades, and an English cemetery. Málaga is noted for its wine, which is largely exported. Other exports include raisins, olive oil, almonds, fruit, sugar, palmetto hats, bird seed, iron, and lead. Manufactures include pottery, mosaics, chocolate, chemicals, spirits, cotton, linen, and lithographed work. Founded probably by the Phoenicians, Málaga became important under the Romans and later under the Moors. From the latter it was wrested by the Christians in 1487. Pop. 238,857.

In the Spanish Civil War, Málaga, which had been an important Republican stronghold, was captured by the Nationalists on Feb. 8, 1937. Its fall ended the winter deadlock between the two sides. The Nationalist assault was made irresistible by Italian and German help in aircraft and men on a new and greater scale.

**Malagasy.** The name popularly denoting the indigenous population of Madagascar. Numbering over 3,000,000, they represent ancient negroid settlements subsequently dominated by immigrations, extending over 2,000 years, of Indonesian bands coming from S.E. Asia, primarily in outrigger canoes with mat sails. Pre-Mahomedan Hinnyars from Arabia exerted political and cultural influence upon them, as did settlers from India.

Thus the tall, dark, frizzy-haired, long-headed Sakalava of the W. slope are distinguished from the chestnut-hued, crisp-haired Betsimisaraka of the E. coast, derived from the earlier pastoral Arab immigrations, and from the short, olive, straight-haired, round-headed Hova of the central highlands, whose aspect is almost Javanese. The prevalent Austronesian speech, introduced before Malay was affected by Sanskrit, and the Oriental culture, such as oblong pile-houses, vegetable clothing, blowguns, dug-outs, outrigger canoes, Asiatic bellows, terrace-cultivation of rice, taboo customs—locally called *fadi*—infanticide, and the like, suggests that the original negroid elements emanated from sea-going Melanesians and not from Bantu Africa. Swahili slave-dhows introduced more recently an African negro strain. See Madagascar.

**Malakand.** Pass in the N.W. Frontier Province, Pakistan. It leads from the valley of the Kabul

river to that of the Swat. A branch rly. runs from Naushahra (Nowshera) on the Kabul and on the Peshawar rly. to Dargai at the foot of the pass. In 1897 the Swats made a fierce attack on the British post at Malakand. In the ensuing successful operations of the Malakand field force, Winston Churchill, served as war correspondent for *The Pioneer*.

**Malakoff** OR **MALAKOV**. A fort of Sevastopol, taken by the French in the Crimean War, Sept. 8, 1855. The batteries were stormed with such fury that in three minutes the French won the fort. Gen. Pélissier, their commander-in-chief, was made duke of Malakoff. The action is commemorated by a vast triptych at Versailles.

**Malan**, ADOLPH GYSBERT (b.1910). S. African airman. Born at Wellington, S. Africa, he was the son of William Adolph Malan. Educated in S. Africa, after service with the Union Castle S.S. co., he joined the R.A.F., 1936, becoming a fighter pilot. In 1940 he won the D.F.C. at Dunkirk and, while serving in Fighter Command in the Battle of Britain, the D.S.O. Later he was awarded bars to both. He commanded Biggin Hill Fighter station, 1943, and a T.A.F. wing, 1944. A member of the staff of the R.A.F. staff college 1945-46, "Sailor" Malan retired 1946 with the rank of group captain.

**Malan**, DANIEL FRANÇOIS (b. 1874). S. African politician. Born at Riebeeck W., Cape prov., May 22, 1874, he went to Stellenbosch and the univ. of Utrecht, Holland, became a minister of the Dutch Reformed Church, and entered the Union parl. 1917 as member for Cape prov. Minister of the interior, public health, and education in the Nationalist govt. of 1924, he resigned 1933, and led the Herenigde (Nationalist Republican) party against the Smuts-Hertzog coalition.

Malan moved in the house of assembly, Jan. 12, 1942, that the Union should withdraw from the Second Great War and separate from the British crown. He was exonerated, 1947, by a select committee from charges of dealing with German agents during the war. In the 1948 election his party won 70 seats against the 65 of Smuts's party, and Malan became prime minister. See South Africa.

**Malaprop**, Mrs. Character in Sheridan's comedy, *The Rivals*, who is remarkable for her misapplication of big words. She illustrates her weakness thus: "Sure, if I reprehend anything

in this world, it is the use of my oracular tongue and a nice derangement of epitaphs." This form of humour had been employed by earlier writers (Shakespeare's Dogberry; Fielding's Mrs. Slip-slop; Smollett's Tabitha Bramble), but Mrs. Malaprop stands as the typical misuser of words, and her name, coined from the French *mal à propos*, meaning the reverse of well said, is the origin of malapropism, i.e., a word misapplied.

**Malapterurus**. Genus of African catfish. They are remarkable for their powers of giving an electric shock. *M. electricus*, found in the Nile, reaches a length of 4 ft. See Electric Fish.

## MALARIA: ITS CAUSE AND PREVENTION

Sir Philip Manson-Bahr, C.M.G., D.S.O., M.D., F.R.C.P., Consulting Physician to the Hospital for Tropical Diseases, London

*An account by a world-famous authority of the discovery of the cause of malaria, a disease that has sapped the vitality of millions of human beings; of remedies; and of ways to prevent it*

Malaria (Ital. *mala aria*, bad air) is a common term for a group of fevers of man caused by parasites which inhabit and multiply in the red blood corpuscles. Formerly it was known by many other names such as ague, marsh fever, remittent fever, etc.

In 1880 Laveran discovered the parasite of malaria, which was named plasmodium, and in 1894 Patrick Manson enunciated his mosquito-malaria hypothesis, which paved the way for the final discovery by Ronald Ross in 1898 that if a certain species of mosquito be fed on the blood of birds infected with a blood parasite, closely resembling that of the malaria organism of man, the plasmodium, after passing through various stages in the stomach wall of the insect, could be transmitted to other birds by the bite of that mosquito. This discovery was confirmed in man shortly afterwards with the human parasite by Grassi in Rome, and subsequently by Bignami and Marchiafava. Almost equally important, only one genus of mosquito, termed *Anopheles* by Grassi, could subserve this particular function, though why this should be so has not been determined. Experiments undertaken in 1900 at Ostia, one of the most malarious localities in the Roman Campagna, at Manson's instigation, confirmed the mosquito-malaria hypothesis: for three most malarious autumn months of that year, Drs. Low and Sambon, together with Signor Terzi, and their servants, lived in a specially constructed hut, the doors and windows of which were

protected against mosquitoes by wire gauze. During the daytime they roamed freely about the neighbourhood. They observed no precautions against malaria beyond retiring to their hut from sunset to sunrise. Although their immediate neighbours, the Italian peasants, were stricken with malaria, their use of the mosquito-proof hut at night afforded complete immunity from this fever to its occupants.

Shortly afterwards the reverse of this historic experiment, also devised by Manson, was carried out in London. *Anopheles* mosquitoes, infected with malaria after having fed on suitable patients in Rome, were dispatched in a specially constructed cage to London, and were then made to bite two volunteers, one of whom was Manson's son, Patrick Thurburn; after a period of ten days both volunteers developed malaria and the parasites were demonstrated in their blood. Since that time research work on malaria parasites and mosquitoes all over the world has established that out of over 250 known species of *Anopheles* some 64 are capable, under suitable climatic and environmental conditions, of transmitting malaria.

The geographic distribution of malaria is, therefore, governed by conditions favourable to the development of large numbers of mosquitoes capable of carrying the malaria parasite. (Each species of mosquito has its special habitat, special feeding habits, and special breeding places.) It is also governed by the presence of human beings infected with the malaria

parasite at the right stage of its development: for instance, in villages subject to malaria infected children are more dangerous than adults. The malaria parasite requires a high average temp. (over 60° F.) and high humidity for its development inside the mosquito. Therefore, as a general rule, malaria is most prevalent in the region of the equator, where these conditions most generally prevail, and gradually diminishes N. and S. towards the Arctic and Antarctic.

#### Distribution and Causes

The distribution of malaria has altered in the course of years. In some places advancing civilization has caused it to die out, as in parts of N. America, in most of N. Europe, and in England. Formerly tertian and quartan fevers were not uncommon in E. and S. England, but, although a certain number of benign tertian malaria cases originated after the First and Second Great Wars in the S.E. (Kentish marshes and I. of Grain), yet England as a whole has become singularly free of it. It occurs to the edge of the Arctic Circle, in Sweden and Finland, and in N. Russia (Archangel, 65° N.) where some British troops became infected in 1919. It is widely distributed in Central and S. Europe, Africa, Asia, New Guinea and Micronesia, Central and S. America. In the W. Indies, too, it is common, with the exception of Barbados (where it was introduced in 1927, but was immediately stamped out). The islands of the W. and S. Pacific are free of it as there are no anopheles mosquitoes there, and so was Mauritius until it was introduced in the middle of the 19th cent. Malaria is still common in southern U.S.A., and in Canada a focus exists on the N. shore of Lake Ontario (42° N.).

Malaria in man is now known to be caused by the entry into the blood of any of the following four species of parasite: *Plasmodium vivax* (benign tertian), *P. malariae* (quartan), *P. falciparum* (malignant or subtertian), and *P. ovale* (oval tertian). Each of these parasites has a life-cycle and periodicity which are responsible for a distinctive type of fever; for instance, the life-cycle of *P. vivax* and *P. ovale* in the blood occupies 48 hours and produces a tertian fever, or attacks, on alternate days: that of *P. falciparum* occupies about the same time and produces a subtertian type of fever; that of *P. malariae* produces a quartan periodicity with fever every fourth day.

Of these fevers, the subtertian, confined to the hottest and most humid districts, is found in S. Europe (S. Italy, Sicily, Greece), W., Central, and E. Africa, S. India, Malaya, S. China, New Guinea, Central and S. America. It has not the same precise and definite periodicity as the other three, but produces febrile attacks of great severity which vary greatly in length and in virulence. It may produce alarming complications: when the parasites multiply inside the vessels of the brain it causes coma or cerebral malaria. Sometimes the abdominal vessels are affected, when symptoms resembling severe dysentery or cholera are evoked; and in certain circumstances it is the cause of the dreaded and fatal blackwater fever. The underlying pathology of this malignant type is due to the method of development of the parasite, which evokes a stickiness of the red blood corpuscles in which it lives, causing them to agglomerate and clump together, thus impeding or actually blocking the blood flow.

The character of any one of these fevers may be modified or altered by the maturing in the blood at different periods of two broods of a particular parasite, or by infection of the individual with two or even three different species of parasite at the same time. These parasites tend to have a somewhat different geographical distribution. The benign tertian is world-wide; ovale tertian appears to be confined to Africa, mainly to the West Coast; quartan has a local and patchy distribution, being found mainly in Malaya and Ceylon, though it also occurs in the W. Indies, and in S. and Central America.

#### Characteristics and Duration

An attack of malaria is characterized by a shivering fit, or rigor, soon succeeded by the hot and the sweating stages. Vomiting, often bile-stained, is frequent. In the first stage, the patient shivers with a sensation of cold water being poured down the back, the teeth chatter, and he piles on clothing for warmth; in the second, the shivering ceases and the patient becomes flushed, hot, and dry with intense headache and bone pains; the third or sweating phase is accompanied by the most profuse perspiration and a sense of great relief. The interval which occurs between two attacks varies with each infection.

The duration of malaria is very variable. In the benign tertian

the latent period between two attacks may be as much as a year, and it is reckoned that the parasite may persist in the blood for three years after one inoculation. The quartan is by far the longest-lived and may persist for as long as 21 years. On the other hand, the dreaded subtertian dies out usually within a few months. Ovale tertian produces a very mild, evanescent form of fever.

In the quiescent intervals between the attacks the parasite develops slowly within the blood corpuscles somewhere in the circulation, but where has not been accurately determined. Some think that a different form of development takes place within the lining cells of the capillary vessels. However, when an attack does occur the parasites appear in the blood stream in swarms; Ross estimated that some 150 million are necessary to provoke an ague fit. The actual rigor corresponds to the stage when the parasites have sporulated inside the blood corpuscles to the extent that they disrupt them, thus setting the spores free in the blood serum. As each infected corpuscle is disintegrated and the poisons thereby liberated destroy a great many more, malaria produces serious anaemia. As the malaria parasites live mostly within the blood vessels of the spleen, marked enlargement of this organ is usual.

#### Combating the Disease

Prevention of malaria depends on the elimination, as far as possible, of the breeding places of that particular species of anopheles mosquito which carries the infection in each particular locality. This involves a close study of the life history and breeding habits of every species of anopheles: some breed in brackish water, others in fresh, some in placid pools, others in running brooks, some seek shade, others light, and so on. It entails draining of swamps, banking of streams, screening of wells, filling in of pools sometimes the building of sea walls and locks to keep out seawater, etc., and the use of larvicides, especially D.D.T., the most potent insecticide known which destroys both larvae and mosquitoes. The oiling of pools and other collections of water with paraffin or crude petroleum is much practised. The removal of plants and water weeds on which anopheles larvae feed and in which they hide is important. The use of mosquito nets round the sleeping couch at night has become universal in districts subject to malaria;

the spraying of these nets with a solution of 5 p.c. D.D.T. enhances their efficacy. The introduction of larvivorous fish which feed on mosquito larvae has been followed in many places by excellent results. In the W. Indies and S. America "millions" (*Cerardinus poeciloides*) have been employed. Many countries possess fish equally efficacious. The top minnow, *Gambusia affinis*, has been introduced into S. Italy and many other countries with favourable results. In S. India and Java a species (*Puntius javanicus*) feeds on water plants, thus depriving mosquito larvae of their food-supply.

For 300 years and more quinine has been the specific drug against malaria. It acts more quickly and with more certainty than any other drug, and is therefore much the most useful against the subtertian form in the acute stage. There is however, some reason to believe that it may precipitate blackwater fever. Atebrin or mepacrine, introduced by Kikuth in 1930, is a yellow dye which rapidly destroys the parasite, especially the subtertian. It has the disadvantage that it stains the skin yellow, but it has proved a potent drug in preventing malaria, especially under war conditions. During the Second Great War troops in the field took one tablet (1½ gr.) daily for six days in the week; undoubtedly this precaution greatly reduced the incidence of malaria, and may almost be said to have won the war in India, Burma, and the Far East. Paludrine, a later discovery, is possibly even more remarkable. The dose is one tablet (1½ gr.) three times daily during a malarial attack. It is very effective in subtertian malaria and has the great advantage of being virtually non-poisonous. As a prophylactic, the dose is one tablet a day during residence in a malarious country. As prophylactics, both atebrin and paludrine should be taken for at least 10 days before exposure to possible infection. Consult Malarial Fever, its Cause, Prevention, and Treatment, R. Ross, 1902; Stitt's Diagnosis, Prevention and Treatment of Tropical Diseases, R. P. Strong, 7th ed., 1944; Tropical Diseases, P. Manson, 12th ed., ed. P. Manson-Bahr, 1945.

**Malaspina.** Glacier in Alaska. At the base of Mt. S. Elias, it has a sea front of 70 m., and an area of 1,500 sq. m., and is a glacial plateau fed by numerous large valley glaciers. The front is low, but rises inland to 2,000 ft.; the

surface is generally level, with crevasses near the mountain margin. Glaciers break away from the W. edge; elsewhere large and small streams issue from ice caves and discharge coarse silt which builds the land seawards.

**Malatesta.** Italian princely family. The parent stock of the Malatesta settled in Rimini in 1216,

S. Malatesta,  
Italian soldier

Giovanni being podestà of that city in 1237, and Malatesta di Verocchio assuming the supreme power in 1295. Giovanni, brother of the latter, was husband of Francesca da Rimini, whose love story is told in Dante's *Inferno*. The family were ardent Guelph partisans and during the Renaissance rose to considerable power. Sigismondo (d. 1468), son-in-law of Francesco Sforza, was a noted patron of the arts and a capable general, fighting as a mercenary in the armies of Venice, Naples, and Florence, and making war on Pope Pius II, who excommunicated him in 1460. Pandolfo IV sold Rimini to the Venetians in 1503.

**Malatya.** A town of Asiatic Turkey. Situated about 115 m. N.W. of Diarbekir, on a plateau, alt. 3,000 ft., it is an important centre of trade in the upper course of the Euphrates, a great road junction, and served by rly. It lies among beautiful vineyards and orchards. In the neighbourhood are copper workings. In 1895 about 3,000 Armenians were massacred here by the Turks. Pop. 41,559. Some 5 m. N.E. is an older Malatya, the ancient Melitēne, from which the majority of the people migrated to found the new town. A vilayet named from the town has a pop. of 438,397.

**Malaviya, MADAN MOHAN** (1862-1946). Indian politician. Born at Allahabad, Dec. 25, 1862, he was educated at the government high school and Muir central college. Associated with the Indian national congress almost from its inception, being a delegate in 1886, he edited *The Hindustan*, 1887, *The Indian Union*, 1889-92, and later helped to found the *Nationalist daily*, *The Leader*. On the United Provinces legislative council 1902-12, he was elected to the imperial legislative council in 1910,

sat ten years, and was president of congress in 1909, 1918, and 1933. He deprecated the extremism of its later manifestations, although obsessed by the idea of British exploitation of his country. His outstanding work was the creation of a Hindu university at Benares. When non-cooperation was rife in 1930, he resigned from the legislative assembly, and subsequently underwent imprisonment. Nevertheless he came with Gandhi as a delegate to the round table conference in London. This vehement advocate of Indian political advancement died at Benares, Nov. 12, 1946.

**Malay.** People of Mongoloid stock in the Malay Peninsula and Archipelago. The name is employed as a synonym for the Oceanic branch of the S. Mongols, whose physical characters became softened in their tropical habitat, and whose cultural inheritance was modified by the acquisition of seamanship. This Malayan or proto-Malay type includes the main populations of Java and Sumatra, the Borneo Iban, the Celebes Bugi, the Bajau rovers, some Philippine and Formosan tribes, and distant offshoots in Madagascar. They number 50,000,000 all told.

The true Malays, forming a small fraction of the Malayan branch, call themselves Orang Malayu. They descend from a proto-Malay tribe in Sumatra, who, after some infusion of Hindu blood and culture from A.D. 400 onwards, crossed to the mainland and founded Singapore about 1160. They spread also to

Malay. Chieftain in semi-European costume. Inset, head of typical Malay girl

Java, and carried their maritime trade and piracy to other coasts, often driving the Indonesian aborigines, as in Borneo, into the uplands. Recent colonies have reached other parts of the British Empire, Ceylon, and S. Africa.

A well-knit, olive-brown people, with high cheekbones and small hands, they betray some ethnic admixture, possess a uniform temperament, and are easy-going, reserved, impassive, and intelligent. Under Arab contact the Malays became muslimised during the 13th-15th centuries, but are still animist at heart. Their spirit-worship and sorcery include a belief in man-tigers, and the related semi-hypnotic state called latak, and they are subject to neurotic crises, especially in the form called running amok. They are addicted to cock-fighting and games of chance. Their language is a sub-family of the Austronesian division of the Austric family. See Amok; consult *The Modern Malay*, L. R. Wheeler, 1928.

**Malaya, Federation of.** That part of the Malay peninsula S. of Siam. The territories comprising the federation are: (1) the British Straits Settlements, formerly a crown colony, except Singapore (Penang I., Province Wellesley, Malacca); (2) the former federated Malay states, which were under British protection and administration (Perak, Selangor, Negri Sembilan, Pahang); (3) the former unfederated states, which were under British protection only (Kedah, Kelantan, Trengganu, Johore, Perlis).

The possessions of the E. India co. became a crown colony in 1867; the federated states, each of which retained its Malay ruler, came under British administration between 1888 and 1896, in which year they were federated under a British resident-general; Johore came under British protection in 1819 when Singapore was founded; the other four states passed from Siamese to British suzerainty by a treaty of 1909.

During the Second Great War the Japanese attacked Malaya Dec. 8, 1941. Forces which had been massed in French Indo-China landed at Singora, Kra, C. Patani and elsewhere in Siam, and N. of Kota Bharu in Kelantan. Air raids by the greatly superior Japanese air force on Malayan airfields and on Penang followed; while the sinking by air attack of H.M.S. Prince of Wales and Repulse in the Gulf of Siam destroyed British capacity to prevent at sea

Malaya. Map of the Federation of Malaya, including the British Straits Settlements and the former federated and unfederated Malay states

the passage of Japanese troop convoys. The Japanese advanced down the pen. in a three-pronged drive, two coastal thrusts and a central one, and it soon became clear that their troops were trained to a very high standard of jungle fighting. British, Australian, and Indian troops resisted stubbornly; but by the second week in Jan., 1942, the Japanese had reached Kuantan on the E. coast, and Kuala Lumpur in the W. On the night of Jan. 30-31, all Empire troops were withdrawn to Singapore I., on the N. coast of which the Japanese landed Feb. 8. On Feb. 15 Lt.-Gen. A. E. Percival surrendered, and the whole of Malaya was in Japanese hands.

In accordance with Japanese plans for their new order in S.E. Asia, a combined state of Malaya and Sumatra was set up with its capital at Singapore, renamed Shonan (Light of the South). In July, 1943, Japan agreed to the annexation by Siam of Kedah, Perlis, Kelantan, and Trengganu. Following the surrender of Japan, British forces reoccupied Singapore Sept. 5, 1945.

A month later, Oct. 10, the secretary for the Colonies announced in the house of commons a scheme for a Malayan Union comprising the federated and unfederated states and the British territories of Penang, Province Wellesley, and Malacca, Singapore becoming a separate colony. The Malay rulers, after first accepting this scheme, decided against it on the ground that it deprived them of too much of their sovereignty. A new plan worked out by a committee of six Malay and five British representatives came into effect Feb. 1, 1948, following the signing at Kuala Lumpur, Jan. 21, of the treaty establishing it by all the rulers except the sultan of Johore who, being incapacitated by gout, signed it in his own palace. This treaty set up the Federation of Malaya covering the same territories as the rejected Malayan Union, with a central govt., under a British high commissioner, composed of a federal executive council and a federal legislative council. Each state under its constitutional ruler had a state executive council and a council of state. The states

had control of their own finances and contributed to the central govt. The king's jurisdiction was limited to defence and external affairs; the rulers undertook to accept the advice of the high commissioner on all matters of govt. except those affecting the Muslim religion and Malay customs.

Of Malaya's pop. of some 5½ million, only about 40 p.c. is Malay; another 40 p.c. is Chinese, there are some 750,000 Indians, the rest are Europeans and Eurasians. All persons born in Malaya, and those resident there for not less than ten years, became citizens of the federation with electoral rights, eligibility for the state councils and employment in govt. service, etc., while remaining also nationals of their own territory (the peoples of the former Straits Settlements remained British). For a record of subsequent events see Malaya in the N.V. pages at the end of this work. See Malay Peninsula; consult also British Malaya, Sir F. Swettenham, 1929; Malaysia, R. Emerson, 1937; Strategy at Singapore, E. H. Miller, 1942; In Seventy Days, E. M. Glover, 1947.

**Malay Archipelago.** Variant name for the East Indies, the islands largely peopled by Malays, and lying near the Malay Peninsula. The larger islands, Borneo, Sumatra, and Java, stand on the Sunda continental shelf, which extends S.E. from Malaya and Coochin China at a depth of less than 250 ft. Celebes and the smaller islands to the S. and E. are the tops of submarine ridges which rise between deep basins, such as the Flores, Celebes, and Banda Seas, each more than 16,000 ft. below sea level. See Indonesia.

**Malay Peninsula.** Long, narrow peninsula in S.E. Asia, extending from the isthmus of Kra to Singapore. Its length is 700 m. and its maximum breadth 180 m. The Strait of Malacca separates it from Sumatra; on the E. is the China Sea. It includes the southern part of Siam. The backbone of the peninsula is a system of granitic forested mountains, with peaks, Yong Blar, Ulu Temengor, etc., exceeding 7,000 ft. in alt., and in general the ridge forms a political boundary. On the E. side the chief rivers, the Kelantan, Trengganu, and Pahang, form extensive basins, each comprising almost precisely a separate state; the separating ridge N. of the Pahang runs almost E. to W., and rises in Tahan to 7,186 ft. The rivers on the W. are shorter, the Perak being the longest; the

Malaya. Village scene in Pahang, Malaya, showing the native system of building on piles

Krian, Bernam, Sepang, and Kesang are political frontiers.

The coasts are usually swampy and mangrove-lined. The forests yield ebony, teak, sandalwood, and camphor; tin is mined in considerable quantities; gold is worked, and other ores exist; rubber is the most important export crop, rice the chief food grain. Elephants, rhinoceros, and seladang (*Bos gaurus*) are hunted; monkeys, snakes, tigers, leopards, lizards, and beautiful birds are found in the forest. Natural resources are exploited by Chinese and Tamil immigrants. The native Malay is content with the minimum of toil necessary to supply his scanty needs. A trunk rly. connects Singapore with the Siamese rly. system, and many miles of motor roads have been constructed. See Malaya.

**Malbork.** Polish name for the city of Marienburg (*q.v.*).

**Malcolm** (Gael., tonsured one of Columba). Name of four kings of Scotland, and since their time a popular Christian name.

**Malcolm I** (d. 954), son of Donald VI, succeeded Constantine II in 943. He was friendly with

Malcolm I, King of Scotland

**Malcolm II** (d. 1034), son of Kenneth III, contested the crown with his cousin Kenneth IV, and succeeded to it when his rival was killed in battle in 1005. In 1018 he conquered Lothian and the part of Cumbria N. of the Solway, but did

homage in 1031 to Canute. He was succeeded by Duncan I.

**Malcolm III** (c. 1025-93), son of Duncan I, fled when his father was slain by Macbeth in 1040 to

Malcolm III, King of Scotland

his uncle Siward, earl of Northumberland, who in 1054 put him in possession of Lothian and Cumbria. Three years later Malcolm slew Macbeth, and was crowned at Scone. About 1067 he married Margaret, sister of Edgar Atheling, supported his brother-in-law's claims, and invaded Northumberland five times. In 1092 he lost Cumberland, and on Nov. 13, 1093, he was treacherously slain with his eldest son Edward by Robert de Mowbray, earl of Northumberland, at Malcolm's Cross near Alnwick. Margaret, afterwards canonised, died a few days later. Malcolm, known as Canmore or Great Head, left four sons who succeeded him in turn; one daughter, Matilda, married King Henry I. See Macbeth.

**Malcolm IV** (1141-65), styled the Maiden, succeeded his grandfather David I, May 24, 1153. His reign was disturbed by revolts in Gallo-way and Moray, and by two risings of Somerled, lord of the Isles. He placed himself in 1157 under the protection of Henry II of England, to whom he surrendered Northumberland and Cumbria, and was confirmed in the earldom of Huntingdon. He accompanied

Malcolm IV, King of Scotland

the English army to Toulouse in 1159. He died Dec. 9, 1165.

**Malda.** District and town of India, in Bengal, in the Rajshahi division. The district lies E. of the Ganges, and is drained by the Mahananda river; four-fifths is cultivable, but only two-thirds is tilled; rice is the chief crop. The district headquarters are at English Bazar. Malda lies E. of the Ganges due N. of Calcutta, with which it has rly. connexion. Area, 2,004 sq. m. Pop. 1,232,618; town, 4,600.

**Malden.** City of Massachusetts, U.S.A., in Middlesex co. It is a northern residential suburb of Boston and linked with it by rly. Named after Maldon, England, it was the first place to petition the colonial government to withdraw allegiance from George III. It had been incorporated since 1649 and became a city in 1881. Manufactures include rubber boots and shoes, clothing, leather goods, paints and varnish, drugs and chemicals, and furniture. It has a fine collection of French and American pictures. Pop. 58,010.

**Malden and Coombe.** Mun. bor. of Surrey, England. Lying 3 m. W. of Kingston, it is a residential suburb of London, with several rly. stations. Merton College, Oxford, was founded here in 1264 and is still in possession of property in the neighbourhood. Pop. approx. 45,000.

**Maldivé Islands.** Group of 12 coral atolls in the Indian Ocean, 400 m. W. of Ceylon. It is a dependency of Ceylon; a constitution introduced in 1932 gave it a people's assembly, mainly elected, and a cabinet of four ministers under the sultan. The surface of the islands is chiefly jungle, but they are rich in coconut palms and produce millet and nuts. The people are Muslims, and are expert traders and navigators; they numbered 93,000 in 1941. That year a British naval base was set up for fuelling and watering convoys proceeding to the Far East and Australia; this base was known as Port T.

**Maldon.** Mun. bor., seaport, and market town of Essex, England. It stands on the Chelmer, where it enters the Blackwater estuary, 44 m. N.E. of London. It is served by rly. and has a shipping trade. Brewing, making agricultural implements, and fishing occupy the people. The chief buildings are All Saints' church, an Early English building with a triangular tower and hexagonal spire, which was restored as a

memorial to Washington; S. Mary's church; a 16th century grammar school; a 15th century town hall, originally D'Arcy tower; and a modern public hall. Maldon was a town, presumably important before the Norman Conquest. It

Maldon arms

received a number of charters granting privileges to the citizens, and gives its name to a county constituency. Roman remains have been found in the neighbourhood, and near are the ruins of Beeleigh Abbey. Market day, Thurs. Pop. 9,250.

**Maldon, THE BATTLE OF.** An Anglo-Saxon poem of the 10th century. It describes the fight between Norse invaders under Olaf Tryggvason, later king of Norway, and the East Saxon ealdorman Byrhtnoth, who fell in this battle, in 991. It is known only in a spirited fragment of 600-700 lines, from a MS. destroyed in the fire at the Cotton Library, 1731. The text appears in H. Sweet's Anglo-Saxon Reader, and a verse translation by Lt.-Col. Lumsden was published in Macmillan's Magazine, March, 1887.

**Maldonado.** Maritime dept. of S. Uruguay, fronting the Rio de la Plata. Mainly level country, except in the N., the soil is fertile, and agriculture and stock raising are largely engaged in. Maldonado, the capital, on the coast, 30 m. E. of Montevideo, was founded in 1757 and has a fine harbour, sheltered by the island of Goriti at its entrance. It is a naval station, fortified, and a seaside resort. Regularly planned, with a fine plaza, it exports cattle, hides, wool, grain, and limestone. Area, 1,587 sq. m. Pop. 67,015.

Maldon, Essex. Picturesque street in this small but ancient market town and port on the estuary of the river Blackwater

**Malebranche, NICOLE** (1638-1715). French philosopher. Born in Paris, Aug. 6, 1638, he joined

Nicole Malebranche, French philosopher

the Oratorians, and studied the Church fathers and historians, afterwards turning to philosophy. His chief works are *The Search after Truth*, trans. 1694, and *Entretiens sur la Métaphysique*, 1688. Died Oct. 13, 1715.

His philosophy is founded upon that of Descartes, but he refuses to admit the existence of innate ideas. He asserts that we see all things in God, since God, as the place of spirits, contains our spirit in Himself. He denies the action of the soul upon the body, seeing in their movements only "occasional" causes. Neither our will nor our intelligence can do anything alone; it is God that decides our actions. A study of his philosophy by R. W. Church appeared in 1931.

**Male Fern** (*Dryopteris filix-mas*). Fern of the family Polypodiaceae. A native of the temperate regions of the N. hemisphere, and of India and Africa, it has a solid woody rootstock formed of the bases of decayed fronds. The lance-shaped fronds are, in well-developed plants, 3-4 ft. long; the leaflets or pinnae tapering to a point and deeply cut into lobes. The lower part of the stock is densely clothed with pale brown scales, which appear more sparingly on the upper portion. The clusters of spore-cases are found in two brown lines on the back of the lobes. The rootstock contains an oil used as a vermifuge. The name indicates its robust habit. See Fern illus.

**Maleme.** Village of Crete, in the N.W. corner of the island, 10 m. W. of Canea. At Maleme German glider-borne troops landed in the attack on Crete, May 20, 1941, and having gained control of the airfield and beaches, prepared for landings which led to the capture of the whole island. See Crete in the Second Great War.

**Malerkotla.** A former state of India, now part of the Patiala and E. Punjab union. To the S. of Ludhiana district., it was a Mahomedan state under an Afghan ruler. It came under British protection in 1809. Wheat, cotton, sugar-cane, and tobacco are produced. The former cap., Malerkotla, is 30 m. S. of Ludhiana by rly. Area, 165 sq. m. Pop. 88,109; town, 30,100.

**Malesherbes, CHÉRIEN GUILLAUME DE LAMOIGNON DE** (1721-94). French statesman and ad-

C. G. de Malesherbes,  
French statesman

vocate. Born in Paris, Dec. 6, 1721, he became counsellor to the parliament of Paris, and succeeded his father in 1750 as president of the Cour des Aides, in which capacity he addressed himself to the abolition of official abuses. As press censor he permitted a wide latitude. In 1771 his condemnation of legal abuses ended in his being banished to his estates. On the trial of Louis XVI by the Convention, when all others had deserted the king, he undertook to defend him. For this he was marked down by the revolutionists, and was arrested and guillotined in Paris, April 22, 1794. His fearless devotion to duty has become almost proverbial. *Consull* Œuvres Choiesies, 1809; Lives, E. Vignaux, 1874; J. M. S. Allison, 1938. *Pron.* Malzayrb.

**Malet, SIR EDWARD BALDWIN** (1837-1908). British diplomatist. Born at The Hague, Oct. 10, 1837, he was educated at Eton and Corpus Christi College, Oxford, entered the diplomatic service, and as an attaché gained experience in Washington, Paris, Peking, and Rome. During the Commune of 1871 he was in charge of the British embassy in Paris. In 1878 he acted as plenipotentiary at a critical time in Constantinople, and had a still more difficult task as British agent and consul-general in Egypt, 1879-83. Ambassador in Berlin, 1884-95, he was knighted

in 1881, and in 1904 succeeded to the family baronetcy. From 1900 to 1906 he was a member of The Hague court of arbitration. Malet died June 29, 1908.

**Malet, LUCAS** (1852-1931). A British novelist. Younger daughter of Charles Kingsley (*q.v.*), she was born at Eversley, her Christian names being Mary St. Leger. She was educated at University College, London, and married in 1876 William Harrison (d. 1897), rector of Clovelly. She published her first novel, *Mrs. Lorimer*, in 1882, and established herself as a best-seller with *The Wages of Sin*, 1891. Her other books included *Colonel Enderby's Wife*, 1885; *The Gateless Barrier*, 1900; *History of Sir Richard Calmady*, 1901; *The Golden Galleon*, 1916; *The Tall Villa*, 1920; *The Dogs of Want*, 1924. She died Oct. 27, 1931.

**Malham.** Village in the W. Riding of Yorkshire, England. On the Aire, it is 6 m. E. of Settle. About a mile from the village are Malham Cove and Gordale Scar, two precipitous amphitheatres of rock 300 ft. in height, produced by the vast displacement of the mountain limestone known as the Craven Fault. N. of the cove is Malham Tarn, a secluded upland lake about 3 m. in circumference, the property of the nation. Charles Kingsley's *Water Babies* was partly written near. See Aire illus.

**Malherbe, FRANÇOIS DE** (1555-1628). A French poet. Born at Caen, July 13, 1555, he lived for some years at Aix, where he married Marie de Coriolis in 1581. About 1605 he began to enjoy court favour under Henry IV, and continued his successful career under

François de Malherbe,  
French poet

Louis XIII. Deeply affected by the death of his son in a duel, 1627, commemorated in a fine sonnet, he died in Paris Oct. 16, 1628. Malherbe's work was chiefly done in his later years, addressed to court patrons or celebrating public events. The odes and stanzas are laboriously finished and technically correct, but lacking in real poetic inspiration. But his fine precision of language and his critical influence had a profound effect on the development of French poetry during the next century. Notable pieces by Malherbe are his *Consolation à M. du Périer* and his paraphrase of Psalm 145.

**Mali** (Skt., garland). Indian gardener caste. The Marathi name is Marar. Numbering some two millions, they are dark, undersized descendants from the pre-Aryan population. Their earliest occupation was growing flowers for use in Hindu ritual. They eat goat flesh and mutton, and in modern times have largely monopolised market-gardening from the Punjab to Hyderabad.

**Malibran, MARIA FÉLICITÉ** (1808-36). French opera singer. Born in Paris on March 24, 1808,

M. F. Malibran,  
French singer

she was a daughter of the singer Manuel Garcia (*q.v.*), was trained as a singer in Italy, and made her first appearance in The Barber of Seville, in London, 1825. After an instant success she went with her father to America, where she made an unhappy marriage with a French merchant, and in 1827 returned to sing at the Théâtre des Italiens in Paris. Gifted with powers of acting as well as a fine voice, she was one of the most popular singers of her day. Divorced from Malibran, she married Charles de Bériot, a Belgian violinist, 1835, but died in Manchester, Sept. 23, 1836, at the age of twenty-eight.

**Malic Acid.** Substance discovered by Scheele in 1785, in gooseberries and unripe apples. It has subsequently been shown to be widely distributed in the juices of plants, and may be prepared from the berries of mountain ash (*Sorbus aucuparia*), collected just before they begin to redden. The juice of the berries is expressed, milk of lime added, and the calcium malate, which separates as a white sandy powder, is collected, washed, and decomposed with hot dilute nitric acid. On cooling, the malic acid crystallises out. Chemically it may be obtained by partial reduction of tartaric acid or by the catalytic oxidation of benzene.

**Malice.** Term used in English law. It may mean either actual ill-will formed against another in the mind of the person charged with malice; or the doing of some kind of deliberate act so injurious to another that the law will imply evil intent. Thus in murder, malice aforethought is required; this has a technical meaning, including not only the deliberate intent to kill the murdered person, but also

the making of a "suicide pact" or the infliction of a wound likely to cause death or grievous bodily harm, even though neither was intended.

In libel, the deliberate act of writing causes the law to presume malice; but not so in slander. When a libel or slander is proved to have been written or uttered on a privileged occasion, *e.g.* when giving a servant's character, express malice must be proved. It used to be thought that an act lawful in itself might become unlawful if it were done maliciously, but the house of lords repelled this doctrine in the trades union case of *Allen v. Flood*, 1898. See Libel; Slander.

**Malicious Damage.** A legal term meaning damage done to property wilfully and purposely, as distinct from an act done in ignorance or by accident. If, in order to assert a claim of right, damage is done to property, it is not malicious unless the damage done is in excess of what was necessary to assert the claim. Sometimes malicious damage is a felony, *e.g.* damage to sea-walls, canals, reservoirs, docks, etc., sometimes merely an offence punishable by fine by a magistrate's court.

**Malicious Prosecution.** Term used in English law for the preferring of a criminal prosecution, or the presentation of a bankruptcy petition, maliciously and without reasonable or probable cause. In an action for damages for such a prosecution the plaintiff must

prove a negative, namely, that there was no reasonable or probable cause for the prosecution, and this is to be decided by the judge and not the jury. He must also prove that he was acquitted of the charge, and that the prosecutor acted maliciously, *i.e.* not in exercise of a real right, and not honestly, but from temper, or from actual ill-will. See Malice.

**Malignant Disease** (Lat. *malignus*, evil). Term applied to any virulent manifestation, usually ending fatally, of a disease ordinarily simple, *e.g.* scarlet fever; but a cancerous growth of some type is usually understood. This is characterised by rapid progress, power to infiltrate into neighbouring tissues, and a tendency to form secondary deposits in other organs, the cells being carried by the lymphatic or blood stream; also by its termination in the death of the victim.

**Malignant Pustule.** Name for the boil-like sore which marks the site of entrance of the bacillus of anthrax (*q.v.*).

**Malignants.** Term first used by the parliamentarians, as in the Grand Remonstrance, of the advisers of King Charles I in his

struggle with parliament. Strafford and Laud were named as the chief of these malignants. Eventually the term came to be applied to all supporters of the king.

**Malindi.** Harbour in Kenya Colony. It is 66 m. N.E. of Mombasa by sea, at the mouth of the Sabaki river. The town was once the capital of Portuguese E. Africa, and during the Arab period was of considerable importance. Rubber is cultivated in the area; from the port maize, copra, and cotton are exported.

**Malines** OR **MECHLIN** (Flemish, *Mechelen*). Fifth town of Belgium, in the prov. of Antwerp. It is 13 m.

Malines arms

by rly. N.N.E. of Brussels, and lies in flat country on the river Dyle, the branches of which intersect the town. It is a busy rly. junction, with extensive rly. engineering sheds, and has furniture making, printing, and carpet and lace making, and other textile industries, but is best known as the ecclesiastical capital of Belgium and seat of the archbishop-primate.

The cathedral of S. Rombold is a noble Gothic building, built about 1300-12, but remodelled during the 14th-16th centuries. The great W. tower (318 ft.), begun in 1452, was never completed. The interior contains a large altarpiece by Van Dyck and other pictures. Among

many churches are those of S. John, 15th century, and Notre Dame, founded 1255 and rebuilt in the 16th century, both containing paintings by Rubens, and the Baroque churches of Notre Dame du Val-des-Lis, 1662-1715, the Grand Béguinage, Notre Dame d'Hanswyk, and SS. Peter and Paul, 1677. The palais de justice is a picturesque group of Gothic and Renaissance buildings. On the Grande Place, with characteristic Flemish gabled houses, stands the Cloth Hall, completed 1326 (now town hall).

After Charlemagne, Malines came to Lotharinga 915, under the rule of the bishops of Liège. Having developed a certain strength and independence, and fought the count of Flanders to whom the bishop had ceded his rights, it was

Malines, Belgium. Cathedral of S. Rombold, 14th-16th cent. Top, Cloth Hall; right-hand part 14th cent., left-hand Gothic part rebuilt after 1913 from a 16th cent. design

incorporated with Burgundy in 1384. A period of prosperity followed, and under Margaret of Austria as *stadholder*, Malines was the virtual capital of the Netherlands, 1507-30. In 1559 it became the seat of an archbishop. A famous holder of that office was Cardinal Mercier during the First Great War. The town suffered several bombardments during both Great Wars, but its main treasures survived. In the Second Great War, it was liberated by the British without fighting on Sept. 4, 1944, during their spectacular week's advance from the Seine to Antwerp. Pop. 60,729, essentially Flemish.

**Malingering** (Fr. *malinger*, sickly). Feigning illness, either from hysteria, or from the hope of escaping disagreeable duty as in war, or in postponing return to work in the hope of drawing compensation pay. There is generally some basis for the symptoms complained of. In cases associated with payment of compensation, the cure is often the settling of the claim. The experienced consultant, by reason of knowledge of his special branch of medicine, and by the use of instruments, can usually decide whether the symptoms recounted are possible or probable or inconsistent with known medical facts.

**Malinowski, BRONISLAW** (1884-1942). A British anthropologist. Born in Cracow, April 7, 1884, he studied at the universities of Cracow and Leipzig, and at the London School of Economics. From 1914 onwards he visited New Guinea, N.W. Melanesia, and S. and E. Africa where he carried out research among native tribes. His studies of the ethnology and ethnography of the Mexican Indians emphasised the cultural effect on primitive tribes of their contacts with more advanced peoples. He later adopted British nationality and eventually became one of the world's leading anthropologists. He left England in 1939 to become professor of anthropology at Yale, dying at New Haven, Conn., U.S.A., May 16, 1942. His many books include: *The Family Among the Australian Aborigines*, 1913; *Argonauts of the Western Pacific*, 1922; *Myth in Primitive Psychology*, 1926; *Sexual Life of Savages in N.W. Melanesia*, 1929; *The Foundations of Faith and Morals*, 1936.

**Malinowsky, RODION YAKOVLEVITCH** (b. 1899). A Russian soldier. Born in Odessa of peasant stock, he served in the First Great War in a Russian brigade in

France, and was a corporal when in 1917 he joined the revolutionaries. He returned to Russia

R. Y. Malinowsky,  
Russian soldier

and became an officer in the Red army; despite a short spell of retirement, he rose to the rank of major-general, and in 1939 was commanding the Soviet 6th army. His forces fought a successful delaying action on the Dnieper in 1941, and defeated the German efforts to relieve Stalingrad in 1942. In 1943 he commanded the troops which reoccupied Rostov; he took part in the fighting in the Ukraine, and entered Bucharest, Aug., 1944, where he signed the United Nations' armistice with Rumania. He was promoted colonel-general and general of army in 1943, and marshal of the Soviet Union in 1944. His troops led the drive through Hungary into Austria, 1944-45. In 1941 he was decorated with the Order of Lenin, and in 1943 with the Order of Suvorov.

**Mall, THE.** London thoroughfare. A tree-lined avenue, it runs along the N. side of St. James's Park between Admiralty Arch at Charing Cross and the Queen Victoria Memorial in front of Buckingham Palace. It is used on state occasions as a processional route, and, like Pall Mall (*q.v.*),

derives its name from the game of paille-maille, or pell-mell, played here in Charles II's time. It has on the N. the gardens of Carlton House Terrace, the Duke of York's Steps leading to Waterloo Place, and the gardens of Marlborough House, St. James's Palace, and Lancaster House. See Admiralty Arch; St. James's Park.

**Mallaby-Deeley, SIR HARRY** (1863-1937). British financier and politician. Born Oct. 27, 1863, son of W. C. Deeley, he was educated at Shrewsbury and Trinity College, Cambridge. He added the surname of Mallaby in 1922.

He was a prominent financier and a dealer in real estate. Among his extensive financial operations was the purchase from the duke of Bedford of Covent Garden, 1913, for a sum exceeding £1,750,000. Shortly after the First Great War, when tailoring prices appeared excessive, he promoted a scheme for the retailing of men's ready-made suits at a low price: an enterprise reputed to have cost him £60,000; his tailoring shop in the Strand was well known. Conservative M.P. for Harrow, 1910-18, and E. Willesden, 1918-22, he was created a baronet in 1922. He died Feb. 4, 1937.

**Mallard.** Common wild duck of Great Britain and the N. hemisphere. In the male the head and neck are glossy green, the breast chestnut, the underparts greyish white, and the wings reflect a metallic violet hue. The beak is greenish yellow, the legs and feet red. After the breeding time the colours are less bright. The female is smaller and has mottled brown and buff plumage. The mallard breeds in most retired districts of Gt. Britain that are near to water; but great numbers are winter migrants. It feeds upon plants, snails, worms, and insects, and usually nests in a hollow of the ground near the edge of a river or pond, but sometimes in a tree. Most of the domesticated ducks are descended from the mallard. See Duck.

The Mall, London. View along the avenue from Buckingham Palace, on the occasion of the Victory Parade, June 8, 1946. In the foreground is the Queen Victoria memorial

**Mallarmé, StÉphane** (1842-98). French poet. Born in Paris on March 18, 1842, Mallarmé was

StÉphane Mallarmé,  
French poet

educated at Auteuil and Sens, and spent some time in England. From 1862 onwards he published poems in various reviews, translated E. A. Poe's The Raven, 1875, other of Poe's poetry in 1888, issued his beautiful L'Après-midi d'un Faune in 1876, and collected poems in 1887. The recognized leader of the Symbolists, Mallarmé exercised great influence on the rising generation of French poets. After his retirement from teaching in 1892, he published Vers at Prose, 1893, and Divagations, 1897. He died at Valvins, near Fontainebleau, Sept. 9, 1898. His Vers de Circonstance, a collection which shows his delicate craftsmanship, appeared in 1920. Consult French Profiles, E. Gosse, 1905; The Symbolist Movement in Literature, A. Symons, 2nd ed. 1908.

**Malleability.** A physical property. Malleable materials can be deformed permanently in all directions normal to a permanent compression strain without any rupture of the material.

This property is particularly important in such processes as the forging, pressing, and rolling (*q.v.*) of metals and metal alloys, many of which are malleable in varying degrees. Probably the most malleable metal is gold which can be hammered out to thicknesses of the order of one-300,000th part of an inch. Some metals are malleable only at temperatures above their recrystallisation temperature (*q.v.*) and a few only at temperatures below their recrystallisation temperature, the former because of cold shortness and the latter because of hot, or red, shortness. Some metals and materials are malleable only over a very limited range of temperature.

**Malleco.** Inland province of Central Chile. It is bounded E. and N. by the prov. of Biobío, and S. by Cautín. The chief products are wheat, timber, and cattle. Gold is found. The capital is Angol, 70 m. by rly. S.S.E. of Concepción. Area, 5,511 sq. m. Pop. 154,174.

**Mallee Scrub** (*Eucalyptus dumosa*). Species of eucalyptus, a native of Australia. The root forms

a flat disk about 3 ft. across and 8 or 10 ins. thick, known to the colonists as a "scab." From its underside numerous rootlets descend until they reach moisture, often to a depth of over 30 ft. From the upper side there are many slender stems 14 or 15 ft. long, bearing dense clusters of leaves at the summits. The scrub extends monotonously over many miles of the dry plains, but the rootlets, cut into lengths, yield a supply of drinkable fluid.

**Malleson, (WILLIAM) MILES** (b. 1888). British actor. Born at Croydon, Surrey, May 25, 1888, he went to Emmanuel, Cambridge, then studied at the R.A.D.A. He made his first stage appearance at Liverpool, 1911, his first London appearance 1913. He was specially successful in Shakespearian comedy parts, *e.g.* Aguecheek, Quince, Polonius. A member of John Gielgud's co., 1944-45, he also had several seasons with the Old Vic co. His English versions of Molière's L'Avare (The Miser) and Tartuffe were put into the Old Vic repertory. His first wife, Lady Constance Mary Annesley (b. 1895), acted under the name Colette O'Neil.

Miles Malleson,  
British actor

**Malling.** Name of a parish and market town and of a village in Kent, England. West Malling, or Town Malling, is 5 m. W. of Maidstone, on the Pilgrims' Way (*q.v.*), with a rly. station. It is notable for the ruins of an abbey founded for a community of Benedictine nuns by Bishop Gundulf in 1090, and partly rebuilt in 1738. Near by is St. Leonard's Tower, built about 1070. The village of E. Malling has an old church. For the horticultural research station, see East Malling.

**Mallock, WILLIAM HURRELL** (1849-1923). British author. A nephew of J. A. Froude, he was educated privately and at Balliol College, Oxford. He first attracted

W. H. Mallock,  
British author

attention with a semi-philosophical satire. The New Republic, 1877. Later books, aiming at exposing the fallacies of radical, socialist, and

secularist ideas, include Social Equality, 1882; Labour and the Popular Welfare, 1893; Aristocracy and Evolution, 1898; Social Reform, 1914; and The Limits of Pure Democracy, 1918. He also wrote novels and Memories of Life and Literature, 1920. He died, April 2, 1923.

**Mallory, GEORGE LEIGH** (1887-1924). British mountaineer. A member of the Everest expeditions of 1922 and 1924, he lost his life in an attempt with Andrew Irvine to reach the summit. They were last seen at 28,239 ft. on June 8. It is not known if they achieved their object before they died. (Consult The Epic of Mount Everest, Sir F. Young-husband, 1926.) Sir Trafford Leigh Mallory (*q.v.*) was a younger brother.

G. L. Mallory,  
British mountaineer

**Mallow** (*Malva*). Genus of herbs of the family Malvaceae. They are natives of Europe, temperate Asia, and N. Africa. They have large, lobed, or divided leaves, and showy rose, purple, or white flowers. The fruit is a ring of large seeds, each in a leathery shell. The common mallow (*M. sylvestris*) has a stem two or three ft. in height, with lobed leaves and blue-purple flowers. Musk mallow (*M. moschata*) has the leaves divided into slender segments, and pale rosy flowers. Marsh mallow (*Althaea officinalis*) belongs to a separate genus which includes the hollyhock.

**Mallow.** Market town, urban dist., and watering-place of co. Cork, Eire. It stands on the Blackwater, 21 m. from Cork, with a station on the Eire State rly. It has a mineral spring, for which there is a pump-room, and there are ruins of a castle once belonging to the Desmonds. The industries are tanning and milling, while the town is the centre for an agricultural district and for salmon fishing. It has a large sugar-beet factory, with 1,000 employees. The town was seriously damaged by fire in Sept., 1920, as the result of reprisals for the action of some insurgents who raided the barracks and shot dead a sergeant of the 17th Lancers. The shooting of several railwaymen here in Jan., 1921, led to the threat of a rly. strike in England, but this was averted by the appointment of a military court of inquiry. Market days, Tues. and Fri. Pop. 5,217.

**Malm.** Geological term used in Germany to denote the Upper Jurassic beds—Oxford Clay to Purbeck. See Jurassic System.

**Malmaison.** Château of France, in the dept. of Seine-et-Oise. It lies 4 m. S.E. of St. Germain-en-Laye, and 6 m. by tram from Paris. The château, dating from the early 17th century, but rebuilt under Napoleon I, is famous as the residence of the Empress Josephine (*q.v.*), who died here in 1814. For some years the property of Queen Christina of Spain, it was bought by Napoleon III. In 1900 it was given to the nation by D. Osiris.

**Malmédy.** Town and district of Belgium. The town is 25 m. S. of Aix-la-Chapelle on the river Warche, and lies amid steep, wooded hills. It has a population of 5,000, mostly Walloons, who are chiefly employed in tanneries and paper mills. The dist. covers an area of 318 sq. m., with a pop. of 37,000, of whom 9,500 are Walloons. The staple industry is dairy farming. With the adjoining dist. of Eupen (*q.v.*), Malmédy was given to Prussia in 1814. By the treaty of Versailles, 1919, Germany renounced in favour of Belgium all rights and title over the two dists., in which a plebiscite was permitted. Only 62 persons voted against annexation, of whom 43 were German officials, and Malmédy was reunited to Belgium in Sept., 1920.

Malmédy was occupied by the Germans on May 10, 1940, and on May 18 was reincorporated into Germany. The town, liberated by troops of the U.S. 1st Army on Sept. 12, 1944, was hotly contested during the German Ardennes offensive in Dec., being severely bombed in error by U.S. aircraft while actually occupied by Allied forces. The Germans failed to retake the town. See map in p. 588.

**Malmesbury.** Mun. borough and market town of Wiltshire. It stands on the Avon, 17 m. W. of Swindon and 94 m. from London, with a rly. station. The chief building is the church of S. Mary and S. Aldhelm, which was part of the

Malmesbury arms

church of the Benedictine abbey. It is mainly of the 12th century, and is noted for its beautiful Norman porch. There is a market cross of the 16th century in the market place. The town has a trade in agricultural produce, and has factories manu-

facturing electrical and electronic equipment. Malmesbury grew up round the abbey, which developed from a hermitage founded by an Irish missionary named Maildulf, hence Malmesbury. The magnificent monastic buildings, of which little remains, were erected about

this time, and in the 12th century a castle was built here. Malmesbury was long known for its manufacture of cloth. Fairs and markets were granted to the citizens, and the town was separately represented in parliament, 1295–1885. Pop. 2,334.

**Malmesbury, JAMES HARRIS, 1st EARL OF (1746–1820).** British diplomatist. Born at Salisbury, April 21, 1746, the son of James Harris, M.P. and author, he was educated at Winchester and Oxford, and in 1768 began a long diplomatic career. He was first at Madrid; was minister at Berlin, 1772–76, at St. Petersburg, 1777–83, and at The Hague, 1783–88. In 1788 he was made a baron and in 1800 an earl. He died Nov. 21, 1820, and was succeeded by his son James Edward (1778–1841). His Diaries and Correspondence were edited by the 3rd earl of Malmesbury, 1844, who also published a volume of his grandfather's letters, 1870.

**Malmesbury, JAMES HOWARD HARRIS, 3RD EARL OF (1807–89).** British politician. The son of the 2nd earl, he was born March 25, 1807, and educated at Eton and Oriel College, Oxford. In 1841 he entered the house of commons as M.P. for Wilton, but in the same year he became a peer. Attached to the Tory party, he was foreign minister in the short ministries of 1852 and 1858–59. From 1866 to 1868 he was lord privy seal, as he was from 1874–76. In 1884 he published his Memoirs of an Ex-Minister. He died May 17, 1889, and was succeeded by his nephew Edward James (1842–99). In 1899 James Edward (b. 1872), the latter's son, became 5th earl. He was chairman of the London Hospital Saturday fund 1921–38, and a prominent Freemason.

**Malmesbury, WILLIAM OF (c. 1093–c. 1143).** English chronicler. A monk of Malmesbury, he

Malmesbury, Wiltshire. Norman south porch of the abbey  
Valentine

passed most of his adult life there. Having studied the work of Bede, he began to write an account of the history of England, the *Gesta Regum*, dedicated to his friend, Robert, earl of Gloucester, the narrative being continued to 1142 in his *Historia Novella*. He also wrote a *Gesta Pontificum Anglorum*. William is probably the best extant authority for the reigns of the Norman kings.

**Malmgren, FINN (1895–1928).** Swedish meteorologist. Born at Falun, he became assistant professor at Borno hydrographic institute, joining Amundsen in the N. Polar basin in 1922, and later becoming meteorologist to the expedition. He was also meteorologist to Nobile in the airship Italia on the N. Pole expedition in 1928 and was injured when the Italia crashed on the ice, May 25, 1928. To bring help he and two companions set out for Cape North, but on June 15, unable to go any farther, he induced his companions to go on without him. As a memorial of this sacrifice a professorship was founded at Uppsala university.

**Malmö.** Seaport of Sweden, capital of the län or co. of Malmöhus. It stands on the Sound,

Malmö arms

almost opposite Copenhagen, 16 m. away. An important naval port and rly. junction, it has a castle, now partly used as a barracks. The town hall dates from 1546 and the church of S. Peter from the 14th century. The harbour is capacious and well equipped with docks, warehouses, etc. There are shipbuilding yards, iron-works, and breweries, besides factories for the production of sugar, tobacco, and textiles. A large trade is carried on in timber,

matches, chalk, cement, and agricultural produce. Communication is maintained across the Sound by train ferries. Malmö was fortified in the Middle Ages, and, owing to its position, became an important seaport when the Baltic trade was at the height of its prosperity, during the Hanseatic period. Pop. 171,158.

**Malmöhus.** A län or co. of Sweden. Situated at the S. extremity of Sweden, the S. half of the peninsula of Scania, it is one of the most fertile areas in the country. Malmö is the capital. Area 1,871 sq. m. Pop. 551,647.

**Malmsey.** Name given to a white or red wine, originally made in Crete or other Greek islands. It was exported from Napoli di Malvasia, in the Morea, and from its medieval French name, *Malvesie*, the older form, *Malvoisie*, is derived. It is a sweet, luscious, white wine of high alcoholic content, and is now chiefly produced in the Azores, Canaries, Madeira, Sicily, and Sardinia.

**Malmstone.** A local variety of Upper Greensand. It is a siliceous rock, and some hard fine grained beds have been used in buildings. Other varieties have been in demand as firestones for lining limekilns, etc.

**Maloja** or **Maloggia.** Mountain pass of Switzerland in the canton of Grisons. It begins at St. Moritz, and leads to Chiavenna, in the prov. of Sondrio, Italy. Lowest of the passes between the two countries, with an alt. of 5,940 ft., it descends into the Bregaglia valley, the beginning of the Engadine.

**Malolos.** A town of Luzon, Philippine Islands, the capital of the prov. of Bulacán. A busy trading centre, it stands on a channel of the Pampanga delta, N.W. of Manila, about 5 m. from the sea, and close to the Manila rly. Rice is the chief article of trade. Malolos was chosen as the seat of government during the revolt of the Filipinos against the authority of the U.S.A., 1898-99. Pop. est. 26,000.

**Malone, EDMUND** (1741-1812). British critic. He was born in Dublin, Oct. 4 1741, and educated at Trinity College. He settled in London in 1777, and devoted himself to literature. He died May 25, 1812. His great work is his edition of Shakespeare in 10 volumes,

Edmund Malone,  
British critic  
After Reynolds

Malmö, Sweden. Quays and warehouses on the inner harbour

1790. He detected the Shakespearian forgeries of William Henry Ireland (*q.v.*), and was also one of the first to deny the authenticity of the so-called Rowley poems of Chatterton (*q.v.*).

**Malonic Acid.** White crystalline substance discovered in 1858 by Dessaignes. He prepared it by oxidising malic acid with potassium bichromate. It is best prepared from a mixture of monochloroacetic acid, potassium carbonate, and potassium cyanide. When malonic acid is heated at a high temperature, carbon dioxide and acetic acid result. It is soluble in water, alcohol, and ether. Malonic ester, which is prepared from the acid, is an important agent used in the synthesis of organic substances.

**Malory, SIR THOMAS** (*fl.* 1469). English romance writer. According to Bale, he was a Welshman, but Prof. Kittridge showed, in *Who Was Sir Thomas Malory?*, that he was a knight of Newbold Revell in Warwickshire. His *Morte d'Arthur* is the most important English prose work written before the age of Elizabeth, a compilation and free translation mainly from French sources of the old Arthurian romances, arranged in more or less connected form. Finished in 1469, it was first printed by Caxton in 1485, and has been many times reprinted. The work, which has influenced poets, prose-writers, and artists from Spenser to our own time, is in 21 books. A notable modern edition is that of Oskar Sommer, 3 vols., 1889-91. See *Morte d'Arthur*.

**Malot, HECTOR HENRI** (1830-1907). French novelist. He was born at Rouen, May 20, 1830. In 1858 he published *Victimes d'Amour*, the first of a series of novels largely presenting the period of the Second Empire. Several of his novels were translated into English, *Sans Famille*, 1878 (Eng. trans. *No Relations*, 1880) achieving wide success. He died July 19, 1907.

**Malpas.** Market town of Cheshire, England. It is 13 m. S.E. of Chester, and has a rly. station. Chief building is the Perpendicular

church of S. Oswald. This was restored in the 19th century. There was a castle here in the Middle Ages, and here Reginald Heber (*q.v.*) was born. Pop. 1,101. There is a Malpas in Cornwall, 2 m. from Truro.

**Malpighi, MARCELLO** (1628-94). Italian anatomist. He was born March 10, 1628, near Bologna. He discovered by means of the microscope capillary circulation, blood corpuscles, and important facts relating to the skin, the kidneys, and the spleen, and he was admittedly the father of microscopic anatomy. He used this instrument also in botanical research, and his *Anatomia Plantarum* was published by the Royal Society. He wrote many treatises, the chief being *On the Lungs*; nearly all were also pub. in London. Died in Rome, Nov. 30, 1694. *Pron.* Malpeeghee.

M. Malpighi,  
Italian anatomist

**Malplaquet, BATTLE OF.** Allied victory over the French in the War of the Spanish Succession, Sept. 11, 1709. Malplaquet is a French village in the dept. of Nord, 10 m. S. of Mons. The duke of Marlborough and Prince Eugene, in command of the allied British and imperial troops, had been bivouacked opposite the French army of Marshal Villars for two days, Marlborough impatiently awaiting the concurrence of the Dutch envoys to make an attack. On either side over 90,000 men were engaged,

At 9 a.m. the Prussians and Austrians attacked, but were resisted stubbornly. Not till Marlborough had hurled three British battalions into the fray were the French forced back. The Royal Irish regiment then charged and totally routed the Irish brigade in the service of France, and the battle spread. The prince of Orange, on the left, was repulsed with overwhelming losses by the French; Eugene and Marlborough at the head of their troops made an irresistible assault on the centre and right, and eventually the Allies began a general advance before which the whole French force retired. Marlborough's own losses were too heavy for him to follow. In the whole war no battle

approached Malplaquet for its fierce fighting and desperate resistance, the Allies losing 20,000 men, and the French 12,000. The principal result was that it gave Mons to the Allies. See Spanish Succession, War of the.

**Malraux, André** (b. 1895). French writer and politician. As a young man he travelled widely, and conducted an archaeological expedition in Indo-China. He later edited the *Nouvelle Revue Française*. He served with the republican army during the Spanish Civil War, of which he gave his impressions in *L'Espoir* (Eng. trans. *Days of Hope*). One of the leading French novelists of his day, his chief works included *Tentation de l'Occident*, *Les Conquérants*, *La Voie Royale*, and *La Condition Humaine* (Eng. trans. *Man's Fate*). During the Second Great War, he fought with the tank division, 1939-40, was imprisoned by the Germans, but escaped to what was then unoccupied France. Here he fought with the maquis, and led the Alsace-Lorraine brigade with the French 1st army in the Vosges, 1944-45. He was then minister of information in the de Gaulle government, 1945-46.

**Malstatt-Burbach**. Industrial suburb lying to the N.W. of Saarbrücken (q.v.), on the right bank of the Saar.

**Malt**. Raw material of the brewer and distiller. It is produced by causing the seed-grains of various cereals, principally barley, to germinate, so converting their albumen into diastase, and their starch into sugar. When the growth has been stopped, the malt

is screened to remove the rootlets or "sprits," which contain about 43 p.c. of digestible carbohydrates and albuminoids. Under the name of malt-culms or malt-combs these are given as a nourishing food to milk-cows and other cattle. See Barley; Distilling; Malting.

**Malta**. A British island of the Mediterranean, awarded the George Cross, 1942, for its service to the British Commonwealth during the Second Great War. It lies 60 m. S. of Sicily and 180 m. from the nearest point on the coast of Africa. An important sea-air base,

it possesses three aerodromes, an up-to-date dockyard, and a fine double harbour on the E., at Valletta. In the First Great War it was an Allied base, in particular of the French fleet; over 100,000 British wounded from Salonica and the Dardanelles passed through its hospitals, and it became known as the nurse of the Mediterranean. For the story of Malta during the Second Great War, see the separate entry following this.

An irregular oval in shape, Malta is 17 m. long by about 9 m. broad, and has an area of 91½ sq. m. Off the N.W. lies the smaller island of Gozo, with an area of 24½ sq. m. Comino and some islets also form part of the colony. Pop. of the islands is 270,000, with a density of 2,520 per sq. m. in Malta, 95 in Gozo. Both islands, composed mainly of limestone, have an irregular and rocky surface. Over

40,000 acres of land are normally under cultivation: the soil, though shallow, is rich in phosphates, which render it fertile. Chief products are potatoes, onions, oranges, grapes and figs, wheat and barley. Goats, pigs, and sheep are reared. It can produce enough food for its pop. for 100 days only. The coastline, except on the S.W., is much indented, the chief bays being, on the N.E., Melleha, St. Paul's, and the double indentation formed by the promontory on which Valletta, the capital, is built; on the S.E., Marsa Scirocco. The climate is mild and healthy in winter, warm in summer.

The principal occupations of the inhabitants are agriculture and services rendered in H.M. dockyard and for the navy, the army, and the R.A.F. The British govt., as the largest employer of labour, keeps Maltese economy functioning. Minor manufactures include beer, lace, cotton, cigarettes, pipes, filigree. Soft limestone, which is cut with axes and of which the houses are built, is the island's only mineral.

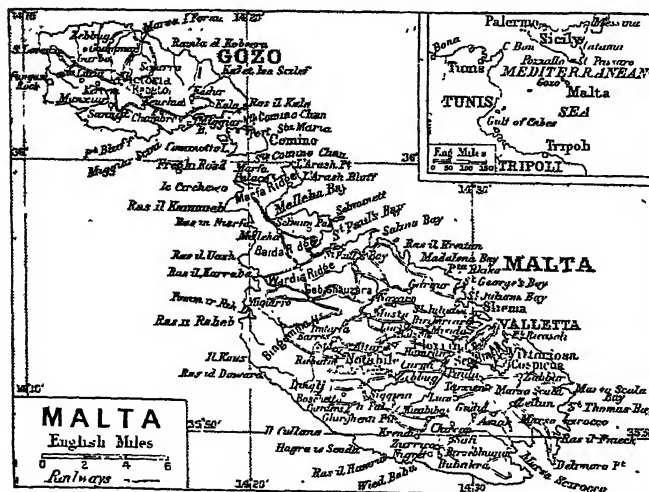

Rainfall averages 18 ins. a year. Water is stored in underground galleries, into which the rain percolates. The supply is inadequate for all needs.

Malta contains some remarkable megalithic sanctuaries (e.g. Hal Tarxien) of the Neolithic period (3rd millennium B.C.), with oriental affinities. These shrines had fallen into disuse before the Maltese Bronze Age (c. 2000 B.C.). Phoenicians reached the island soon after 1000 B.C. and founded towns there in the 8th and 7th cents. In the 6th cent. they were reinforced by settlers from Carthage. The Romans turned the Carthaginians out during the Second Punic war, and the island enjoyed considerable prosperity under Roman rule. St. Paul's Bay is identified as the scene of the shipwreck of the apostle in A.D. 58 (Acts 27).

With the decline of the Roman empire, Malta was ravaged by the Vandals and Goths in the 5th cent. A.D. They were driven out by Belisarius, who attached it to the Byzantine empire. In the 9th cent. the Arabs established themselves here, their control lasting from 870 to 1090. The Maltese language, Phoenician in origin, assimilated Arabic idiom, and has continually absorbed many European, including English, words. In 1090 the Arabs were expelled by Count Roger the Norman with a handful of men, the island thus becoming a dependency of Sicily,

Malta arms

Malta. Map of the islands forming a British territory in the Mediterranean. Inset, map showing position of the islands in relation to Sicily and Africa.

and like Sicily passing by marriage to the house of Hohenstaufen. On the extinction of that house, soon after 1250, Peter king of Aragon secured Malta. The Aragonese kings recognized the privileges of local govt. granted to the island by Count Roger the Norman, and set up a popular council. As a Spanish dependency Malta became part of the inheritance of Charles V and in 1530 that sovereign gave it to the knights of S. John of Jerusalem, who, driven from Rhodes by the Turks, sought a new home. When the Turks laid siege to Malta in May, 1565, it was strenuously defended by the knights, led by their grand master John Parisot de la Valette and assisted by Maltese troops, of whom 6,000 perished. The Turks withdrew on Sept. 8, 1565. On that day in 1945, the armistice signed by Italy on Sept. 3 came into

routes. Malta is also the base of the British Mediterranean fleet.

Under British protection, Malta was governed as a crown colony under the Colonial office with various forms of representative council to assist the governor, that of 1887 being the most liberal. It was replaced in 1900 by a more

to the exclusion of Maltese. From 1934 Maltese became the language of the law courts, and was taught in the university (which has an average of 250 students). Subsequent constitutions under crown colony rule, to which the island had reverted, made English and Maltese the official languages. The

effect, and the dual victory is now celebrated in Malta on that day, the feast of Our Lady of Victories, which is Malta's national day.

The knights of S. John fortified Malta and built many auberges, palaces, and churches, but in 1798 the effete grand master Hompesch, yielding to the defection of the French knights, surrendered the island to Napoleon without a fight. Three months later the Maltese rose against the French, who in 1800 capitulated to British, Maltese, and Neapolitan forces. In 1814 the treaty of Paris ratified the cession of the Maltese Is. to Great Britain, a cession made at the explicit request of the Maltese people. With the opening of the Suez canal in 1869 Malta became an important coaling station on the great trade route between Great Britain, India, Australia, New Zealand, and the Far East. With the development of air transport, she became a staging post on the empire air

restricted one. At the end of the First Great War, Malta suffered from unrest and mild riots, and in 1921 was granted responsible government under the Amery-Milner constitution, together with a grant in aid of a quarter of a million sterling. There was an elected legislative assembly of 32 members and a senate of 17. Local affairs were the concern of the prime minister and his cabinet, imperial interests and defence being reserved to the crown. Under self-government, education and communications improved and the Maltese language finally supplanted the Italian, which had been imported by Sicilian notaries at the time of the knights. Fascist interference in Malta's domestic affairs in a struggle to Italianise Malta on the part of Mussolini was strongly resisted by the Maltese people and ended in 1933 in the withdrawal of the constitution of 1921, under which Italian and English were the official languages

MacDonald constitution of 1939 created an advisory council of government, consisting of ten elected, two nominated, and eight official members, of which the governor was president; and the governor's executive council included two elected members. This form of govt. functioned throughout the Second Great War. A new constitution, restoring autonomy in local matters, promised in July, 1943, came into effect Sept. 22, 1947. The first parliament under this was opened by the duke of Gloucester, Nov. 10; Labour held 24 out of 40 seats, four parties, including a nationalist pro-Italian party with seven members, sharing the others. The assembly met in the 17th cent. hall of S. Michael and S. George, still standing though damaged by blast from enemy bombs.

The British govt. made a free grant of £10,000,000 to Malta in 1942 to help in the reconstruction of bomb-damaged buildings, and provided food subsidies of £2,000,000 a year during the last stages of the war to keep down the cost of living. Damage to school buildings and increase in pop. halted the effort made to stamp out illiteracy; 55 p.c. of the people are unable to read or write.

## MALTA IN THE SECOND GREAT WAR

The Hon. M. E. Strickland, Editor, The Times of Malta

*The stubborn and heroic defence put up during 1940-43 by Malta, isolated British island in a hostile Mediterranean, is here vividly described by one who shared in it*

In 1939 there were two schools of thought regarding the strategic value of Malta in the event of a declaration of war by the Axis on Great Britain and France; one, that Malta would be torn from the empire, the other that Malta could and would be defended. The chief protagonist of the second was Lord Strickland, prime minister of Malta and leader of the elected majority in the council of govt.

After the Munich crisis it was decided to strengthen Malta's defences. A.A. guns were dispatched from Great Britain, and the cutting of deep rock shelters in the dockyard area began in 1939. Malta came under the French zone of Mediterranean responsibility, and the air defence was to be supplied from bases at Bizerta.

From Sept., 1939, to June 19, 1940, after the first anxiety as to whether Italy would fight or not was allayed, Malta continued on its peace-time level, save that the fleet had sailed and only submarines remained. Maltese traders imported stocks of wheat, other food, and fuel. Some surface shelters were built.

In May, 1940, Gen. Sir William Dobbie became acting-governor, an appointment confirmed when his predecessor, Gen. Sir Charles Bonham-Carter, was invalided out of the army. On June 8 the Maltese quailing Carlo Mallia broadcast from Rome that he and his friends were coming to liberate their Maltese brothers from the British yoke. A wave of anger swept the island. Anti-Italian demonstrations took place in Valletta, and in the towns and villages. Mussolini's declaration of war at 5 p.m. on the 10th relieved the tension. Malta waited, but not for long. The French air defence she should have had was not there.

### The First Air Attacks

At 6.45 a.m. on June 11 came the first air attack, followed through the day by seven successive waves. The guns blazed back. Anger surmounted fear. Casualties were far fewer than had been anticipated: the solid stone houses stood up to the 500-lb. Italian bombs. Admiral Sir Wilbraham Ford organized the dockyard defence battery. Evacuees poured out from the three dockyard cities to the inland towns and villages. Air attack continued. Malta put

on a stoical mood almost overnight; it was not to yield as the months passed. Four British Gladiators took the air, plunged in among the Italian marauders, and shot some down. One Gladiator was lost. The three others, which became known as Faith, Hope, and Charity, fought on. The A.A. guns, manned by Maltese gunners and gunners from the U.K., also took their toll of the enemy. Aug. brought six Hurricanes as reinforcements from Great Britain, sent despite her own desperate need, for the battle of Britain was on, too. Everyone in Malta began cutting rock shelters in the soft limestone; by the end of 1941 eleven miles of shelters had been cut by hand.

The A.R.P., which had come into being in 1935 during the Abyssinia crisis, when Malta had the first anti-gas school in the empire, functioned well; so did the special constabulary.

### Development of the Battle

In Oct., 1940, military reinforcements for the thinly held beach posts, and additional guns, arrived. Thousands of Maltese volunteered for the King's Own Malta regt. and Royal Malta Artillery. Sir Andrew Cunningham arrived in the Warspite in Dec., after bombarding Valona, and a wave of enthusiasm swept Malta: the navy was back. Mussolini's boast that the Mediterranean was an Italian lake was disproved. In Jan., 1941, the scene changed. In limped the aircraft carrier H.M.S. Illustrious and the damaged destroyer Gallant. The dockyard worked feverishly to repair the Illustrious, the wounded were tended, the dead buried. Then came a new menace in the sirens' wail. Something new happened. The German Stuka dive-bombers were there, swooping in a perfect circle upon the great ship and her protecting land guns. The dust of battle cleared. The battered ship had survived. She survived further attacks and sailed to fight again. But from then on Malta was to know the meaning of war. The 1,500-lb. armour-piercing bombs cut through her stone buildings, the savage air attacks wore on, a slow process of attrition. In May, 1941, the Italians relieved the Germans. Malta was reinforced. Air Vice-Marshal Sir Hugh Lloyd

took command of the R.A.F. Malta-based planes began bombing Naples. At dawn, July 26, 1941, the Italians launched an E-boat attack on the Grand Harbour. Gunners of the R.M.A. shot up the whole of the attacking force of 17. Aircraft finished the job.

The Royal Navy's surface ships were again in and out of Malta and Malta-based submarines were winning laurels. In Dec., 1941, the Germans returned and began a day and night aerial attack which lasted with little respite until May, 1942. On April 15, 1942, King George VI awarded Malta the George Cross. On May 10, 1942, a great victory was won. The air defence had been down to seven planes, but Spitfires were flown in from aircraft carriers and went straight into battle; they and the guns of Malta shot down 63 enemy planes and damaged 31. Before this, the March convoy which the navy had brought in lay wrecked and burning in the harbours. Every village bore its bomb scars.

### Severe Food Shortage

On May 7, 1942, F.M. Viscount Gort relieved Gen. Sir William Dobbie. Devastation reigned in Malta, but it was to be even greater yet, and food was getting short. The British 8th army was thrown back to Mersa Matruh—Malta was still a thousand miles from any friendly land. The last phase of the aerial siege began in earnest. Bread was rationed at 10½ oz. a day, with 1 oz. of corned beef or goats' meat. There was no flour, butter, or coffee, and only 1 oz. of tea a week. One plate of soup was allowed at communal meals, or 1 oz. of corned beef if not drawn at home. There was no milk except for children under three. Gort organized a rigid economy. Livestock was ruthlessly reduced and transport limited. The food resources of Malta and the adjacent islands were pooled for army and civilians as one. The army got 1,750 calories a day, civilians 1,350. By June there was no milk save for babies and nursing mothers and the sick. All restaurants closed on July 14. By Aug. one meal a day was being served to all alike by communal kitchens in every town and village. In June two ships made for Malta from the W. and Malta's scanty harvest from her bomb-cratered fields was coming in. A convoy coming from the E. turned back—its fuel and ammunition had been exhausted before it could reach its goal. Aug. saw the epic convoy reach the island—

1. Bomb smoke over the bastions of Valletta. 2. Homeless inhabitants of Valletta on their terrace after a raid. 3. Typical air raid damage. 4. British coal miners working with Royal Engineers on the excavation of

shelter tunnels; a loaded skip is being pushed away, and an empty one goes for refilling. 5. Flower stall amidst the devastation. 6. Children playing amongst the ruins. 7. Casualties from Italy enter a reception area.

**MALTA: ILLUSTRATING HER INDOMITABLE SPIRIT IN THE SECOND GREAT WAR**

*Photos, British Official, Crown Copyright reserved*

four-and-a-half ships out of 14 that sailed; they saved the island from defeat. There were two ration periods left when, on Nov. 19, 1942, thanks to the victory of Alamein and the subsequent fall of Tripoli, "bomb alley" was opened in the E. and four ships made Malta unmolested. The siege was raised, for these ships were the first of a stream of 53 which arrived within two months. The first substantial increase in rations was on Jan. 21, 1943. Customers at communal kitchens decreased from 205,000 to 20,000 in Nov., 1942.

Throughout this period Malta-based aircraft and submarines continued to attack Axis transport carrying supplies for the Afrika Korps; their success deprived Rommel of much needed oil and petrol, men and munitions. The maintenance of Malta's own diminishing supplies of vital essentials was assisted by consignments from submarines and bombers.

#### Renewal of Air Attack

On Oct. 4, 1942, the 3,000th alert heralded a renewal of the air attack. By the 18th, 119 enemy aircraft had been destroyed by the R.A.F. for the loss of 27 Spitfires, 14 pilots being saved; 14,000 sorties were flown by the enemy, but Air Marshal Sir Keith Park used the tactics of offence by which the battle of Britain had been won. He had only a few days' petrol left when the enemy called off the attack, and Malta's guns would again have been without assistance and short of ammunition. With relief the garrison and people of Malta tightened their belts to continue the fast which bombing was rendering intolerable. Firewood from the damaged houses kept the victory kitchens in fuel. Nineteenths of the population were dependent on the communal daily meal provided by them.

On Oct. 23 the Eighth Army opened its offensive at Alamein. On Nov. 8, U.S. and British forces landed in Morocco and Algeria. Nov. 19 saw the death sentence on Carmel Borg Pisani for treason; he had landed in Malta from Italy in Aug., was arrested and tried by a Maltese civil court.

Among some 120 Maltese arrested when Italy entered the war were Dr. E. Mizzi, leader of the Nationalist party and the former chief justice Sir A. Mercieca. They were later, with the consent of the council of government, deported to Uganda for the rest of the war.

On Dec. 11, Malta's aircraft joined in the Tunisian battle, making an onslaught on enemy air

transports. On March 24, 1943, Malta saw its first balloon barrage and began to prepare for the invasion of Sicily. On June 20, 1943, the king arrived at his George Cross island on board H.M.S. Aurora; he received a tumultuous welcome.

In July Malta was crowded with men and supplies. Eisenhower, Cunningham, Montgomery, and Alexander had their H.Q. in Malta, deep in her rock shelters, before invading Sicily. Malta's armada joined the thousand other ships that sailed to reach Sicily on July 10, 1943. Malta's aerodromes provided the base for the R.A.F. fighter cover for this first invasion of Axis Europe. Malta had vindicated her stand, the armed forces had their reward for the sacrifices made in her defence. Malta's story is well summed up in Gen. Eisenhower's statement to Lord Gort published in *The Times* of Malta, Aug. 5, 1943: "The epic of Malta is symbolic of the experience of the United Nations in this war. Malta has passed successively through the stages of woeful unpreparedness, tenacious endurance, intensive preparation, and the initiation of a fierce offensive. It is resolutely determined to maintain a rising crescendo of attack until the whole task is complete. For this inspiring example the United Nations will be forever indebted to F.M. Lord Gort, the fighting services under his command, and to every citizen of the heroic island."

The *Times* of Malta, the Sunday *Times* of Malta, and *Il-Berqa* maintained unbroken publication throughout the aerial battle and the long siege.

#### The Price of Victory

Casualty figures were: civilians, June 11, 1940, to Dec., 1943: killed 1,190 (including 404 children), died of wounds 296, missing 54, seriously injured 1,846, slightly injured 1,932. The fatality rate represented 5.7 per thousand pop.

10,400 houses were demolished, 18,000 partly damaged, 48 churches damaged or destroyed; the church of S. Mary of Damascus, 1576, was obliterated, and the oldest part of the palace of the grand master of the Order of S. John, begun 1574, was destroyed.

In 1942 the death rate exceeded the birth rate (by 1,835) for the first time since 1799. In the spring of 1943 an epidemic of infantile paralysis swept the island. Malta, apart from Gozo, had 375 cases. In Aug., 1943, a typhoid epidemic broke out, the result of dislocation of drainage by bombing. Of some 1,000 cases, 100 were fatal.

Military casualties: army, Maltese and U.K., under 300; naval, under 200; R.A.F., about 80. Casualties in the navy and merchant navy ships that fought through to Malta were over 2,000.

Axis planes destroyed from June, 1940, to July, 1943: 1,237; 236 were shot down by gunners, 1,001 by the R.A.F. Alerts, 3,343; 16,500 tons of bombs were dropped on Malta.

There were approx. 15,000 Maltese in the army and an equal number of troops from the United Kingdom forming the garrison. Conscription was agreed to in 1941. Over 4,000 Maltese served in the Royal Navy and merchant navy, and over 1,000 in the R.A.F.

After the raising of the siege, from Dec., 1942, to April, 1943, planes based on Malta destroyed 216 rly. engines, eight in Tunis, the remainder in Italy and Sicily. Submarines based on Malta sank 1½ million tons of Axis shipping during the war, and three V.C.s were won by men of Malta-based submarines.

**Malta, KNIGHTS OF.** Name sometimes given to the knights of the order of S. John of Jerusalem, during the period 1530-1798, when they ruled Malta. Once established in the island, they continued their martial career. They helped Charles V in his campaign in N. Africa, but soon their whole energies were occupied in defending the island from a great Turkish attack. The knights took their galleys, in 1571, to fight at Lepanto.

In the 17th century the knights were constantly at war, but the order soon began to lose ground. They helped to defend Candia against the Turks and fought under John Sobieski in Hungary. They warred, too, against Venice. In the 18th century one or two of the grand masters made spasmodic attempts to restore the power of the order. The knights lost Malta in 1798, when the grand master, Ferdinand von Hompesch, surrendered it almost without a struggle to France. Many of the buildings erected by them were damaged or destroyed by enemy bombing from the air during the Second Great War. Part of the palace of the grand masters at Valletta survived, but the oldest portion, dating from 1574, was destroyed, and the marble staircase was damaged. See *Knighthood*; *Malta*; consult also *The House of the Temple*, F. W. Ryan, 1930.

**Malta Artillery, ROYAL.** Regiment of the British army. Formed in 1802 as the Malta Coast Artil-

lery, it assumed its present title in 1889. All ranks are Maltese, and during the Second Great War the regiment earned distinction for its work in the A.A. artillery defence of the island. In 1940 King George VI became col.-in-chief of the unit.

**Malta Fever.** This term is a misnomer for Undulant Fever (*q.v.*).

**Maltese Cross.** Badge of the order of the knights of Malta. This is a development of the cross pattée or formée, the limbs expanding in thickness towards the ends. In the Maltese Cross each extremity is indented, so that it is sometimes known as the cross of eight points. See Cross.

**Maltese Terrier.** Name of an ancient breed of lap-dog. Superficially it resembles a toy Skye terrier, but in fact it is not a terrier. In colour it is pure white, occasionally marked with fawn. The long hair that covers the face and sides is of a very fine silky character. The tail is very short, but, carrying an extensive plume of hairs, appears large, and is usually curved over the back. The dog is of a very affectionate disposition, loyal to its owner, and displays remarkable intelligence, alertness, and good temper. It is no longer bred in the island of Malta. See Dog.

**Malthus, THOMAS ROBERT** (1768-1834). British economist. Born near Dorking, Surrey, Feb.

17, 1766, and educated by private tutors, he went to Jesus College, Cambridge, where he became a fellow. He was ordained and held a curacy for a time, but soon gave his attention to political economy, which was to be his life study. The work by which he is best remembered, his *Essay on Population*, was first published in 1798 by way of reply to Godwin's *Enquirer*, 1797, and met with fierce criticism. His theory (*v.i.*), suggested, perhaps, by Hume's *Essay on the Populousness of Ancient Nations*, was attacked afterwards by Karl Marx in his *Capital*, and by other writers.

In 1799 Malthus made a tour through Scandinavia and Russia in search of information, and in 1802 visited France and Switzerland. The new edition of his *Essay*, 1803, was virtually rewritten, and in it he acknowledged the effects of prudence as a check

on population, which in the first edition had only been implied. In 1805 he was appointed professor of political economy at the East India College, Haileybury, and here he passed his remaining years except for short intervals of travel. He was elected F.R.S. in 1819. He wrote *Political Economy*, 1820, and other works, and died Dec. 23, 1834. See Malthus and His Work, J. Bonar, 1885.

**Malthusianism.** Theory of population expounded by T. R. Malthus (*v.s.*). It became almost identified — wrongly — with the views and principles of those who advocate small populations and birth control. Malthus, in his

Maltese Terrier. Champion specimen of this breed of lap-dog

*Essay on the Principles of Population as it Affects the Future Improvement of Society*, 1798, challenged Rousseau's theory of the "perfectibility of society" by pointing out that the natural tendency of population was to increase faster than the means of subsistence. Directly or indirectly, therefore, the size of a population was, he held, controlled by want and its attendant miseries.

In essence, this view has never been seriously controverted; and it is certainly not incompatible with the great rise of populations which kept pace with growing industrialisation and increase in scientific knowledge during the 19th century. Malthus's law, however, is not the only one governing changes in size of population, such changes are influenced by many considerations.

The views of Malthus, though by no means original, were a shock to the orthodox opinion of his day; and he was also much misunderstood. Later he was acclaimed as an inspired prophet by the advocates of contraception. Malthus himself, however, advocated only "moral restraint"; and there is good reason to think that he would have been shocked at the practice of contraception by mechanical means.

Malthus's great contribution to scientific thought was indirect. It was his *Essay on Population* which inspired both Darwin and Wallace to produce the theory of evolution: if population presses upon subsistence, they argued, then the individuals which survive to breed will be the fittest — hence the origin of species and natural selection.

**Malting.** Term for the conversion of cereal grains or other seeds into a dry, friable condition, the product being known as malt. Long experience has proved to the brewer that barley best serves his purpose, and much care is given to the growth and harvesting of malting barley in California, India, Great Britain, and elsewhere.

The barleycorn includes a small germ at the lower end which would, in normal conditions, develop into a new plant; behind and above this is the main bulk of the corn composed of a hard network of cellulose enclosing many millions of starch grains, known as the endosperm, and surrounded by a thin layer of cells containing grains of protein, the whole seed being enclosed in a chaffy covering or husk.

As harvested, barley requires a certain resting period before germination can begin, and a longer period before it is fully matured. Maturity can be accelerated by a process known as sweating, in which the barley is heated on a kiln to 100° or 110° F., with occasional turning, for about 30 hrs. This treatment eliminates excess of moisture, and full maturity is attained a few weeks later. Since the moisture content at this stage is about 12 p.c. the barley can be stored without deterioration for a long time.

The maltster screens barley to remove such foreign matter as other seeds, stones, and dust. The barley is then steeped in water to remove some of the remaining extraneous matter by flotation. Two or three changes of water are used in steeping which lasts for 50-100 hrs.; the grain absorbs a considerable weight of water, and the excess is run off.

The wet barley is spread out upon the malting floor in a layer a few ins. thick, known as the couch. This begins to germinate, each corn producing a few rootlets, the shoot, or acrospire, growing up beneath the husk. The respiration of the growing seed produces heat, and to keep the temp. down the mass is turned at intervals either by hand or by a

mechanical plough. During this process various enzymes are formed; one, the *cytase*, acts upon the hard interior network or cellulose, breaking it down and rendering the enclosed starch accessible in the mashing procedure. At the same time some of the insoluble protein is attacked by proteolytic enzyme and converted into simpler soluble compounds.

When the shoots are about three-quarters the length of the corn (in 9-12 days), the thickness of the couch is increased, and it is then left to wither for a day or more, when the rootlets begin to shrink and develop a little colour. The product now contains about 40 p.c. of water and is known as "green malt." The green malt is spread in a thin layer upon the perforated floor of a kiln, and a current of warm air heated by a fire beneath is passed through it for one or two days during which it is frequently forked and turned until the mass becomes what the maltster calls hand-dry.

The next process, curing, involves reducing the supply of air and allowing the temp. to rise gradually to about 200° F., when the moisture is still further reduced, the enzyme diastase is partly destroyed, and the malt develops colour and a pleasant biscuity flavour. For pale ales, the colour of the malt is increased only slightly, for mild ales or stouts it must be darker. When unloaded from the kiln the malt contains about one p.c. of moisture and is allowed to cool before being removed to storage.

This traditional flooring method of preparing malt is still used; but various forms of plant have been designed. In some the

germination takes place in large boxes (Saladin method), in others in revolving metal drums (Kropff, etc.), in which temp., aeration, humidity, etc., are easily controlled. The malt produced in these plants is no better than that grown by the older method; but less floor space is required, malting can be carried out at any time of year, and with less manual labour.

By the use of higher curing temps. amber and brown malts are obtained, the latter usually by roasting over an oak-wood fire. Crystal malt is prepared by heating green malt to 160° F. when the interior of the corns liquefies, after which the temp. is raised until the desired colour is produced. On cooling, the liquid interior solidifies to a brown crystal-like mass of characteristic flavour. The darkest variety, black malt, is made by roasting ordinary kilned malt in a revolving drum over a series of gas flames, after which it is rapidly cooled with a water spray to prevent spontaneous combustion.

Malt usually contains more diastase than is necessary to convert the whole of its starch into sugar in the mash tun. It is therefore sometimes desirable to add unmalted starch-containing materials to the grist, especially if the malts used have a high nitrogen content. The principal materials in the U.K. in normal times are thin flakes of maize and rice, produced by removing the husks, germ, etc., and heating the remainder with water to form a paste. Other materials—potatoes, rye, raw barley, etc.—have been tried, but without much success. See Brewing.

**Malton.** A market town and urban dist. of Yorkshire (N.R.). It stands on the Derwent, 18 m. to N.E. of York, and is served by rly. It consists of Old and New Malton, while across the Derwent is the sister town of Norton, which is in the East Riding. The chief buildings include three churches, S. Michael's, S. Leonard's, and S. Mary's, all containing Norman work. S. Mary's was the church of a priory here. The chief industries are tanning, brewing, and milling, and the making of agricultural implements. Malton is also a centre for horse-breeding. Near is Castle Howard. In early Saxon times Malton was

the residence of the kings of Northumberland, becoming a town soon after 1066 and having a castle. From 1640 to 1885 it was represented in parliament. Its rights as a borough were lost in 1684. In 1854 a local board was established, and in 1894 it became an urban dist. Market day, Sat. Pop. 4,300.

**Maltose.** Sugar prepared by the action of malt upon starch. It was at first mistaken for dextrose, but its true nature was pointed out by A. P. Dubrunfaut, who gave it the name maltose. To prepare it starch is mixed with water, and heated on a water-bath until it gelatinises. To this is added the crushed malt, and the mixture kept warm for an hour to enable the enzyme of the malt (diastase) to hydrolyse the starch into maltose and dextrin. These two substances are separated by means of alcohol, which dissolves the maltose, leaving the dextrin as a residue. Maltose crystallises in fine needles, and when boiled with dilute sulphuric acid is decomposed into grape sugar.

**Malvaceae.** Family of herbs, shrubs, and trees. Natives of all temperate and tropical regions, they have alternate leaves, and the sepals are united to form a five-lobed calyx. There are five petals, and numerous stamens and styles. The calyx has often an outer false calyx (*epicalyx*) formed of united bracts. Many of the species yield fibres, and all are mucilaginous. Among the genera are *Althaea* (marsh mallow), *Gossypium* (cotton), *Hibiscus*, *Malva* (mallow), etc. See Fruit; Hollyhook; Mallow.

**Málván.** A subdivision and town of Bombay state, India, in the Ratnágiri dist. The subdivision lies along the coast, and Málván Bay affords a safe anchorage for coasting vessels. The town has the chief harbour on the bay, and is 70 m. S. of Ratnágiri. It was formerly a stronghold of Mahratta pirates, who were extirpated in 1812. In that year Málván was ceded to the British government by the raja of Kolhapur. Area, 238 sq. m. Pop. subdiv., 124,410; town, 25,677.

**Malvern.** Name used for Great Malvern, an inland watering-place, urban dist., and cultural centre of Worcestershire, England, and also for a number of other places on the Malvern Hills, all visited for health and pleasure.

Malton, Yorkshire. West front of S. Mary's, or the Priory Church of Old Malton  
Valentine

Malton arms

Malvern arms

These include Little Malvern, Malvern Link, Malvern Wells, West Malvern, and North Malvern.

Great Malvern, which is 128 m. from London and 9 m. from Worcester, has a rly. station. Its chief building is the beautiful cruciform church, that once belonged to the priory. This was founded in the 11th century, and there are remains of the refectory. Mainly Perpendicular, this has a Norman nave, and is noted for its glass. Of the springs the chief is St. Ann's Well. Malvern votes in the co. constituency of S. Worcs. Pop. 22,778.

**Malvern College.** An English public school at Malvern, Worcestershire. Founded in 1862, it was opened in 1865 as a Church of England school with a system modelled upon that of Winchester. Its 500 boys live in ten houses, and there are a small number of

Malvern, Worcestershire. The cruciform Priory Church from the N.E.

**Malvern Hills.** Range of hills in England. It extends for about 9 m., mainly N. and S., between

Worcestershire and Herefordshire. The highest points are Worcestershire Beacon and Herefordshire Beacon, both nearly 1,400 ft. high. From the former 15 counties can be seen. Other heights include North Hill, Holly bush Hill, Sugarloaf Hill, Swinyard Hill, Midsummer Hill, and Gloucester Beacon. The

district is called Malvern Chase. It was disafforested in the 17th century. The Malvern Hills Act, 1924, was designed to preserve various beauty spots here. On Herefordshire Beacon are remains of a British camp.

**Malvernian.** In geology, a group of Pre-Cambrian rocks which form the main ridge of the Malvern Hills (*v.s.*). Probably the rocks were originally sediments, tuffs, and volcanics of fairly basic composition. Later they were rendered gneissic by metamorphism accompanied by permeation by granitic fluids. The resulting rocks are now of variable character, which can be graded from basic amphibolites to acid granites. See Metamorphism; Pre-Cambrian.

Malvern College. School Buildings, with chapel on the left, from the cricket ground

day boys. It is divided into classical and modern sides, and has a school of engineering.

**Malvern Festival.** Founded by Sir Barry Jackson and Roy Lambert in 1929, this dramatic festival was held at Malvern each summer until 1939. On Jackson's retirement in 1938, control was assumed by Lambert, who nominated Sir Cedric Hardwicke as associate director. Sixty-five plays by some 40 dramatists were given in the 11 seasons, six specially written by Bernard Shaw: *The Apple Cart*, *Too True to be Good*, *The Simpleton of the Unexpected Isles*, *On the Rocks*, *The Millionairess*, and *Geneva*. Many 17th century plays were revived, including Southerne's *Oroonoko*, Jonson's *Volpone*, and Dryden's *All for Love*. The festival was revived in 1949.

**Malvery, OLIVE CHRISTIAN** (d. 1914). British author and social worker, known also under her married name of Mrs. Archibald MacKirdy. Her first book, *The Soul Market*, 1906, was followed in 1907 by *Baby Toilers*, an investigation into the conditions of children in industrial life. Later works included *A Year and a Day*, a record of investigations into the employment of women, 1912; and, in collaboration with W. N. Willis, *The White Slave Market*, 1912. Her work on behalf of homeless women and girls led to the establishment of homes in London and the provinces, she herself founding two which she presented to the Church Army and Salvation Army. She died Oct. 29, 1914.

**Malvolio.** Character in Shakespeare's *Twelfth Night*. Steward

to the Countess Olivia, he becomes by reason of his petty persecution the butt of Sir Toby Belch and his bibulous cronies. They trick Malvolio into making a fool of himself by appearing before his mistress in yellow stockings, and cross-gartered. It is to him that Sir Toby exclaims: "Dost thou think, because thou art virtuous, there shall be no more cakes and ale?" and in the fabricated letter to him appear the

Malvolio, in the fantastic dress with which he hopes to win the heart of the Countess Olivia

words: "Some are born great; some achieve greatness; and some have greatness thrust upon them."

**Malwa.** Historically, a tract of Central India, lying N. of the Vindhya range and drained by the Mahi river. It was annexed to the Mogul empire by Akbar in 1562, and later fell to the Mahrattas and so to the British until 1947. The name was given in 1948 to a union of 20 formerly independent states, later commonly known as Madhya Bharat (*q.v.*). Malwa's chief crops are food grains, while wheat, hemp, and sugar-cane are grown, but the opium supply has ceased. Dhar, Ratlam, and Ujjain are important places. Area of Malwa, 2,727 sq. m. Pop. approx. 390,000.

**Mamba.** Slender snake inhabiting Central, E., and S. Africa. It attains a length of 10 ft. and, with the possible exception of the hamadryad, is the deadliest of all snakes. There are two varieties, one black which seldom leaves the ground, while the green mamba often lies entwined in the branches of trees overhanging paths and will bite natives on the head and shoulders as they pass. The bite is usually fatal within a few hours.

**Mamelukes** (Arab., slaves). Military class of foreign origin in medieval and modern Egypt, to which they gave a number of sul-

tans. In the 13th century the Seljuk Turks, whose greatest chief had been the sultan Saladin, were masters of Egypt and W. Asia. It was a Turkish custom to carry off boys from conquered territories as slaves, and to train them as military bodyguards for the sultans.

Such a bodyguard of white slaves or Mamluks was formed in Egypt. The Mamelukes became an invaluable fighting force; their leaders were taken from their own ranks, and in 1250 their commander, Kutuz, overturned the government and made himself sultan of Egypt. Ten years later another Mameluke captain, Beibars (*q.v.*), slew Kutuz and seized the sultanate. From this time the Mamelukes were masters of Egypt and ruled until the conquest by the Ottoman Turks in 1517. The series is divided into two groups, the Turkish (1250-1390) and the Circassian (1390-1517). The succession of each sultan was usually secured by the violent death of his predecessor. Lesser Mameluke chiefs ruled the provinces under a kind of feudal system.

The Mameluke sultans were, on the whole, able rulers, and raised Egypt to great prosperity. They were also great patrons of literature, architecture, and other arts. After the Ottoman conquest, Egypt was officially placed under a Turkish pasha, but virtually under Mameluke beys, who controlled the several provinces. The army overthrown in Egypt by Bonaparte, 1798, was a Mameluke force. They were exterminated or expelled by the pasha Mehemet Ali in 1811. See Egypt.

**Mamers.** Town of France. In the dept. of Sarthe, it lies 28 m. N.N.E. of Le Mans, with which it has rly. communication, and is a junction on the Ouest line. There are cloth and leather industries, printing works, and sawmills. The church of S. Nicholas dates from the 13th-15th centuries, with Renaissance additions.

**Mamertine Prison** (from Mamers, a form of the name Mars). Alternative name, of medieval origin, for the Tullianum (*q.v.*), the subterranean prison of ancient Rome on the Capitoline hill.

**Mammal** (Lat. *mamma*, breast). Name given to the class of vertebrate animals which suckle their young. Some time when coal was still being laid down by the overwhelming of great forests, the Amphibia (*q.v.*), the first vertebrates to conquer the land, gave rise to two separate lines of descendants which differed from amphibia and

from each other. Both of these lines, together with the amphibians, are represented by animals alive today. One line consisted of ordinary reptiles, related to, and in many ways like, living reptiles. Some of these had, there is every reason to think, four-chambered hearts derived from the amphibian three-chambered heart by complicated but explicable steps. The other line consisted of reptiles, too, but they were very different. They almost certainly had four-chambered hearts, which, however, could not possibly be derived by the same steps from the amphibian three-chambered heart. These reptiles are generally called the theromorph, or beastlike, reptiles, the implication being that they were the true ancestors of the mammals. Through the Permian, the Triassic, and the Jurassic they formed a relatively tiny group numerically. They were small animals, active, and of rapidly growing intelligence.

#### The Dominant Group

At the end of the Cretaceous period this group stepped into the place of the ordinary reptiles, most forms of which met disaster for some obscure reason at this time. Through the Cainozoic period, up to the present day, they have remained easily the dominant group. They have produced a number of lines of highly successful and very specialised forms, and at the same time there have remained lines of primitive, relatively unspecialised, mammals, such as the hedgehog, which probably resemble in many ways the earliest creatures which could fairly be called mammals.

Perhaps the most important single step taken by the evolving line of mammals was the acquisition of a mechanism for stabilising their internal temp. By burning their food at a slow rate, all animals inevitably produce some heat. The mammals have a metabolism so balanced as to give considerable amounts of heat even when relatively little active work is being done. Great exertion generates relatively great amounts of heat. This necessitates some cooling mechanism. Heat is lost, in these circumstances, through evaporation at surfaces, particularly through the evaporation of sweat. Large mammals, in which the ratio of volume to surface is high, are confronted with a serious problem in keeping cool, small mammals with an equally serious problem in keeping warm. Mice do not live in arctic conditions. The arctic fox is probably near the lower limit of

practicable size for such regions. At a relatively constant internal temp. of about 37° C., the mammals can develop very precise chemical mechanisms of all kinds to mediate their precise and elaborate lives. Such precision and such elaboration would be impossible in conditions of wildly varying temp.

The other vital step in the evolution of the mammals was the retention of the developing embryo within the mother's body for an increasing time. This made possible an elaboration of the brain in circumstances where the individual was safe from competition with all but its litter-mates. Subsequent maternal solicitude and provision of milk enabled the young to survive bearing a brain, scarcely functional and at that age a handicap, but destined at maturity to give its owner a decisive advantage in the struggle for existence against stronger but stupider rivals.

These two things, control of temp. and maternal nourishment of the young, have been made possible in the mammals by the development of those particular structures which distinguish the group: hair, sweat, and those modified sweat glands which provide milk.

#### Hair and Keratin

Hair (*q.v.*) is a special local manifestation of the capacity found all over the skins of mammals, and many other animals, to produce a horny substance called keratin (*q.v.*). Its production at the walls and the tip of a little nodule sunk in a pit at a very much higher rate than elsewhere leads to the production of a hollow, dead tube of keratin, perpetually elongating, at varying rates, by the accretion of new keratin at the base. In this keratin there is often included a colouring matter called melanin, varying in tone from straw colour to black. The huge number of hairs on the skin of most mammals provides an efficient mechanism for the conservation of heat.

Sweat is produced by glands distributed unevenly over the bodies of most, but not all, mammals. It helps in the removal of some waste products, and its evaporation leads to a great loss of heat. For this reason its controlled production plays a very important complementary part to that of hair in the regulation of temp. Further, sweat, in man for instance, where the hair is so much reduced, contains substances which absorb much of the radiation from the sun over a range of wavelengths which is most harmful in

producing sunburn, so that sufficient sweat is a protection.

The number of groups of sweat glands modified to produce milk is not constant from species to species, varying from a normal of two in man to a dozen or more in a sow. Even in man the number two is not constant. The condition of polymastia (many breastedness) is not uncommon. Tradition holds that Anne Boleyn had more than the usual complement; which fact is said to have fascinated Henry VIII with profound historical consequences. Any sweat gland, in either sex, seems able exceptionally to develop into a milk gland, and the removal of such unwanted formations is a part of surgical practice. The secretion of milk consists in the breakdown of the walls of the gland, built up during pregnancy and replenished during lactation.

#### Reproductive System

Associated with the retention of the embryo within the mother (a specialisation by no means confined to this group) we find, in the mammals, a profound modification of the vertebrate urino-genital system in both sexes. To ensure the meeting of sperm and egg (see Fertilisation) an intromittent organ is developed in the male to deliver the semen, consisting of sperms in a medium supplied partially by the prostate gland (*q.v.*), into or at the entrance of, the uterus, which is a part of the ordinary vertebrate oviduct modified to provide a suitable environment for the development of the embryo. To ensure that the female system shall interact correctly in time with the male system many mammals have retained a primitive response to the changing seasons, and breed at a season when both sexes are properly attuned to it.

The condition of being ready to breed is mediated by the secretions of the pituitary (*q.v.*), and, particularly in the female, an enormously complicated system of hormonal control has grown up, taking its time from the pituitary, to ensure that all the parts of the reproductive system, including the milk glands, act harmoniously and in step, so that, for instance, the expulsion of the embryo coincides in time with the production of milk. (See also Hormones; Menstruation, etc.)

Since teeth are extremely durable, it is from their teeth that many early mammalian forms are known as fossils. In the Jurassic the best authenticated mammals had three cusps to their grinding

teeth, and are called the Trituberculata from this quality. A number of unsuccessful groups branched off, some with many cusps, and by the beginning of the Cretaceous three groups are fairly clearly to be made out: (1) the ancestors of the duck-billed platypus and its allies; (2) the ancestors of the kangaroos and their allies; (3) the ancestors of the familiar mammals.

These three groups are made up today as follows:

**THE SUB-CLASS MONOTREMATA.** Here, as the name implies, the openings of the urino-genital system and of the rectum occur at the bottom of a single common depression. The duck-billed platypus (*Ornithorhynchus*) and the Australian spiny anteater (*Echidna*) lay eggs which are fertilised internally and develop a little before being laid. When laid they are placed by the mother in a ventral pouch where development is completed, the young animal being nourished by milk secreted by milk glands to which the embryo becomes closely attached. The sub-class is Australasian.

**THE SUB-CLASS DITREMATA.** Here, as the name implies, the openings of the urino-genital system and of the rectum are separate. In the sub-class there are two grades: (a) The Marsupialia (Australasian and American), in which the young are born very immature, are protected by the mother in a pouch or marsupium, and are fed by milk glands. Here are the kangaroos, opossums, bandicoots, phalangers, and their allies. (b) The Placentalia. In this group the embryo develops far more fully before being expelled from the uterus, and after birth the young are not protected in a marsupium. They are nourished, for a long time in some cases, with milk from the mother, who protects them from attack. The placenta (*q.v.*) permits the passage of nourishment, hormones, antibodies, and oxygen from the mother to the embryo and the passage of waste products, hormones, and antibodies from the embryo to the mother. This passage is via the blood streams of the two, which, however, never mix; diffusion takes place through thin membranes separating them.

In living or recently extinct placental mammals the following orders are commonly recognized:

(i) *Insectivora* including the hedgehogs, moles, and shrews. These are in many ways perhaps the most primitive of living mammals. The brain is very little more

developed than in some reptiles, being smooth and not convoluted.

(ii) *Cheiroptera*: the bats. Here the hand is modified for flight.

(iii) *Rodentia*, or gnawing animals, such as the rabbit, the rat, beavers, porcupines, and others.

(iv) *Carnivora*, or flesh-eaters. Here are the dogs, cats, wolves, tigers, weasels, bears, and seals. All have teeth more or less specialised for their diet of flesh. Many have developed great speed and strength for killing their prey.

(v) *Artiodactyla*, or hooved animals with even numbers of toes. Here are the cows, camels, pigs, deer, and sheep. Many of these animals chew the cud. Many run very fast. They frequently live in herds for mutual protection against the carnivores. Many of the males develop great strength.

(vi) *Cetacea*: the whales, in which the limbs are reduced and the animals have taken on a secondary fish-like shape.

(vii) *Perissodactyla*, or hooved animals with odd numbers of toes, such as the horse and the rhinoceros. These do not chew the cud, but have developed very great strength and speed as a protection against the carnivores.

(viii) *Proboscidea*, elephants.

(ix) *Sirenia*: the sea-cows. Here are the dugong and the manatee (*q.v.*), and the recently extinct huge *Stella's Sea Cow (q.v.)*.

(x) *Hyracoida*, e.g., Hyrax, the true coney of Scripture.

(xi) *Edentata*: a confused group, almost certainly not a true order. Here are the anteaters, the sloths, and the armadillo.

(xii) *Dermoptera*, the cobago or so-called flying lemur.

(xiii) *Primates*. Here are the true lemurs, the tarsoids, the Old and New World monkeys, the great apes, and man.

Further details may be found under the heading of any of these orders or of the animals mentioned as belonging to them.

Paul G. 'Espinasse

**Bibliography.** There are no up-to-date books dealing with the evolution and structure of mammals exclusively, but the older textbooks, written before much that is now known was discovered, are out-moded. The following books provide classifications and, in their bibliographies, an introduction to the more advanced study of the mammals: *Vertebrate Zoology*, G. R. de Beer, 1928; *Studies in the Structure and Development of Vertebrates*, E. S. Goodrich, 1930; *Early Forerunners of Man*, W. E. Le Gros Clark, 1934; *Tempo and Mode in Evolution*, Simpson, 1944; *Mammals of Nevada*, Hall, 1946.

**Mammee Apple** (*Mammea americana*). A large tree of the family Guttiferaceae. It is a native

Mammee Apple. Foliage and fruit. Inset, left, flower; right, single fruit

of tropical America. It has large opposite, oval, leathery leaves, and sweet-scented showy white flowers, from which the aromatic *liqueur eau de Créole* is distilled. The yellow fruit is three or four ins. across, and within the bitter rind it contains a sweet, edible flesh. The large seeds are used medicinally, and a resin obtained from the bark is used to rid the feet of chigoes. It is sometimes called S. Domingo apricot, and derives its name from the Haitian name of the fruit, *mamey*.

**Mammillaria.** Large genus of succulent perennials of the family Cactaceae. They are natives of the warmer regions of America,

Mammillaria. Stem and flowers of this type of cactus

especially Mexico. They have stems of cylindrical or globular form, studded with spirally arranged tubercles, which bear radiating spines and rose, white, or yellow flowers. These are followed by scarlet berry-like fruits.

**Mammon** (Aramaic *mamona*, riches). Phoenician term for gain. In the N.T. it implies love of money and deceitful wealth (Matt. 6, v. 24; Luke 16, vv. 9 and 13). The Book of Enoch, 62, v. 10, has the expression, mammon of unrighteousness, a later equivalent of which is filthy lucre. Milton, Pope, Byron, and Hood use the word, which is spelt Mammon in the R.V., as a proper name. In Jonson's play, *The Alchemist*, the character Sir Epicure Mammon is a luxurious seeker after boundless wealth. Carlyle uses Mammonism, and Tennyson Mammonite.

**Mammoth** (*Elephas primigenius*). Extinct elephant occurring in all N. continents. An inhabitant of central Europe in the Pleistocene period when the North Sea was covered by forest land, its remains have also been found throughout Asia and in N. America, whither it probably migrated. From fossil teeth and bones dredged from the North Sea, and from complete animals entombed in the ice, the whole

structure and general habits of mammoths have been ascertained. Despite the name, the average mammoth did not greatly exceed in size the African elephant of today, the largest mammoth discovered standing 13 ft. in height.

Generally closely resembling the Indian elephant, the mammoth had long and slender tusks which curled upwards and outwards, and was covered with long hair and a thick, woolly under-fur, these two characteristics differentiating it from the modern elephant. The animal was once very numerous. The disappearance of the pine forests, on the leaves and undergrowth of which it fed, led to the mammoth's extinction. Its fossil remains in Siberia supply large quantities of valuable ivory. One intact specimen discovered there had tusks 8 ft. long. Fragments of the limb bones of a mammoth were discovered in Regent Street, London, in 1921. Drawings of the mammoth, engraved on ivory by Palaeolithic cave-men, have been found in S. France. See Elephant; Ice Age; Mastodon.

**Mammoth Cave.** Limestone cavern in Edmondson co., Kentucky, U.S.A., about 85 m. by rly. S. by W. of Louisville. Mammoth Cave national park, 50,548 acres, and including a series of caverns, was created in 1936. Cave formations of St. Louis limestone and

Mammoth. Mounted specimen of Siberian mammoth, found preserved in the Arctic ice, now in the Leningrad Zoological Museum. Top, left (by courtesy of American Museum of Natural History), skeleton of Columbian mammoth, 10 ft. 6 ins. high at the shoulders, found in Indiana

Chester sandstone cover 8,000 sq. m. in central Kentucky, N. Tennessee, and S. Indiana. The surface area above Mammoth Cave is 10 m. in diam., but the length of the underground caverns, passages, etc., which are at five different levels, is 150 m. Colossal Cave, also in Edmondson co., is

almost the equal of Mammoth. The three rivers, two lakes, a sea, and many streams and pools link up with the Green river which passes by. Reverberations along the walls of the  $\frac{3}{4}$ -m. long Echo river continue for 10-30 secs. The Main Cave is 40-300 ft. wide, reaches a height of 125 ft., and extends for 4 m. Indian councils were once held in chief city or temple, a part of the Main Cave which is 541 ft. long, 287 ft. wide, and 125 ft. high. Many mummies have been found. The cave, through which boat trips are conducted, has been so commercialised that meals are served in its banquet hall, and weddings are solemnised at its bridal altar.

Many of the avenues are covered by a remarkable variety

Mammoth Cave, Kentucky. Portals of Vaughn's Dome, an enormous chamber within the cave, 26 ft. to 40 ft. wide, 800 ft. long, and 78 ft. high

By courtesy of the American Museum of Natural History

of crystals, and in the chambers stalagmites and stalactites abound. Notable geological formations, the nature of which is indicated by their names, are the pillars of Hercules, the giant's coffin, the star chamber, the marble temple, the Epsom salts deposits, the snowball room, the diamond grotto, the valley of flowers, and the florist's garden. The fauna of Mammoth Cave consists of blind fish and several insect species, while the outer galleries swarm with bats. The temp. remains at 54° throughout the year. The cave is mentioned in county records as far back as 1797. In the rotunda, saltpetre was prepared for use in gunpowder during the war of 1812.

**Mamore.** River of Bolivia. It rises in the Cochabamba Mts. and the main stream, here called the

Rio Grande, follows a circuitous course round the E. end of the range and finally flows N.N.W. to unite with the Beni to form the Madeira, an affluent of the Amazon. Its chief tributary, the Guaporé, forms the N.W. boundary of Bolivia. These three rivers drain the greater part of Bolivia, and receive numerous affluents from the Andes and the heights of Matto Grosso.

**Mamore.** A deer forest in Inverness-shire, Scotland. It lies between Ben Nevis and the head

of Loch Leven, and covers about 32,000 acres. Fort William is the nearest place of importance.

**Mamre.** Perhaps originally the name of an Amorite, who seems to have given it to a plain where Abraham bought the cave of Machpelah as a burying place for Sarah, and was afterwards buried in it himself. See Abraham; Machpelah.

**Mam Soul** OR MAM SODHAIL. Mountain on the borders of Inverness-shire and Ross and Cromarty, Scotland. It is 3,862 ft. high, and about  $3\frac{1}{2}$  m. W. of Loch Affric.

## MAN AND HIS EVOLUTION

Sir Arthur Keith, F.R.S., Author, *The Antiquity of Man*, etc.

*This article deals with man as a member of the animal kingdom, other aspects of the subject being under Anthropology and Ethnology. See Anatomy; Animal; Embryology; Heredity; Life; Mammal; also Family; Society, and other articles on man's domestic activities. See N.V. for later discoveries*

In everyday life no learned definition is needed to describe a member of the human species. Scientific men have very good reason for regarding the gorilla, the chimpanzee, and the orang as the nearest relatives of mankind now alive on earth, but no one, even the most experienced, hesitates for a moment in denying humanity to these great anthropoid apes. They are not rejected as members of the human species because they are covered with hair, nor because of their small brains.

### Chief Characteristics

The brain chamber in an average Englishman measures about 1,480 c.c. (about 90 cu. ins.); that of an average male gorilla 500 c.c. (32 cu. ins.); but occasional imbeciles have brains no larger than that of the gorilla, yet legally and morally are members of the human species. Apes are incapable of articulate speech, but humanity is not denied to a person who is mute. All anthropoid apes can use the great toe as a thumb, but although in many races the great toe can be used as a grasping organ, it is never set, as in anthropoids, in the form of a great free opposable grasping thumb.

We do not base our claim to humanity on one character; we are not men because of our peculiar great toes or plantigrade feet, but because we possess a general combination of characters, chief among which are the size and capacity of our brain and the general adaptation of our bodies to an upright posture on land. We have not a monopoly of the upright posture. The anthropoid ape shares that with us—with this difference. In the main, the anthropoid ape is a

tree-living, climbing animal, using all four limbs for progression. Man is a land-living form, using only his lower limbs for progression, and thus setting free his hands to be the servants of his brain.

**INTERMEDIATE FORMS. MISSING LINKS.** Although we have no difficulty in distinguishing man from all other kinds of animals in our modern world, yet there was a time in a geological sense of comparatively recent date, when it would have been very difficult for even the most skilled anatomist to draw a sharp line between human and anthropoid types. Anthropologists still debate whether *Pithecanthropus erectus* is to be regarded as man or ape. The matter has been discussed since 1894, when Eugène Dubois first announced the discovery of its fossil remains in Java. There is a general agreement as to the geological date at which this extinct form lived. The thigh bone, the skull cap, and the three teeth were found in a Pleistocene stratum, 45 ft. below the present surface of the land.

### Problem of the Humanoids

Some half-million years ago—assuming that the Pleistocene had a duration of one million years—this much debated animal form lived in the tropics of Java. If the thigh bone only had been found there would have been no discussion as to the nature of its owner. The thigh bone is human in shape and gives us the most complete assurance that *Pithecanthropus* walked in the human manner, and was fully adapted to the erect posture. If the erect posture is the human hall-mark, then this ancient Javanese form was a man. If, however, we centre our atten-

tion on the skull-cap, it is its anthropoid characters which impress us—its flat roof, its beetling eyebrow ridges, its peculiar shape. Yet the brain space is large; Du Bois estimated that it would have contained a brain 840 c.c. in size, being thus smaller than the lowest

African cousins, the gorilla and chimpanzee, which are fitted for life on trees, the Dartians were adapted for life on the ground. Although they lived as late as the Pleistocene in S. Africa, they may well be regarded as survivals from the Miocene period just after they

had separated from the tree-living anthropoids, a separation which marks the first step in human evolution (see chart). Seeing the many points of resemblance between Dartians and the gorilla and chimpanzee, and that they have been found only in Africa, we may presume that they were evolved in that continent.

Equipped for life on land, they were free to spread abroad and so reach the other continents of the Old World, and in these continents become the fore-runners and ancestors of the Hominids of the Pleistocene. This conception is depicted in the chart in the next page.

Between 1929 and 1939 another form of Hominid was discovered in China, to which the discoverer, Davidson Black, gave the name *Sinanthropus*—the man of China. The scene of this discovery was a limestone hill at Choukoutien, 37 m. S.W. of Peiping (Peking). From the filled-in caves of the hill, fossil parts of 40 *Sinanthropes* have been extracted. They were contemporaries of the Hominids of Java—at least, both belong to the same Pleistocene horizon, but the *Sinanthropes* were larger brained and were rather more human in their structural characters, particularly in their teeth, which possess certain features now found in the teeth of Mongolian peoples. In the family tree, *Sinanthropus*, in accordance with Weidenreich's idea of his origin, is given a place in the Mongolian stem. The fossil Hominid of Java, on the other hand, is connected by a series of intermediate links with the aborigines of Australia, and is therefore given a place in the stem leading on to Australasians.

**PILTDOWN MAN.** In 1912 Charles Dawson and Smith Woodward announced the discovery of fossil bones at Piltdown in Sussex. Only the greater part of a skull, less than half of a lower jaw, and three teeth

Man. First known example of the fossil skull of a missing link, discovered by Raymond Dart, 1925, in S. Africa. It corresponds in point of growth to that of a human child of six years

human brain, but greater than the largest anthropoid brain. The cast taken of the interior of the skull-cap showed that the brain was human, not anthropoid, in its markings. In brief, *Pithecanthropus* was neither human nor ape, but the representative of a great missing group of animals which have been named Hominids. Here there is a difficult problem, but the majority of the characters are at the human rather than at the anthropoid end of the balance. The discovery of *Pithecanthropus* was a realization of Darwin's postulate; if the theory that men and anthropoids are the descendants of a common stock is correct, then we ought to discover extinct forms in which the characters of apes and men are blended.

In 1925 Raymond Dart discovered in S. Africa the fossil remains of a missing link which represents a much earlier stage in the evolution of man than the fossil Hominid of Java. To the family represented by these extinct beings Dart gave the name of *Australopithecinae*, but here we shall speak of them as Dartians.

The Dartians had the face and skull of anthropoids; their brains, too, were anthropoid in dimensions, ranging from 435 c.c. to 650 c.c., yet they possessed certain human features. Their teeth were human, not anthropoid. Their bodies and limbs also were human in that they were adapted for the upright posture on the ground. Unlike their

Man. Comparative sizes of skulls of four types of primitive man, based upon fossil remains. Each side of the ruled squares represents 200 millimetres or 7.87 ins.

were found. They were discovered in a stratum which is apparently of about the same geological date as that in which the Javanese remains were found. If the jaw alone had been found, it is certain that it would have been assigned to an anthropoid not unlike the chimpanzee. The canine tooth is conical and prominent as in anthropoids, yet in the grinding or molar teeth, and also in minor features of the jaw itself, there are certain human traits. The skull is distinctly human.

We classify modern races of mankind into three groups as regards size of brain.

(1) The "big-brained," where the average capacity, as in European nations, rises above 1,450 c.c.; (2) the "small-brained," in which the average falls below 1,350 c.c., as is the case with the aborigines of Australia; and (3) the intermediate or medium-brained, in which the brain is above 1,350 c.c. but under 1,450, including many native races of Africa and India.

**Pitdown and Java: Comparison**  
Smith Woodward assigned the skull found at Pitdown to a form which he named *Eoanthropus*. By size of brain, *Eoanthropus* falls on the border line between the big-brained and medium-brained groups. If we confine our attention to the brain we give our judgement unhesitatingly that *Eoanthropus* was a human being; if we regard the jaw as more essential than the brain, then we must assign *Eoanthropus* to a non-human class. Here again we have a transitional form, but one which is much more decidedly human than *Pithecanthropus*. Thus, about the same ancient period there was living in Java a being which had the human form of body, but an ape-like skull, and in England a being with a human brain and an ape-like jaw. We can explain the occurrence of such forms only if we suppose Darwin's theory valid.

**NEANDERTHAL MAN.** Another intermediate type, known as Neanderthal man, although possessing many ape-like features, has never had the term "man" denied it. In 1857 some labourers, while excavating the Neanderthal cave, discovered the type specimen of this peculiar species of mankind. The nature of the man, of whom these bones had formed part, was much debated at the time. Virchow regarded the peculiar characters of the fossil bones as the product of disease. In Huxley's opinion Neanderthal man represented a primitive human type.

William King regarded the fossil skull and skeleton as belonging to an ancient and extinct species of mankind which he named *Homo neanderthalensis*, and time has proved that his verdict was right.

In the later part of the 19th century and the early part of the 20th, further discoveries were made of this extinct type of man in Belgium, France, Spain, Germany, and Croatia. These discoveries brought

derthal man represented a stage in the evolution of modern Europeans. This idea had to be given up because everywhere in Europe graves containing the fossil bones of Neanderthal man were immediately followed by burials which contained the fossil remains of men of Caucasian type. Nowhere have intermediate types been found, and it came to be realized that so far as Europe is concerned,

the Neanderthals had not been transmuted into, but had been suddenly replaced by, Caucasians who, therefore, had been evolved outside the bounds of Europe. Neanderthal man was consequently removed from the ancestry of modern Europeans. In 1929, however, an excavating party, led by Dorothy Garrod, began the exploration of caves in Mount Carmel, Palestine, and brought to light the fossil bones of people who were the contemporaries of the Neanderthals of Europe. The fossil Carmelites were of an intermediate type, having a mixture of Neanderthalian and Caucasian features. They are regarded as representing a stage in the evolution of a Neanderthal into a Caucasian type. Thus Neanderthal man has been restored to a place in the ancestry of Europeans (see chart). Somewhere in Asia, to the E. of Palestine,

Man. Chart showing the anthropologists' conception of the origin of the present groups of mankind, which are depicted as stemming from a common ancestry at the beginning of the Pliocene period, and assuming their modern forms in the Pleistocene. Earliest known forms such as *Pithecanthropus*, *Sinanthropus*, etc., are given places in human lineage

another very important addition to our knowledge of ancient man. The remains of Pitdown man and of *Pithecanthropus* were found in deposits laid down before the midpoint of the Pleistocene. The remains of Neanderthal man have all been found in cave-strata or deposits which are attributed to the later half of the Pleistocene.

**FOSSIL MEN OF MOUNT CARMEL.** At first it was thought that Nean-

anthropologists expect to find in graves, older than those of Mount Carmel, the fossil bones of Neanderthals showing clearly their characteristics at a still earlier stage of their transmutation into a Caucasian type.

**RHODESIAN MAN.** A human skull, with some limb bones, discovered during mining operations in 1921 at the Broken Hill Mine in Rhodesia, can serve as progenitor

Man. Types of primitive man illustrated by reconstructions, showing the increasing intelligence indicated by greater prominence of chin, reduction of eyebrow ridges, and increased size of skull with proportionately greater brain capacity. of some living African races, *Homo rhodesiensis* probably inhabited Africa when Neanderthal man was living in Europe. His eyebrow ridges and his jaws are massive, and in these characters he resembles the gorilla. But his brain was almost equal in volume to that of many modern natives of Africa. Another fossil type came to light before the discovery of Rhodesian man, known as the Boskop type. Boskop man lived in S. Africa towards the end of the Pleistocene period. He had a long skull, a very large brain, and small eyebrow ridges, the antipodes of the Rhodesian type. Yet fossil types have been discovered at Florisbad and at Lebomba which reveal transitions from the Rhodesian to the Boskop type. Further, all intermediate types between Boskop man and the living Bushman and Hottentot races of S. Africa are now known. We infer, then, that these peoples have been evolved from the very primitive Rhodesian type of mid-Pleistocene times. This conception has been embodied in the chart.

**ANTQUITY OF MODERN MAN.** Although the modern races of mankind show great diversity of bodily characters, yet these are not of a pronounced structural kind. The white man and the negro are but variants of a common form or species which we name modern man. All modern races are fertile—the one with the other; all are formed on the same basal pattern. To account for this similarity students of human evolution have supposed that all living or modern races of mankind have been evolved from a common ancestry, the fossil remains of which they expected to find in the older

deposits of the Pleistocene period. Hence in earlier charts of man's family tree all modern races were shown emerging from a common ancestor at the beginning of the Pleistocene. The search for such an ancestral type has been in vain; all the earlier types that have been found are very unlike the modern type. After 1930 the outlook of anthropologists was altered by the discovery of fossil forms which linked the early Pleistocene types to modern types, such as *Pithecanthropus* to the Australian aborigines, the Rhodesian to the Bushman, *Sinanthropus* to the Mongolian peoples, and so on. Hence they had to recast their evolutionary tree and give it the form shown in the chart. Hence emerges the surprising fact that modern races, in the course of their evolution, have not diverged in structure but have converged. This has come about by each race assuming independently many similar modifications.

**THE ANTIQUITY OF THE MODERN EUROPEAN TYPE.** Although there is a general agreement amongst anthropologists that the Caucasian type made its first appearance in Europe, and supplanted the Neanderthal type, some 60,000 or 70,000 years ago, there are still some who remain uncertain on this point. They have in mind many cases in England, France, and Italy where human remains of the Caucasian type have been found deep in apparently undisturbed strata of early Pleistocene date. The most famous of these is the Galley Hill man. Galley Hill is on the 100-ft. terrace on the S. side of the lower valley of the Thames. There in 1888 all parts of a human skeleton were found embedded in

the terrace at a depth of 8 ft. If the body had been entombed when the Thames deposited the stratum in which the body lay, then Galley Hill man was of early Pleistocene date—as old as the Piltdown man. As to his racial characters there is no dispute; he was like the long-headed type whose fossil remains are found in Continental caves dating from towards the end of the Pleistocene period. If we accept the geological evidence at its face value, then we have to believe that a human race can exist for hundreds of thousands of years without undergoing change. Much more probable is a misinterpretation of the geological evidence. That is the view taken in this article. Hence in the chart Galley Hill man is given a place in the Caucasian stem late in the Pleistocene, whereas in older charts of the same kind he was placed early in the Pleistocene.

Our belief that man has been evolved from a lower form does not rest on the discovery of fossil remains of extinct human types. Indeed, Darwin, when he published the *Descent of Man* in 1871, made very little use of geological evidence. He did not see how the stages which the human body is known to pass through during development of the embryo could be explained unless it was supposed that the human body was, like all living forms a product of evolution. At the end of the first month of development the human embryo shows a distinct tail which soon afterwards becomes gradually drawn into the rump, leaving a dimple to mark the point at which it disappears. In this respect man does not differ from anthropoid apes; their tails disappear at an

equally early period and in a similar manner. Occasionally the human brain is arrested in its development. In some of these cases it shows a broad resemblance in its convolutionary pattern to that found in anthropoid brains. At one stage of development the brain of man and ape manifest a degree of resemblance that we are compelled to regard as modifications of a common pattern. The manner in which the developing ovum attaches itself to the mother's womb and the stages through which the embryo passes are exactly alike in man and the anthropoid ape. In the human embryo of the third week we see the foundation laid down for a gill-system—which suddenly becomes transformed to meet the needs of a land-living organization.

Of the 2,000,000,000 people now estimated to be living no two are identical. Everyone has his or her distinctive marks. Every face is made up of the same parts, but there is an infinity of variety as regards the shape and size of forehead, eyes, nose, mouth, chin, and cheeks.

Those individual differences on the surface of the body extend also to all its deeper structures. The wealth of structural variation is recognized by all who have dissected the human body. We know that structural variations are inherited, and that they afford material for the production or evolution of new varieties of mankind. Certain structures of the human body are more liable to variation than others. This is particularly true of those called "vestigial"—structures which are now of little or of no functional use to us. We account for their presence by supposing that we have inherited them from a stock in which they were of functional importance.

In the human ear there is often to be seen a small nodule or projection on its entwined margin. If the pointed ear, seen in lower forms of apes and on nearly all mammals in which the ear is freely movable, were to be enfolded and fixed as the human ear is, then the point would occupy the position of the nodule so often seen in the human ear. We suppose that at one stage of man's ancestry the ear was pointed and freely movable. There are at least a dozen vestigial muscles in the human body. We find vestiges in our hands and feet of bones which are well developed in lower apes. We cannot account for the presence of vestigial structures, nor

for the wealth of structural variation in the human body, unless we suppose that there lies behind us an evolutionary history.

**STRUCTURAL DEGENERATION.** Under conditions of current civilization the human body is being subjected to a more severe strain than in any former stage of its evolution. Our organs were evolved to meet the conditions of a life very different from that which we now lead. Man has known the uses of fire for a very long time; in the caves occupied by the *Sinanthropes* of China, traces of hearths have been found. It is possible that the discovery of fire and its application to the preparation of food may be related to the reduction in size of teeth and jaws in modern races. Certain it is that cooking completely altered the nature of the task thrown on the organs which have to masticate, digest, and absorb food. Another revolution in the conditions in which man lives was effected with the introduction of agriculture; an abundance of easily digested food then became available. The art of agriculture was probably first practised in S.W. Asia; by the beginning of the 4th millennium B.C., it was widely spread in Mesopotamia and in Egypt.

The third great revolution in man's environment began only a few centuries ago, when by means of a world-wide commerce the luxuries of every part of the earth could be emptied into the lap of Europe. That structural

changes are being produced under these new conditions there can be no doubt. We never meet the contracted palates, the irregularities of the teeth and jaws, the constricted noses, and sunken-in cheek-bones now so prevalent in England among the remains of the pre-Roman inhabitants of Britain.

There can be no doubt that there is a distinct tendency towards structural degeneration of our jaws and teeth. We know nothing of the condition of the stomach and bowels of our ancestors, but we have every reason to suppose that we are much more subject to alimentary disturbances and diseases than they were. Inflammation of the appendix vermiformis—appendicitis—certainly existed centuries before medical men were cognizant of it as a special and common disease. Our knowledge of appendicitis began only a few years before 1900. At first the liability of the appendix to disease was attributed to its vestigial nature. We now know that at birth the appendix is as well developed in man as in anthropoid apes, but whereas in the apes the appendix retains its pristine form and activity, in man, at least in a great proportion of Europeans, the appendix tends to atrophy and becomes functionless or diseased as growth of the body proceeds. The appendix undergoes degeneration, not because of its vestigial nature, but because our dietary has completely changed the amount and nature of its

task. The appendix and caecum are intrinsic parts of the great bowel.

Metchnikoff came to the conclusion that the whole of the human great bowel was superfluous, and that the human body would be better without it. There can be no doubt that the great bowel is particularly liable to disease among highly civilized people of today. Its condition may become so injurious to the whole system that excision offers the only means of cure. Life and health are possible after such a radical operation, though medicine aims at treating the great bowel so that its removal is unnecessary.

**GROWTH.** On the other hand, we have every reason to believe that in stature and in size of body we are not degenerating, but are growing taller and heavier. It is also becoming more and more evident that certain small bodies or glands—known as glands of internal secretion, such as the pituitary, the thyroid, suprarenal, testes, and ovaries—have a very direct influence on the growth of the various parts of the body. They throw into the circulation substances which regulate the rate as well as the kind of growth in bones, muscles, and tissues of the body. In giants there is always a pathological increase in the size of the pituitary body; in certain dwarfs there is a diseased condition of the thyroid gland.

**FURTHER EVOLUTION OF THE HUMAN BODY.** The more progressive races of mankind differ from the less progressive in a functional rather than in a structural sense. We have no reason to suppose that the brain of the European, the Egyptian, or the American Indian has undergone any decided increase in size during the last five or six thousand years; but we have reason to think that the progressive types are the bigger brained, and that if we take a sufficiently long period for our survey, the tendency in nature has always been, and always will be, towards the selection and preservation of the races possessing a high average of brain size. Against this optimistic statement, however, must be set the fact that the late Pleistocene ancestors of modern races had larger brains than their present-day descendants. There is also a tendency towards the preservation of the characters seen in quite young children—a relatively large brain, a face which stops short of the rugged massiveness of the robust adult

man, a development of bone and muscle of a more delicate or adolescent mould.

**Man, ISLE OF.** Island in the Irish Sea. Part of the British Empire, it has a government and constitution distinct from that of the United Kingdom, although the imperial parliament exercises certain powers over it. It is 27 m. from the W. coast of England, and about the same from both Scotland and Ireland; with a length of 33 m. and a breadth of 12 m., it has an area of 221 sq. m. Belonging to it is a small island on the S., the Calf of Man. The pop. of the Isle of Man is 49,308.

The coast, in which are a number of bays and other openings, is in the main rugged, and the interior is hilly. A range of hills stretches from N.E. to S.W., the highest point being Snaefell, 2,034 ft. Between the hills are beautiful glens. There are no lakes, but a number of streams add to the beauty of the scenery. Douglas is the capital and the largest town. Other towns are Castletown, the old capital, Peel, and Ramsey, while Port Erin, Port St. Mary, Kirk Michael, and Laxey are among

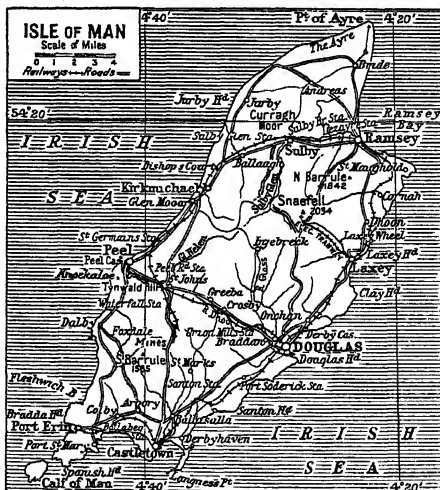

the smaller towns on the coast. The climate is mild; fuchsias and myrtles grow in profusion in the open. Snipe are found, but there is no abundance of game. The island is known, however, for its breed of tailless cats. The coat of arms is three legs, taken, it is said, from a pillar cross at Maughold in the N. of the island.

The soil of the island is not very fertile, but much of it is cultivated. Oats, barley, wheat, and turnips are the chief crops. Dairy farming is carried on, and much of the land affords pasture for cattle, horses, and sheep. There is a coasting trade, and some of the inhabitants are employed in the herring fishing, but the fisheries are far less important than formerly, though 169 fishing vessels are still registered. A rly. system of about 50 m. links up the principal towns, and there are electric tramways radiating from Douglas. There is regular steamboat communication with Liverpool, Fleetwood, Barrow, Glasgow, Dublin, Belfast, and other places. There are a few domestic industries, but many of the inhabitants obtain a livelihood by providing for visitors. The provision of cheap and rapid transit in the 19th century made the island, especially Douglas, one of the most popular pleasure resorts in the British Isles.

The island is governed by a lieutenant-governor appointed by the crown, a council consisting of the bishop, deemsters, and other high officials, and a house of keys, an elected body of 24. These two bodies form the court of Tynwald, which is the executive as well as

Isle of Man arms

Isle of Man. Map of the self-governing island in the Irish Sea, showing the many favourite resorts of visitors from the mainland

the legislative authority. The lieutenant-governor is its president. For local government purposes it is divided into six sheadings, each with its own officials, and parishes.

The island revenue comes mainly from the customs duties, and of it £10,000 a year is paid to the imperial exchequer. There is a high court of justice, over which also the lieutenant-governor presides; it has common law and chancery divisions, with a court of appeal. In the common law courts the deemsters are the judges, and they also hold courts of summary jurisdiction. There are also magistrates, whose duties resemble those of their fellows in England. The law relating to real property differs from that of England, but most of the other branches have been made similar. The Isle of Man is not bound by acts of the British parliament unless specifically mentioned in them. The island has its own bishop, Sodor and Man, who has his own ecclesiastical organization. The diocese is part of the Church of England, being in the province of York, although there was once a separate Manx Church.

#### History of the Isle

The origin of its name is said to be Mananan Maclir, the pre-Christian sea-god of the Irish. At one time known as Mona, the island was inhabited in early times by a Celtic people. Remains of that, or a still earlier age, exist in the form of Runic crosses, portions of stone circles, cairns, mounds, and lake dwellings. It had its own language, a branch of Celtic. In the 6th and 7th centuries the people were converted to Christianity by Irish missionaries. Before 700 it was conquered by Scandinavian rovers, and it remained under their rule for a long time, although such was not always effective.

The kings of Norway succeeded to this Scandinavian conquest, and Magnus Barefoot made his authority real by his presence in the island, but soon the kings of Scotland appeared as rivals. The result was that, after a Norwegian defeat at Largs in 1263, the island was handed over, in return for a sum of money, to Scotland. The Scots, however, were not liked; an appeal brought Edward I to the aid of the Manx, and after a time the sovereignty of England was firmly established. In 1406 Henry IV gave the island to Sir John Stanley, and the Stanleys, earls of Derby, were lords of Man until 1736. During the time of the Commonwealth the island was taken from the 7th earl, in spite of the gallantry of his wife.

This was the time when the native hero, William Christian, executed at the Restoration, led the people in a revolt against the Stanley rule, which was in some respects oppressive.

In 1736 the lordship passed to the duke of Atholl, a relation of the earls of Derby. In 1765 the sovereign rights of the duke were bought by the English crown for £70,000. The main reason for this was because the island had now become a great centre for smuggling, but this continued. In 1828 the remaining rights of the duke of Atholl were bought for over £400,000. The British parliament then exercised the sovereignty, but in 1866 greater powers in the direction of home rule were given to the island authorities.

In recent times the isle has produced literary men of some importance, the most noteworthy being T. E. Brown and Hall Caine, a number of whose novels, e.g. *The Manxman*, *The Deemster*, *The Master of Man*, *The Woman of Knockaloe*, are set in the island. During the First Great War there were internment camps at Knockaloe and Douglas, and at the outbreak of the Second Great War camps for enemy aliens were similarly established on the island, being followed by others for prisoners of war. The principal sites were at Douglas, Ramsey, Peel, and Port Erin. A number of persons arrested under regulation 18b, including Sir O. Mosley, were detained on the island. The R.A.F. No. 1 Ground Gunnery School was located at Douglas and Castletown from 1940 to 1942, and the R.A.F. Regt. No. 2 Training Centre was at Castletown during 1942-43; a Royal Navy training establishment for boys was at Douglas from 1943 to 1945.

Limited conscription was introduced in Oct., 1939. In 1942 the Tynwald rejected extended conscription under the National Service (No. 2) Act of Dec., 1941, but in 1948 it reversed this decision. *Consult* *The Little Manx Island*, T. Hall Caine, 1891; *History of the Isle of Man*, A. W. Moore, 1900.

**Man**, HENRI DE (b. 1885). A Belgian politician and writer. He was born at Antwerp, educated at Brussels, Leipzig, and Vienna. In 1911 he became director of Belgian committee of labour education, and from 1920 to 1922 principal of the Belgian labour college. From 1920 to 1932 he held various professional posts at Brussels and Frankfurt o. M. He gained inter-

national reputation by his views on Socialism expressed in his books *Remaking of a Mind*, 1919; *Psychology of Socialism*, 1927; *Joy in Work*, 1928; *The Socialist Idea*, 1933; *The Belgian Plan of Work*, 1933. His views were much quoted by the Nazis, whose experiments he tried to adapt to his own Socialist ideology. On the strength of his published work he was appointed minister of public works and unemployment, 1935-36; minister of finance, 1936-38. At one time vice-president of the Belgian labour party, he resigned from it simultaneously with giving up his portfolio, issued a manifesto of the task of socialism, and founded a pro-Nazi party. He also started two journals, *Le Peuple*, 1941, and *Le Travailleur*, which was German-controlled, shortly afterwards. In Aug., 1944, he was arrested by the Free French forces.

**Mana**. A native term of the Pacific region for an impersonal supernatural power believed to act, for good or ill, through a material vehicle. Mana is communicated to the medium (a bone, stone, water) by any personality already possessing it, who may be a living man, disembodied spirit, or supernatural being.

**Manaar**. Gulf and island between Madras state and Ceylon. The island, with Adam's Bridge and Rameswaram island, forms an almost continuous ridge between Ceylon and the Deccan; Pamban Passagelies to the W. end, and Manaar Island is near Ceylon, to which it belongs. The gulf lies S.W. of the island, and is so shallow that ocean steamers must pass S. of Ceylon on the route from Cape Comorin to Madras and Calcutta. Manaar town lies under the shadow of an old Dutch fort, and its church contains Portuguese tombstones of the 16th century.

Pearl fishing had a meteoric life in Manaar. The first fishing in 1905 produced 50 million oysters. The industry went into liquidation in 1912, was taken over by the govt., but ceased in 1925. *Trepang* (*bêche-de-mer*) is obtained in the neighbourhood of Rameswaram.

**Manabi**. A maritime prov. of Ecuador, bordering on the Pacific Ocean. Its surface is hilly, well forested, and fertile, and large quantities of sugar and cocoa are produced. Area, 7,891 sq. m. Pop. 312,850. The capital is Manabi or Puertoviejo.

**Manacle Rocks**. Dangerous reef off St. Keverne, Cornwall, England, 7 m. S. of Falmouth. The

Manacles, as they are called, have been the scene of many shipwrecks, notably of the emigrant vessel, John, May 1, 1855, with the loss of 200 lives.

**Manacor.** Town of Spain, on the island of Majorca, Balearic Islands. It stands near the E. coast, is well built and spacious, and contains many fine buildings, among them a palace of the kings of Majorca. Trade is carried on in wine, fruit, oil, cereals, and cattle. It is the starting point for tourists visiting the caves of Drach and Artá. There is a rly. to Palma. Pop. 13,113. See Majorca.

**Maná Ghat.** Pass over the Himalayas, in the Garhwal district of the Uttar union, India. It is used by Hindu pilgrims on their journeys to Lake Manasarowar. Its height is 18,000 ft.

**Managua.** Lake of Nicaragua, Central America, on the W. side of the republic. Formerly known as Leon, it has a length of 32 m., and a width of 16 m. It is picturesquely situated 30 ft. above the level of Lake Nicaragua, into which it drains by the Tipitapa river.

**Managua.** Town of Nicaragua, Central America, the capital of the republic, and of the dept. of Managua. It stands on Lake Managua, is connected by rly. with Granada and the port of Corinto, and is a mart for the coffee locally grown. It has a national palace, a town hall, and a museum. In 1931 the city was almost entirely destroyed by earthquake, but has since been reconstructed. Pop. 132,154.

**Manahiki.** Island of Polynesia, Pacific Ocean, belonging to Great Britain. It lies in lat. 10° S.

Manaos, Brazil. Theatre and monument commemorating the opening of the Amazon to international traffic in 1867

and long. 160° W., and is a coral atoll, containing a large lagoon, from which pearl shell was formerly obtained. It has extensive coconut groves. For administrative purposes it is included with the Cook

Islands (q.v.). Area about 30 sq. m. Pop. 435.

**Man and Superman.** Comedy by Bernard Shaw. First produced at the Court Theatre, London, May 21, 1905, it was based on the Nietzschean gospel of the superman and his eternal recurrence, and tells how John Tanner, author of the Revolutionist's Handbook and Pocket Companion (printed as an appendix to the published edition) is pursued and married by Ann Whitefield, the impersonation of the life force. In the original production Granville-Barker appeared as Tanner and Lillah McCarthy as Ann. The third act, showing Don Juan in Hell, was omitted but included in the revival at the Criterion, 1911, when Robert Loraine scored a great success as Tanner.

Manatee. Specimen of the large aquatic mammal found in the Atlantic Ocean

Later revivals of the abridged version included those at the Prince's, 1927 (with Gwen Ffrangcon-Davies as Ann); Court, 1930; Old Vic, 1938. Full versions were given at the Regent, 1925 (with Esmé Percy as Tanner); Cambridge, 1935; Alvin (New York), 1947.

**Manaoag.** Town of Luzon, Philippine Islands. It is in the prov. of Pangasinán, 20 m. E. by N. of Lingayén. In the vicinity rice, maize, sugar, and tobacco are cultivated. Pop. est. 22,000.

**Manaos OR MANAUS.** City and river port of Brazil, the capital of the state of Amazonas. It stands on the Rio Negro, 10 m. from its entry into the Amazon, and 1,000 m. from the Atlantic. It has a good harbour, is a regular port of call for liners. The steamship journey from Para takes four days. Formerly known as Barra do Rio Negro, it is a handsome, well-built town, with fine parks and public buildings. Rubber, cocoa, nuts, hides, and dried fish are exported. Steamer connexion is maintained with Europe and the U.S.A. Pop. 107,456.

**Manasarowar OR TSO-MAVANG.** Lake in the extreme W. of Tibet. With the neighbouring Mt. Kailas, it is a goal of Hindu pilgrims, as well as an object of veneration to Lamaism. The lake, oval in shape, lies at 15,100 ft. alt. See Lamaism.

**Manasseh.** (1) Elder son of Joseph (Gen. 41), over whom his younger brother Ephraim took precedence. His descendants, a tribe which settled on both sides of the Jordan, were noted as warriors, Gideon and Jephthah being two of their most notable men.

(2) King of Judah, son and successor to Hezekiah. He reigned c. 697-642 B.C., restored idolatry, persecuted the prophets, and was carried captive to Babylon. An apocryphal Prayer of Manasses occurs in some MSS. of the Septuagint (2 Kings 21; 2 Chron. 33). Manasses is a Greek form of the name (Matt. 1, v. 10).

**Manatee.** Aquatic mammal of the order of Sirenia, or sea cows. It is about 8 ft. in length, and in general appearance somewhat re-

sembles a very bulky and heavy seal; but there are no external hind limbs, the body ending in a broad flattened tail, and the fore limbs forming paddles. The head is blunt, and the great upper lip is divided.

The eyes are comparatively small; the skin is thick and wrinkled; and the body is covered with fine hairs. Manatees live in fresh water and along the coasts of S. America and Africa, feeding on aquatic vegetation.

**Manbhum.** Dist. of India, in Bihar state. Situated W. of Bengal, it is the most populous district in the plateau of Chota Nagpur; it owes its importance in this respect to the Jherria coalfield, opened in 1893, the most valuable coalfield in India. The coal is mined by the East India rly., and sent to Calcutta for use on the rlys., for bunker coal, and for export to Colombo and Singapore. The mines are worked under considerable difficulties; the output per miner is comparatively small, and the miners rarely work continuously for more than a few weeks at a time. More than three-quarters of the cultivated area is devoted to rice. The chief town is Purulia. Area, 4,131 sq. m. Pop. 2,032,146.

**Manche.** Maritime dept. of France, taking its name from Fr. La Manche, the English Channel. Part of the old prov. of Normandy, it is bounded W., N., and N.E. by the English Channel, and adjoins the depts. of Calvados, Orne, Mayenne, and Ile-et-Vilaine. It includes the peninsula of the Cotentin, and its long coast-line alternates

between rugged cliffs and long dunes. The cape of La Hague forms its N. extremity. Cherbourg, with its great naval base, is the chief port, Granville a fishing centre, and there are several bathing resorts. The surface is generally hilly, watered by numerous small streams, and affords good pasturage, especially for sheep and cattle. The country is well wooded in parts, and large quantities of apples and pears are grown; cider and some perry are manufactured. Textiles, granite quarries, shipbuilding,

salt, ironware, and bleaching are representative industries. The chief town is St. Lô, the arrondissements being those of Cherbourg, Coutances, Mortain, Valognes, and Avranches. Area, 2,475 sq. m. Pop. 435,153.

During the Second Great War the dept. of Manche was the scene of the Allied landing of June 6, 1944, and of the heaviest fighting in France. Many of its towns and villages, including St. Lô, were destroyed completely or in part. See Europe, Liberation of Western.

## MANCHESTER: ITS MANIFOLD INTERESTS

Wright Robinson, Alderman of Manchester City Council

*This article is followed by others on certain aspects of life in Manchester: e.g. Manchester Guardian; Manchester School; Manchester Ship Canal, etc. See also Cotton; Lancashire; and biographies of Bright; Cobden; Scott; and others associated with the city*

Manchester is a city and inland seaport of Lancs, England, ranking as the fourth city in the country with an estimated pop. (1946) of 684,640, and as the fourth port by reason of its 35½ m. long ship canal. It lies on a plain rising to the N. at the junction of the river Irwell (a trib. of the Mersey) and the river Medlock, 187 m. N.W. of London, 31 m. E. of Liverpool. It covers an area of 43 sq. m. and its climate is mild and humid. Manchester is an airport with regular services running from Ringway airport.

The largest purely commercial city in Great Britain, it functions not only as a clearing house and commercial centre for the region with which it has planning and service relations, but for a far wider area. It has been estimated that 4,000,000 people live within a 20-m. radius, 10,250,000 within a 50-m. radius. Although the city is best known for its cotton goods, it is one of the world's great engineering centres, one of the country's largest clothing centres, and has important production plants in metal, minerals, rubber, chemicals, furniture, heavy motors, radio, and other industries. It is the capital of the cooperative movement, which was born at Rochdale a few miles away, but found its fuller development in Manchester. The Cooperative Wholesale society has extensive premises near the city's centre, and employs many thousand workers in its factories in and around the city.

Manchester is second only to London as a newspaper centre.

Manchester arms

Apart from the two local morning and two local evening papers, northern editions of four national dailies are produced in Manchester. The Kemsley press produces morning, evening, and weekly papers as well as numerous magazines and periodicals; its printing house in Withy Grove is said to be the largest printing unit in the world.

Architecturally, Manchester is not equal to its reputation. The rapid rise in pop. from 72,275 in 1801 to 303,382 in 1852, at a time when there was little public feeling about, and no regulation of, development, left it a legacy of unplanned thoroughfares and densely packed slum dwellings. The city's pride went into its massive warehouses, and before the Second Great War, Portland St., a consistent warehousing street, was the handsomest street in the city, the symbolic epitome of Manchester's major concern with trade. By contrast, over 50,000 houses are listed for demolition as below reasonable standards. Manchester was the cradle of the Industrial Revolution, a pioneer in industrialisation, and is now facing the problems arising from its earlier unplanned development. The congestion of works and factories, and the density of housing impregnate the atmosphere with smoke, and greatly reduce the amount of sunlight that reaches the inhabitants. Powers to make the centre of the city a smoke-free zone have been granted by parliament and mark an important stage in smoke abatement.

Such fine buildings as there are lack space to win them appreciation. Each is unrelated to its neighbour except in its common dark or black face from the grimy

atmosphere. A short walk from any one of the three principal rly. stations, or from the civic centre, would take in most of the noteworthy buildings. Manchester cathedral church, founded as a collegiate church in 1421, and the city's oldest and most impressive link with the past, became the cathedral church in 1847 when the see of Manchester was created. Chetham hospital, a school for 90 boys, conjoined with one of the first free libraries in Europe, founded under the will of Humphrey Chetham (d. 1653), and dedicated in 1656, is also a reminder to the hurrying passer-by of a more leisurely past.

All other notable buildings emphasise the fact that Manchester is essentially modern. The royal exchange, a massive building dedicated to trade and commerce, although concerned primarily with cotton, is used by traders from scores of other branches of trade. A business man may see there more clients in half a day than he could visit individually in a week. Until it was damaged by German bombs in 1941 its main hall could accommodate 13,000 traders at one time; it had ten floors, a post office, 250 offices, 38 shops, and a ground space of 1½ acres. The street on which the main frontage abuts, Cross St., has large banks and insurance and shipping offices in all styles mixed with small shops; it does not make an impressive whole. The ship canal offices and the Midland bank dominate the upper section of King St., a shopping street in its lower section.

### Town Hall and Library

The civic centre has its main frontage on Albert Square, named from the Prince Albert memorial which is its centrepiece. One side of the square is occupied by the old town hall, opened 1877, at a cost of a million pounds. The frontage is 328 ft., with a pointed tower rising 284 ft. over the main entrance. Two bridges connect the old town hall with a new extension opened in 1938 by George VI. Beyond the extension is the central library, a modern classical building, circular in shape, and the most distinctive architectural feature of the city. The library and extension cost one and a half million pounds. The library, one of the world's largest, has commercial, music, and reference sections as well as a lending dept. Other buildings of note are the university, college of technology, John Rylands library, Midland hotel, the royal infirmary on its 13½-acre site, and the Christie

cancer hospital; but the real Manchester cannot be assessed in terms of its face value.

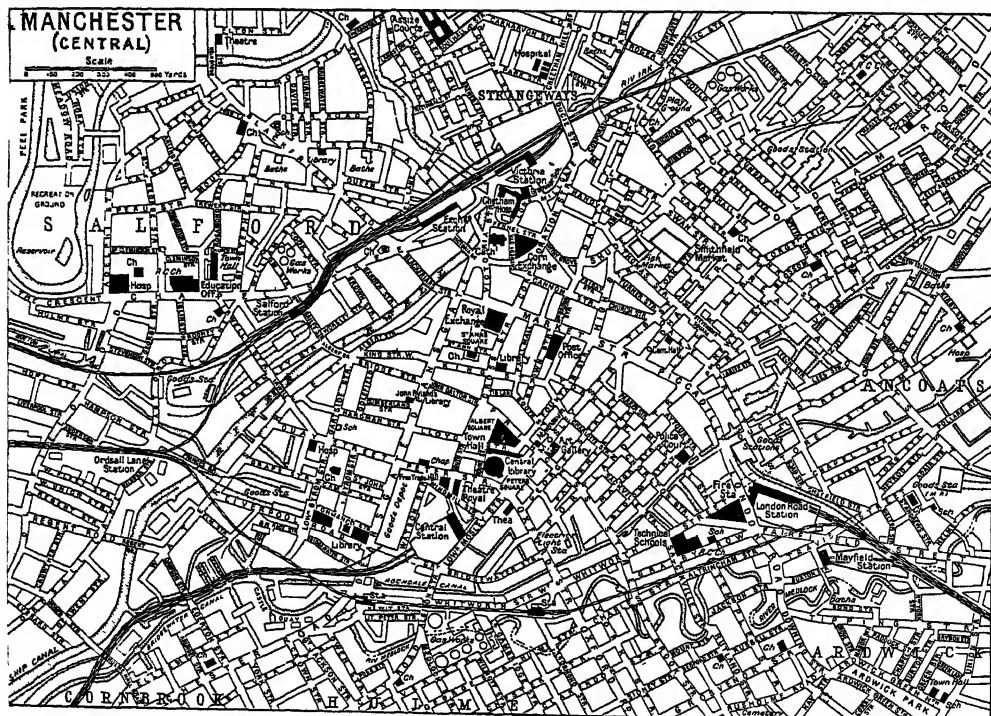

Four names stand out in the history of Manchester education: Hugh Oldham, founder (1515) of the grammar school, now the largest public school in the country; Humphrey Chetham, under whose will Chetham hospital and library were opened, 1656; John Owens, founder (1846) of Owens College, later to become merged with Manchester university; and William Hulme, founder of the Hulme charity and the Hulme grammar school. The tradition so begun has been well maintained. Manchester university is the largest and second oldest of the provincial universities. With its 4,000 students in attendance, it caters through its extra-mural dept. for another 7,500 part-time students. The college of technology is a municipal institution having close ties with the university, 800 students taking university courses to degree standard within the college. Altogether, over 7,000 students, full-time and part-time, attend the college of technology. An extension estimated to cost a million pounds was under construction in 1948. Free secondary education was in operation 20 years before it was obliga-

tory, but had to be suspended by government fiat. The local education authority has consistently pursued a progressive policy, and among its institutions may be listed eight municipal grammar schools before the 1944 Act; the school of art, including architecture; the high school of commerce, to degree standard; the college of domestic economy, to teacher training standard; evening classes, in addition to 7,000 students in two women's institutes for technical and domestic subjects; and an adult education institute with which over 100 cultural, educational, and recreative voluntary organizations are in association. Nursery classes were available many years before they received government encouragement. Selective central schools with an advanced curriculum were established in the 1920s.

More than 50 organizations carry on cultural activity within the city. They include art, antiquarian, literary, geographical, musical, playgoing, photographic, and other learned societies. Statues of Dalton and Joule are the first figures to receive the visitor within the main entrance to the town hall. Rutherford carried out some of his earlier researches into atomic structure during his period at the

university. Samuel Alexander made important contributions to philosophy during his long connexion with that institution.

C. P. Scott, the famous editor of the Manchester Guardian, is named on the roll of freemen of the city for his distinguished record within it. The Hallé Orchestra, founded over 80 years ago, has an international standing, and its value to Manchester is acknowledged by a Corporation grant and a guarantee. Belle Vue, Manchester's privately-owned stadium and playground, is the scene not only of prize fights and speedway racing, but also of great brass band contests. Two leading Association football clubs are associated with the city—Manchester United and Manchester City. The Lancs co. cricket ground, Old Trafford at Trafford Park, has been the scene of many international matches. The Gaiety theatre, now a cinema, in its heyday under the inspired sponsorship of Miss Horniman wrote a page in the history of the theatre. Tuesday mid-day concerts, the first of their kind to be organized, have been running successfully for many years. Manchester had the first free public library service in the U.K. under a permissive Act of 1850. Two other

Manchester. Plan of the central districts of the city, indicating the railway stations and principal buildings

1. Piccadilly, one of the principal streets. 2. John Rylands library. 3. Art Gallery. 4. Free Trade Hall, destroyed by German bombs in the Second Great War. 5. The cathedral, which dates from the 15th century.

# **MANCHESTER: PLACES OF INTEREST IN THE GREAT MANUFACTURING CENTRE**

*Photos: 1, British Railways; 6, Manchester Evening News*

factors have greatly influenced the cultural life of the city: citizens of foreign extraction who settled in Manchester and enriched its culture; and Manchester's great newspaper, the Manchester Guardian, whose enlightened policy has made it one of the great intellectual and social forces of the 19th and 20th centuries.

Municipally, Manchester is a co. borough with a city council consisting of 108 councillors and 36 aldermen, from whom the lord mayor is selected annually for one year, the city council is responsible for the water supply, its three sources being the reservoirs in the Longdendale valley, straddling portions of Cheshire and Derbyshire, Thirlmere and Haweswater in the lake district. It now owns a total of 53,400 acres

as catchment areas, including part of Mt. Helvellyn, and has planted several million trees. By an Act of 1930 the Wythenshawe estate of 5,567 acres was incorporated to house an excess pop. of 100,000.

The city has 34,000 municipal employees, and its assets show a surplus over loan debt of £51,000,000. For a number of years before the Second Great War the city council published an annual review, How Manchester is Managed, and in 1947 it engaged Paul Rotha to produce the documentary film for schools, A City Speaks, at a cost of £17,000.

The Representation of the People Act, 1948, reduced the number of Manchester's parliamentary representatives from 10 to 9.

**HISTORY.** Originally a Roman fort, Mancunium, Manchester was

settled by English and Danes, but has no consecutive history until it became a Norman fief. By 1530 it was the most populous town in Lancs, weaving having been introduced in the 13-14th cent. The Bridgewater Canal (*q.v.*), 1772, and pioneer Manchester-Liverpool rly., 1830, helped its great 19th cent. development.

Politically, Manchester has always been in the forefront. In 1819 an assembly of over 50,000 people met to agitate for much needed reforms. In a panic, although there had been neither riot nor serious disorder, the crowd was charged by yeomanry with drawn swords, and many people were killed and injured. Parliament commended the authorities at the time, but history has emphatically reversed that verdict. The field of

Manchester. Map of the industrial district and manufacturing towns of which Manchester is the centre

Peterloo, on which the Free Trade Hall was built, became the symbol of execration to workers of the world, and inspired one of Shelley's most passionate outbursts. The agitation for the repeal of the corn laws centred in Manchester, and the statues of Cobden and Bright are prominent in the city. Manchester was the citadel of the free trade movement. During one of the dark periods of the American Civil War a Manchester Citizens' meeting sent a letter to Abraham Lincoln urging him to continue the fight against slavery, although unemployment and privation were rampant through the failure of the cotton supply. Lincoln thanked the people of Manchester in memorable terms for their loyal support and encouragement. A famous statue of Lincoln, the gift of the American people, now stands in Platt Fields, one of the city's parks.

**SECOND GREAT WAR.** Manchester suffered two severe raids from the air during the war, one of the night of Dec. 22-23, 1940, which went on for hours and resulted in huge fires and heavy damage to business and residential quarters, hospitals, churches (four were destroyed), etc. In the second on June 1-2, 1941, thousands of incendiary and tons of H.E. bombs fell, in particular in working-class areas. The Free Trade Hall was destroyed, and the royal exchange was severely damaged. A number of flying bombs came down in the Manchester area on Dec. 24, 1944; the only occasion on which these missiles were reported from the N. of England. Total air raid casualties were 559 killed, 1,778 injured and detained in hospital.

**Bibliography.** Story of M., J. F. Wood, 1921; Short History of M. and Salford, F. A. Bruton, 1927; A Century of City Government, S. D. Simon, 1938; History of Local Government in M., 3 vols., A. Redford and I. S. Russell, 1940. *Consult also* City of M. Plan, R. Nicholas (for the city council), 1945.

**Manchester.** City of New Hampshire, U.S.A. It is one of the co. seats of Hillsboro co. The largest city in the state, it stands at the junction of the Piscataquog and Merrimac rivers, 18 m. S.E. of Concord by rly., and 55 m. N.W. of Boston. It has an airport. The Amoskeag falls of 55 ft. in the Merrimac provide power. It is an important cotton centre, owing this position largely to Samuel Blodgett who, after visiting Manchester, England, prophesied that the New Hampshire city

would become "the Manchester of New England." Settled in 1722 and incorporated as Derryfield in 1751, it was renamed Manchester in 1810 and became a city in 1848. The first cotton mills were established here in 1805 and flourished for over 100 years; but after the trade depression of 1929 they were closed down, being later restarted with the help of funds raised by the citizens. Among the outstanding buildings are the Carpenter memorial library, the Currier gallery of art, and the R.C. cathedral. Pop. 77,685.

**Manchester.** Town of Connecticut, U.S.A., in Hartford co. Situated 8 m. E. of Hartford, it is served by the New York, New Haven, and Hartford rly. The township, which has a special legislative charter, includes South Manchester. It is the centre of a region which produces tobacco, vegetables, and fruits. Known as the "Silk City," it is the site of the first silk mills in the U.S., which were established by the Cheney brothers about 1836 and are the only ones which include all the processes required to convert raw silk into finished articles. The city's other dominant manufactures are woollens, paper, rayon, velvet, fibre board, soap, electrical instruments, machinery, tools, chimes, leather goods, and toys. A state trades school is here. Settled in 1672, it formed part of Hartford and later of East Hartford and became a separate municipality in 1823. Pop. 23,799.

**Manchester, DUKE OF.** British title borne since 1719 by the family of Montagu. It derives not from the Lancashire city, but from Godmanchester in Huntingdonshire. Sir Henry Montagu (1563-1642), a noted judge in the time of James I, became lord treasurer and lord privy seal, being made a baron in 1620 and earl of Manchester in 1628. His grandson Charles, the 4th earl, a stout supporter of William of Orange, became English ambassador in Venice, Paris, and Vienna, and was created duke of Manchester in 1719.

William, the 5th duke (1768-1843), was postmaster-general in the Tory cabinet of 1827-30, and governor-general of Jamaica. William, the 7th duke, married Louise, countess von Alten, afterwards wife of the 8th duke of Devonshire and a famous society figure. William Angus Drogo, the 9th duke, succeeded to the title at the age of 15, when he was

still at Eton. He was captain of the Yeomen of the Guard, 1906. In 1932 he published *My Candid Recollections*. He died Feb. 9, 1947, and was succeeded by his son, Alexander George Francis Drogo Montagu (b. Oct. 2, 1902) as 10th duke.

The duke's seats are Kimbolton castle, Huntingdon, and Tandragee castle, co. Armagh. The eldest son bears the courtesy title of Viscount Mandeville.

**Manchester, EDWARD MONTAGU, 2ND EARL OF (1602-71).** English parliamentarian leader in the Civil War.

2nd Earl of Manchester, English parliamentarian

The eldest son of the first earl, and educated at Sidney Sussex College, Cambridge, he represented Huntingdon in parliament 1623-26. In 1626 he was

raised to the peerage as Baron Montagu, though generally known by the courtesy title of Viscount Mandeville. He sided with the Puritans in the quarrel with the king, and became one of the chief leaders of the popular party among the lords. His name was added to those of the five members who were impeached for treason by Charles I in 1642.

In the same year he succeeded his father as earl of Manchester and became a leader in the parliamentary army. He thought, however, that peace could better be re-established by negotiation than by fighting. He was nominally in command at Marston Moor, and won the second battle of Newbury, but quarrelled with Cromwell, and was deprived of his command by the self-denying ordinance. He opposed the trial and execution of the king, and retired when the Commonwealth was established. He took part in bringing about the Restoration, and was in 1661 made K.G. He died May 5, 1671.

**Manchester and Liverpool District Bank.** Oldest joint stock bank in England. It was established in 1829, chiefly through the efforts of a man named Joseph Macardy, who had conceived the plan of extending a bank's sphere of influence by means of a network of branches. With the idea of expansion as one of its *raison d'être* the bank has had a long series of amalgamations and mergers to record. One

of the most interesting of its satellites is the Lloyd Entwistle, Bury, and Jervis Company. The history of this firm can be traced back to 1771 and it was acquired by the District Bank in 1863. Another interesting association is that with the Saddleworth Banking Company which, through its connection with Buckley & Co., has local history going back well into the 16th century.

In 1924 the Bank dropped its more cumbersome title and adopted the simplified form of District Bank Ltd. Eleven years later the most important amalgamation to date took place, that with the County Bank. This merger placed the District among the seven largest banks in the country and brought its total number of branches up to nearly 600. In 1870 the Bank was incorporated under the Companies Act and received from the Heralds' College a grant of arms. The shield copies that of the borough of Manchester, but it is silver instead of red, and has two bendlets gules instead of three golden ones. The crest is a ship, which may be taken as the emblem of commerce, while the motto is *Decus Prudentiæ Merces*. "Honour, Wisdom's Meed." The Bank's total assets exceed £225,000,000, the authorised capital is £10,560,428.

**Manchester College.** A residential theological college in Oxford. It was founded in 1786 in Manchester, one of a succession of academies, the earliest being that opened by Richard Frankland at Rathmell in 1670. Its chief purpose was to give a training for the ministry of religion among dissenters. After being located in York and again in Manchester it was transferred to London in 1853, and from there in 1889 to Oxford. In 1893 the present fine buildings were erected in Mansfield Road. It is open to students of any denomination, without doctrinal tests, but its main support and constituency have been Unitarian. Among its past principals were James Martineau, James Drummond, J. Estlin Carpenter, and L. P. Jacks. Scholarships may be awarded for research in religion, theology, or ethics. Generous exhibitions are granted to external students for their undergraduate course prior to entering the college and to internal students for the ministry.

**Manchester Guardian, THE.** English daily newspaper. Founded May 5, 1821, by John Edward

Taylor (1791-1844) as a four-page weekly at 7d., it began daily publication at 2d. on July 2, 1855, and was issued at 1d. from Oct. 5, 1857, until the First Great War. It was edited by its founder, 1821-44; by his eldest son, R. S. Taylor, 1844-48; by J. Garnett, 1848-61; by J. E. Taylor, 1861-71; by Charles Prestwich Scott (*q.v.*), a nephew by marriage of the founder, 1872-1929; by E. T. Scott, 1929-1932; by W. P. Crozier, 1932-1944; and by A. P. Wadsworth since 1944. A London office was opened 1868, and a weekly edition in July, 1919.

The Manchester Guardian is one of the most influential papers in the kingdom, notable for the standard of its criticism, its independence, its foreign service, and the fullness and value of its general news and commercial intelligence. Among its eminent recent contributors may be mentioned C. E. Montague, Allan Monkhouse, Samuel Langford, Neville Cardus, Howard Spring, and Ivor Brown.

*Consult The Manchester Guardian: A Century of History*, W. H. Mills, 1921; C. P. Scott, 1846-1932; *Making of the Manchester Guardian*, various hands, 1947.

**Manchester Players.** British theatrical company. Miss A. E. F. Horniman, who had already launched the Irish Players on their career in the Abbey Theatre, Dublin, began a similar enterprise with the Manchester Players at the Midland Theatre, Manchester, in Sept., 1907. In the spring of 1908 she bought the Gaiety Theatre, Manchester, and within two years built up a repertory of the very first rank.

Among its most noteworthy productions were John Galsworthy's *Strife*, *Justice*, and *The Silver Box*; *The Voysey Inheritance*, by Granville Barker; *Hindle Wakes*, by Stanley Houghton, a comedy of Lancashire life; and plays by Charles McEvoy, Harold Brighouse, St. John Hankin, and Bernard Shaw. Among notable members of the company may be mentioned Sybil Thorne and (Sir) Lewis Casson; the latter was director of the theatre 1911-14. In 1920 Miss Horniman sold the Gaiety Theatre, Manchester, owing to lack of support for her movement, and the company was disbanded. *See* Horniman, A. E. F.; *Repertory Theatre*.

**Manchester Regiment.** Regiment of the British army. It was formed in 1881 by amalgamating the 63rd and 96th Foot and two

battalions of the Royal Lancashire Militia; the 63rd becoming the 1st and the 96th the 2nd battalion of the new regiment. The 63rd had been formed in 1758 from the 2nd battalion of the 8th Foot, now the King's Regiment, which was raised in 1685. The 63rd Foot first saw active service at Guadaloupe in the West Indies, and after fighting in Flanders again went to the West Indies where it gained the honours Martinique, 1794, and St. Lucia, 1796. In the Crimea the regiment was at the battles of Alma and Inkerman, and the siege of Sevastopol, and it served in the Afghan campaign of 1879-80.

The 96th Foot had been raised for service in the Napoleonic wars and was with Abercromby in Egypt in 1801 and later fought under Wellington in the Peninsular campaign. Disbanded in 1818, the 96th Foot was reformed in 1824 and fought throughout the New Zealand War of 1846-47. The Manchester Regiment's first engagement was in the S. African War, in which it played a prominent part under Sir George White at Elandslaagte and at the siege of Ladysmith.

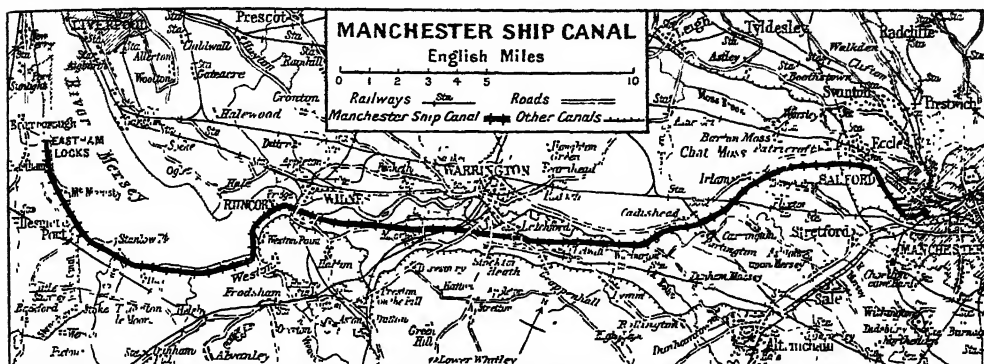

Forty-two battalions of the Manchester Regiment were raised in the First Great War and gained the honours: Mons; Givenchy, 1914; Ypres, 1915, '17, '18; Somme, 1916, '18; Hindenburg Line; Piave; Macedonia, 1915, '18; Gallipoli, 1915; Megiddo; and Bagdad.

Of the five service battalions that fought in the Second Great War, the 1st was captured at Singapore, the 2nd served in Burma, the 8th was at Malta throughout the air siege, and the 9th took part in the Sicily and Italy campaigns.

**Manchester School.** Name given in the 19th century to a group of politicians and economists and the ideas associated with them. Their leaders were Cobden, Bright, and Milner Gibson, and their headquarters were in Manchester, where the Anti-Corn Law League was founded in 1838. Founding their principles on utilitarianism, they believed in non-interference in industry by the state, in free trade, and peace. The period during which the ideas of the school were dominant is generally regarded as 1845-75. *See* Free Trade; Utilitarianism.

**Manchester Ship Canal.** Canal connecting Eastham on the Mersey with Manchester. The long-contemplated project for making Manchester an inland seaport began to

Manchester Ship Canal. Map showing the course of the canal from Eastham, on the Cheshire side of the Mersey, to Manchester, which affords sea-going vessels of large tonnage access to the city

take practical shape in 1882, when Daniel Adamson, ironfounder, called a meeting of the mayors of Lancashire manufacturing towns to consider the construction of a tidal waterway between Liverpool and Manchester.

His enterprise and enthusiasm led to the undertaking of the work, and in spite of many initial difficulties the construction, begun in 1887, was completed Dec. 16, 1893, and the Manchester Ship Canal was formally inaugurated by Queen Victoria, May 21, 1894. Traffic had begun in Jan. In 1905 Edward VII opened dock No. 9. The canal is 35½ m. in length, and the districts within a 50 m. radius of Manchester have the densest population in the world. The original contract was £9,000,000, but additional costs brought the capital expenditure up to over £19 millions.

The ship canal has had an enormous influence upon the commercial importance and development of Manchester, which now ranks as the fourth port in the U.K. It is provided with the most adequate dock accommodation, appliances, and modern equipment; with an elaborate system of transit sheds, the handling of cargo is expeditious; regular lines of steamers enable exporters to ship direct to the principal foreign ports, and the Bridgewater department deals with the traffic between the docks and inland towns. The tonnage figures, which were 925,659 tons, value £97,901, in 1894, were 6,409,873 tons in 1938; revenue value in 1944 was £1,455,000.

The entrance to the ship canal is at Eastham, 19 m. from the bar at the mouth of the river Mersey, and the access is from the sea by way of the lower estuary. The canal skirts the shore of the estuary up to Runcorn, terminating at Trafford Bridge in Man-

chester. It is divided into four reaches, and the passage is about seven hours, allowing about half an hour for locks. The customs port begins at the E. termination of the Port of Liverpool, and includes the rivers Mersey, Irwell, and Weaver, and the canal from Eastham to Hunt's Bank.

The depth of the canal is 28-30 ft., maintained by dredging, and the bottom width is 120 ft. (except near Latchford, 90 ft.). At Manchester are three graving docks and a pontoon dry dock, and a second pontoon dry dock is at Ellesmere Port. Twin-screw steamers of 12,500 tons navigate the canal. The dock estate covers 206½ acres, water space 120 acres, and the quay and storage area is 286½ acres. Adjoining on the S. side is the huge Trafford Park estate, 1,183 acres, with 3 m. of frontage to the ship canal and 3½ m. to the Bridgewater Canal; here are located some 125 firms engaged in engineering and other industries. In the cold storage department, with a capacity of 1,000,000 cu. ft., 10,000 tons of meat and perishable goods can be preserved. See Aqueduct; Bridgewater Canal; consult History of the Manchester Ship Canal, B. Leech, 1907.

**Manchester Square.** London square. It lies between Baker Street and Thayer Street, Marylebone, W., and, built in 1770-88, was named after the 4th duke of Manchester, who built Hertford House (q.v.). Lady Blessington, William Beckford, and Matthew Arnold were among notable residents. The site was once known as Maribone Gardens, which extended to Wimpole and Harley Streets.

**Manchester University.** Educational establishment in England, in full the Victoria University of Manchester. In 1851, through the munificence of John

Owens, a Manchester merchant, a college was opened in the city for higher education. In 1880 this became one of the colleges of Victoria University, founded in that year; but in 1903 the university, which included colleges at Liverpool and Leeds, was dissolved, and Manchester obtained a separate university. In 1872 the Manchester school of medicine had been united with Owens College.

The university has faculties and departments for every kind of study. Normal

Manchester University arms

degree courses, open to men and women, are three years. In arts a high standard is maintained, while great attention is paid to science, medicine, and technology, as well as to other modern subjects, e.g. commerce and administration. The municipal college of technology has been associated with the university since 1905, the principal of the college being dean of the faculty. The buildings, near the centre of the city, include the original Owens College and subsequent additions, as well as the Manchester museum, with the Flinders Petrie Egyptology collection. The library has over 300,000 vols. A new arts library was opened in 1936. There are laboratories for study and research in electro-technics, radio-activity, etc. In 1948 there were over 4,000 students on the books. Various theological colleges are recognized by the university. See Gown col. plate.

**Manchineel** (*Hippomane mancinella*). Tree of the family Euphorbiaceae. A native of Central

Manchinel. Spray with flower, foliage, and fruit. Inset, flower head.

America and the W. Indies, it has shining egg-shaped leaves with toothed edges, small inconspicuous flowers, and yellowish-green fleshy berries. It abounds in milk-like and intensely poisonous sap. A single drop of the juice in contact with the eyes will cause blindness for days, and similar results arise from the smoke of its wood when it is burnt.

**Manchu.** People of pure Tungus stock in E. Asia. Tall, slender, level-eyed, medium-headed, they betray contact with the prehistoric Caucasoid migrations. Originally pastoral nomads in the Sungari basin, they are now peaceably settled husbandmen, professing Lamaism and forming one-tenth

of the Manchurian population. The women's feet are unbound. Their Altaic speech is written in a modified Aramean script resembling Mongolic. The Tsing dynasty which they imposed upon China in 1644 endured until the republican revolution of 1912. *See Asia.*

**Manchukuo.** Former puppet state of Asia. Proclaimed an independent state by Japan in 1932, it comprised the three N.E. provinces of China, Liaoning, Kirin, and Heilungkiang, together with Jehol. With Japan's defeat in 1945, Manchukuo ceased to exist.

**Manchuria.** Generic but non-official name for the North-Eastern Provinces of China. Nine in number, they are named Antung, Heilungkiang, Hokiang, Hsingan, Kirin, Liaoning, Liaopei, Nunkiang, and Sungkiang, and each has its separate entry in the pages of this Encyclopedia. Before Sept., 1945, the territory comprised three provs., Heilungkiang, Kirin, and Liaoning. Its area is est. at 503,013 sq. m. and pop. 43,233,954. Mukden, Harbin, Changchun, and Antung are the chief cities. Manchuria is bounded N. by Siberia, E. by Korea, and W. by Mongolia.

Two mountain ranges, Khingan Mts. and Changkwangsai Mts., run from S. to N., with peaks ranging from 3,000 to 8,000 ft. They are

rich in timber and minerals, especially coal. The N. boundary is the Amur, which receives the Argun, Kumara, Sungari, and Ussuri. Of these tributaries the Sungari is the longest; with its tributary, the Nonni, it almost encircles the Little Khingan Mts. In the S. the Tumen, Yalu, and Liao-ho drain fertile plains which form some of the richest land in E. Asia.

Manchuria extends from 39° 40' N. lat. to 53° 50' N. lat., and has a climate comparable with that of the N.E. United States and the maritime provinces of Canada. The S. ports, Dairen (Dalny) and Lushun (Port Arthur), are ice-free all the year, but other ports and the rivers are frozen for about six months; the ice is generally thick enough to bear heavy traffic. The rainfall is, on the whole, slight; most of it falls in Aug., when floods on the rivers interfere with traffic. Snow falls to a depth of 1½ ft., and sledges are used over it in the towns and along the highways, which are but dirt-tracks across the countryside.

#### Agriculture and Industries

All the valleys are fertile and on the whole, well cultivated; soya beans, kaoliang, millet, maize, and wheat occupy most of the arable area. Minor crops are red beans, oats, hemp, and tobacco. In the S. tussore silk is obtained from wild silkworms reared among the leaves of a species of oak; ginseng is found wild and is cultivated in Kirin. Cattle kept for milk and meat, and horses, mules, and donkeys reared for draught purposes, are common domestic animals; sledge dogs are reared in the N.E. and camels near Mongolia.

Gold is mined in the N. and coal in the S., while silver, lead, copper, iron, and salt are also found. The extraction of bean, casor, and other oils is a valuable industry in normal times at Mukden, which also had flour milling, brewing, bricks and earthenware establishments. Rlys. radiate from Harbin; the 5-ft.-gauge section of the Trans-Siberian Rly. runs N.W. to Chita and S.E. to Vladivostok. S.W. a line goes to Mukden, changing to the 4 ft. 8½ in. gauge at Changchun; three lines go from Mukden to Shanhaikwan and Tientsin to the system of China proper, to Antung to join the Korean system, and to Lushun.

About the beginning of the 17th century Nurhachi, a Manchu ruler, had firmly established himself in Manchuria, and in 1623 he transferred his capital to Mukden. His son conquered Korea and S.

Manchuria. Map of the northernmost territory of China, through which pass the railways connecting China with the western world

Manchuria, and the next ruler overthrew the Ming dynasty of China. There are hardly a million Manchus left in their former home, most of the present inhabitants being immigrant Chinese. This territory has been desired by foreign powers, on account of its fertility and its ice-free harbours. In 1895, by the treaty of Shimonoseki, Japan obtained part of S. Manchuria, but gave it back on the advice of the powers. Russia almost immediately obtained rly. rights and a lease of Liao-tung. At the Portsmouth conference in 1905 Japan gained Liao-tung and rly. concessions in S. Manchuria; in 1917 the Japanese S. Manchurian rly. obtained control of the Korean rly. system and so gained a through route from S. Korea to Changchun and the Trans-Siberian rly. system.

In spite of her agreements with the western powers to give up her claims on China's north-east, Japan continued to covet the territory. Various incidents were provoked which led to open seizure of the whole territory in 1931. The Lytton commission, appointed by the League of Nations, denounced this action as aggression, and Japan left the League. The territory thenceforward became a base for operations against China's northern provinces. Full-scale, though undeclared, war followed an incident near Peiping, on July 7, 1937. For eight years the N.E. provinces served as an arsenal and supply base for Japanese troops operating elsewhere in China. In Aug., 1945, Soviet troops invaded the territory and engaged Japanese forces till their capitulation on Aug. 15. The Russians evacuated all Manchuria except Port Arthur by May, 1946, taking, however, much industrial equipment as reparations. Their withdrawal was preceded by tension between the Chinese Communists there and the central Chinese govt., and was followed by open warfare between them. See China in N.V.

**Bibliography.** M., its People and Recent History, A. Hosie, 1901; International Relations of Manchuria, C. W. Young, 1930; M., Cradle of Conflict, O. Lattimore, 1932; North China Front, J. Bertram, 1939.

**Mandaeans.** People of Semitic stock in S. Babylonia and Khuzistan. Upon the old Babylonian popular religion they en-

grafted Gnostic elements. Their sacred books, notably the Genza or Treasure, written in S. Babylonian Aramaic dialect and script, and including Hebrew and Christian traditions, were collected about the 1st century A.D. Their characteristic rite is immersion in running water. They are a dwindling community of traders and artisans numbering fewer than 4,000.

**Mandalay.** Division and dist. of Burma. The division comprises the upper valley of the Irawadi. While the Mandalay dist. in the S. of the div. has 160 persons per sq. m., the four dists. to the N. have fewer than 30. The S. dist. is

Mandalay, Burma. Left, palace of Theebaw, the last king. Right, some of the 450 pagodas forming the Kuthodaw, or temple

slightly cultivated (13 p.c. of the area), chiefly for rice; the rest is almost uncultivated. The S. dist. is part of the dry area of Central Burma, the annual rainfall being 33 ins., while that of the remainder exceeds 60 ins. and the coasts of Burma receive at least 100 ins. The Mandalay Canal, 42 m., irrigating 125 sq. m., was opened in 1902, running parallel to an old Burmese waterway. Div.: area 32,476 sq. m.; pop. 1,907,703. Dist.: area 2,117 sq. m.; pop. 408,926.

**Mandalay.** A city of Burma, formerly the capital of Upper Burma. A modern river port, its situation on the Irawadi 350 m. almost due N. of Rangoon destined it to be the commercial centre of inland Burma. To the S. the Sittang valley leads to Rangoon and the Gulf of Martaban; S.W. lies the Irawadi, N. the Upper Irawadi; and E. the Myitnge yield access to N. Burma. Except to the S.W. all these routes are followed by rly. lines, while a fourth line leads up the Chindwin Valley to the N.W. The city lies in the dry belt of Burma, surrounded by a broad alluvial plain. In 1860 its site was a jungle swamp.

The early town was a square, surrounded by a wall with curious wooden towers over its gates. It contained the royal palace within

a square enclosure, 370 yds. each side. The front of the palace included the great hall of audience, made of elaborately carved and gilded teak timber. Within the enclosure also stood the treasury, arsenal, mint, and the stables of the white elephant. From 1857 Mandalay was the capital of the Burmese kingdom; in 1885 it was occupied by the British who captured King Theebaw. A great fire in 1892 destroyed considerable portions of the city, and a new city was built. The old walled town is now known as Fort Dufferin; outside its walls are numerous temples, pagodas, and monasteries.

Of these the most remarkable is the Kuthodaw, or temple, with its hundreds of pagodas, arranged to form a square, about 800 yds. each side. Mandalay agricultural college is part of the university of Rangoon.

In the Second Great War Mandalay, wrecked by enemy bombing, was evacuated by the British and occupied by the Japanese May 1, 1942. British troops re-entered the N. outskirts of the city March 8, 1945. By the 12th Fort Dufferin, with its massive walls, was the only serious obstacle remaining, but this the Japanese defended fanatically, and the end came only after Mitchell bombers, on the 19th, breached the wall, with 2,000-lb bombs. Next day at 12.45 the besieging troops were astonished to see an Anglo-Burman walk out of the N. gate carrying a Union Jack and a white flag. The Japanese had pulled out of the fort at noon, leaving in it only 346 refugees, including a number of missionaries. See Burma Campaign.

The pre-war pop. was 147,932. Kipling's famous verses, On the Road to Mandalay, included in his Barrack-Room Ballads, 1892, give the flavour of the early British period of occupation.

**Mandamus** (Lat., we command). English court order of a high nature, made by the king's bench division. It is made only where there is no other remedy, and is addressed to a court, a person, or a corporation, commanding the performance of some legal duty of a public nature—e.g. to a court of petty session commanding it to hear and determine a case according to law, or to a municipal body, ordering the

provision of an isolation hospital. It enforces some private rights when withheld by public officers. Non-compliance is contempt of court. The procedure was simplified in 1938. See Writ.

**Mandarin** (ultimately from Skt. *mantrin*, counsellor). Term used under the Empire by Euro-

Mandarin of Hanyang in official robes

peans for a Chinese official, civil or military. There were nine grades, distinguished by the button on the cap, the embroidery on the robes, and the girdle-clasp. The buttons, the same for civil and military mandarins, were in order of rank as follows: A ruby or a transparent red stone, a red coral button, a sapphire button, an opaque blue stone, a crystal button, an opaque white shell button, a plain gold button, a worked gold button, and a worked silver button. The embroidery for civil mandarins represented birds, and for military mandarins wild beasts. The Chinese spoken by officials and educated people is called mandarin (Kuan-hua). It is now known as gwoyeu. The term was formerly applied to other Asiatic officials besides Chinese.

**Mandarin Duck** (*Dendrocygna galeuculata*). Bird of the duck family found in China and E. Asia. The plumage of the male is brilliant, the head bearing an erectile crest of green, white, and brown. One of the scapular feathers is developed into a large upturned fan of bright chestnut with a broad purple band, which adds much to the striking appearance of the bird. The female is soberly clad in mottled brown.

Owing to their beauty, these ducks are in favour for ornamental waters. See Duck.

**Mandasor**, **MANDSAUR**, OR **MANDESUR**. Town in Gwalior state, Madhya Bharat, India. It is 80 m. N.W. of Ujjain on the Malwa section of the Rajputana-Malwari. It gives its name to the treaty

which in 1818 ended the Mahratta-Pindari war. Here is centred the poppy-growing industry of Malwa.

**Mandate**. In law, a command, charge, or commission. A consignment of goods to be carried, or to have something done to them, is sometimes called a mandate; the term derives from the Roman *mandatum*, a contract by which one person undertook to perform some service for another without payment, if guaranteed against loss. In canon law a mandate is a command by the pope to put a certain person into the first vacant benefice in the gift of the individual to whom the command is addressed. Politically, the word is used to signify a charge laid by electors upon their representatives. The Labour government of 1945 used the expression freely in support of their more far-reaching measures for the nationalisation of various industries.

**Mandated Territories**. Colonial territories taken by the Allies from Germany and Turkey at the end of the First Great War and administered on a trusteeship for the inhabitants under the general control of the League of Nations. The territories fell into three classes: (a) those considered merely to require assistance in administration for a time, e.g. Palestine, Syria; (b) backward territories which were to be administered on a basis that included the grant of equal opportunities for trade to other members of the League, e.g. Tanganyika; (c) those to be administered by the controlling power as parts of its own territory—e.g. S.W. Africa.

Mandates were accepted by Great Britain for Iraq, Palestine, Transjordan, Tanganyika Territory, and parts of Cameroons and Togoland; by Australia for New Guinea and Nauru; by New Zealand for Samoa; by South Africa for S. W. Africa; by France for Syria, Lebanon, and parts of Africa; by Belgium for Ruanda-Urundi (German E. Africa); and by Japan for groups of islands in the Pacific.

The League mandates were by nature impermanent, and that for Iraq ceased when the country was admitted to the League in 1932. The Syrian and Lebanese mandates, though juridically still

in force, were *de facto* terminated by the treaty between France and the new republics, Dec. 27, 1943. The position concerning the Palestine-Transjordan mandate was more complicated; while in Palestine there was little sign of a settlement of the Arab-Jewish question, Great Britain recognized Transjordan as a sovereign independent state in 1946. The remaining mandates were surrendered to the United Nations with the acceptance of the trusteeship system in 1945-46.

**M and B**. A term in England designating drugs of the sulpha group. It comes from the initials of the firm of May and Baker, manufacturing chemists. It describes a bactericidal agent which inhibits the growth of organisms by interfering with their metabolism, and so is used in treatment of pneumonia and other diseases. Gerhard Domagk, of I. G. Farbenindustrie, discovered the principle while doing research work on aniline dyes. See Sulphonamides.

**Mandel**. **GEORGES** (1885-1944). French politician. He was born June 5, 1885, son of a Jewish draper. He contributed to *L'Aurore*, a newspaper owned by Clemenceau, and was assistant chief of cabinet in 1906 during the latter's first ministry. When Clemenceau became prime minister in 1917, Mandel was made director of the cabinet, and in 1937 was minister for the colonies under Édouard Daladier. In June, 1940, he became minister of the interior. After the 1940 armistice he fled to Morocco, but was brought back to France. One of the defendants at the Riom (*q.v.*) trial, he was handed over to the Germans and put in Buchenwald concentration camp. Brought back to Paris as a hostage, he was murdered July 8, 1944, while ostensibly being taken to Vichy. Two men were executed for the crime Oct. 28.

**Mandelic Acid** OR **PHENYLGLYCOLIC ACID**. Crystalline body discovered by Winckler in bitter-almond water. It is prepared by converting benzaldehyde into mandelonitrile and hydrolysis of the latter. Mandelic acid was introduced into the British Pharmacopoeia in 1941. It has been used in medicine in the treatment

Mandarin Duck. Drake of this Chinese aquatic bird  
W. S. Berridge, F.Z.S.

Georges Mandel,  
French politician

of urinary infections, especially in the form of its ammonium salt.

**Mandeville**, BERNARD (c.1670–1733). A Dutch-English satirist. Born at Dordrecht, Holland, and educated at Rotterdam and at Leyden, where he took his degree of M.D., he settled in London and practised as a physician. He died Jan. 31, 1733. His *Fable of the Bees*, which grew from a small volume of doggerel verse, *The Grumbling Hive*, 1705, into an elaborate treatise, was condemned by the Middlesex grand jury and attacked by William Law, Berkeley, and others. In a vein of coarse and impish wit and paradox he pictured a hive of vicious bees whose prosperity was ruined by their becoming virtuous. Maintaining that private vices were public virtues, he professed to find some ignoble and grossly selfish motive at the base of virtue.

**Mandeville**, GEOFFREY DE (d. 1144). English earl. Constable of the Tower and created earl of Essex in or before 1141, he took the side of the empress Matilda (or Maud), daughter of Henry I, against Stephen, but later deserted her cause and assisted in the siege of Winchester. By grants from Stephen he came to monopolise the judicatory power in Hertfordshire, Middlesex, and Essex, and surpassed all the nobles in wealth and importance. He conspired once more with the empress, was arrested, set at liberty again, once more revolted, and, retiring to the fen country, led raids into the eastern counties. In one of these raids he was fatally wounded. This figure of feudal anarchy was the subject of a monograph by J. H. Round, 1892.

**Mandeville**, SIR JOHN. Reputed English author of a medieval book of travels. The earliest known version, written between 1357 and 1371, is in French, and the earliest English text is a faulty adaptation of it. The author of the travels states that he was born at St. Albans and had travelled widely in the East. A Latin version made at Liège declares that the book was written there, and a tomb was to be seen at Liège until 1798 with an inscription recording that Mandeville died there Nov. 17, 1372. The real author, however, appears to have been a Liège professor of medicine, Jehan de Bourgogne. The first part of the *Travels* is a guide to the Holy Land for the use of pilgrims, plagiarised from a German traveller, William of Boldensele, and from others. The second part,

which describes more distant travels in Asia, is taken from Odoric of Pordenone and others. Among the marvels popularised by the book were those of Prester John, the fountain of youth, the earthly paradise, and the vegetable lamb.

**Bibliography** *Early Travels in Palestine*, ed. T. Wright, 1848; *Voyages and Travels of Sir J. M.*, ed. H. Morley, 1886, repr. 1905; *The Buks of J. M.*, ed. G. F. Warner, 1889; *The Travels of Sir J. M.*, ed. A. W. Pollard, 1900; *Mandeville's Travels*, ed. P. Hame lius, 1919.

**Mandi**. Former Punjab hill state, from 1948 part of the Himachal union, India. Drained by the Beas, much of the area is forested, the deodar and blue-pine yielding valuable timber. It has an annual rainfall of 50 ins. Rice, wheat, and pulses are grown, a third of the fields yielding two crops a year. The capital, Mandi, is on the Beas, here spanned by a fine iron bridge. Founded in 1527, it is a trade centre for Sinkiang, and is connected with the railroad at Pathankot, 131 miles to N.W. by a good road. A hydro-electric scheme was opened in 1932. The area of the state is 1,139 sq. m.; pop. 232,593.

**Mandible**. Term applied to the jaw of vertebrates, and to the jaws or pincers of insects, crustaceans, and other animals. *See* Animal.

**Mandingo** OR MANDE. Name denoting a sub-group of W. Sudanic languages. The negroid peoples, numbering several millions, by whom they are spoken, include the Soninke or Sarakole of the middle Senegal; the Bamana or Bambara of the upper headwaters; the Vai of S.W. Liberia; the upper Niger Malinke; many forest tribes in Sierra Leone and Liberia; and Caucasoid tribes such as the Susu. This virile stock established the powerful medieval Mahomedan kingdom of Mali,

Mandrake. Foliage, flowers, and root. Inset, fruit

which faded before the Songhai and Fula powers. The most typical tribes, athletic, fair, full-bearded, dignified, are now herdsmen, agriculturists, traders, and craftsmen. *See* Africa; Mendi.

**Mandla**. Dist. and town of India, in the Jubbulpore division, Madhya union. The district is situated N.W. of the Maikala Range, and is largely uncultivated, forested plateau. It is drained by the headstreams of the Narbada. A short rly. connects Nainpur with the town of Mandla, which has 37 temples built between 1680 and 1858 on the banks of the Narbada. Area, 5,115 sq. m. Pop. of dist., 504,580; town, 11,700.

**Mandoline**. Musical stringed instrument with pear-shaped body and short neck. It is of the lute

Mandoline of Neapolitan type, with four pairs of strings

class but has pairs of strings tuned in unison. In the larger Milanese mandoline, with five or six pairs of strings, the tuning is similar to that of the lute; but the much commoner Neapolitan mandoline has four pairs of strings, tuned in fifths like the violin:

Mandoline strings are of gut for the lowest pair, and of steel for the others.

They are played with a plectrum, the special effect being produced by a tremulous movement of the hand, which keeps the strings in continuous vibration.

**Mandrake** (*Mandragora officinarum*) OR DEVIL'S APPLES. Perennial herb of the family Solanaceae. A native of the Mediterranean region, it has a thick, fleshy root, and large, oblong, lance-shaped leaves. The flowers are white or bluish, with network veining. The plant has a fetid smell and all parts of it have poisonous properties.

The mandrake was formerly used as a narcotic; the classical writers knew of it, and Shakespeare speaks of it as "the insane root that takes the reason prisoner." The forking of the root often produces a resemblance to the human figure, and from early times this, and its poisonous nature, surrounded the plant with superstitious beliefs. Its possession was said to bring good

fortune in all the affairs of life and it was pulled from the earth by attaching to it a dog, which, it was alleged, died of fright when the plant shrieked on being uprooted.

**Mandrill** (*Mandrillus sphinx*). Large species of baboon, found on the W. coast of Africa. The muzzle

Mandrill. Specimen of the brilliantly coloured West African baboon  
W. S. Derridge, F.Z.S.

somewhat suggests the snout of a pig, the nose is a brilliant vermillion, and the swellings on either side of it are bright blue, and deeply ridged. The skin of the hinder part is shaded with purple, and the great callosities on the buttocks are bright red. The fur is olive brown, with a dark crest on the head, and a yellowish beard on the chin, which tends to turn white with age. The canine teeth are of great size and length. In its native state it goes about in troops, and is said to live on insects. In captivity it is morose and ferocious.

**Mandu** or **MANDUGARH**. A ruined city in the Mahratta state of Dhar, 55 miles southwest of Mhow in Central India. Mandu was once the capital of the ancient kingdom of Malwa. To its buildings, of which the Jami Masjid is still in a good state of preservation and regarded as the best example of Afghan architecture in India, the great ruler Hoshang Shah (1405-34) made notable contributions. The city is on the summit of the Vindhya Hills, 1,944 ft. above sea level. It was once 37 m. in circumference and its ruins occupy 8 sq. m. Sir Thomas Roe, ambassador of James I, entered Mandu in the company of the emperor Jehangir, whose procession included 500 elephants.

**Manduria**. Town of Italy, in the prov. of Lecce. Situated 22 m. by rly. E. of Taranto, it stands near the site of an older Manduria,

of which remains have been found. From tombs in the vicinity many gold ornaments, etc., have been recovered. An important stronghold in the 4th century B.C., it was captured by Rome, 209 B.C., and destroyed by the Saracens in the 10th century, the inhabitants building the present town, which, until 1700, was called Casalnovo, i.e. new village. Pop. 13,000.

**Mandvi**. Harbour of India, on the N. shore of the Gulf of Cutch, Bombay. It is the largest town in the state of Cutch. Pop. 28,000.

**Manes** (Lat., the good). Among the Romans and Italians generally, a name for the spirits of the dead. In imperial times they were regarded as gods, as is shown by the letters D.M.S. on sepulchral monuments — *Dis Manibus Sacrum*, sacred to the divine Manes. A general propitiatory festival of All Souls (*Feralia*) was held in their honour, Feb. 17, at which various offerings of food were brought to the tomb. Three times a year the Manes were supposed to come forth from their home in the underworld, to roam about the earth. Pits were dug near towns, resembling inverted domes, covered by a stone, called *lapis manalis*, which was removed with great ceremony on these occasions. The Manes are good, kindly spirits, as opposed to the Larvae and Lemures, bogies and hobgoblins. (Pronounced in two syllables.)

**Manet**, **ÉDOUARD** (1832-83). French painter. Born in Paris, Jan. 25, 1832, he studied under

Édouard Manet,  
French painter

Couture, and in 1863 became the leading spirit of an iconoclastic group known as the *École de Batignolles*, which included Degas, Monet, Sisley, Fantin-Latour, and Pissarro. Manet broke, at least outwardly, so completely from classical traditions of beauty, form, and design that many of his works were the objects of general abuse, e.g. his *Déjeuner sur l'herbe*, now in the Louvre, which was rejected

Édouard Manet. His fine painting, *The Bar at the Folies-Bergères*, now in the National Gallery, London

by the Salon in 1863 and exhibited in the Salon des Refusés the following year. His great *Olympia*, 1864 (Louvre), Christ Reviled by the Soldiers, 1865, and *Angelina*, 1866, were similarly rejected and scorned. His paintings were derisively labelled impressionist. But his influence on Monet was such that the latter adopted the label proudly (see Impressionism).

While serving as a gunner during the Franco-Prussian war, 1870-71, Manet perceived the beauty of open-air painting, and the popularity of the *plein-air* school owed much to his subsequent work. His later paintings, e.g. *Le Bon Bock*, 1873, and *The Bar at the Folies-Bergères*, 1882 (now in the National Gallery, London), won him wide esteem at last, and he has since become recognized not only as an important figure in the history of art but as in himself a great painter whose works have an intrinsic beauty and reveal an uncommon mastery of technique. Zola, who supported him throughout the controversy, wrote a biography, 1867. Consult also *Life* by J. E. Blanche, Eng. trans. 1925.

**Manetho** (Egypt. Manethoth, given by Thoth). Egyptian priest and writer. Born at Sebennytus (Semenud) in the Nile delta, he became chief priest and keeper of the sacred records at Heliopolis in the reigns of Ptolemies Soter and Philadelphus (323-247 B.C.). He was the author of *Aegyptiaca*, a history of Egypt from the earliest times to Alexander the Great. Some fragments are preserved in Josephus and in later chroniclers. A poem called *Apotelesmatika*, dealing with the influence of the stars on men's lives, formerly attributed to him, was written by a later astrologer bearing the same name. See Egypt.

**Manettia.** Genus of evergreen climbing plants, of the family Rubiaceae. Natives of tropical America, they have more or less oval leaves and funnel-shaped flowers of yellow, white, or red, according to species.

**Manfalût.** Town of Egypt. It is situated on the Nile, below Assiut, 222 m. by rly. S. of Cairo and 27 m. by river from Assiut. There are Coptic churches, and woollen factories. Date brandy is manufactured for local consumption and export. Near are the crocodile mummy pits of Maabda. Mehemet Ali here united his troops in 1820. Pop. 14,500.

**Manfred** (1231-66). King of Naples and Sicily. A natural son of the emperor, Frederick II, he was made prince of Taranto, and in 1257 with Saracen aid usurped the kingdom of Naples and Sicily. Excommunicated by Alexander IV, Manfred entered the Papal States, and from Tuscany southwards the whole Italian peninsula thrived under his rule. He fell in the battle of Benevento, Feb. 26, 1266.

Manfred is the title of a dramatic poem by Byron. The central idea of the play is the unexplained remorse of the magician Manfred. It was published in 1817, but was not staged until 1863, though it had been set to music by Schumann eleven years previously.

**Manfredonia.** Town and harbour of Italy, in the prov. of Foggia. It stands on the Bay of Manfredonia, at the base of Monte Gargano, 23 m. by rly. N.E. of Foggia. Founded in 1263 by Manfred (*q.v.*), it still retains part of its medieval walls and castle. Two m. S.W. is the fine cathedral of S. Maria di Siponto (consecrated 1117), part of the remains of ancient Sipontum (*q.v.*). Manfredonia was destroyed by the Turks in 1620, but was afterwards rebuilt. The 8th army captured it Sept. 29, 1943, during the Second Great War. Only the castle was seriously damaged. Many of the inhabitants are employed in the fisheries. The neighbouring lagoons yield large quantities of salt. Figs, almonds, and carobs are exported in considerable quantities. Pop. 15,000.

**Manfredonia, Gulf of.** Wide opening of the Adriatic Sea, on the S.E. coast of Italy. It is bounded N. by Monte Gargano, washes the shores of the provinces of Bari and Foggia, and is 32 m. wide at its mouth.

**Mangabey** (*Cercocebus*). Group of monkeys found in W. and E. Africa, and usually distinguished by the presence of white or flesh-

Mangabey. Specimen of the crested or grey-checked West African monkey

coloured eyelids. They are nearly related to the macaques (*q.v.*), but are of more slender build and have a shorter muzzle and smaller callosities on the buttocks. They are long-tailed, and the general colour of most of the species is blackish. Remarkably docile and good-tempered, these monkeys make excellent pets. See Monkey.

**Mangaia.** One of the largest of the Cook Islands, Pacific Ocean. It is a dependency of New Zealand, 116 m. from Rarotonga. The island is 30 m. in circumference and is of volcanic origin, and on the E. is a wide expanse of infertile basalt. Inland a short distance from the shore is a wall of dead coral, 100 ft. in height, which goes round the island. Within this coral rampart there are swamps and the central plateau, 650 ft. in elevation. Copra, coffee, and oranges are exported. Pop. 1,845.

**Mangalia.** Town of Rumania, in the Dobrogea (Dobruja). It stands on the shore of the Black Sea in the S.E. of Rumania, and has road connexions with Constanta, 35 m. to the N., and Bazargic. In the Middle Ages it was a flourishing port, trading with Italian ports; the harbour is inadequate for large ships. Pop. 2,776.

**Mangalore.** Town of India, in Madras, headquarters of the S. Kanara dist. It is situated on the Malabar coast on a backwater formed by the Netravati and Gurpur rivers, and has a harbour used in fair weather by small vessels. It is 407 m. S.S.E. of Bombay. The main line rly. from Madras through the Palghat gap to Calicut terminates here. There are roads across the W. Ghats to Mysore and Coorg. Two colleges are affiliated with the university of Madras. Coffee is the chief export, while nuts and pepper are also exported. Coarse cloth is manufactured.

A quarter of the people are Christians; the Jesuit mission

dates from 1880. In the 14th century it was a famous centre of commerce. Sacked in the 16th century three times by the Portuguese, it became in the 18th century the principal port for the rulers of Mysore. Captured by the British in 1768, retaken in 1784, it was held by the British in 1799. Pop. 53,877.

**Mangan, James Clarence** (1803-49). Irish poet. Born in Dublin, May 1, 1803, the son of a grocer, he received an excellent education, but owing to intemperance was never able to achieve any solid success, though some of his poetry is of a high order. He died of cholera, June 20, 1849. An incomplete edition of his poems, which include renderings from Irish, was published with a biographical note by J. Mitchel, 1859, and a centenary edition, edited by D. J. O'Donoghue, in 1903. Consult

J. C. Mangan, Irish poet  
From a drawing after death, by Sir F. Burton  
Life and Writings of Mangan, D. J. O'Donoghue, 1897.

**Manganese** (Ital. corruption of *magnesia*). Metallic element of great importance, particularly because of its use as a constituent of all steels and of many non-ferrous alloys. The mineral pyrolusite, an oxide of manganese, was probably known in ancient times and was named *magnesia* by Pliny. It was used under the name lapis manganensis in the manufacture of white glass, as it counteracts the green tints. The black Derbyshire Wad was, and still is, used to make black oil-paint. Until late in the 18th cent. it was thought to be a compound of iron, but in fact it contains only small amounts of iron. First isolated in 1774 by J. G. Gahn, the Swedish chemist, it was named manganese in 1808, after the isolation of the true magnesium by Davy. The element, chemical symbol Mn, is one of the transitional elements in the first long period of the periodic table, being associated with iron, cobalt, and nickel on the one side and chromium, vanadium, titanium, and scandium on the other. It has atomic number 25, atomic weight, 54.93; melting point, 1242° C.; boiling point, 1900° C.; density, 7.39 gm. per c.c.; electrical resistivity about  $5 \times 10^{-6}$  ohm cm. Manganese exists in

two crystal forms, alpha-manganese and beta-manganese, both of which are complex in nature and probably contain manganese atoms in different states. The element has two free-valency electrons, but probably forms six different oxides, among them being  $\text{MnO}$ ,  $\text{Mn}_2\text{O}_3$ ,  $\text{Mn}_2\text{O}_4$ , and  $\text{MnO}_2$ .

The chief ores of manganese are pyrolusite,  $\text{MnO}_2$ , containing 63 p.c. Mn and 37 p.c.  $\text{O}_2$ ; braunite,  $\text{Mn}_2\text{O}_3$ ; hausmannite,  $\text{Mn}_3\text{O}_4$ ; manganite,  $\text{Mn}_2\text{O}_3 \cdot \text{H}_2\text{O}$ ; psylomelane, similar to pyrolusite; rhodonite or manganese spar,  $\text{MnCO}_3$ ; wad or bog manganese in which it is associated with iron, cobalt, or copper and water; and manganese blende,  $\text{MnS}$ . The minerals are widely dispersed and Blumenbach at the beginning of the 19th cent. said that "most of the black, dendritic marks in various stones depend upon the presence of this substance." Various ores are used directly in their native conditions, in the preparation of glass, the colouring of pottery, tiles, and bricks, for bleaching, where their facility for yielding nascent oxygen is of value. High grade pyrolusites are used for the manufacture of dry batteries and also for the removal of sulphur from gases produced from coal. The chief sources of such high grade ores are in the U.S.S.R. and parts of the British Commonwealth—India, the Gold Coast, and S. Africa. The U.S.A. imports ores from Brazil, Cuba, and the Gold Coast.

#### Sedimentary Deposits

In sedimentary deposits manganese has been precipitated in beds or nodules invariably accompanied by iron compounds on lake-bottoms or on sea-floors—this process is taking place at the present time in the deep sea. The elevation of these deposits above water-level may give commercial deposits, especially if concentration by natural chemical or mechanical processes takes place. The sedimentary concentration of manganese in lakes may also be accomplished by the action of bacteria or algae, giving rise to bog-manganese deposits in e.g. Sweden, Spain, and the U.S.A. The extensive deposits of nikopol in the Ukraine and chiaturi in the Caucasus are examples of sedimentary ore-bodies formed by bacterial agencies which have been elevated and reconcentrated by natural processes.

The metamorphism of sedimentary or residual deposits may result in workable concentrations

of hausmannite, braunite, and franklinite, as at Franklin Furnace, U.S.A., and in Sweden.

#### Processes and Uses

The metal can be obtained by reduction of the dioxide by carbon in the electric arc furnace, when it contains varying amounts of carbon as an impurity. An alternative is to use the thermit process, reducing  $\text{Mn}_2\text{O}_4$  with aluminium, in much the same way as chromium can be produced. Metal of very high purity can be obtained by electrolysis of a solution of manganous chloride, using a mercury cathode. The amalgam formed with the mercury is collected and the mercury distilled off under vacuum at  $250^\circ \text{C}$ . The crude metal produced in the first case has a coarse, silvery, crystalline fracture tinged with yellow or red, but the electro-deposited metal is silvery-white. The pure metal is extremely hard and brittle: glass can be scratched with it. Although it can be obtained of a purity greater than 99.98 p.c., so far it has not been of use as a metal by itself, but it is used in many alloys. Alloys with copper and nickel are used for electrical resistances, while the high-tensile brasses or manganese bronzes (*q.v.*) are widely used in both cast and wrought forms, particularly where resistance to sea water corrosion is important. Manganese is used in aluminium alloys to improve their mechanical properties and in magnesium alloys to increase resistance to corrosion.

But the principal use of manganese is in the iron and steel industry. The pure metal is rarely added to ferrous materials; it is added either as ferro-manganese or as spiegel-eisen. Ferro-manganese is the crude pig metal, manufactured either in a blast or an electric arc furnace by a process similar to that used for the pure metal. It contains 65–85 p.c. of manganese. Spiegel is really a manganiferous cast iron; it contains 5–25 p.c. of manganese. Both these alloys contain 5–7 p.c. carbon; a special variety of spiegel, silico-spiegel, contains as much as 10 p.c. of silicon. The manganese alloy is added to the steel just before pouring. It acts primarily as a deoxidiser, removing any ferrous oxide, which would otherwise make the steel unworkable. It also converts the iron sulphide, which would form films round the individual steel grains, into manganese sulphide, which is globular and comparatively harmless. The oxidised man-

ganese forms a readily fusible slag, which can be removed from the top, but the excess alloys with the iron and improves the properties of the steel. Hence most carbon steels contain 0.5–0.7 p.c. of manganese, while as much as 1.5 p.c. is added to give the perlitic manganese steels, which are stronger and tougher than the plain carbon steels. The austenitic manganese steels, containing 12–15 p.c. of manganese, are very subject to work-hardening. They are therefore used for such machines as ball mills, jaw-crushers, and rly. points, where the surfaces are subject to abrasion and so become work-hardened continually during use. Manganese is also added to cast irons.

Various manganese salts are used in the chemical and dye industries, perhaps the best known being the red-purple potassium permanganate, used as a disinfectant. The element occurs in many mineral waters and plants, chiefly cereals and certain vegetables. See Cast Iron; Manganese Bronze; Steel; Metallurgy.

**Manganese Bronze.** Customary name for what is really a high tensile brass. The composition is similar to the normal 60/40 brass, but contains various alloying additions which vastly improve its mechanical properties. The alloying elements replace the zinc, having effects in accordance with Guillet's Equivalents (*q.v.*). Typical alloys might contain 2–4 p.c. of aluminium and manganese, and they would have a tensile strength of about 40 tons per sq. in. with an elongation of 15–25 p.c. They make excellent castings and forgings, and are used for marine propellers and rudders, where their resistance to sea water corrosion is of benefit, for gun mountings, car fittings, etc. See Brass; Bronze; Manganese.

**Manganin.** An alloy containing approx. 83 p.c. copper, 13 p.c. manganese, and 4 p.c. nickel. It is used in wire form for standard electrical resistances as it possesses a remarkably low temp. coefficient of resistance.

**Manganite.** An ore mineral of manganese, one of the hydrated manganese oxides ( $\text{Mn}_2\text{O}_3 \cdot \text{H}_2\text{O}$ ), occurring as bundles of black prismatic crystals or in stalactite form. It is found in veins associated with other manganese minerals and may change to pyrolusite (*q.v.*).

**Mangbetu** or **MONBUTU.** Negroid people, mostly in the upper Welle and lower Welle districts of Belgian Congo. Their Caucasoid

features—light-brown skin, occasionally greyish hair, curved nose—suggest racial contact with the Fula; their culture connects with the Bahima. The widespread physical type observed by Schweinfurth has dwindled, but the language is spoken by allied tribes who share with them the Zandé culture—cannibalism, throwing axes, ironworking—displayed by their neighbours, the Niam-Niam.

**Mange.** Name given to parasitic skin diseases of animals. There are two types of parasite giving rise to two different infections: sarcoptidae (scabies in man) and demodectidae (follicular).

Sarcoptic mange is caused by various members of the sarcoptic family affecting animals in different ways. These parasites affect man and all domestic animals including birds. They give rise to constant and often acute irritation of the skin, loss of hair, soreness and crustiness of the skin, and often loss of general condition. Sarcoptic mange is not infrequently transmitted from dog to man. Noticeable symptoms are seen within a month of infection. Psoroptic mange in sheep (sheep scab) and sarcoptic mange in horses are diseases which on discovery must be reported to the ministry of Agriculture and Fisheries. Treatment will take from three to eight weeks. Sulphur ointment and various watery and oily sulphur preparations are commonly used. Benzole benzoate and preparations of this product may give rise to toxic symptoms, especially in the cat.

Follicular mange is found on the skin of man, dog, ox, pig, and goat; rarely on that of the horse and other animals. The parasite is found in the hair follicles and sebaceous glands. It causes little irritation, but loss of hair is complete over the affected patches, which may cover the whole body

surface. In late stages the condition is seriously complicated by addition of a staphylococcal infection. Cure may take from three weeks to several months according to the resistance of the parasite. Some cases prove incurable. Treatment has usually been confined to sulphur ointment or some oily preparation containing sulphur. More recently crystal violet and brilliant green have been used with varying success. Penicillin and thiazamide will combat the secondary invasion of the staphylococcus.

**Mangin, CHARLES MARIE EMANUEL** (1866–1925). A French soldier. Born at Sarrebourg, July 6, 1866, he passed into St. Cyr in 1886. He was on active service in the Sudan, 1889–99, and took part in Marchand's expedition to Fashoda. He was in Tongking 1901–04. In 1910 he was a colonel on the W. African staff, and in 1913 was appointed brigadier-general, commanding the 8th infantry brigade.

In the first battle of the Marne, 1914, Mangin led the 5th infantry division. In 1916 he was fighting at Verdun, was made temporary general of division, then full general. During the Verdun operations he recaptured Douaumont and Vaux. Criticised for his conduct in the offensive of April, 1917, he was exonerated after a searching inquiry. Given the 10th army in 1918, he conducted on June 11 the counter-attack which arrested the German offensive on Compiègne; and from July 18 to Aug. 2 took a leading part in the counter-offensive which forced the Germans to retire on the Marne and the Aisne. On Aug. 20 he drove the enemy to the Oise and the Ailette. He was appointed grand cross of the legion of honour, and died May 12, 1925.

**Mango** (*Mangifera indica*). Evergreen tree of the family Anacardiaceae. A native of the East Indies, it attains a height of about 60 ft., and its leaves are oblong lance-shaped. The yellowish flowers streaked with orange form dense clusters, and are succeeded by bunches of kidney-shaped fruits, 3–6 ins. in length and nearly half as broad, with tough green skin and yellow pulp, enclosing a fibrous-coated seed. The fruit of the best cultivated kinds is very delicate. It is also used in the manufacture of chutney and preserves.

**Mangold (or Mangel) Wurzel** (Ger., beet-root). Cultivated variety of the sea beet (*Beta maritima*), principally used for feeding stock. Belonging to a different family (Chenopodiaceae) from turnip and swede, which are Cruciferae, mangolds require somewhat different cultural treatment, especially as regards manures. There are three leading types, the long red, the globe-shaped yellow, and the tankard, which is of intermediate shape. The crop takes longer to mature than turnip or swede, and has to be sown before them. Also, being deeper-rooted, it can thrive with less rain, and is more tolerant of heat. It is not eaten on the ground, nor will it stand the winter if left in the soil, and it is stored for winter and spring feeding.

The "seeds" are really fruits, from each of which two or three shoots may arise. Uniform drilling is secured by previously milling these fruits so as to set free the true seeds. Sowing takes place in April or May, at the rate of 6 to 8 lb. of seed per acre.

Mangold Wurzel. Leaves and root of the best used for feeding stock

The best crops are raised on deep clay loams, but good results can be obtained on a great range of soils. Heavy dressings of manure are required, as the crop is a gross feeder. Dung does not supply the necessary nitrogen, and has to be supplemented by some form of nitrogenous manure. Potassic manures are essential, and salt has a good effect, as might be expected when the origin of the mangold from a shore plant is remembered. The roots are pulled by hand before the frosts begin, usually in late Oct., the tops being either twisted or cut off. Pitting or clamping in the field is the usual method of storage. On good soils an average of from 40 to 60 tons per acre may be expected.

**Mangonel.** Medieval siege engine, also known as the trebuchet. Presumably a modification of cer-

Mango. Specimen of the East Indian tree in fruit

tain Roman engines, it was used to throw heavy stones or incendiary missiles over walls. It consisted of a heavy base carrying a vertical frame at the front end, fitted with a crossbar at the top. A beam was pivoted lower down the frame and carried a cup at the rear end, while it could be loaded either with a heavy counterweight or twisted cords in such a manner that there was a tendency to pull the beam into a vertical position. The end of the beam was held down against this action by a catch, and the missile placed in the cup. When the catch was released the beam sprang up, and when it struck the crossbar projected the missile upward and forward for a considerable distance. Engines embodying exactly this principle and of the same general construction were used in the earlier period of the First Great War for throwing grenades and heavier bombs, the motion being obtained by strong spiral springs in place of cords.

**Mangosteen** (*Garcinia mangostana*). Small evergreen tree of the family Guttiferae, native of

Mangosteen. Fruit of this East Indian tree

the Moluccas. It has elliptic, leathery leaves, and rose-like red flowers with waxy petals, succeeded by fruits the size of an orange with leathery, dark-purple rind, enclosing a white pulp which Burbridge describes as possessing "a flavour which is like the finest nectarine, but with a dash of strawberry and pineapple added." An infusion of the dried rind makes an astringent drink used in dysentery.

**Mangotsfield.** Urban district of Gloucestershire, England. It includes Downend, Mangotsfield, Soundwell, and Staple Hill. About 5 m. N.E. of Bristol, it has a rly. junction for the Midlands and the S. coast. The district was formerly a mining one, but now footwear, clothing, and chocolate provide industries. Gas, electricity, and water are supplied from Bristol.

The dist. votes in South Glos. At Downend W. G. Grace was born. Pop. approx. 16,000.

**Mangrove** (*Rhizophora*). Genus of trees of the family Rhizophoraceae. Natives of tropical coast swamps, they have thick, leathery leaves of elliptic form, and large flowers. The trunk sends out roots above the water-line, as well as below it, and these extend laterally for some distance before arching down into the mud. The branches also send down prop-like roots similar to those of the banyan. The fruits are inversely pear-shaped, and the seed germinates while the fruit is still hanging on the tree. The seedlings grow in this position until they have stems several feet in length, with roots at the lower end and a leaf bud at top, when they drop into the mud and continue their growth. The fruits of the common mangrove are edible, and their fermented juice provides a kind of wine. The bark is used for tanning and dyeing; also as a fever medicine.

**Mangrove**, WHITE (*Avicennia nitida*), or **COURIDA**. Small evergreen tree of the family Verbenaceae, native of S. America. It has opposite, narrow-oblong leaves, and inconspicuous flowers in terminal clusters. The trees grow in mudbanks along the coasts, their roots forming a network which holds the mud. Vertical branches arise from the roots to assist in the work, which has had the effect of converting thousands of square miles of muddy coast into firm land. For the story of the Courida's reclamation work, *consult* In the Guiana Forest, J. Rodway, 1894.

**Manhattan.** Island at the mouth of the Hudson river, U.S.A. It is  $12\frac{1}{2}$  m. long, with an extreme breadth of  $2\frac{1}{2}$  m., and forms the smallest of five boroughs which comprise New York city. Each bor. is also a co., Manhattan constituting New York co. It lies E. of the Hudson, and is bounded N. by the Harlem river and ship canal; 230th St.; and Marble Hill; E. and S.E. by Harlem and East rivers (in reality estuaries); and S. by Upper New York Bay. Battery Point is the S. extremity. Several

fine bridges give access to other parts of the city.

The most populous borough after Brooklyn, Manhattan includes the most noted features of the city, e.g. the famous skyline of the world's tallest buildings, Wall St. (financial centre), piers and docks of the largest ocean-going ships, New York civic centre, federal and state buildings, museums and art galleries, Fifth Avenue shops, Broadway (*q.v.*), with its theatres and night clubs, and the smartest and most expensive residential areas in the upper E. side streets, and along the upper East river. Pop. 1,899,924. *See* New York.

**Mani**, MANES, or MANICHAËUS (215-276). Persian religious reformer, whose real name is said to have been Cubricus. An ascetic from his youth, he formulated a system to supplant Zoroastrianism (*q.v.*), proclaimed himself a messenger of the true God, surrounded himself with apostles, found some favour at court, and went on missionary journeys. Forced into exile by the priests, he won the support of Hormisdas I, but in the reign of Bahram I, when the priestly party again came into power, he was seized and crucified, his body being flayed, stuffed with hay, and

nailed to the city gate that was later named after him. Of his numerous writings only fragments remain. *See* Manichaeism; *consult* Mani, G. Flügel, 1862; Mani, K. Kessler, 1889.

**Mania.** Disease of the mind characterised mainly by loss of control. The condition is often associated with periods of depression, and many alienists now prefer to speak of manic-depressive insanity rather than to regard mania by itself as a distinct form.

Maniacal attacks may also occur in other forms of insanity, e.g. epileptic insanity and general paralysis of the insane. The cause of manic-depressive insanity is not known, but hereditary influences play a part.

Acute and chronic forms of mania are recognized. Acute mania may come on gradually, or may begin suddenly after a period of restlessness or depression. Sleeplessness is often an early symptom. The

Mangrove. Trunk and roots of *Rhizophora mangle*

patient's ideas are disordered, his attention distracted, his judgement impaired, and his speech incoherent. He may display great loquacity, or be constantly shouting or singing, and may be obscene in his language. Delusions are frequent and often take the form of exalted beliefs. He may hear voices or sounds.

A maniac may be happy and cheerful at one moment, and at the next may be irritable and even violent. He may endeavour to destroy his clothing or articles of furniture, or attack those around him. He may be constantly in motion, waving his arms about and yelling. He is often filthy in his habits and indecent in his behaviour. Sleeplessness is common, and the patient may refuse all food. The general nutrition becomes impaired and muscular wasting occurs. Complete recovery may occur, but there is always the possibility of further attacks, and the condition may eventually become chronic. Ultimately the patient may become demented, physical exhaustion becomes marked, and the patient may die either from exhaustion or from an intercurrent disease such as pneumonia. Treatment in suitable cases is often an endeavour to restore by local electrical shock the function of the brain cells. Drugs are sometimes used to produce a similar effect. See Mental Disorder.

**Manicaland.** District partly in Rhodesia, and partly in Mozambique. The Manicaland goldfield has long been worked. The richest reefs are in the Penhalonga mountains; water supply is abundant, and some ore is obtained by quarrying. The dist. is 150 m. S.E. of Salisbury and 220 m. N.W. of Beira. See Africa; Umtali.

**Manichaeism.** Religious system of W. Asia, founded by Mani (q.v.) in the 3rd century A.D. Mystical and dualistic, and aiming at an explanation of the problem of human existence, it consisted of a fusion of Parsee metaphysics, Buddhistic morals, Babylonian mythology, and certain elements of Gnosticism and Christianity. The dualism was of the regions of light and darkness, mingled in the visible world. Salvation was regarded as attainable by knowledge of the true nature of the universe and the final separation of spirit (light) from matter (darkness). Manichaeism ruled out the O.T. Christ was regarded as a messenger of the light, but the apostles had misrepresented Him, and Mani was the promised Paraclete.

The followers of Manichaeism were divided into the Elect, bound, after the example of the founder, to an ascetic rule that forbade defilement by mouth, hand, and bosom; and the Hearers, from whom the mysteries were concealed. The Elect went direct to Paradise, the Hearers to a kind of Purgatory, the non-Manichaeans to Satan. There was an ecclesiastical system, and the simple worship included prayer, singing, fasting, and the observation of baptism and communion. One great festival, the Bema (pulpit), was observed on the anniversary of the death of the founder. Faustus, an African bishop (fl. 400) and the most eloquent of Manichaean teachers, placed morality before doctrine as a test of the true believer. The system spread to India, Turkistan, Syria, Palestine, and Egypt. Forms of it appeared among the Paulicians, Bogomiles, Cathari, and Albigenses.

**Manicure** (Lat. *manus*, hand; *cura*, care). Term applied to the care of the hands and finger nails. It is now an essential part of the toilet, and the services of a manicurist are provided for both men and women by most coiffeurs. Manicure can be carried out personally without elaborate apparatus. The hands are first soaked in a lather of good soap to which a little eau de Cologne or toilet vinegar has been added, together with lemon juice. They are thoroughly dried, and after cold cream has been rubbed into the base of the nails, the cuticle should be pushed back with an orange stick; metal must not be used. The nails should be trimmed with curved-bladed scissors, care being taken not to press the points too deeply below the free edge, otherwise the nail will develop bruises and white spots. When filing the nails to shape, an emery board should be used in preference to a metal file; the latter may bruise or scratch the nail. The nails are rubbed with a suitable powder and then polished with a chamois-leather buffer.

Application of varnish preserves the polish. This varnish may be colourless, but modern Western fashion has revived among women the ancient Egyptian custom of colouring the finger nails with various shades of red or pink varnish. In Eastern countries henna is used for tinting. In China long nails among men were once an indispensable sign of high rank, but their inconvenience led to disuse, though sometimes one nail is allowed to grow, protected

by a sheath. In Spain it is customary for both sexes in the leisured classes to allow the nail of the little finger of the right hand to grow long as a sign of freedom from manual labour. In most countries today women at least have fairly long pointed nails.

**Manifest.** Term used for a document that contains a description of the articles contained in the cargo of a ship, and particulars about their destination. Every vessel carrying goods must have a manifest, to be delivered to the Custom House officers at the port of destination. It is one of the ship's papers, which in time of war are usually inspected when a vessel is boarded either to search for contraband or for other purposes.

**Manifold.** Machine for producing a number of facsimile copies of a plan or document from a single original. Sometimes it is called a duplicating machine or mimeograph. The earliest type of manifold was the hektograph, introduced about the middle of the 19th century. Its operation is based on the principle of absorption; the original writing or drawing is done on a sheet of hard bond paper with a water-soluble ink, and the sheet placed in contact with a moist surface of gelatine composition; the writing is then absorbed from the paper and impressed in reverse on the gelatine surface. By placing a sheet of dry paper on the moist surface, the impression is transferred to the paper. This type of manifold is still used for the reproduction of large drawings and plans, up to 100 copies being obtained from a single impression.

For the reproduction of large numbers of copies stencil methods are now chiefly used. In the early stencil manifolds, the stencil was made on a sheet of wax-covered paper, which was written upon either with a stylus or with a typewriter from which the ribbon had been removed. Waxed paper has now been replaced by sheets of tough, flexible tissue. The stencil is fastened over a hollow, revolving cylinder partially covered by an inked pad. Each revolution of the cylinder brings the stencil in contact with the paper, and the ink, passing through the letters or outline of the drawing, makes the impression. In 1902 the automatic, electrically-driven rotary duplicator was patented by David Gestetner; this can reproduce 5,000 copies an hour.

Photocopying machines are used for the rapid reproduction of

titles, deeds, contracts, etc. The machine combines a camera with developing and fixing tanks. A roll of sensitised paper photographs the original and then automatically passes through the fixing and developing baths. As the photographs are made through a reversing prism, the lettering or drawing appears exactly as in the original. It is also possible to print two sides of a page simultaneously.

**Manifold.** River of Staffordshire, England. A tributary of the Dove, which it joins 3 m. N.W. of Ashbourne, it is noted for its sinks or swallets. Near Thors Cave it disappears and comes to the surface again in the grounds of Ilam Hall, flowing underground for a distance of 4 m.

**Manihot.** Genus of American shrubs and herbaceous plants of the family Euphorbiaceae. See Cassava; Tapioca.

**Manila.** City of the Philippine Islands. The capital and chief port of the group, it stands on the W. coast of Luzon Island at the entrance of the Pasig river into Manila Bay. The Pasig divides Manila into two portions, the old walled city lying to the S. and the modern suburbs to the N.

The former, reduced to rubble in 1945 (*v.i.*), was enclosed by a 16th century wall and contained the most important buildings. These included the 16th century cathedral, the archbishop's palace, the university, government buildings, convents, hospitals, colleges and schools, and the observatory.

The chief industries included cigars, cigarettes, tobacco, distilled and malt liquors, Manila hemp products, and textiles. There were also foundries, machine shops, boot and shoe and furniture factories, flour-mills, and ship- and boat-building yards. Although its industry was much damaged during the Japanese occupation, Manila exports hemp, copra, sugar, and tobacco, and imports cotton goods, rice, machinery, chemicals, and food stuffs. From the time of its acquisition by the U.S.A. to the Second Great War the city underwent a remarkable transformation. The harbour was greatly improved, electric lighting and tramway systems were provided, telephone services installed, and the drainage entirely remodelled. The water supply was

also improved by the adoption of gravity works, the water being carried about 24 m. to a large reservoir some 200 ft. above sea level.

Manila was founded by Spaniards in 1571, and about 20 years later was strongly fortified. It suffered at the hands of the Dutch at the beginning of the 17th century, and from 1762 to 1764 was in British occupation. The Filipinos began to manifest a feeling of discontent with Spanish rule in 1890, and from 1896 until the American declaration of war against Spain much skirmishing took place. The sinking of the Spanish fleet in Manila Bay was the signal for further action by the insurgents under the leadership of Aguinaldo, and on Aug. 13 the city was forced to capitulate to an American army. Friction then ensued between the Americans and the Filipinos, who attacked the city on Feb. 4, 1899, but were defeated.

During the Second Great War the U.S. authorities declared Manila an open city, Dec. 25, 1941, but Japanese bombers attacked it next day, destroying many buildings. MacArthur evacuated Manila and the Cavite naval base, the Japanese entering on Jan. 2, 1942. U.S. troops advancing from three sides entered Manila, Feb. 4, 1945. The part of the city on the N. bank of the Pasig was under U.S. control by the 6th, but the Japanese retired to Intramuros, the old Spanish walled city on the S. bank, blowing up the bridges behind them, and held out there until Feb. 24. Intramuros was reduced to rubble.

The town suffers from earthquakes. The first recorded shock

was in 1599, and that of 1862 was the most calamitous: it threw down the cathedral and nearly 600 buildings, many people being buried in the debris. The senate, treasury, and mint buildings were nearly destroyed by fire in 1920, and in April, 1921, a fire destroyed 3,000 houses in the native quarter. Pop. 684,800.

**Manila, UNIVERSITY OF.** Educational centre in the Philippines. Inaugurated in 1585, when Philip II of Spain gave authority for its inception, the university of Manila began when the college of S. Joseph for the aristocracy was opened by the Jesuits in 1601, and, ten years later, the college of S. Thomas was established by the Dominicans for poor Spaniards and natives. After 1619 degrees were granted by the colleges, which became the university in 1644, when a school of law was added. In 1730 the university was closed. The existing institution arose in 1857, and in 1871 medical and pharmaceutical schools were opened. Modelled on American lines, the university has faculties of canon and civil law, engineering, medicine, education, pharmacy, philosophy and arts, and theology. Although closed during the Japanese occupation, 1942-45, it was reopened soon after liberation.

**Manila Bay.** Large inlet of the China Sea in S.W. Luzon, Philippine Islands. Triangular in shape, it communicates with the sea by a passage 11 m. wide; N. of the passage the shore of the peninsula of Bataán is high and forested; the Cavite shore on the S.E. is low, while most of the Manila shore on the N.E. is occupied by the marshy

delta of the Pam-panga. The bay is deep, with good anchorages at Cavite and Manila, and is the finest harbour in the Far East. For accounts of the fighting in the Second Great War see under Bataán Peninsula; Manila; Luzon.

**Manila Bay, BATTLE OF.** Naval engagement in the Spanish-American War, May 1, 1898. War had been declared five days when Commodore Dewey, then at

Hong Kong, was ordered to attack the Spaniards in the Philippine Islands. Arriving on the night of April 30, he entered Manila Bay, attacked early the next morning, and destroyed the fleet of ten ill-equipped and almost immobile vessels under Admiral Montojo. See Spanish-American War.

**Manila Hemp** OR ABACA. Fibre obtained from *Musa textilis*, a plant of the banana family. The native name of the plant is Abaca. It is a native of the Philippine Islands, and is now grown in many tropical countries. The outer fibre is very strong and makes excellent ropes. The old ropes, unravelled and picked, are made into Manila paper. The fine inner fibres are worked into dress fabrics by the natives, and in Europe are manufactured into veils, handkerchiefs, and articles of clothing. These fine fabrics are known as grasscloth, though the plant is not a grass. As a binding medium for builders' plaster, Manila hemp is stronger than animal hair. See Hemp.

**Manila Tamarind** (*Pithecolobium dulce*). Large tree of the family Leguminosae. It is a native of Mexico, but is extensively grown for its fruit in the Philippines and India. The leaves are twice divided into small leaflets, and the clustered whitish flowers are tubular. Long cylindrical pods, curled at the top, contain glossy seeds embedded in sweet edible pulp.

Manila Tamarind. Flower sprays and foliage. Inset, left, flower; right, seed pod

**Manilius, GAIUS** (1st cent. B.C.). Roman tribune of the people. A strong supporter of Pompey, in 66 B.C. he brought forward a proposal that Pompey, who had already cleared the Mediterranean of pirates, should be entrusted with the supreme command in the war against Mithradates, with unlimited powers. The proposal was supported by Cicero.

Another Manilius whose praenomen is unknown, was the author of a Latin poem in five books, written in hexameters, entitled *Astronomica*. Nothing is known except that he lived during the reign of Augustus, as is evident from certain allusions. The poem, which deals with the influence of the stars on the life of man, is of an astrological character.

**Manin, DANIELE** (1804-57). Italian patriot. Born in Venice, May 13, 1804, of Jewish origin, he became a lawyer and associated with advanced revolutionary spirits. On the outbreak of the revolution of 1848 he was rescued by

the people from prison, and elected president of the Venetian republic. Upon the Austrians advancing against Venice in 1849, he inspired the populace to defend the city, and only after four months' siege did Venice fall on Aug. 24. Manin was one of 40 citizens excluded from the amnesty, and he retired to exile in Paris, where, crushed by poverty and domestic sorrow, he died Sept. 22, 1857.

**Man in the Iron Mask.** This celebrated mystery of 17th century France is discussed under Iron Mask.

**Manioc.** French name for *Manihot utilisissima*, cassava or tapioca (q.v.).

**Maniple** (Lat. *manipulus*, handful). In the Roman army, a subdivision of the legion. The 3,000 heavily armed legionaries were divided into 30 maniples, 20 of which consisted of 120, the remaining 10 of 60 men. The unit took its name from the handful or bundle of hay or straw twisted round a pole, which was adopted as its standard. See Legion.

**Maniple** (Lat. *manipulus*). Ecclesiastical vestment of the Western Church. Originally it was a narrow strip of linen shaped like a stole, and carried in the left hand of the celebrant. Now its ends are fastened together so that it can be worn securely on the left wrist. By degrees it was made of silk or velvet, and embellished with a fringe, needlework, and gold embroidery, and even

Maniple as worn in celebrations of the Mass

golden bells. It is represented in the Bayeux tapestry and on figures in the basilica of S. Ambrose at Milan. Abandoned by the English Church at the Reformation, its use has been revived. It is said to symbolise penance and sorrow. See Stole.

**Manipur.** A state of the Union of India. It comprises a narrow valley along the Lushai Hills, on the Burmese border. At the time of the Indian Mutiny, its raja, Chandra Kirti Singh, rendered service to the British. Ultimately a British resident was stationed at the capital, Manipur or Imphal, responsible to the chief commis-

sioner of Assam. In 1891 the raja was deposed by the hill tribes under the Senaputty, and the commissioner, J. W. Quinton—who with a small force attempted to arrest the Senaputty—together with the resident, F. St. Clair Grimwood, was killed. After the massacre Mrs. Grimwood made a plucky escape under fire. A punitive expedition was sent against the Manipuris, the Senaputty was hanged, other leaders of the mutiny were transported for life, and Chura Chund was declared raja, a British officer being appointed to administer the state until his majority. Area, 8,638 sq. m. Pop. 512,069, more than a third belonging to animistic hill tribes.

In March, 1944, Japanese forces crossed the Burma-India frontier and invaded Manipur, driving towards the Imphal plain. Heavy fighting took place towards the end of the month on the Manipur-Chin Hills front, British and Indian troops forming "box" positions and receiving supplies by air. Early in April a Japanese column cut the Imphal-Kohima road, isolating Kohima and also threatening the supply lines of Gen. Stilwell's force making the Ledo road. Kohima was relieved on April 22, and the Japanese advance was halted, though the enemy was not cleared from Kohima until May 14. By Aug. 25 the last Japanese troops had left the state. See Burma Campaign.

**Manis** (Lat. *manes*, ghost). Generic name of the scaled anteaters or pangolins. They are all natives of Asia and Africa, and are so called from their nocturnal habits. See Anteater; Pangolin.

**Manishtusu.** King of Akkad, N. Babylonia. Successor, either before or after Rimush, and perhaps son of Sargon I, he appears on statues as a bearded Semite, and on stelae as a vigorous conqueror. His famous obelisk found at Susa, 1897-98, is a diorite block 4½ ft. high, bearing 7,600 signs in Semitic cuneiform. See Naramsin.

**Manissa** OR **MANISA.** Town of Asiatic Turkey, the ancient Magnesia ad Sipylum. It lies about 20 m. N.E. of Izmir, with which it is connected by rly., and is the junction of a branch line N. to Panderma on the Sea of Marmara. An important centre of trade, it makes cotton goods. It was the seat of the Byzantine imperial government in the 13th cent., and Murad II two centuries later made it his place of retreat after abdication. Manissa gives its name to a vilayet with pop. 472,442.

**Manitch** OR **MANYCH.** Name of a depression or river-bed in the Azov-Black Sea area and the Kalmuck A.S.S.R., European Russia. It extends 425 m. from the Don to Lake Keke-Uzun 50 m. from the Caspian Sea. In spring, when the snow melts, the bed is filled with water, forming two rivers, flowing W. and E., the first into the Don. This depression, regarded by some as the boundary between Europe and Asia, is below sea level, and once connected the Black Sea with the Caspian.

**Manitoba.** Lake of Canada. In the prov. of Manitoba, it is 60 m. W. of Lake Winnipeg, with which it is connected by the Little Saskatchewan river, also called the Dauphin, and by Lake St. Martin. It receives through the Waterhen river the waters of Lake Winnipegosis. It abounds in fish, has a length of 122 m., a breadth of 25 m., an area of 1,820 sq. m., and is at an alt. of 810 ft. The lake was discovered by a French explorer, 1739.

**Manitoba.** Province of the dominion of Canada. Its area is 246,512 sq. m., of which 26,789 are

Manitoba arms

water. It lies between Ontario and Saskatchewan, with the U.S.A. on the S., while N. it reaches to the shores of Hudson Bay. It is watered by many rivers, one group falling into the three great lakes in the province—Winnipeg, Winnipegosis, and Manitoba. The chief rivers are the Red, which comes from the U.S.A., the Assiniboine from the W., and the Nelson, which carries the waters of Lake Winnipeg to the bay. The most easterly of the three prairie provinces, Manitoba is one great plain. Winnipeg is the capital and the largest city.

The affairs of the prov. are controlled by a legislative assembly of one house; its 58 members are chosen for a term not exceeding five years, women being voters and also eligible for membership. There is a cabinet responsible to the legislature, while a lieutenant-governor represents the crown. Provincial affairs include education and agriculture; other departments are finance, attorney-general's, health and welfare, labour, mines, municipal affairs, and public works. The province sends 17 members to the house of commons and six to the senate of the dominion parliament at Ottawa. For the town and rural districts

there is a system of local government with an elected council.

Although grain growing is of major importance, farmers also raise cattle, pigs, and sheep. Horses, once the main source of power, are being replaced by tractors and trucks. Much revenue is derived from dairying, poultry, and apiaries. Sugar beet, field peas, and sunflowers are successfully cultivated. The lakes and rivers provide excellent fishing. Copper, zinc, gold, and silver are mined. The province has 4,837 m. of rly. line, and the two transcontinental lines cross it, meeting at Winnipeg.

Manitoba developed from the Red River settlement. In the 18th century it was a region inhabited only by fur traders, but in the 19th regular colonisation began, Fort Rouge, where Winnipeg now stands, being the centre. The land was administered by the Hudson Bay Company until 1869, when it was bought by the new dominion. In 1870 the province of Manitoba was created, in 1881 it was enlarged, and in 1912 part of the North-West Territories was added. The pop., estimated in 1941 at 729,744, is mixed, but 84.8 p.c. were born in Canada or the U.K. See Canada; Red River Settlement. Consult Manitoba, its Development and Opportunities, F. H. Kitto, 1931.

Douglas L. Campbell

**Manitoba**, UNIVERSITY OF. Canadian university at Winnipeg. Founded in 1877 for the province of Manitoba, it was at first only an examining body. In 1900 it became a teaching body. Affiliated to it are six colleges: S. Boniface, S. John's, Manitoba, and Wesley, belonging respectively to the R.C., Anglican, Presbyterian, and Wesleyan denominations, the law

school at Winnipeg, and the agricultural college at St. Vital. The university buildings are in Winnipeg. The university has a library, laboratories, etc. In 1898 the government of the province made it a grant of 150,000 acres of land. Some 2,700 students take courses.

**Manitou**. In N. American Indian religion, the god or protecting spirit of a tribe or individual, always conceived as a totem or animal spirit. The term is also used of supernatural beings with a wider sway, such as Gitche Manitou, the Great Spirit, described in Longfellow's *Hiawatha*.

**Manitoulin**. Group of islands in Lake Huron. Except for Drummond, which belongs to the U.S.A., they are in the prov. of Ontario. The chief are Great Manitoulin, 90 m. long, Drummond, 24 m. long, and Little Manitoulin, or Cockburn, 7 m. long. They are visited in summer for fishing and pleasure. The inhabitants are largely Indians.

**Manitowoc**. City of Wisconsin, U.S.A., the co. seat of Manitowoc co. A port of entry on Lake Michigan at the mouth of the Manitowoc r., 75 m. N. of Milwaukee, it is

served by the Chicago and North-Western and other rlys., and by lake steamers. Manitowoc has a good harbour and docks, and an important trade in coal and limestone. Fishing, shipbuilding, canning, and other industries are carried on. A trading post was established here in 1795. Settled about 1835, it became a city in 1870. Pop. 24,404.

**Maniu**, JULIUS (b. 1873). Rumanian statesman. He was born Jan. 8, 1873, near Alba Julia, Transylvania. He was from 1906 to 1910 a member of the Hungarian parliament, and fought for autonomous rights of the Rumanian minority. After the First Great War he organized, Dec. 1, 1918, the incorporation of Transylvania with Rumania, was elected chairman of its National party in 1919, and, in 1926, merged it with the Rumanian Peasants' party in the National Zaranist party. Enthusiastically supported by the farming population in a fight against bribery and corruption, centralism, and bureaucracy, he was appointed premier in November, 1928, when he favoured the return of King Carol II, who had been forced into exile in 1926. Carol was reinstated in June, 1930. Forced by court intrigues to resign, and succeeded by his party colleague Mironescu, Maniu served again as prime minister for a few months during 1932-33. Soon Nazi Germany was pressing against Rumania and, by threats and the assassination of his colleagues, was trying to subdue Maniu. Yet he survived the Second Great War. Though Russian and Communist domination prevented his once more taking the helm, his National Peasant party was the strongest in opposition to the govt., which dissolved it, July, 1947, and brought Maniu to trial for conspiracy; he was sentenced in Nov. to solitary confinement for life.

**Manizales**. Town of Colombia, S. America, capital of the dept. of Caldas. It stands at an alt. of about 7,064 ft., at the junction of the transit routes over the Andes, 73 m. S. of Medellin and 100 m. N.W. of Bogotá. It has rly. connexion with Buenaventura on the Pacific coast. A prosperous trading centre, it exports gold, coffee, and cocoa. Pop. 86,027.

**Manjusri**. Buddhist personage, the so-called god of wisdom in China. Apparently a central Asian culture-hero, who introduced irrigation into Nepal, he was adopted into Mahayana Buddhism as a bodhisattva or Buddha elect. In

Manitoba. Map of the Canadian province situated between Ontario and Saskatchewan

silk paintings recovered by Stein in Chinese Turkistan he is depicted riding on a lion, and is sometimes represented with sword and book in hand. On the Wutai Mt., Shansi, 5th century temples are sacred to him; a 6th century stone image was found at Sarnath, near Benares; and bronze statuettes have come from Tibet and Java.

**Mankato.** City of Minnesota, U.S.A., the co. seat of Blue Earth co. At the junction of the Blue Earth and Minnesota rivers, 85 m. S.W. of St. Paul, it is served by the Chicago, Milwaukee and St. Paul, and Pacific and other rlys. Among the industries are the manufacture of foundry and machine-shop products, knitted goods, cement, bricks, flour, and shirts. It is situated in the midst of a farming and dairying region, near quarries of limestone and cement. Settled in 1853, Mankato became a city in 1868. Pop. 15,654.

**Manlius, MARCUS.** Ancient Roman hero. He received the surname of Capitolinus from the fact that in 390 B.C. he frustrated an attempt of the Gauls to take the Capitol, the only part of Rome not in their possession. The cackling of the sacred geese in the temple of Juno warned Manlius and his garrison that the Gauls were endeavouring to climb the rocks upon which the Capitol stood. Champion of the plebeians, the hostile patricians charged him with high treason, and secured his condemnation, whereupon he was thrown from the Tarpeian Rock.

**Manly.** Suburb of Sydney, New South Wales, Australia. It is beautifully situated on a peninsula forming the northern boundary of Sydney Harbour, 7 m. N. of Sydney, with which it is connected by ferry. Manly Beach, at the neck of the peninsula, is noted for its surf bathing. See Sydney.

**Mann, HEINRICH LUDWIG** (1871-1950). German novelist. Brother of Thomas Mann (q.v.), he

was born Mar. 27, 1871, at Lübeck. In 1933 he emigrated, eventually settling at Beverly Hills, California, where he died Mar. 12, 1950. His novels, usually containing biting, satirical criticism of

Heinrich Mann,  
German novelist

German petty-bourgeois servility, often contrasted with Renaissance figures and life enjoyment, while

very successful, were often subject of bitter controversy. The best known were Professor Unrat, 1905 (filmed, 1930, as *The Blue Angel*); and the trilogy *Die Goettersagen*, 1903; a drama of the French Revolution, *Madame Legros*, 1916, was also a considerable success.

**Mann, MARY ELIZABETH** (1848-1929). British novelist. Born at Norwich, Aug. 14, 1848, she began writing fiction after her marriage to Fairman Joseph Mann. She gained wide popularity with *The Patten Experiment*, 1899, and came to be known as a writer of well-characterised novels and short stories, being particularly successful in her presentation of the social atmosphere of East Anglia. She died July 14, 1929.

**Mann, THOMAS** (b. 1875). German writer, born at Lubeck, June 6, 1875. In 1933 he emigrated to the

Thomas Mann,  
German writer

U.S.A. Mann was one of the greatest figures in German literary life, and was accepted as a great writer when he settled in the U.S.A. During the Nazi ascendancy he wrote and made many broadcasts against Hitler. His novels and essays were successful when he was still a schoolboy; *Buddenbrooks*, 1901, a novel of patrician life in his Hanseatic home town, was a best-seller. Other noteworthy books were *Royal Highness*, 1909; *Death at Venice*, 1913; *The Magic Mountain*, 1924; the trilogy, *Joseph the Provider*, 1930-34; *Lotte in Weimar*, 1940. He also wrote many essays on historical, literary, and political themes. In 1929 Mann was awarded the Nobel prize for literature. An American citizen, he refused to reside in Germany after the Second Great War, but occasionally revisited Europe, affirming his belief in democracy and international cooperation. His daughter Erica married W. H. Auden.

**Mann, TOM** (1856-1941). British Labour leader. Born at Foleshill, Warwickshire, April 18, 1856, he began work on a farm at the age of 7, and in a coal-mine three years later, before becoming an engineer. He joined the Socialist movement in 1885, and was a leading figure in trade union circles, taking a prominent part in the 1889 dock strike. He became secretary of the Independent

Tom Mann,  
British politician

but never achieved election to parliament. He was several times imprisoned, and his views became increasingly extreme; in 1935 he was acquitted at Glamorgan on a charge of sedition. He published many works on socialist themes, and his memoirs appeared in 1923. He died March 13, 1941.

**Manna.** Edible coagulated saccharine juice which exudes from various trees or shrubs, including

the manna ash, and species of tamarisk, oak, larch, eucalyptus, etc. Another source of manna is *Alhagi maurorum*, a shrub of the family Leguminosae, native of W. Africa and S. Asia. It has oblong, undivided leaves and purple, pealike flowers in sprays. The food of the Israelites in the desert, described in Ex. 16, etc., is supposed to have been the exudation from this shrub, or more probably *Tamarix mannifera*.

**Manna Ash** (*Fraxinus ornus*). Tree of the family Olceaceae, native of S. Europe. It has opposite, toothed, lance-shaped leaflets, and small, greenish-white flowers in large clusters. It is largely grown

Manna. Flower spray  
of *Alhagi maurorum*

Manna Ash. Spray of leaves and  
flowers. Inset, single flower

in plantations in S. Italy for the production of commercial manna, used medicinally as a mild laxative. It is obtained by making incisions in the stem; the saccharine sap flows, and dries in flakes. The manna is light, porous, yellow in colour, and a valuable food.

**Mannerheim**, GUSTAVUS CHARLES, BARON (b. 1869). Finnish soldier and politician. The son of Count

G. C. Mannerheim, Finnish soldier and politician

Charles Mannerheim, he was born at Hilnes, in the co. of Åbo, Finland, and educated in the Finnish Cadet Corps at Fredrikshamn and in the Officers'

Cavalry School, St. Petersburg. He entered the Russian army and served in Manchuria, 1904-05, afterwards commanding a regiment of dragoons in Poland, and became A.D.C. to Nicholas II. During the First Great War he was in command of the Guards' brigade, and was a general at the head of a cavalry corps in 1917, when the Russian revolution broke out. He returned to Finland and raised the White Guards, which, with German assistance, defeated the Red Guards after much fighting. In 1918 the Finns formed a coalition government, and in Nov. elected him regent of Finland, but he was defeated at the presidential election held in July, 1919.

He reorganized the Finnish army and planned the Mannerheim line of fortifications across Karelia. This system of concrete forts, gun positions, machine gun posts and trenches stretched from the Gulf of Finland to Lake Ladoga, being based on the water system of the Vuoksi river. It was extended from Taipale to Sortavala, to cover the greater part of the western and northern shores of Lake Ladoga.

Promoted field-marshal in 1933, he led the Finnish army in the first war with Russia, 1939-40, and was again in command in the second war, 1941-44. When, in 1944, it became obvious that Finland was losing the war Mannerheim was made president on Aug. 1, and conducted the armistice negotiations with Russia. He resigned in March, 1946. See Finland: Russo-Finnish War.

**Manners**, CHARLES (1857-1935). A British singer. Born Southcote Mansergh, in London, Dec. 27,

1857, he became a bass singer after studying in Italy. He sang in Gilbert and Sullivan operas, with the Carl Rosa company, and under Augustus Harris at Covent Garden. Also a well-known choral singer, he had greatly furthered the promotion of opera in England when he died May 3, 1935. Manners married in 1900 Fanny Moody (1866-1945) who, born at Redruth, Cornwall, Nov. 23, 1866, made her début at Liverpool with the Carl Rosa in 1887. A soprano of great brilliance, she was prima donna at Covent Garden for four years. The Moody Manners opera company was founded 1897. She died July 21, 1945.

**Mannheim**. City of W. Germany. It is in Württemberg-Baden, at the confluence of the Rhine and the Neckar, and forms, together with Ludwigshafen (*q.v.*) on the W. bank of the Rhine, one of Germany's most important industrial centres and inland ports. It is

Mannheim arms

linked with this neighbouring palatinate city by two bridges—destroyed during the Second Great War, but later repaired. Mannheim, as an unimportant village, was known in 764; as a town, however, it was established in 1606 by the palatinate elector Frederick IV, and at first populated mainly by Huguenot and Dutch refugees. It was built strictly according to a plan and is therefore covered with a rectangular network of streets. Until heavily damaged by bombs, 1943-45, it contained many remnants of its 18th century rôle as electoral residency, containing a town hall, a Jesuit church, an armoury, an observatory, and a huge baroque palace with art and other galleries. Its main modern features were its industrial and commercial enterprises and the activity of its port, which dealt with more than 10,000 vessels and more than 5 million tons of goods annually. It was the home of the Daimler-Benz motor works, the leading German woodpulp and paper factories, and some of the most important chemical, rubber, wood, textile, cigar, and food industrial plants. There was also an active trade in coal, iron, and timber, though the heavy industries were mainly located outside the city. Mannheim possesses an academy of economics and law, a musical high school and many other edu-

cational establishments; it had three theatres, one of which, the National Theatre, saw the first performances of several of Schiller's plays during 1782-84. The city transferred from the jurisdiction of Bavaria to that of Baden in 1802. Mannheim was attacked by the R.F.C. during the First Great War, the raid on Christmas Eve, 1917, when one ton of bombs was dropped, being considered especially noteworthy. It was also a frequent target for Allied air forces during the Second Great War, being methodically reduced, mainly in five heavy attacks in the autumn of 1943, when many industrial targets were destroyed or heavily damaged. In 1945, owing to its position as German centre of communications on the Western front, it sustained four more heavy attacks. The city surrendered to the U.S. 7th army on Mar. 29, 1945, and became part of the U.S. occupied Württemberg-Baden state, separated from Ludwigshafen, which was in the French zone. Pop. before the Second Great War was 275,162.

**Mannheim**, KARL (1893-1947). Hungarian sociologist. Born at Budapest, March 27, 1893, and educated at the universities of Budapest, Berlin, Paris, and Heidelberg, he came to London in 1933 after he had been removed by the Nazis from the chair of sociology at Frankfurt university. He became lecturer in sociology at the London school of economics, being attached to the staff of the institute of education in 1941, and appointed to the chair of education at the institute in Dec., 1945. He made the study of education a lifelong interest, and it was to education that he turned for a solution of social and cultural problems. He died in London, Jan. 9, 1947. His many works include *Ideology and Utopia*, *Man and Society in an Age of Reconstruction*, and *Diagnosis of Our Time*.

**Mannheim**, LUCIE (b. 1905). German-born British actress. Born April 30, 1905, she studied for the stage in Berlin, and after appearing in Hanover, played in Shakespeare, Ibsen, and Chekhov at well-known Berlin theatres, 1924-34. She first appeared on the London stage in 1935, scoring an immediate success in *Nina*. One of her most noteworthy parts was that of *Nora* in *A Doll's House*, 1939. She married the actor Marius Goring.

**Manning**, HENRY EDWARD (1808-92). English cardinal. Born at Totteridge, July 15, 1808, he

was the son of a London banker and M.P. He was educated at Harrow and Balliol, Oxford. In 1832 he was made fellow of Merton, Oxford, and having been ordained was in 1834 given the rectory of Lavington, Sussex, being then an adherent of the Oxford movement. Having gained considerable note as a preacher, he was made in 1840 archdeacon of Chichester. He had married in 1833 Caroline Sargent (d. 1837), thus becoming related to Samuel Wilberforce. In 1838 he visited Rome in Gladstone's company and there met Cardinal Wiseman.

*Henry E. Cardinal Manning*

Manning went over to the Church of Rome in 1851 and after a short period of retirement was ordained. In 1857 he founded the London congregation of the Oblates of S. Charles at Bayswater, and became its superior, acting also as assistant to Wiseman. On the latter's death in 1865 he became archbishop of Westminster. He was made a cardinal in 1875. Active to the last, he died Jan. 14, 1892. He is buried under the high altar in Westminster cathedral.

Manning was a man of ascetic life, and an untiring worker. He was a supporter of the temperance movement, and had a real sympathy with the labouring classes, evidenced by his share in settling the dock strike in 1889, and by his presence on the royal commission on housing. On the other hand he was intolerant, while he showed a certain lack of scruple in seeking his ends and in securing advantages for his Church. Towards the papacy he adopted a strong ultra-montane attitude, in contrast to the Gallican position of most of the R.C. families in England. But the outstanding fact of his life is the enhanced position which his labours and personality secured for the R.C. Church in England. He figures in Beaconsfield's *Lothair* as Cardinal Grandison. He wrote *The Temporal Mission of the Holy Ghost*, 1865; *The Eternal Priesthood*, 1883. *Consult Lives*, A. W. Hutton, 1892; F. A. Gasquet, 1895; Shane Leslie, 1921.

**Mannings, THE.** Husband and wife, executed for the murder of

Patrick O'Connor, on Aug. 9, 1849. O'Connor was a former lover of the wife, Maria Manning, and the relationship was continued after the marriage, and condoned by Manning. The pair plotted finally to obtain O'Connor's money, and the story of their cold-blooded conspiracy has become a classic in criminal literature. They invited O'Connor to a dinner of roast goose, killed him on his arrival in the house, flung his body into the already prepared grave under the flags of the kitchen floor, and then ate a hearty meal while discussing their next steps. Mrs. Manning went to the lodgings of her victim and ransacked them for valuables, while her husband covered the dead man with lime. The two were tracked down through a friend of O'Connor's knowing of his intrigue with Maria Manning, and were hanged at Horsemonger Lane Gaol, Nov. 13, 1849, the woman in a black satin dress. The execution was witnessed by Dickens, who wrote a remarkable and moving letter to *The Times* on the horrors of public executions.

**Manningtree.** Market town of Essex, England. It stands on the estuary of the Stour, 8 m. N.E. of Colchester, and is a rly. junction. There is a trade in wheat and malt, while malting is the chief industry. The principal buildings are the church of S. Michael and the public hall. The town is a good centre for the Constable country in Suffolk, East Bergholt, where the artist was born, being 3 m. away. Pop. 790.

**Mannite** or **MANNITOL.** Sweet substance discovered by Proust in 1806, prepared from manna, the dried exudation from various species of the ash tree. Mannite occurs also in other vegetable substances, e.g. celery roots and larch sap, and is also formed in the lactic and viscous fermentation of sugar.

**Mannock, EDWARD** (d. 1918). British airman. During the First Great War he joined the air force from the Royal Engineers, being awarded the M.C. and bar, and the D.S.O. and two bars. He was brought down in flames over the German lines and killed, July 26, 1918, by which date he had accounted for 50 German aeroplanes. A major, he was posthumously awarded the V.C.

**Manns, SIR AUGUST FREDERICK** (1825-1907). Anglo-German conductor. Born at Stolzenberg, near Stettin, March 12, 1825, he learned to play several instruments as a boy. At Elbing he was in the town orchestra, and later

belonged to a regimental band at Danzig; he conducted the music at Kroll's Garden, Berlin, and was bandmaster at Cologne and Königsberg. In 1854 Manns settled in London as assistant conductor at the Crystal Palace, becoming conductor in 1855. He raised the music there to a high pitch of excellence, and by his generous encouragement of British composers exercised a powerful influence on musical progress in England. During 1883-1900 he officiated at the Handel Festivals. Having become a naturalised British subject, Manns was knighted in 1903. He died March 1, 1907.

**Manny, SIR WALTER DE** (d. 1372). English soldier. Born in Hainault, he was originally named Mauny, and his father had been a soldier in the English service. He came to England in the train of Philippa of Hainault, wife of Edward III, in 1327, and soon made a reputation as a fighter. He served with distinction in Edward's French wars; in 1337 he led a raid on the island of Cadzand and was in command of other expeditions. He was made a baron in 1347 and K.G. in 1359. Manny helped to found the Charterhouse. His wife, Margaret, a granddaughter of Edward I, was made duchess of Norfolk.

**Manning, ROBERT** (c. 1264-c. 1340). An English chronicler. Known also as Robert of Brunne, now Bourne in Lincolnshire, he became a monk and spent most of his life in monasteries in that county. His principal work is the poem *Handling Synne*, a free translation of the *Manuel des Pechiez* of William of Waddington, which was a valuable and quaint commentary on early English life. He also wrote *The Story of Inglande*, which traces the descent of a king of Britain to Aeneas, describes the Trojan War, and includes a close version of Wace's *Brut d'Angleterre*. This work had great effect upon the language in its rejection of Teutonic and adoption of French words.

**Manod.** Quarry, near Blaenau Festiniog, Merioneth, Wales. During the Second Great War the extensive workings of this quarry were fitted with air-conditioned brick chambers, in which were housed the pictures removed for safety from the National Gallery.

**Manoel.** Name of two kings of Portugal. Manoel I, king from 1495 to 1521, is known as the Fortunate. He sent out Vasco da Gama and other explorers, and did much for literature and art.

Manoel II (1889–1932) was born in Lisbon, Nov. 15, 1889, the second son of King Carlos I. He was made duke of Beja, and succeeded to the throne Feb. 1, 1908, on the murder of his father and elder brother. In Oct., 1910, when the republic was established, he took refuge in England, staying first with his mother's brother, the duke of Orleans, at Wood Norton, near Evesham, Worcestershire, and later settling at Twickenham. There he devoted himself to a life of culture, and made a reputation as a musician, a bibliophile—he was the leading private collector of works of the Portuguese renaissance—a historian, and a patron of athletics and the arts. In 1913 he married Princess Augusta Victoria of Hohenzollern-Sigmaringen. There were several abortive attempts to restore him to the throne. For political reasons his offer to serve in the British army in the First Great War could not be accepted. He died July 2, 1932, leaving no children.

**Manoeuvres.** Large-scale exercises carried out by the fighting forces to train leaders and test methods of war. Military manoeuvres were introduced by Frederick the Great in the Prussian army in 1753 and adopted by most other Continental countries after the Napoleonic wars; after 1870 they were everywhere greatly influenced by German practice. The available force was generally divided into two parts, and directed to engage in operations in accordance with a given plan. Manoeuvres were held at the end of the year's military training, after the harvest, to avoid damage to crops. They were introduced in England in 1898.

Naval manoeuvres are exercises carried out at sea on similar lines. First introduced in the British navy in 1885, they were generally held every summer. Air manoeuvres were held after the establishment of the air force as a separate arm. The term manoeuvres has now been officially discarded in favour of fleet exercises, combined exercises, etc.

A vital principle of manoeuvres is that the intended war-time leaders should be engaged in them, so as to learn the capacity of the forces they will command in the event of war. The weakness of peace-time manoeuvres lies in the necessity of avoiding damage and casualties. Although valuable lessons can be learned, given sufficiently high quality in the directing staff, it is notable that

the conclusions drawn have been as often wrong as right, and as often disregarded as not. In 1913, for instance, two fleets representing in strength approximately the British and the German met in an exercise; after an indecisive engagement the weaker fleet succeeded in getting away. Had the proper deductions been made, the German fleet might not have escaped after the battle of Jutland (*q.v.*). On land, again, the Allies in 1940 were at fault over the value of such systems as the Maginot line, and over the relative effectiveness of armour and armour-piercing weapons; problems which the Germans had solved correctly by using the Spanish civil war as a testing-ground. The Germans had used a proportion of live ammunition in manoeuvres, both in small arms and artillery, before the Second Great War; and its use was adopted by the British in some of their large-scale exercises between 1941 and 1944. The death-rolls and material damage arising would of course be out of question in peace-time; but the lessons were powerfully brought home.

Manoeuvres in war are the tactical or strategical moves by which an enemy is attacked, or his attack countered. To render a manoeuvre successful, a commander requires a combination of surprise and of local superiority over the enemy.

**Man-of-War Bird.** Popular name for the frigate bird (*q.v.*), and also given to the albatross.

**Manometer** (Gr. *manos*, rare; *metron*, measure). Instrument for measuring the pressure or density of a gas. The simplest form of manometer is the barometer, which measures atmospheric pressures. The ordinary form of the instrument depends for its principles of working on the elasticity of gases, and consists usually of a U-shaped tube closed at one end, with mercury in the bend of the U, and air

in the closed limb. In the figure the open end O is connected with the vessel containing the gas the pressure of which is to be measured. If the pressure is greater than that of the atmosphere, the mercury is forced up the closed end of the tube, and by means of a graduated scale the pressure exerted by the gas is known. Another form of manometer is typified in the steam gauge. Here a piston is moved by the pressure of the steam and operates an indicator controlled by a spring, so that the steam pressure may be read.

**Manon.** Heroine of Manon Lescaut, romance by Abbé Prévost. Three operas have been founded on her story: by Auber, to a libretto by Scribe, first produced Paris, 1856; by Massenet, to a libretto by Meilhac and Gille, first produced Paris, 1884, and by the Carl Rosa co., Liverpool, 1885; and by Puccini (Manon Lescaut) to an anonymous libretto, first produced Turin, 1893, and Covent Garden, 1894.

**Manor.** Name given in England from the 11th century to an estate of a certain kind. The system was also found in France, Germany, and other parts of Europe where feudalism prevailed, and something akin to it elsewhere. The origin of the manor has given rise to discussion. A Roman parentage has been claimed for it, but others think it originated in the free village community of the Teutons. F. W. Maitland has put forward the theory that the manor was primarily a house or estate which was assessed separately for the geld, or taxes, of Norman times. This, he thinks, explains not only the variations in the size of the manors, but solves other difficulties. Others, however, think this explanation too narrow, and describe a manor as "a complex of rights over lands and tenements."

As revealed in Domesday Book and later authorities, the manors in England varied very much in size and in other ways, but certain features appear to have been common to all. Each had a lord and tenants called villeins, who owed him certain duties, and on each the land was divided into the demesne, or holding of the lord, the arable and meadow in which the villeins had also a share, and certain woods and commons. The arable was divided into strips, each tenant having an equal number. The villeins paid certain dues to the lord, and, moreover, were bound to work for him for a certain number of days in the week or

Manor House at West Hoathly, Sussex. An example of the Tudor manor house of the late 16th century  
By courtesy of Country Life, Ltd.

year. In addition to the villeins there were on many manors a poorer class of tenants called cot-  
ters, or bondars. All were in a  
sense unfree, but the villeins had  
certain rights in their holdings  
which were recognized by the law.  
Other classes of tenants appear in  
various parts of England, especially  
socmen, probably freemen who  
held land on condition of service  
to the lord of the manor.

A feature of the manor was the  
manorial courts. These exercised  
a little criminal jurisdiction, but  
they were mainly occupied with  
civil business concerned with the  
manorial holdings, and from the  
records which they kept comes the  
term copyhold. The chief officials  
of the manor were the steward, who  
presided over the courts, the bailiff,  
who managed the lord's own prop-  
erty, and the reeve, chosen by the  
tenants to look after their interests.

Before the end of the Middle  
Ages the system began to decay.  
The villeins were attracted to  
towns, wherein residence for a year  
and a day made them freemen.  
Courts, copyholds, and other ves-  
tiges of the system survived into  
the 20th century, but the Law of  
Property Act, 1922, provided for  
their extinction. See Copyhold;  
Feudalism; Villeinage; consult  
Domesday Book and Beyond, F.  
W. Maitland, 1897; Growth of  
the Manor, P. Vinogradoff, 1905.

**Manor House.** In feudal times,  
the residence of the lord of the  
manor and his retinue. The hall  
was the most important chamber,  
and in addition to this were the  
solar, i.e. the lord's private cham-  
ber, the kitchen, servery or general  
service room, larder, and buttery.  
During the 13th century windows  
began to be glazed. The hall con-  
tinued for some centuries to be the  
principal apartment; but the solar  
was enlarged and used as a "with-

drawing room" (hence drawing-  
room), bedrooms  
and sitting-rooms  
were added, and  
the family living-  
rooms were separ-  
ated from the ser-  
vants' quarters  
and offices.

The plan con-  
sisted of a hall,  
with family apart-  
ments on one side,  
and offices at the  
other; or the  
rooms were group-  
ed round a court.  
Larger manor  
houses of the late

16th century are generally tri-  
lateral in plan. The hall became  
less important as retinues grew  
smaller. Towards the end of the  
16th century, a separate dining-  
room for the family became usual.  
After Elizabeth's reign the manor  
house loses its distinctive archi-  
tectural character.

**Manor Park.** Parish and resi-  
dential district of Greater London,  
in the co. of Essex, England. Lying  
between Forest Gate and Ilford,  
with a rly. station, the eccles.  
parish was formed from that of  
Little Ilford in 1901. The church  
of S. Barnabas was consecrated in  
1900. Here are Manor Park and  
the City of London cemeteries. The  
name of Manor Park is given also  
to districts of Lee, S.E., and else-  
where.

**Man Power.** Term used to de-  
note the proportion of a nation's  
adult population  
available for the  
production of indus-  
trial wealth in peace-  
time, or for service  
in the armed forces  
and supporting in-  
dustries in time of  
war. Man power is  
one source of nation-

al wealth, greater in the case of an  
industrialised nation. Thus, the  
man power of Great Britain's pop.  
of less than 50,000,000 is a source  
of greater national wealth than  
that of the sub-continent of India,  
which exceeds 400,000,000. Simi-  
larly, a highly industrialised coun-  
try like the U.S.A. is richer in the  
man power available from its pop.  
of 130,000,000 than is the U.S.S.R.  
with a pop. of 193,000,000.

In time of war the allocation of  
man power in such proportion that  
the maximum numbers can be  
drafted into the fighting services,  
while ensuring that sufficient  
workers are retained in industry to  
supply the fighting services, is one  
of the most difficult administrative  
problems. In the Second Great  
War the democracies were obliged  
to follow the example of the dic-  
tatorships and direct the adult  
population to the services or in-  
dustries in which their labour  
could best be employed. In the  
U.K., by the Emergency Powers  
(Defence) Act of May, 1940, the  
ministry of Labour was given  
authority to mobilise man power  
and direct it into the channels most  
likely to increase the efficiency of  
the war effort. At one time a  
nation's strength in man power  
was judged by the number of  
troops it was able to put in the  
field, but in modern warfare only a  
comparatively small proportion of  
the population is available for the  
fighting services. Between the  
years 1939 and 1945 only 4,542,000  
men and women were available for  
the fighting services out of a pop.  
of 50,000,000; all other adults  
capable of working were required  
to supply civil and warlike needs.

After the Second Great War,  
Great Britain's lack of dollar ex-  
change demanded the maximum  
export of manufactured goods in  
order to gain exchange for the im-  
port of food and raw materials.  
Hence, in 1947-50 the govt. again  
took powers to direct man power,  
this time into industries making  
goods for export, thus preventing  
shortage of man power in many  
industries, especially coalmining  
and textile production.

**Manresa** (anc. Munorisa). Town  
of Spain, in the prov. of Barcelona.  
It stands on the river Cardener,  
spanned by Roman and modern  
bridges, 40 m. by rly. N.N.W. of  
Barcelona. It has a beautiful  
Gothic church, a church built over  
the grotto associated with Loyola's  
visions, and a Dominican monas-  
tery. A busy rly. junction, it manu-  
factures cotton, woollen, and  
silken goods, chemicals, etc. Pop.

Manresa, Spain. Main entrance of  
the cathedral of Our Lady of Dawn

30,465. During the Spanish Civil War, Manresa was captured by the Nationalist forces of Gen. Franco, Jan. 23, 1939, during their advance on Barcelona.

**Manrique, JORGE** (1440-78). Spanish lyrical writer. Son of the count de Paredes, he was a member of a family of poets and soldiers. His Coplas (Couplets) brought him fame and were translated by Longfellow.

**Mansard.** Type of roof named after François Mansart (*v.i.*). It consists of four planes hinging on and externally inclined to each other

at an angle wide enough to provide ample room space within its limits, and generally fitted with dormer windows. Structurally inadequate in its simplest forms, it has to be strengthened by tie beams. It was abundantly employed in French neo-classic architecture of the 17th century, and has since been used for large buildings in England and Germany where space and external artistic effect are important. The roof may be trussed or untrussed.

**Mansart** or **MANSARD, FRANÇOIS** (1598-1666). French architect. Born in Paris, he was commissioned by the duke of Orleans in 1635 to design the rebuilding of the château at Blois, and in 1642 undertook the famous Maison (now Maison-Laffitte) for René de Longueuil. His greatest work was the monastery of Val de Grâce, Paris, (1648), in the execution of which he was superseded by Richelieu's favourite, Lemercier.

**Mansart, JULES HARDOUIN** (1646-1708). French architect. Born in Paris, nephew and pupil of François Mansart, he became, in 1675, the principal architect of Louis XIV, his most important work being the palace of Versailles (1678-1708). His other buildings included the château of Clagny for Mme. de Montespan (1676), the dome of the Invalides (1693), the château of Marly (1683), the façade of the town hall at Lyons, and the Place Louis-le-Grand, Paris. He was made a count, and died suddenly at Marly.

**Mansbridge, ALBERT** (b. 1876). British educationist. Born at Gloucester, Jan. 10, 1876, he was educated at elementary schools and Battersea grammar school. Founder of the Workers' Educational Association in England, 1903, he was a member of government committees on education, including the consultative committee of the board of Education, 1906-12 and 1924-39. He was expert adviser to the British and Australian army education services, 1918-1919, and lecturer on the Lowell foundation, Boston, U.S.A., 1922 and 1934. He was created C.H., 1931. His published works include *An Adventure in Working Class Education*, 1920; *Talbot and Gore*, 1935; *The Trodden Road*, 1940; *The Kingdom of the Mind*, 1944.

**Manse** (medieval Lat. *mansa*, dwelling). General name for the dwelling-house of a Scottish minister. Originally the house of a landowner with the land attached, the term was later restricted to the house and land attached to churches of the established church of Scotland. The duty of providing and maintaining the manse in repair rests upon the landed proprietors of the parish, though if they can get it declared a free manse the incumbent must do the repairs after the first 15 years. The term is also occasionally applied to the dwelling-house of a minister of any Free Church in England and the U.S.A., more particularly if it is the property of the church.

**Mansel, HENRY LONGUEVILLE** (1820-71). British philosopher and divine. Born at Cosgrove, Northamptonshire, Oct. 6, 1820, he was educated at the Merchant Taylors' School, London, and S. John's College, Oxford. He became fellow and tutor of S. John's in 1843, but was transferred in 1855 to Magdalen as reader in philosophy. In 1859 he was made Waynflete professor of philosophy, and in 1867 professor of ecclesiastical history. From 1868 until his death, July 30, 1871, he was dean of S. Paul's. In his philosophical writings Mansel was in the main a supporter of Sir W. Hamilton, but he was also influenced by the older

Scottish school and by Kant. He adopted the theory of the relativity of knowledge; external perception provides us with appearances only. He was hostile to the idealism of Hegel, then making way at Oxford. His works include *Prolegomena Logica*, 1851; *Metaphysics*, 1860; and *The Gnostic Heresies*, 1875.

**Mansfeld, ERNST, COUNT VON** (c. 1580-1626). German soldier. He was illegitimate son of Peter, prince von Mansfeld, governor of Luxemburg, where he was born.

Count Ernst von Mansfeld, German soldier After Van Dyck

He served first in the imperial army against the Turks in Hungary, but afterwards joined the emperor's foes. When the Thirty Years' War began, known as an able soldier, was given a command to help the Bohemians. He fought with varying success for Frederick, elector palatine, against Tilly, but his troops were as harmful to their friends as to their foes, for Mansfeld was one of the worst of the mercenary leaders of that time. He took a command under the Dutch government, but is better known as the leader of the force sent by James I to restore the king's son-in-law, Frederick, to his electorate in Germany. This failed, and, after a defeat at the hands of Wallenstein, Mansfeld died in Bosnia. Nov. 29, 1626. The family of Mansfeld, known in Germany, mainly for the military prowess of its members, for about seven centuries, became extinct about the year 1780.

**Mansfield.** Mun. borough and market town of Notts, England. It stands on the Maun, 139 m.

Mansfield, Nottinghamshire. Old parish church of St. Peter from the south-east

Valentine

Mansfield arms

from London and 13 m. N. of Nottingham, with which it has rly. connexions. The chief buildings are S. Peter's church, a fine old edifice, S. John's church, a fine modern one, the town hall, and the grammar school, founded in the 16th century. There are manufactures of hosiery, shoes, machinery, textile fabrics, decorated tin ware, etc., while around are coal mines, to the opening of which is due the rapid growth of the town since about 1890. On the edge of Sherwood Forest, in early times a royal hunting ground, Mansfield was often visited by royalty. To the S.W. is the King's Mill, associated with the story of the miller of Mansfield and Henry II. Mansfield became a borough in 1891, and gives its name to a county constituency. It has a museum and art gallery. Market days, Mon., Thurs., and Sat. Pop. est. 49,000.

**Mansfield**, City of Ohio, U.S.A., the co. seat of Richland co. It is 66 m. S.W. of Cleveland, and is served by the Pennsylvania and other rlys. and an airport. An important industrial centre, it contains factories manufacturing electrical appliances, sheet steel and tinplate, and farming machinery. Settled in 1808, it was incorporated in 1828 and became a city. Pop. 37,154.

**Mansfield**, EARL OF. British title borne since 1776 by the family of Murray. The first holder was the lawyer, William Murray. He left no sons, but by special remainder was succeeded by his nephew, David Murray, 7th Viscount Stormont (1727-96). This Scottish title dates from 1621, when it was given by James I to Sir David Murray. The 2nd earl was in turn an ambassador to Austria and to France, a secretary of state, and a lord president of the council. The earldom is still held by his descendant, Mungo David Malcolm Murray (b. Aug. 9, 1900), becoming 7th earl in 1935. He had been M.P. for Perth, 1931-35, served on various government commissions and was well known as an ornithologist. The earl's chief seat is Scone Palace, near Perth, and his eldest son is known as Lord Scone.

**Mansfield**, WILLIAM MURRAY, EARL OF (1705-93). English judge. A son of the 5th Lord Stormont, he was born at Scone, near Perth, March 2, 1705, and educated at

Westminster and Christ Church, Oxford. Called to the bar in 1730, he became M.P. for Borough-

*Mansfield*  
After Reynolds

bridge and solicitor-general. 1743; attorney-general, 1754; and lord chief justice, 1756. He held office in the duke of Newcastle's cabinet and was one of the weightiest and most eloquent Tory leaders in the House of Lords, although he refused to be distracted by politics from his judicial career. His decisions on commercial law were important, but his legal learning has been questioned. As a poli-

In 1911 she published her first collection of short stories, *In A German Pension*. Much influenced by Chekhov, she established the intellectual position of the contemporary short story in English literature. Later collections included *Bliss*, 1920; *The Garden Party*, 1922; *The Dove's Nest*, and *Poems*, 1923; and a posthumous volume *Something Childish*. She died at Fontainebleau, Jan. 9, 1923. Her journal appeared in 1927; her letters in 1928; collected stories in 1946. *A Life* by R. E. Mantz and J. M. Murry was published in 1933.

**Mansfield College**. Non-affiliated college at Oxford for training men for the Nonconformist ministry. It originated with Spring Hill College, Birmingham, where students were trained to become Congregational ministers. In 1886,

Mansfield College, Oxford. Front of college buildings, with the chapel forming the wing on the right  
Perth

tician he was fiercely attacked by Junius, and incurred odium by his falsely alleged bias in conducting the trial of that writer's printers and publishers. He gave the famous decision that slaves are free when they land in England. Owing to his support of the R.C. relief bill in 1778, his house in Bloomsbury was burnt by the Gordon rioters in 1780. Having received an earldom in 1776, Mansfield retired from the bench in 1788, and died March 20, 1793. See Ken Wood. *Consult* Life, C. H. S. Fifoot, 1936.

**Mansfield**, KATHERINE (1890-1923). New Zealand-born British writer. Born at Wellington, N.Z., she came to England as a child, and settled in London. In 1913 she married J. Middleton Murry (q.v.) with whom she was associated in the publication of the review *Rhythm*, and contributed leading articles to *The Athenaeum* under her husband's editorship.

Katherine Mansfield,  
British writer

under the principalship of A. M. Fairbairn, this was re-founded at Oxford, a fine block of buildings, comprising chapel, class-rooms, and principal's house, being opened in 1889. The name Mansfield was given to it to honour one of the benefactors of Spring Hill. It is a post-graduate theological college, open to ministerial and missionary candidates of all evangelical churches and has become residential.

**Mansfield Park**. Novel by Jane Austen. Published anonymously in 1814, it is notable for its admirably drawn scenes of English country society and the lifelike characters of Mrs. Norris, Henry and Mary Crawford, and the Price family. The scene is set principally in Northants where, at Mansfield Park, the heroine Fanny Price lives with her uncle and aunt, Sir Thomas and Lady Bertram. Of greater maturity than *Pride and Prejudice*, this novel ranks with *Persuasion* in its restraint and depth of observation.

**Mansfield Woodhouse**. Urban dist. of Notts, England. It is 2 m. N. of Mansfield, with a rly. station. It is in a coal mining district, while limestone and sandstone are also worked. Pop. 17,000.

**Mansion House.** Name given to the official residence of the lord mayor of London, and also applied to other buildings of the kind. It stands opposite the Bank of England in the heart of the city. The foundation stone was laid Oct. 25, 1739, but the building, designed by George Dance the elder, was not finished till 1753. The front façade is screened by a portico of six fluted Corinthian columns, the pediment enclosing a design by Sir Robert Taylor, in high relief, of a female figure crowned with turrets, symbolising the city of London. The building is of Portland stone. The principal apartment is the Egyptian Hall, designed by the earl of Burlington after Vitruvius, 90 ft. by 60 ft., where banquets and various functions are held. Corinthian columns support the roof of this room, which is gorgeously decorated. The city police court is on the first floor.

There is also a Mansion House in Dublin, the official residence of the lord mayor since 1715. This is in Dawson Street, and contains the Round Room, built in honour of George III, and still the largest meeting place in the city. Here was held the first session of Dáil Eireann; here was signed the Anglo-Irish treaty of 1921.

**Manslaughter.** Term used in English law. It means unlawfully slaying another without malice aforethought. Manslaughter may be almost an accident, or very nearly a murder, or any homicide between those two. Thus, to kill a man upon great provocation, "upon a sudden heat," is manslaughter removed from murder only by the fact of the provocation. If the driver of a vehicle drives with such negligence that a jury finds his negligence criminal, and runs over and kills someone, he also is guilty of manslaughter, though he had no intention of harming the person slain. Manslaughter is a felony; and its maximum punishment is imprisonment for life. See Murder.

**Manson, JAMES BOLIVAR** (1879-1945). British art critic and painter. Born in London, June 26, 1879, he was educated at Dulwich, and studied art at Heatherley's, Lambeth art school, and Julian's, Paris. On the foundation of the London Group (*q.v.*) he became its secretary. Assistant keeper at the Tate Gallery, 1917-30, he was then di-

rector until 1938. Chiefly with portraits and landscapes, he exhibited at the New English art club and

Mansion House, London. Front façade of the lord mayor's official residence

the London Group, and is represented at the Tate by Michaelmas Daisies, purchased in 1923. His publications included studies of Rembrandt (1923) and Degas. He died July 3, 1945.

**Manson, SIR PATRICK** (1844-1922). British physician. Born Oct. 3, 1844, at Fingask, Aberdeenshire, he took his medical degree at Aberdeen University. He specialised in parasitology and became physician and medical adviser to the Colonial office. He was the first to suggest that the malarial parasite was carried by the mosquito, which theory was established by experiment as correct by 1900. He published Goulstonian Lectures, 1896; Tropical Diseases, 1898. Manson, who was F.R.S., was knighted in 1903, and died April 9, 1922. See Malaria; Ross, Sir R.; consult Life, P. Manson-Bahr and A. Alcock, 1927.

**Manson-Bahr, SIR PHILIP** (b. 1881). British physician, educated and trained at Rugby, Cambridge university, and London Hospital. He married the daughter of the above Sir Patrick Manson, and added her surname to his own. Specialising in tropical medicine, he was in charge of research expeditions to Fiji, 1909, and Ceylon, 1912. Consulting physician to the Colonial office from 1929, he was a director of the clinical division of the London school of hygiene and tropical medicine and senior physician at the hospital for tropical diseases. He contributed the article on malaria to this Encyclopedia. He was knighted in 1941.

**Manstein, FRITZ ERICH VON** (b. 1887). German soldier. Twelfth child in an E. German military family named von Lewinski, he was adopted soon after birth by relatives named von Manstein. Becoming a soldier, he was chief

of staff to Rundstedt in Poland during Sept.-Oct., 1939. He captured Sevastopol July 3, 1942, being promoted F.M. on July 1. Commanding in the Ukraine in 1943, he was responsible, Nov.-Dec., for the only serious setback the Russians encountered in reconquering their country. Removed from the command in S. Russia in April, 1944, he was arrested at a hospital in Schleswig-Holstein Aug. 31, 1945, and taken to England. He testified for the German high command and general staff before the Nuremberg tribunal, Aug. 9, 1946. He was released from a p.o.w. hospital at Diss, Norfolk, in July, 1949; but Polish and Russian accusations that he was a war criminal led to his trial before a British military court at Hamburg where he was condemned, Dec. 19, 1949, to 18 years' (later reduced to 12 years') imprisonment, the chief charge sustained against him being that he allowed the killing of hostages.

**Manston.** R.A.F. station in Kent, England. Situated on the coast 2½ m. E. of Margate, it was opened during the First Great War as a R.N.A.S. training centre, converted later into a training centre for R.A.F. flight mechanics and armourers, and a passing out rehabilitation centre. During the Second Great War, Manston was an advanced base of No. 11 fighter group, and in Aug., 1940, was put out of action for some weeks. The camp had air raid shelters 80 ft. below ground in tunnels made by German prisoners in 1917-18 as ammunition stores. The aerodrome covers 1,400 acres, and after the Second Great War passed to R.A.F. transport command.

**Mansurah** or **EL MANSURA**. City of Lower Egypt. Situated at the junction of the Damietta branch of the Nile and a canal which goes to Lake Manzala, it is a flourishing commercial town and the centre of a large cotton growing district. Here is the old fortress of S. Louis of France, recently restored, where he was imprisoned in 1250. Near are the ruins of the temple of Isis. Pop. 69,036.

**Manta.** Coastal town of Ecuador, in Manabi prov. On the S. of Manta Bay, it is a port for cacao, coffee, fruit, ivory, nuts, and the Jipijapa (so-called Panama) hats. Pop. 8,000.

**Mantalini, ALFRED.** Character in Dickens's novel Nicholas Nickleby. An amorous dandy, he spends the money of his wife, a fashionable London mantua maker, until his extravagance brings them both

Mantegna. One of nine frescoes illustrating The Triumph of Caesar, by Andrea Mantegna; painted 1484-90, they are now in Hampton Court Palace

to poverty. His speech is as extravagant as his habits: inconsequential and sprinkled with "dem" and "demd," it helps to make him one of the author's most memorable and entertaining grotesques.

**Mantaro.** River of centra. Peru. Rising in the prov. of Junin, near Lake Chinchaycocha, it flows S.E. into Huancavelica. It breaks through the Andes and, turning N.E., joins the Apurimac, the united stream forming the Ené. Its length is about 280 m.

**Mantegna, ANDREA** (1431-1506). Italian painter. Born at Vicenza, he was adopted by Squarcione, and painted an altar-piece, The Madonna in Glory, for S. Sofia, Padua, 1448. He came early under the influence of Donatello,

Andrea Mantegna, Italian painter

married the daughter of Jacopo Bellini, decorated the Eremitani church at Padua, 1450-59, and painted a triptych, The Madonna Enthroned, for the church of S. Zeno, Verona. By 1455 he was virtually chief of the Paduan school, and had painted his fine Agony in the Garden, now

in the National Gallery, London. Invited to Mantua by the marquess, Lodovico Gonzaga, about 1460, he painted the triptych, The Adoration of the Magi, for the chapel of the old castle in that city. His great series of nine pictures, The Triumph of Julius Caesar, in Hampton Court Palace, was executed 1484-90. In 1488, at the request of the pope, Mantegna decorated the Belvedere chapel in the Vatican with frescoes. He painted the Madonna della Vittoria, now in the Louvre, about 1495.

Mantegna, who died Sept. 13, 1506, was one of the greatest Italian painters, and his influence was immense. His style, formed on the antique, is severe and statuesque. Most of his decorations, painted on dry plaster, have decayed. His easel pictures were mostly executed in tempera. An expert engraver, he introduced to Mantua the art of engraving on copper with the burin. There are Lives by P. Kristeller and P. Yriarte, both 1901.

**Mantelpiece.** Upper part or cloak of a fireplace. In Romanesque architecture they were comparatively small and of the hood type. In Gothic decoration the hood was still the predominating form; but it was often of huge dimensions. With the Renaissance the canopy was replaced by rectangular structures, adorned

with columns, pilasters, cornices, and pediments. Heavy carving was introduced, decorated with figures, animals, flowers, and heraldic symbols. In Tudor and Jacobean England there was a mixture of Gothic and Classic, quaint but not unpicturesque. Inigo Jones and Christopher Wren introduced more purely architectural forms. Stone, marble, wood, faience, and metal have been used for mantelpieces, the marble and wood often being richly inlaid. Mantelpieces went out of fashion about the middle of the 18th century, and came into vogue again towards the end of the 19th; but the 20th century reversion to simplicity and the increasing use of gas and electric radiators did not encourage further development. See Chimney-Piece; House.

**Mantes-Gassicourt.** Town of France, in the dept. of Seine-et-Oise. Formerly called Mantes, and sometimes Mantes-la-Jolie, it lies on the left bank of the Seine, 35 m. by rly. W. of Paris: it is the junction of the Paris-Dieppe and Paris - Cherbourg

Mantes arms

rly. lines. There is trade in cereals, fruits, etc., and tanning is carried on. Noteworthy buildings included a Gothic church of Notre Dame, chiefly from the late 12th century, with later additions, a 15th century hôtel de ville with a fine staircase, and the tower of S. Maclou church, destroyed in the Revolution.

Mantes-Gassicourt, France. W. front of the Gothic church of Notre Dame

William the Conqueror was fatally injured by a fall from his horse at Mantes in 1087. Pop. 13,181.

During the liberation of France, 1944, U.S. armour reached Mantes-Gassicourt, Aug. 19; next day U.S. infantry established the first bridgehead across the Seine near by from which on the 22nd they began a strong offensive.

**Manteuffel**, EDWIN HANS KARL, FREIHERR VON (1809–85). German soldier. Born Feb. 24, 1809, he entered the Prussian army in 1827. In 1864 he served against the Danes, being made governor of Slesvig when the war ended. He led a division and then an army in the war of 1866. In 1870 he led a corps against France before becoming commander of the army in succession to Steinmetz. During 1871–73 he was at the head of the army of occupation. Made a field-marshal, he was governor of Berlin; and from 1879 of Alsace-Lorraine, until he died on June 17, 1885.

**Mantilla** (Sp., little mantle). Veil of black or white lace, the national head-dress of Spanish women, and also worn in Portugal. Originally it was a light cloak or cape, the material being usually a costly fabric.

**Mantineia**. City of Arcadia in ancient Greece, which gives its name to two famous battles. The first was fought in 418 B.C., and resulted in a victory for the Spartans over the combined forces of the Argives, Arcadians, and Athenians. The second was fought in 362 B.C. between the Spartans and the Thebans under Epaminondas, who was victorious, but fell in the battle. The site was excavated in 1888.

**Mantis** (Gr., diviner). Name given to insects of the family Mantidae (order Orthoptera), found in S. Europe and the tropics. Large and powerful, long in the body, and armed with forelegs specially adapted for seizing their prey, they vary greatly in form and colour, many of them being curiously like the leaves and flowers among which they lurk. The name praying mantis has been given to the common European species on account of its habit of resting with

its forelegs raised in a devotional attitude. The insects have always been held in superstitious awe by the Greeks, Turks, Hindus, etc.

**Mantle** (Lat. *mantellum*, napkin; cloak). Sleeveless, loose cloak worn over other clothes by either sex. The toga worn by the Romans and the peplum and chlamys of the Greeks were varieties of the mantle. In the present day a mantle forms part of the robes of state of peers and knights of various orders. See Costume; Toga.

**Mantle**. Appliance for lighting. Gas mantles use substances with a high degree of selective radiation. Chief of these are thoria and ceria, two rare metallic earths, sometimes known as thorium oxide and cerium oxide. The first gas mantle was invented by Welsbach in 1883, since when continual improvements have resulted in the small inverted mantles for domestic use and the long inverted ones for high pressure street lighting.

The physical properties of a mantle depend upon the fabric and the mixture of the oxides of thorium and cerium. Mantles are made by knitting cylinders of ramie or artificial silk fabric. These cylinders are saturated with a solution of nitrates of thorium and cerium and then dried. One end is sewn up with asbestos thread: the other is fixed by asbestos thread to a fireclay holder ring. The mantle is then burnt to convert the nitrates into oxides and finally dipped in a solution of collodion which, when allowed to dry, strengthens the mantle and enables it to be handled and transported. The collodion is burnt off after the mantle has been set in place.

Mantle of mid-Victorian fashion

Mantilla as worn by Spanish ladies

A mantle impregnated with thorium oxide only will attain a high temperature, but will not glow brightly as only a small amount of the radiation emitted is in the visible region of the spectrum. The addition of about 0.9 p.c. of cerium oxide produces a brilliant white light.

**Mantlet**. Military term applied to grooves cut above and below the gunport in tanks to allow the gun to be elevated or depressed.

**Mantling**. Term used in heraldry. It includes the robe of estate placed behind a shield of arms, the silken capes and scarves or fancy scrolls pendent from the helm or crest, and by extension the ribbons and knotted cords placed as external decorations.

Napoleon I and III had their heraldic robes powdered with golden bees, in this following the custom of the Middle Ages, when great nobles powdered both the cloak and lining with their badges.

The silken helm or crest scarf represents the scarf of authority worn in battle, or the gage of honour borne in tournaments, and is represented as tattered in strife. The foliated scroll is a degenerate form of the scarf. It is generally represented as scarlet, lined with white, or is a combination of the livery colours. In Scottish heraldry the scarf is sometimes replaced by a bunch of floating ribbons of the clan tartan. Such ribbons, but of livery colours, were used in the Middle Ages and represented as black, or alternately black and white, when the bearer was in mourning, or had taken vows to enter the religious life.

**Mantoux**, PAUL (b. 1877). French politician and educationist. Born at Paris, April 14, 1877, he became secretary of the Hautes Études Sociales in 1900. In 1906 he was appointed professor at Chaptal college, and 1910 at the Paris school of economics. A brilliant linguist, he came to London university in 1913, teaching literature and sociology, and leaving to serve in the First Great War. He was appointed director of the League of Nations political section in 1919 and left that office, 1927, in order to direct the Geneva high school of international studies, founded by him. He again became professor in Paris in 1935, staying until the outbreak of war in 1939

Mantling in heraldry

Mantis. Specimens of the curious insect called the praying mantis

when he became head of the British section of the French ministry of information. He published books on the industrial revolution in the 18th century and on Britain.

**Mantrap.** Device for catching trespassers. A common form had a pair of metal gripping-jaws

secured horizontally, when set, by a catch, which was released when a member connected to it was stepped upon. Their use is now illegal except in houses between sunset and sunrise.

**Mantras.** Miscellany of psalms, hymns, and prayers forming part of the inspired Scriptures of the Hindus. The term is applied also to a text or religious formula used by Brahmins as a charm. *See* Vedas.

**Mantua** (Ital. Mantova). Province of N. Italy, in Lombardy. It is bounded E. by Venetia and S. by Emilia. Watered by the Mincio, the Po, and the Oglio, it is low-lying but fertile, producing rice, corn, vines, and mulberry trees. Area, 903 sq. m. Pop. 402,948.

**Mantua** (Ital. Mantova). City of Italy, capital of the prov. of Mantua. It stands on the river

Mantua arms

Mincio, 100 m. by rly. E.S.E. of Milan. Surrounded by lagoons and swamps and defended by walls, Mantua, the S.W. of the Quadrilateral fortresses, the others being Leg

nago, Peschiera, and Verona, was long considered the strongest fortress in Europe. The cathedral, founded in the 12th century, has been altered from time to time, the interior having been remodelled by Giulio Romano. It is dedicated to SS. Peter and Paul. The city's finest church is that of S. Andrea. Planned by L. B. Alberti, it was begun in 1472. It has a façade of white marble, and some fine frescoes are among its interior decorations. In it Mantegna is buried.

S. Sebastian's is another noted church. The ducal palace, begun in 1302, has 500 rooms, and mural decorations by Giulio Romano, a native of the city, who also designed the Palazzo del Te and decorated it with statues and frescoes. The castle of the Gonzagas, of the 14th century, with frescoes by Mantegna, houses the archives. There are museums, an observatory and botanical gardens, and also a fine academy of arts and sciences. The industries include ironworks, breweries, tanneries, oil-mills, doll factories, printing

of which it was the centre, was one of the most important of the smaller Italian states. In 1708 Mantua was taken by the emperor Joseph I, and it remained Austrian until 1797. In 1796, during his campaign in Italy, Napoleon laid siege to the city, and after a resistance lasting for eight months it was captured in Feb., 1797. Restored to Austria in 1815, it remained Austrian until 1866, when it was made part of the new kingdom of Italy. Pop. (1936) 39,734.

The city, which lay in the part of Italy occupied by the Germans after the armistice between Italy and the Allies of Sept., 1943, was captured from them by the 5th army without serious fighting, April 25, 1945, and suffered only scattered damage. The Casa della Cervetta had been destroyed in an air raid, Aug., 1944. The cathedral and S. Andrea escaped intact; the 13th cent. church of S. Francis was almost completely, that of S. Maurice completely, destroyed.

**Mantzius, KARL** (1860-1921). Danish actor and author. Son of a famous actor, Kristian Mantzius, his early studies were in philology. He was for 30 years associated with the royal theatre, of which he was director 1909-13, and distinguished himself in some of the plays of Björnson, Ibsen, Holberg, Molière, and Shakespeare. He wrote *A History of Theatrical Art*, trans. into English by L. von Cosel, 1903-09. He died at Copenhagen, May 17, 1921.

**Manu** (Skt., man). In Hindu mythology, the first man and the father of mankind. In the Indian story of the flood his life is said to have been miraculously saved by

Mantua, Italy. Piazza Sordello, with the cathedral, left, and the façade of the ducal palace; monument in the piazza to the political martyrs of the rising in 1851. Top, vegetable market, with tower and dome of S. Andrea

a fish, supposed to be an incarnation of Brahma, which dragged him, in a ship built by him, on to the Himalayas. Here he formed a woman of various substances, and by her became the progenitor of the human race. According to tradition, this being was the originator of the Laws of Manu. The object of these was apparently to support Brahmanism against Buddhism, and the laws, though regarded as uninspired, are still considered binding upon Brahmins. The work is probably a new edition, largely interpolated, of an older work, and dates from about the Christian era. There is an Eng. trans. by G. Bühler in *Sacred Books of the East*, vol. 25, 1885. See Brahmanism.

**Manual Training.** Term formerly applied to training in various handicrafts without any definite vocational aim. The idea was to train hand and eye as part of the general education of the faculties. Manual instruction was defined in the Technical Instruction Act, 1889, as "instruction in the use of tools, processes of agriculture, and modelling in clay, wood, or other material." Since then educationists have realized that much more is desirable, and much more than hand and eye can be developed through the teaching and practice of handicrafts. In consequence the term manual training has been generally discarded in favour of practical instruction (included in the Education Act, 1918) or crafts.

This practical aspect of education has been fully recognized in the provision of it for children of all ages, for adolescents, and for adults as a means of correlating and integrating the work done in separate subjects, e.g. mathematics, history, geography, science, and art. It has been advocated for the development of self-control, self-respect, and self-help, for stimulating the flagging interest of pupils, and for fostering interest in hobbies, a point of special importance to the millions of workers in repetitive processes.

Practical instruction varies in different schools according to the locality, the qualifications of the staff, and their idiosyncrasies. In some secondary schools boys will still have only instruction in wood-work and perhaps metalwork; in others they will design individually everything they make, and prepare, e.g. the scenery for school plays, or devise realistic scenes to illustrate geography, history, or scientific projects. Girls in some

school may have only rudimentary needlework and cookery; in another, the teaching of art will be applied to crafts or house furnishing; in another they will pursue a comprehensive housewifery course. Recent experiments suggest that the extreme differentiation of the craft courses of boys and girls may not be desirable, particularly in regard to crafts associated with the home.

**Manul.** Species of wild cat (*Felis manul*). It has a very broad, flattened head, and long fur varying in colour from grey to buff, with a few dark stripes. It is found among the hills in the wilder districts of Tibet and Mongolia, and feeds on small rodents.

**Manumission** (Lat. *manus*, hand; *mittere*, send). The freeing of a slave. In Roman law a slave might be freed either formally or informally. The formal methods were (1) *vindicta* or a fictitious law suit; (2) *censu*—by enrolment on the census; (3) *testamento*—by will. The informal methods included declaring him free before witnesses or conferring freedom on him by letter.

**Manure.** Material added to soil to increase its fertility. It is used to promote the growth of crops by supplying plant food, and by generally improving the soil as a medium for plant growth. The oldest kind is farmyard manure. Varro in 40 B.C., and Columella in A.D. 40, both describe in detail how it should be prepared and applied, and their instructions were generally accepted until the beginning of the 19th century. Farmyard manure acts in both the ways indicated above, and if it could be obtained in indefinite quantities farmers would ask for little else, but the amount is strictly limited. For many years, therefore, chemists have been confronted with the necessity of finding substitutes.

**NITROGEN COMPOUNDS.** These are perhaps the most effective of all added nutrients under ordinary British soil conditions, and of all possible nitrogen compounds nitrates are the best. For technical reasons only four nitrates are possible in practice, viz. those of sodium, calcium, potassium, and ammonium—and of these, sodium nitrate has proved the most convenient. It comes from Chile, where it forms great surface deposits; its origin is not known with certainty, but it was probably deposited from inland seas which have dried up; owing to its ready solubility in water it survives only in rainless regions.

Enormous amounts are used in agriculture and also for the manufacture of explosives, but supplies are said to be sufficient for over 300 years even at the present rate of consumption. Calcium nitrate, made artificially in large quantities in Norway, is an equally good fertiliser.

Ammonium sulphate is nearly as effective as sodium nitrate. It is produced from coal during the making of gas or coke, and before the First Great War was exported in large quantities from Great Britain. The ammonia can be taken up by plants, but normally it is first oxidised to a nitrate in the soil by micro-organisms. This process goes on without appreciable loss of nitrogen, but ammonium salts are not as speedy in their action as nitrates. Calcium cyanamide or nitrolim is artificially produced on a large scale in Sweden, Italy, Canada, and elsewhere, and easily gives rise to ammonia in the soil.

Many organic substances contain nitrogen in complex combinations which, however, speedily decompose in the soil, yielding ammonia, which then oxidises to nitrates. Usually a certain loss of nitrogen occurs during the process, so that these substances are not as effective as nitrate of soda or sulphate of ammonia. As they offer other advantages to the cultivator, they may command a higher market price per unit of nitrogen. The substances include bone, meat meal, dried blood, and other products from slaughter-houses, fish meals, and also residues from certain crushed oil seeds, shoddy, wool wastes, etc.

Nitrogenous fertilisers are of value on almost all soils and for almost all crops; they increase the weight of leaves, stems, and grain. The increased yield for the first increment of fertilisers is generally proportional to the quantity applied, but later increments produce smaller increases in accordance with the law of diminishing returns, and they may cause undesirable secondary effects, such as increased susceptibility to disease. Calcium cyanamide, calcium nitrate, and ammonia are produced in enormous quantities from the air, and there is no likelihood of any shortage of nitrogenous fertilisers ever arising.

**PHOSPHATIC FERTILISERS.** From time immemorial farmers have recognized the utility of bones as manure. When chemistry was applied to agriculture, it was realized that one effective constituent was

the phosphate, and that better results might be obtained by rendering this soluble by treatment with sulphuric acid. There is no longer a sufficiency of bone, but enormous deposits of calcium phosphate have been discovered. This rock phosphate is acted upon by sulphuric acid, giving a mixture of calcium mono-phosphate and calcium sulphate, which, however, is not separated into its components, but sold as superphosphate. This process was first worked out by Lawes, and it proved the foundation of a great artificial fertiliser industry, which for many years remained largely in British hands. Superphosphate is especially effective in promoting root formation, and it is largely used on the so-called root crops—swedes, turnips, etc.—and on potatoes. It also promotes early ripening of grain, and therefore is used for barley, which must be cut dead ripe, and for wheat and oats in the northern counties of England, and in Scotland, where harvest is apt to be delayed by bad weather.

Another important source of phosphate is basic slag. The richest and best is obtained from the Bessemer converter, but this is now largely displaced by the open hearth system, which gives a much poorer slag. Basic slag is alkaline and is especially well suited for the great grass areas of boulder and lias clay in the midland and northern counties of England.

The following table shows the increased yields that may reasonably be expected from the application of one cwt. of sulphate of ammonia or nitrate of soda, or one cwt. of superphosphate :

	1 cwt. sulphate of ammonia or 1½ cwt. nitrolim	1 cwt. superphosphate or high grade basic slag
Wheat, grain .. .. .	4½ bush.	0-1½ bush.
"   straw .. .. .	5 cwt.	1-5 cwt.
Barley, grain .. .. .	6½ bush.	2-3 bush.
"   straw .. .. .	6½ cwt.	0-2 cwt.
Oats, grain .. .. .	7 bush.	1-3½ bush.
"   straw .. .. .	6 cwt.	0-2 cwt.
Hay .. .. .	8-10 "	
Mangolds .. .. .	32 "	20 "
Potatoes .. .. .	20 "	10 "

Thus one cwt. of superphosphate which contains 11·8 p.c. of phosphoric oxide,  $P_2O_5$ , is about half as effective as one cwt. of sulphate of ammonia, which contains 20 p.c. of nitrogen. In practice it is customary to apply at the rate of  $\frac{3}{4}$  to 1½ cwt. of nitrate of soda or sulphate of ammonia per acre, and two to five cwt. of superphosphate or basic slag.

**POTASSIC FERTILISERS.** In the last decade of the 19th century large quantities of potassium salts were exported from Stassfurt in Germany, and proved very success-

ful on light, sandy, or peaty soils, and for crops such as mangolds, potatoes, and sugar beet, which make large quantities of sugar or starch. They are largely used in the potato-growing districts of Lincolnshire, Scotland, and Cheshire, by the mangold growers of Surrey and Norfolk, and also by the flax growers of N. Ireland. Certain waste products, such as flue dust from blast furnaces, or the rotary kilns of cement works, contain a fair amount of potash and are being exploited. Seaweed is also a possible source, as, too, is felspar. To some extent salt can economise potash in the plant. Potassic fertilisers give tone and vigour to the plant, and help it to resist diseases or other adverse circumstances.

Lime acts by improving the soil. It neutralises the acidity which often tends to accumulate; it flocculates the clay and maintains a good physical texture, and it tends to put out of action disease organisms such as finger and toe in turnips. It can be applied as quicklime at the rate of 10 cwt. to two tons per acre, or as ground limestone in double these quantities, or as chalk in still larger amounts. The use of chalk was known to the Britons, and the method of application as described by Pliny closely resembles that still used in Hertfordshire and the neighbourhood.

Farmyard manure contains all the elements of plant nutrition, and in addition its organic matter exercises important physical effects on the soil, improving the tilth and increasing the water-holding capacity. These physical effects

are largely due to the straw and the undigested food residues. Farmyard manure is applied at the rate of about 10 to 20 tons per acre.

Very much of the fertilising value of farmyard manure arises from the

sing manurial value, but none has stood the test of field trials. Liquid manure may be classed with farmyard manure. Occasionally it is used in the liquid form on permanent grass and seeds.

E. J. Russell

The cotton plant, as it has been proved, is one that well repays the use of manures. The actual cotton that is grown on the plant takes from the soil comparatively little of its fertilising ingredients, but it is quite otherwise with the seed, from which a valuable oil is obtained. The loss to the soil caused by removing the seed is best made good by the application of cotton oil cake, which is much the cheapest fertiliser that can be obtained in the United States.

The cake is used as manure, either directly or indirectly by giving it as food to the animals that are kept on the cotton fields. Of the other manures that are used in the cultivation of cotton, the most important are the offal of fisheries and abattoirs, and superphosphates made from the phosphates of South Carolina, Tennessee, and Florida. See Agriculture; Crops; Fertiliser; consult also A Student's Book on Soils and Manures, E. J. Russell, 2nd ed. 1919.

**Manuscript** (Lat. *manu scriptus*, written by hand). In the wider sense, anything written as opposed to anything graven or printed; in the narrower sense, a text written, before the general adoption of printing, on papyrus, parchment, or paper. It is very commonly abbreviated to MS., plural MSS. The name *chartae* is especially reserved for shorter public or private documents, chiefly of an official or business character, dating from the Middle Ages. The name *codex* (trunk of a tree), now applied to all old MSS. generally, was originally given to wooden tablets with a coating of wax, fastened together for writing upon. The sciences dealing with the documents and manuscripts in general are called Diplomatic and Palaeography.

The form of the manuscript depended upon the nature of the writing material. The papyrus roll-form (*volumen*) was the oldest, only one side as a rule being written upon; if both sides were used, the rolls were called *opisthographi* (written on the back). The modern book-form (*codex*) first came into general use in the 4th century of our era, when parchment had almost entirely ousted papyrus. In Rome, MSS. were as a rule taken down by several slaves at the same time from one person's dictation; this naturally led to a number of

fact that the animal takes from its food mainly the carbon which the plant does not need, while it does not retain much of the nitrogen, phosphorus, and potassium which the plant needs. The richer the diet in these constituents, therefore, the better the manure. As a rule, one ton of farmyard manure contains 9-14 lb. of nitrogen, 4-5 lb. of phosphoric oxide ( $P_2O_5$ ), and 9-15 lb. of potash ( $K_2O$ ). The method of storage on the farm, however, is often extremely wasteful. From time to time other substances are put forward as posses-

mistakes, and these were further increased by the careless copying of the monks.

In the course of excavations at Herculaneum, 1752, and in Egypt from the beginning of the 19th century, a large number of papyrus-rolls has been discovered. The Egyptian finds, mostly in Greek, throw considerable light upon the condition of the country in the time of the Ptolemies and under the empire. Greek literature has acquired valuable additions, as the mimes (farces) of Herodas, odes of Bacchylides, fragments of Menander, and Aristotle's Constitution of Athens. The most important parchment MSS. are the palimpsests (rubbed again), the writing upon which has been erased or rubbed out, so that the parchment could be used again. The original writing has in some cases been restored by the use of chemicals, and deciphered. One of the oldest of the parchment MSS. is the Codex Sinaiticus of the Bible, belonging to the 4th century, and discovered in a Sinai convent. Another famous MS. is the *codex argenteus* of the Gothic translation of the Bible by bishop Ulfilas.

In MSS. the gathering of the sheets in quires was of great importance. Each quire contained a number of sheets, generally four, folded down the middle and placed inside each other, thus making 16 pages. The middle was indicated by a string. Since pagination was not adopted till the 15th century, the test of the completeness of a MS. was the number of pages on each side of the string. The chief task in dealing with several MSS. of the same work is to investigate their mutual relations, especially in the matter of mistakes in which they agree, and to construct a genealogical table, to establish the text of the archetype, or original, from which they are derived. *See* Book; Diplomatic; Kells, Book of; Palaeography; Writing.

**Manutius**, ALDUS (1450–1515). Latinised name of the Italian scholar-printer, Aldo Manuzio or Manucci. He studied at Rome and Ferrara, and about 1490 founded a press at Venice. Here were printed the editions of the Greek, Latin, and Italian classics known as the Aldine editions (*q.v.*). He did much to spread the new learning, and was remarkable for

Aldus Manutius,  
Italian printer

his scholarship and care in securing accurate texts, beautiful compact type, and the cooperation of a band of scholars. After an absence from Venice, 1506–12, he set up his press again with his father-in-law, Andrew Asola, as partner. He died at Venice, Feb. 3, 1515, and was succeeded by his son Paulus (1512–74) and the latter's son Aldus (1547–97).

**Manx**. Word used for anything belonging to the Isle of Man, *e.g.* a Manxman or the Manx speech. A Manx cat is a variety of cat found in the island in which the tail is either absent or stunted. *See* Cat; Man, Isle of.

**Many Inventions**. Volume of short stories by Rudyard Kipling, published in 1893. It owes its title to the text from Ecclesiastes: "Lo! this only have I found, that God hath made man upright; but they have sought out many inventions." It includes some of Kipling's finest early stories, *e.g.* My Lord the Elephant, A Matter of Fact, The Disturber of Traffic, Love o' Women, The Finest Story in the World, The Record of Badalia Herodsfoot. The last-named story, an early excursion into painful realism, with a London slum as its setting, was much discussed on its first appearance.

**Manzanares**. River and town of Spain. The river, on which stands Madrid, flows S. for a course of 40 m. to join the Henares. The town is a rly. junction on the

line from Santiago to Havana (487 m.). Pop. 65,965.

**Manzanillo**. Seaport of Mexico, in the state of Colima. It stands on Manzanillo Bay, an opening of the Pacific, 38 m. by rly. W. by S. of Colima. The harbour has been rendered secure by a breakwater and sea wall, and the port is visited by steamer services. Population, estimated, 30,000.

**Manzoni**, ALESSANDRO (1785–1873). Italian writer. Born at Milan, March 7, 1785, he became the leader of the romantic and medieval reaction in Italian literature. His tragedies, *The Count of Carmagnola*, 1820, and *Adelchi*, 1822, mark an epoch in Italian drama by their adoption of Shakespearean methods, and by their bold romanticism, and his novel of 17th century Milan life, under Spanish rule, *I Promessi Sposi* (*The Betrothed*), 1825–27, established a world-wide reputation and created a school of Italian historical novelists. Later Manzoni wrote *Letters on Romanticism*, defending the romantic school. He died at Milan, May 23, 1873.

Alessandro Manzoni,  
Italian novelist

**Maori** (Polynesian, aboriginal). People of Polynesian stock in New Zealand. Numbering (1945) 98,000, mostly in N. island, they are tall, muscular, olive-brown, with straight or wavy hair, and oval faces of Caucasoid mien. They preserve traditions of the arrival from Rarotonga, about 1350, of their tribal ancestors in a fleet of six double canoes or single outriggers. The newcomers found an indigenous population, partly Papuanian, being absorbed into earlier Polynesian

Maori. Left, Maori woman carrying her child on her back. Right, an old chief

Azuer in the prov. of Ciudad Real, 27 m. E. of the city of that name. It is in the arid, elevated area of La Mancha. There is an old castle. It carries an important trade in wheat and wine. Pop. 15,900.

**Manzanillo**. City and harbour on S.E. coast of Cuba, in the prov. of Oriente. Situated at the mouth of the river Canto, it has a commodious harbour, from which sugar, lumber, tobacco, and hides are shipped. It is a rly. terminus, and has connexion with the main

immigrations, especially one from Tahiti, c. 850.

Without metals, pottery, or weaving, they practised cookery in hot-stone ovens, having brought with them the sweet potato (*kumara*) and the yam (*taro*), also, it is said, the native dog. The colder climate led to the construction of substantial rectangular timber houses, wrought with jade adzes and chisels, and the development of a virile art, especially in the carving of bargeboards, gables,

houseposts, and canoes. Personal ornament included jade amulets, *heitiki*, in the form of human embryos. Face-tattooing, of the type called *moko*, was effected by grooving elaborate designs into the flesh with sharp-edged bone adzes. This custom, reserved for the ruling class, has ceased, but women still tattoo on lips and chin. New Zealand flax was plaited by hand into shoulder-mats and waist-mats, sometimes enriched with kiwi or moa feathers. Cannibalism and infanticide formerly prevailed.

The priests, *tohunga*, controlled taboo and divination, and preserved the national chants, *karakia*. When they exercised temporal power they were called *ariki*, divine chiefs, superior to the secular headmen of the clans. Their insignia—a huia feather in the head-dress and a staff, *taiaha*—were worn by the prince of Wales at Rotorua in April, 1920, when witnessing the pantomimic dances. These comprised the warriors' *haka*, with weapons and violent movements, and the *poi*, in which women twirl between the fingers balls of dried bulrush leaves.

The communal life has been modified since contact with settlers; now nominally Christian, they are often eager for education. There are four Maoris in the house of representatives, and two in the legislative council, besides a minister representing the native race. They mix with the white population on completely equal terms, intermarry without adverse comment, and take their place side by side in the industry, commerce, and government. The fact that the Maori pop. has risen from 48,000 in 1901 to 98,000 in 1945 is an indication of healthy progress.

Maoris fought with distinction in the Second Great War. The famous New Zealand div. of 8th army included a Maori battalion, and in all over 6,000 Maoris served overseas. Recruiting among them was voluntary; none the less nearly 40 per cent. of Maoris of military age joined the forces. A Maori officer, 2nd Lieut. Moana-Nui-a-Kiwa Ngarimu, was awarded a posthumous V.C. for gallantry near El Hamma, Tunisia, March 26, 1943. See New Zealand; consult also The Old New Zealand, F. E. Maning, 1863; Maori and Polynesian, J. M. Brown, 1907; Hawaiki, S. P. Smith, 3rd ed. 1910; The Maoris of New Zealand, J. Cowan, 1910; The Maori, Yesterday and Today, J. Cowan, 1930; Sketches from Maoriland, H. Grieve, 1939.

**Maori Wars.** British campaigns against the Maoris. By the treaty of Waitangi in 1840, Great Britain assumed the sovereignty of New Zealand, guaranteeing the Maoris possession of their lands and fisheries. Friction soon arose, however, between the natives and the colonists over the ownership of the land, and resulted in the first Maori War, 1843–47. It consisted of skirmishes and ambushes, and was finally closed by the definite settlement of the boundaries.

The second war, due to racial hatred, was waged in a desultory fashion during 1861–71. There were few definite engagements, but

despite their bad leadership and ignorance of European tactics, the Maoris proved themselves stubborn fighters. The war increased in bitterness during 1863–64, and severe engagements took place, in which both sides lost heavily, but largely owing to the faulty strategy of General Duncan Cameron the struggle dragged on. The massacre of the settlers at Poverty Bay and Mohaka, 1868, aroused further bitter fighting, but the natives finally submitted in 1870, and by the following year all trouble had ended. See New Zealand.

**Mao Tse-tung** (b. 1894). Chinese communist leader. See N.V.

## MAPS AND MAP-MAKING

R. A. Skelton, Superintendent of the Map Room, British Museum

The history of map-making is here followed by an explanation of how contemporary maps are made and of the way in which they can be used. Related articles include those on Projection and Surveying. See also noted map-makers, e.g. Mercator; Ptolemy; Saxton.

A map is a plane representation of the earth's surface or of a part of it. The data of many human activities—scientific, social, economic, and political—can be concisely plotted on maps which show their geographical extension or distribution. A collection of maps is called an atlas, a term first introduced by Mercator. For the methods by which the curved surface of the earth is represented, or projected, on the flat surface of a map see Projection. The only wholly satisfactory solution of mapping problems is the globe.

**HISTORY OF CARTOGRAPHY.** The basic problems in map-making are the determination of the relative positions of places and the measurement of distances. The history of cartography describes the progressive solution of these problems and the assimilation of new geographical knowledge.

### Oldest Known Maps

The oldest known maps served the needs of the land surveyor and the navigator in the earliest civilizations of the Euphrates valley and the Mediterranean basin. The spherical shape of the earth was a familiar idea to the Greeks by the 6th century B.C.; and they constructed a mathematical framework for their world map by making an approximate calculation of the size of the earth, by laying down the network of parallels and meridians, and by devising instrumental methods for the determination of latitude. In his *Geographia* (c. A.D. 160) the astronomer Ptolemy of Alexandria compiled, from travellers' reports and astronomical observations, tables

of latitude and longitude for many places, accompanied by maps.

Ptolemy's work was unknown to medieval Europe, although it survived among the Arabs; and the diagrammatic world maps of the Middle Ages (e.g. the Hereford map of c. 1280) found their main sources in theological tradition. From the so-called "portolan" charts of the Mediterranean and Atlantic shores there developed another series of decorative manuscript world maps which showed the discoveries of Marco Polo and later travellers.

### Improvements on Ptolemy

Modern geography dates from the 15th century, with the revival of Ptolemy, a Latin translation of whose *Geographia*, made in 1410, was widely diffused after the invention of printing; and with the earliest of the great discoveries, notably of America and of the sea route to India. The outlines of Ptolemy's world map, which depicted three continents and an Indian Ocean enclosed by land, were further modified by Magellan's navigation of the western sea route into the Pacific. The maps of the 16th century, in which Spain, Italy, and Holland in turn took the lead, were continuously corrected by information from new discoveries, by study of the mathematical principles of cartography, and by improved methods of survey and observation. The scientific mapping of provinces and countries began. Among the earliest of such surveys is that of the English counties by Christopher Saxton (pub. 1574–79). The leading cartographers of this period were Gerard

Map of the world according to Ptolemy, about A.D. 160. Lines of latitude and longitude were added later  
By courtesy of H. F. Tozer, *History of Ancient Geography*, Cambridge University Press

Mercator and Abraham Ortelius; and the Dutch remained supreme in this field during the 17th century.

More accurate calculations of the earth's shape and size, made chiefly by French geographers, improved the outlines of the world map in the early 18th century, and map-makers of this period (especially J. B. B. d'Anville) made more critical use of their material and introduced better methods of representation. The problem of determining longitude was at length solved by John Harrison's invention of a reliable timekeeper or chronometer. With the development of precision instruments (e.g. Ramsden's theodolite) official trigonometrical surveys of countries were undertaken, the triangulation of England being begun in 1784. This work has been continued in the 19th and 20th centuries, which have also seen the development of many special types of map required by various branches of science.

**TYPES OF MAP.** Maps are commonly classified according to their scale and their purpose. The scale, or proportion between a given linear distance on a map and the corresponding distance on the ground, is expressed either in units of length or as a representative fraction (R.F.) with a numerator of 1; thus a scale of 1 in. to the mile may also be stated as 1/63,360, (there being 63,360 ins. in a mile), indicating that each linear unit on the map represents 63,360 such units on the ground. The smaller

the denominator of the R.F., therefore, the larger the scale.

The amount of legible detail which a map can show depends primarily on its scale and on the clarity of the conventional signs, or symbols, used. Land maps can be classed, according to scale,

out undue distortion; and (c) general or atlas maps, on the smallest scales.

Among the more important general and topographical maps are the International Map, on a scale of 1/1,000,000 (1/M), and the national surveys of many countries.

The British Ordnance Survey publishes topographical maps on scales of  $\frac{1}{4}$  in.,  $\frac{1}{2}$  in., 1 in., and 2 ins. to the mile, covering the whole country, besides plans on 6 ins. and 25 ins. to the mile and town plans on 5 ft. and 10 ft. to the mile.

Nautical charts give little or no land detail but show all marine features which have significance for navigation, e.g. sea depths (within soundings), tides and currents, navigation marks.

Hereford Map, compiled about 1280

as (a) plans, on a scale (not less than 1/10,000 or about 6 ins. to the mile) large enough to define separate buildings and plots of land and to serve the needs of cadastral survey and local administration; (b) topographical maps, on smaller scales but showing the outline of natural and artificial features with-

Special maps illustrate many aspects of physical geography (e.g. meteorological, geological, botanical maps) and of human geography (e.g. population maps, racial, linguistic and political maps, road and railway maps, land utilisation maps, and maps to indicate distribution of products etc.).

**MAP-MAKING: (1) Plane Survey.** The maker of a map on any scale works from the whole to the parts and begins by constructing a rigid geometrical framework of lines and angles to which he can relate the manifold and unsystematic details of the ground. This survey, an essential prelude to the construction of a map, consists of the accurate measurement of distances and directions (or angles). The simpler methods of measuring distance are pacing, the use of a wheel of known

circumference, calculation from the time and rate of movement, and the surveyor's chain. Angles can be measured by compass, plane-table, or theodolite. The plane-table is a drawing-board on a tripod, on which is placed a movable ruler (or alidade) fitted with sights; the theodolite is a telescope which, as it rotates in bearing and elevation, measures both horizontal and vertical angles.

In making large-scale plans of small areas both distance and direction are commonly found from measurements of distance alone. For maps on smaller scales, representing a larger part of the earth's surface, the precise latitude and longitude of a number of points should be known; and one of two methods may be used for the survey and plotting of intermediate (and perhaps inaccessible) points. These methods are (a) traverse, (b) triangulation; each involves measurements of direction or angle.

A traverse is a connected series of lines, or "legs," whose direction and length are known. A traveller can, without leaving his route, determine the bearing and approximate position of visible features on either side of it by prismatic compass or theodolite; or the details can be graphically plotted by plane-table. This method is appropriate in difficult country.

In triangulation the whole area to be mapped is covered with a network of triangles by which the position of a number of points is precisely fixed. A base line (Fig. 1) A B is accurately measured: the surveyor then observes with the theodolite the angles made at each end of this base between it and his line of sight to conspicuous landmarks (in the diagram, C, D). By plane trigonometry he can then calculate the size of the third

angle and the length of the other two sides of the resulting triangle. In a major survey the triangles

directly depending on the base line are very large, and the base and angles measured with the greatest accuracy; from this primary triangulation are developed a number of secondary and tertiary triangles. The accuracy of the whole system depends on the precision with which the primary base is measured.

Triangulation can be carried out graphically direct on the plane table without actual

measurement or calculation of angles. The base line is measured and drawn to a convenient scale on the plane table, which is then set up, correctly oriented, at each end of the base in turn; the other two sides of the triangle are drawn along the lines of sight. After the positions of "ruling (or trigonometrical) points" have been determined by triangulation, the horizontal or plane survey is completed by sketching in other detail to be shown on the map.

In addition to the methods described above, photography is used in various ways by the surveyor, and survey from the air is increasingly used, particularly in remote or difficult country. (See Air Photography.)

(2) *Heights.* In the survey for a map which is to represent surface relief, the height of many points above mean sea level must be determined and the slopes between them defined.

The commonest methods of ascertaining the difference of height between points are:

(a) by the aneroid barometer and other instruments for recording changes in atmospheric pressure and therefore in height; (b) by clinometer or theodolite, i.e. sighting instruments which measure vertical angles; (c) by "levelling." The first, and least accurate, method is convenient for rapid travel. In the second method the angle of sight and the horizontal distance provide data for the solution of a right-angled triangle (as in Fig. 2), and the calculation of the vertical height (i.e. the horizontal distance multiplied by the tangent of the vertical angle). In levelling, a graduated staff and a level fitted with a sight make it

possible to measure small differences of height with great precision. By these methods the surveyor plots "spot heights"; the level of the intervening ground is determined by interpolation or by measurement (with a clinometer) of the average gradient or angle of slope. The outlines of the land forms are completed by sketching in horizontal "form lines" at selected levels.

There are several ways in which the information thus obtained from survey can be so drawn on the map that the relief of the area is clearly conveyed to the reader's eye poised, as it were, vertically above the landscape. A series of contour lines (the most exact method) can be drawn at fixed vertical intervals, e.g. 50 ft. or 100 ft., joining all points which have the same altitude above sea level. The space between contours can be tinted in different graduated colours, usually from lighter shades at sea level to darker at greater heights; this is called layer colouring.

Other conventions for representing relief are less precise but more graphic. Form lines are roughly drawn, unsurveyed contours. "Hachures" are lines drawn down the slope, closer together where the gradient is steep, wider apart where it is gentle. Hills can be shaded as if light were thrown on them from an angle (usually the N.W. corner of the map). All these modes of representing relief can be found in

Map. Fig. 2. Measurement of heights

the later editions of the Ordnance Survey 1 in.-to-a-mile map of England.

(3) *Drawing the Map.* From the material collected in the field survey, the draughtsman compiles the map. After the scale and size of sheet have been chosen, he draws the outlines, using appropriate conventional signs and colours, usually blue for water features, green for woods, red or brown for contour lines. The names are inserted in a size adapted to the character and importance of the features which they designate. The sheet is then, if necessary, reduced by photography or by hand to correct size.

**MAP READING.** The first characteristics to be appreciated in reading a map are its scale and its orientation. Scale, direction of N., and local magnetic variation, with much other useful information, are usually given in the margin, or in a corner. Where the scale is small and the area represented large, the projection of the map should be known, for the linear scale will not be the same in every part of it; the scale given is usually that at the equator or on the central meridian. The scale being known, linear distances and areas can be measured on the map. The measurement of areas is important in using cadastral plans and some types of distribution map, e.g. population maps; otherwise the reading of special maps requires little more than an intelligent understanding of the map's intention and limitations and of the symbols used.

Topographical maps show the distribution of land and water, the physical formation and principal surface features, and the evidences of human settlement. The reading of such maps involves, first, the understanding of the conventional signs, a table of which is provided by a "characteristic sheet" in the margin, and, secondly, the interpretation of their appearance and juxtaposition on the map. It is essential to remember that the many detached symbols to be found on a map depict a *continuous* land surface which must be visualised.

The geographical significance of quite small vertical differences makes the correct reading of relief in topographical maps important. If the map-drawing is sufficiently graphic, a general idea of the relief of an area can be formed by rapid inspection of the map; but exact visualisation of the land forms depicted and of the "run" of the country demands closer examination.

The following clues will help in the reading of contoured maps:

(a) Level ground is contourless; but the absence of contours does not necessarily denote either quite level ground or a regular slope.

(b) The closer the contours, the steeper the slope.

(c) From the drainage system, i.e. the position of watersheds and river valleys, can be determined the direction of slopes.

(d) V-shapes in contours pointing downhill represent projecting ridges or spurs; pointing uphill, valleys. A river will cut through the points of V-shaped contours.

(e) Hills and mts. are represented by contours forming a closed figure.

Such descriptive study of the map leads to analysis of the significant physical character of landscape and of the human activities which are controlled by it. The interpretation of topographical maps is therefore an important aspect of geographical studies.

Garnett, 1930; The Map of England, Sir C. Close, 1932; Map Making F. Debenham 1936; A Key to Maps, H. S. L. Winterbotham, 1936; General Cartography, E. Raisz, 1938; British Maps and Mapmakers, E. Lynam, 1944; Maps and Survey, H. R. Hinds, 5th ed., 1944.

**Map OR MAPES, WALTER** (c. 1140-c. 1210). Medieval Latin author of the Welsh *Marches*. Probably a native of Herefordshire, of Welsh origin, he studied in Paris and was present at the Lateran council in Rome, 1179. Successively chancellor of Lincoln and archdeacon of Oxford, he was also clerk of the court to Henry II, and acted as justice itinerant. He wrote *De Nugis Curialium*—i.e. courtiers' gossip, a miscellany of historical and legendary anecdotes, containing some curious folklore, and also details of his own life. He was probably the author of a French poem on Lancelot of the Lake, the original of the prose romance of that name, and some critics believe he had a great share in shaping the legends of the Holy Grail and the death of Arthur. Some MSS. also attribute to Map, though doubtfully, the authorship of a remarkable cycle of satirical Latin poems on the vices of the

Map-making. Diagram showing how contours are drawn from spot heights

clergy, celebrating an imaginary Bishop Golias or Goliath.

**Maple** (*Acer*). Genus of trees of the family *Aceraceae*. Natives of Europe, Asia, and N. America, they have opposite, undivided leaves and greenish or red flowers, succeeded by a pair of conspicuous "keys," each consisting of a seed

and a wing. They produce useful timber, and the sap is rich in sugar. Several of the American species are

Maple. Common field maple in full leaf

systematically tapped just before spring, when the sap is ascending and yield great quantities of maple-sugar. The species chiefly yielding sugar are *A. saccharinum* and *A. rubrum*. The sycamore or great maple of Europe and W. Asia is *A. pseudoplatanus*; the common field maple of the same countries is *A. campestre*. Many species are grown in European gardens for the sake of the rich autumnal tints of their foliage. See *Aceraceae*. The maple leaf is the national emblem of the dominion of Canada.

**Maple, Sir JOHN BLUNDELL** (1845-1903). British business man, born March 1, 1845. His father kept a furniture shop in London. In this the son joined, and under his enterprising management the business grew enormously until Maple's, in Tottenham Court Road, became a household word for furniture and kindred goods. As a Conservative Maple entered the house of commons for Dulwich in 1887. He was knighted in 1892 and made a baronet in 1897, but left no sons when he died, Nov. 24, 1903. His charities included the rebuilding of University College Hospital, London.

Sir J. Blundell Maple, British man of business

**Mappin Terraces.** Section of the London zoological gardens. First opened to the public in 1913, they were improved after the First Great War by the addition of hills of concrete. The terraces

Mappin Terraces. Feature of the London Zoological Gardens, where visitors can study the exhibits without the interception of bars. The gift of John Newton Mappin, the terraces were opened in 1913

occupy a quadrant-shaped area, in which the animals are seen in tiers. Species of antelope are at the top, bears occupy the middle enclosures, and waterfowl are at the bottom. There are no bars between the exhibits and the on-lookers, a deep ditch keeping dangerous beasts within bounds.

**Maqui** (*Aristotelia macqui*). Evergreen shrub of the family Elaeocarpaceae. It is a native of Chile. It has oblong, toothed leaves and small greenish flowers, followed by small acid berries, at first dark purple, then black, from which is made a wine used as a cure for malignant fever. The wood makes musical instruments, and the tough bark yields strings.

**Maquis** (Fr. from Ital. *macchia*, thicket). Name given to wild, scrub covered areas of Corsica which have frequently served as shelter for bandits. The young men who took to the woods and mountains in Haute-Savoie and elsewhere to avoid being conscripted by the enemy for labour or armed service after the Germans overran formerly unoccupied France in Nov., 1942, called themselves men of the maquis, and under that name formed themselves into resistance groups. Belgians similarly sheltering in the Ardennes (among whom was Prince Charles, Count of Flanders, who

became regent of Belgium in Sept., 1944) also adopted the name. See Resistance Movement.

**Mar**, EARL OF. Scottish title held by the family of Erskine. Mar was one of the ancient divisions of Scotland, comprising most of the S. half of what is now Aberdeenshire. From the

Maqui. Foliage and flowers of the Chilean shrub. Inset, left, flower; right, fruit

12th cent. it was ruled by an earl, who was later one of the seven earls of Scotland. Little is known of the early earls of Mar. In 1377 Thomas, 13th earl, died childless. His sister Margaret, who inherited, married William, earl of Douglas, and their daughter Isabel on her marriage with Alexander Stewart

brought him the title earl of Mar. She died childless in 1407, he in 1435; and the title was adjudged in 1457 to have reverted to the crown in the person of James II of Scotland. He granted it to his son John who died unmarried in 1479. It was afterwards given to other members of the royal family.

In 1565 the earldom was successfully claimed by John, 6th Lord Erskine (d. 1572), as a descendant of one of the early earls, and he is known as the 1st or 6th earl, this double numbering being retained for a time by the succeeding earls. The lands formerly attached to the title, which had been alienated, were recovered by John, the 2nd or 7th earl. John, the 6th or 11th earl, whom his enemies nicknamed Bobbing John, attainted for his share in the rising of 1715, was deprived of the earldom, the Old Pretender, however, making him duke of Mar.

The earldom was restored to his grandson John Francis Erskine in 1824 by Act of parliament. The new earl's grandson succeeded him and succeeded also to the earldom of Kellie (created 1619) by a decision of 1835. On his death, the earldom of Mar was the subject of protracted dispute; a cousin of the late earl inherited without question the earldom of Kellie, and claimed the earldom of Mar, to which there was a rival claimant through the female line in the person of a nephew of the late earl's named John Francis Erskine Goodeve. The title was granted in 1875 to the Lord Kellie, but with precedence only from 1565. This decision was confirmed by Lord Selborne and the lord chancellor in 1877; but was not accepted by Goodeve, who continued to call himself earl of Mar and in 1885 secured, after prolonged legal proceedings, the passage of an Act "restoring" to him the original earldom. He became the 33rd earl of Mar, with precedence from 1404, while his kinsman retained the title earl of Mar and Kellie. The earl of Mar is the premier earl of Scotland; his eldest son is known as Lord Garioch. The earl of Mar and Kellie is also Viscount Fentoun, premier viscount of Scotland, and hereditary keeper of Stirling Castle; his eldest son is Lord Erskine.

**Mar**, SERRO DO (Port., mt chain of the sea). Range of coastal mts. of S.E. Brazil. It is in reality the scarped edge of the S. Brazilian plateau, whence many streams flow to the Parana or Uruguay down the long inland slope. Near

Rio de Janeiro its peaks attain an alt. of 8,000 ft. to 7,000 ft.

**Marabou** (*Leptoptilos crumeniferus*). Species of stork found in Central Africa. It is of large size and ugly appearance, with almost bare head and a pendulous pouch in front of the throat. The marabou is allied to the adjutant stork (*g.v.*).

**Marabouts.** Class of Mahomedan enthusiasts or devotees among the Berbers of N. Africa. They lead public worship in the mosques, profess to work miracles and prophesy, and are revered as saints. In the 11th and 12th centuries, during the Almoravid dynasty, named after them, they exercised great power in Spain and Morocco. Their temporal power has long since disappeared, but in the 19th century they were the chief opponents of French influence in Algeria. The word is also applied to a shrine at the tomb of a marabout. See Mahomedanism illus. page 5418.

**Maracaibo.** Lake in Venezuela. It covers over 5,000 sq. m. and is in reality an inland bay joined to the sea by four separate channels, the largest of which is 8 m. wide and 34 m. long. The lake is a quadrangle about 130 m. long and over 50 m. wide. It is navigable for shallow-draught vessels. Oil is obtained from its bed and basin.

**Maracaibo.** Seaport of Venezuela and capital of the state of Zulia. It stands on the W. shore of a strait leading from the gulf to the lake of Maracaibo, 400 m. W. of Caracas. Although its harbour is small and difficult of access between Oct. and April, it is the second seaport of the republic and a transit port for E. Colombia. It has been completely modernised, and miles of new streets have been built. The climate is damp and hot, with frequent thunderstorms. The chief exports are coffee, cocoa, sugar, rubber, dye-woods, timber, hides, ores, quinine, etc. It has also become the centre of the great oil industry, producing 340,000,000 barrels annually. The sugar plantations, formerly flourishing, have declined in production, but several new sugar centres are being established in the vicinity. The manufactures in-

clude candles, soap, hats, and boots. Pop. 110,010.

**Maracaibo, GULF OF.** Large opening of the Caribbean Sea. In N.W. Venezuela, it is connected on the S. with Lake Maracaibo. Also known as the Gulf of Venezuela, its length is 75 m. and its extreme width about 150 m. It is bounded W. by the Goajira peninsula and E. by that of Paraguaná, on which are two oil refineries. It was discovered in 1499 by the Spanish navigator Ojeda, who, having found houses built on piles, named the dist. Venezuela or Little Venice.

**Maracay.** City of Venezuela. The capital of the state of Aragua, it is connected by a good motor road with Caracas, to which there is also a daily air service. Besides coffee and cacao, the main industries are cattle raising and dairy farming. Pop. 29,250.

**Marachesti.** Town of Rumania, in Moldavia. It is 12 m. N. of Focsani, and is a junction for the rly. serving the Sereth valley.

A battle between the Rumanians and Russians on the one side and the Austro-Germans on the other, was fought near here in 1917. After the defeat and disintegration of the Russians in Galicia, the Germans, under Mackensen, began an attack on the line of the Sereth, which was held by Russian and Rumanian forces. On Aug. 6 Mackensen launched a heavy assault on the Russians N. of Focsani. For the next two days Russians and Rumanians combined in a sharp counter-attack

which checked Mackensen's advance, but did not prevent him from crossing the Susitsa, a W. tributary of the Sereth, capturing Panciu, and getting near the Marachesti junction rly. On Aug. 12 a great battle began to develop in the neighbourhood of Marachesti, but Mackensen was unable to break the Russo-Rumanian line. But on Aug. 28, Mackensen attacked positions held by Russian troops, who, infected with Bolshevism, retired in disorder. Rumanian forces, however, were rushed up, and on Aug. 29 put an end to his further advance. The battle of Marachesti was the greatest battle fought by the Rumanians in the First Great War, and it ended in their complete defeat of Mackensen's tremendous effort to conquer Moldavia. See Rumania.

**Maragha.** City of Persia, in the prov. of Azerbaijan. It stands in a cultivated plain, alt. over 5,000 ft., 20 m. E. of the S. end of Lake Urmia and 50 m. S. of Tabriz. It was the capital of Hulaku Khan, who founded an observatory near by, rendered famous by the work of Nasr-ed-din. A fine, almost transparent marble is quarried, and wine and fruit are exported. There are rock temples in the vicinity. Pop. 15,300.

**Marah** (Heb., bitterness). Place in the wilderness of Shur, where the Israelites found the water bitter, Ex. 15, v. 23; Num. 33, vv. 8, 9. This was perhaps at Ain Suweirah, where the springs are still impregnated with natron. The difficulty was overcome by steeping the leaves of a certain thorn in the water—a very simple method still successfully employed in the district.

**Marajo** or **JOHANNES.** Large, low-lying island of N. Brazil. It is formed by the estuaries of the Amazon and Tocantins and their connecting arms. Swampy and liable to inundation, the W. part bears forests of rubber-yielding trees, and is visited in the dry season by rubber gatherers and hunters.

There are some small settlements on the coast, and the island is intersected by the rivers Mapua and Anajaz. Its length is about 170 m. and its width 130 m.

Marabou. Central African member of the stork family (Ciconiidae)

Maracaibo. The Plaza Baralt in this seaport town of Venezuela, capital of the state of Zulia

**Marbot**, JEAN BAPTISTE ANTOINE MARCELLIN, BARON DE (1782-1854). French soldier. The son of a general, he was born in Corrèze, Aug. 18, 1782. In 1799 he joined the army and soon saw a good deal of service, and became a general in 1814, having won a reputation for leadership in Spain and Russia. He returned to France from an exile in 1819 and, again in the army, served in Algeria, appearing also in politics under Louis Philippe. He died Nov. 16, 1854. Marbot is chiefly known for his *Memoirs*, of which there is an English trans. by A. J. Butler, 1892. They give a fascinating account of the Napoleonic campaigns.

**Marburg**. Town of W. Germany, in the *Land* of Hesse. Situated on a bend of the river Lahn, 19 m. N. of Gressen, surrounded by

the Hessian rulers. It suffered severely during the Thirty Years' War and the Seven Years' War, and became a part of Prussia in 1866. Tobacco, pottery, and wallpaper are normally produced. Taken by armour of the U.S. 1st army, March 28, 1945, it lay within the U.S. zone of occupation after the Second Great War, in the state of greater Hesse. Pop. (1935) 28,439.

**Marcasite**. Sulphide of iron,  $\text{FeS}_2$ . It is of a metallic bronze-yellow colour, and has the same chemical composition as pyrites; but marcasite crystallises as tabular or pyramidal orthorhombic crystals, whereas pyrites is cubic. Marcasite is found in coals, clays, and other sedimentary rocks as nodules, incrustations, and irregular masses. Jewelry is made of cut and polished marcasite. The mineral forms a source of sulphur

Marburg arms

and is used in the manufacture of sulphuric acid and ferrous sulphate.

**Marcellus**, MARCUS CLAUDIUS (c. 268-208 B.C.). Roman soldier. He was five times consul and one of the most successful generals during the second Punic War. His greatest service was the capture of Syracuse after a siege of two years, in 212 B.C. He was slain in a cavalry skirmish near Venusia.

**Marcellus**, MARCUS CLAUDIUS (43-23 B.C.). Nephew and adopted son of the Roman emperor Augustus, and husband of his daughter Julia. He was destined to be the successor of Augustus, and his early death was deeply mourned, cf. Virgil's lines (*Aeneid*, book vi, lines 861-887).

M. Claudius Marcellus  
From a bust

**March**. Third month of the Christian calendar: The first month of the Roman calendar, it was named after Mars, originally the Italian god of the year, especially of the spring. The Anglo-Saxons called it *Lencten-monath* (lengthening month), from the lengthening of the days. From *lencten* comes the word *Lent*. March remained the first month in France until 1564, in Scotland until 1599, and until 1752 in England, where the legal year began on March 25. In England and Scotland the last three days of March were long considered unlucky. See *Calendar*.

**March**. Music designed to assist the marching of soldiers, or processions. Of military marches there are several types for the infantry, including the slow march, for funerals and other ceremonial occasions; the ordinary parade march; the quick march; and the double. Processional marches range from the simple conceptions considered sufficient in the operas of Lully to such majestic creations as Beethoven's *Marche Funèbre* in his Third Symphony, and Wagner's *Siegfried's Funeral March*. March music is usually in 2 or 4 time, but many examples of quick marches are in 6/8 time.

**March**. Market town and urban dist. of Cambridgeshire, England. It is 30 m. N. of Cambridge and 14 m. E. of Peterborough, in the fen district, and has an important rly. junction and the Whitmoor marshalling yards (see diagram pp. 5542-43), with their 40 radiating sidings. The chief industries are engineering and machinery works. Market day, Wed. Pop. 13,000.

**March** or **MORAVA**. Tributary of the Danube, principal river of Moravia, Czecho-Slovakia. It rises in the Sudetic range and flows mainly S. to join the parent stream just W. of Bratislava (Pressburg). The upper course drains about 80 p.c. of Moravia, and the valley forms a wide trough between the Carpathians and the plateau of Bohemia. The lower course was at one time the frontier between Austria and Hungary; it later divided Austria from Slovakia. Its length is 210 m. Part of the river valley is known as the Marchfeld, and has been the scene of many battles.

**March**, EARL OF. Title borne both in England and Scotland by nobles, originally because they had charge of the marches, or the lands which lay around the boundaries between England and Wales or England and Scotland. In England the family of Mortimer pro-

Marburg, Germany. General view of the town and castle

wooded hills and peaks, it is an old and romantic town whose main glory is the church of S. Elizabeth, an outstanding early Gothic building (1235-83) with two towers 226 ft. in height. It contains the tomb of S. Elizabeth of Thuringia and a beautiful Gothic altar. S. Mary's (13th-14th century), the Catholic church (1482), the university church (14th century), the castle on the Schlossberg (1288-1493), the German house (1400), and the town hall (1525) are also buildings of note.

Marburg university was founded in 1527 by Philip of Hesse as a centre of Protestant teaching, but the buildings are modern. It had normally about 200 professors and lecturers and up to 5,000 students. It is closely connected with the history of the Reformation, for there in 1529 Luther's and Zwingli's Marburg religious colloquy was held (see *Lutheranism*; *Reformation*). Marburg obtained urban rights in 1192, became in 1228 the seat of the widowed Elizabeth, and, after her canonisation, a place of pilgrimage. It gained importance as a seat of the Teutonic Order, and in the 15th to 17th centuries as residence of

Marcus Marcellus,  
Roman soldier  
From a statue

vided earls of March from 1328 to 1425. In 1425, when Edward, the 5th earl, died, the estates passed to Richard, duke of York, who was a kinsman, and he and then his son Edward IV were earls of March. (See Mortimer.)

The Scottish earldom was long associated with the family of Dunbar, Patrick, 8th earl of Dunbar, being styled earl of March because of his position as guardian of the marches. The title was forfeited owing to treason in 1434. In 1619 the 3rd duke of Lennox was made earl of March, and in 1675 Charles Lennox, a natural son of Charles II, was made duke of Lennox and earl of March. The title is now used as a courtesy one by the eldest son of the duke of Richmond, a descendant of Lennox. Another earldom of March was created in 1697 for William Douglas, a younger son of the 1st duke of Queensberry. William, the 3rd earl, became the 4th duke of Queensberry, but both titles became extinct on his death in 1810. See Queensberry, Duke of.

**March, ROGER MORTIMER, EARL OF** (c. 1287-1330). The eldest son of Edmund Mortimer, he was made viceroy of Ireland 1316, and in 1321 joined the rebellion of Earl Thomas of Lancaster. He was imprisoned in the Tower, but, escaping to France in 1324, he there formed a liaison with Edward II's queen, Isabella, with whose aid he invaded England. Edward was de-throned and murdered, Mortimer and his paramour becoming the actual rulers. In Oct., 1330, Edward III captured them in Nottingham Castle. Mortimer was hanged at Tyburn, Nov. 29, 1330.

**March, FREDRIC** (b. 1897). An American film actor. Frederick McIntyre Bickel came from Wis-

Fredric March,  
American actor

consin to make his stage debut in Baltimore, in 1920, and played in New York the same year. Entering films in 1928, he came to the fore in *Man-slaughter*, 1931; then *Dr. Jekyll* and *Mr. Hyde* showed his talent for character playing. He was *Browning in The Barretts of Wimpole Street*; *Vronsky in Anna Karenina*; and the hero in *Anthony Adverse*. In 1944 the part of Mark Twain allowed him scope for comedy, and he was starred in *The Best Years of Our Lives*, 1947.

**Marchand, JEAN BAPTISTE** (1863-1934). French soldier. He was born at Thoissey, Aisne, Nov. 22, 1863, and entered the army in 1883, gaining a commission in 1886. He explored extensively in Africa, 1888-98, and in 1898 was in command of the small French expedition concerned in the Fashoda Incident (*q.v.*). He subsequently served in China before resigning from the army. Recalled at the outbreak of the First Great War, he was given command of a brigade, being wounded in Oct., 1914, and again in Champagne in Sept., 1915, when leading his troops. He was promoted general of division in April, 1917, and gained a reputation for great personal bravery. He died Jan. 14, 1934.

**Marchena.** Town of Spain, in the prov. of Seville. It is 47 m. by rly. E.S.E. of Seville, and is a junction on the Cordova-Cadiz rly. A picturesque place, with decaying Moorish fortifications, it has a palace and some interesting churches, one on the site of a mosque. There are sulphur springs and baths, and a trade in agricultural produce. Pop. 15,310.

**Marches** (Fr. *marche*, border). Term applied to territory about the frontiers of adjoining countries, and especially to the borderland of England and Wales and of England and Scotland. The German equivalent is *mark*. Before the final conquest of Wales by Edward I the Welsh Marches comprised the greater part of south and central Wales, and were held by semi-independent English barons known as lords marchers, or marquesses. The marches were not divided into counties until 1536, when the authority of the lords marchers was abolished.

The borderland of England and Scotland was divided into the western and middle marches, each with a governor styled the warden of the marches, and a court intended to settle by peaceful methods the disputes between the people on either side of the border that had formerly resulted in mutual raids and forays. The word is also applied in Scotland to the borders of burghs and estates, and from early times the riding of the marches and the common-riding was an annual custom incumbent upon the bur-

gesses, in order to maintain their rights to the common lands and prevent the seizure and enclosure of these by the feudal barons.

**Marches.** A maritime region of N.E. Italy, situated between the Apennines and the Adriatic. It comprises the provs. of Ancona, Ascoli Piceno, Macerata, and Pesaro e Urbino. The principal products are limestone, sulphur, maize, tobacco, wine, silk, straw-plait, and paper. Formerly a papal possession, it was annexed in 1860 by Victor Emmanuel, and later incorporated in the kingdom of Italy. Area, 3,742 sq. m. See Picenum.

**Marchesi, MATHILDE** (1826-1913). Teacher of singing. She was born at Frankfurt-on-Main, March 26, 1826, and studied in Vienna, and Paris, thereafter having considerable success on the concert platform. In 1852 she married Salvatore Castrone, Marchese della Rajata, Palermo, who as Salvatore Marchesi became famous as a baritone singer and teacher of singing. With her husband, she taught singing at the Vienna conservatoire, 1854-61, at Cologne, 1865-69, and later settled in Paris. Her publications include *École de Chant*, a series of books of Vocalises; in English, *Ten Singing Lessons*, 1901, and an autobiography, *Marchesi and Music*, 1897. She died Nov. 18, 1913.

Her youngest child, Blanche Marchesi, who became the wife of Baron Caccamisi, was educated at Vienna, Frankfurt, and Paris, studied singing under her mother, and herself began to teach at the age of 15. She began her career as a singer at Berlin in 1895, singing thereafter in opera, oratorio, and on the concert platform.

**March Hare, THE.** Character in Lewis Carroll's *Alice in Wonderland*, where he figures in the famous tea-party. The proverb, mad as a March hare, has its origin in the fact that hares are wilder in March, the breeding season, than at other seasons. See *Alice's Adventures* illus.

**Marchienne-au-Pont.** Town of Belgium, in the prov. of Hainaut. It lies in the Sambre valley, 2½ m. by rly. W. of Charleroi, and is an important centre of the coal, iron-working, and engineering industries of the Charleroi area. Glass also is manufactured. Population 22,000.

**Marchioness.** Feminine of marquis (*q.v.*). The Marchioness is the nickname of a character in Dickens's novel *The Old Curiosity Shop*. The ill-used, half-starved maid-of-all-work to Sally and

Sampson Brass is called the Marchioness by Dick Swiveller, who teaches her to play cards and gives her an interest in life. She nurses him through a serious illness, and he eventually makes her his wife.

**Marcion.** Founder of an heretical sect known as Marcionites. He lived in the 2nd century, was a son of a bishop of Sinopé, and was influenced by Docetic Gnosticism. He taught that there was one true God, unnameable and invisible; that the world was created by the Demiurge, identifiable with the Jewish Jahveh; and that the Devil held an intermediate position between the true God and the Demiurge. Christ had not a real body, otherwise He would have connected Himself with matter, a thing essentially evil. The O.T. proceeded from the Demiurge. Of the N.T. Marcion accepted only those parts he regarded as uncorrupted by Judaism. He taught three baptisms for sin, believed in transmigration, denied the resurrection of the body, and advocated extreme asceticism. Tertullian wrote five books against him.

**Marcomanni.** Teutonic tribe that flourished in the first centuries of the Christian era. The name means men of the border or mark. Under their king Maroboduus, who promoted Roman civilization, they extended their dominions from the neighbourhood of Ratisbon (Regensburg) to Bohemia and Moravia. They shared in the great struggle with the Romans, known sometimes as the Marcomannic War, which lasted from 167 to 180, when Commodus bought them off. They were afterwards absorbed by the Bavarians.

**Marconi, GUGLIELMO, MARQUIS (1874-1937).** Italian scientist and inventor. Born near Bologna, Italy, April 25, 1874, of Italian and Irish parents, and educated at the university there, he became interested in the discoveries by Hertz regarding the possibility of wave transmission. He improved existing attempts to make use of the Hertzian waves, notably in the Onesti and Branly coherers, and carried out experiments in 1895-96. Then he submitted his inventions to the British government. In 1897 the Marconi Wireless Telegraph Company was founded, and in 1899 signals were transmitted across the English Channel. Marconi developed a military transmitting and receiving set which was used successfully by the British army in the S.

African war. In Dec., 1901, communication was established between Cornwall and Newfoundland, and a rapid advance was made in methods of communication with ships at sea. By 1903 commercial messages were being transmitted to America by wireless. In 1910-11 Marconi invented a new valve receiver and a new detector, developed a duplex system of transmission, and installed his apparatus in most large ocean-going liners.

Guglielmo Marconi,  
Italian scientist

During the First Great War he was in charge of all radio operations for his government, and introduced radio direction-finding, whereby the position of a stationary or moving transmitter could be plotted and fixed by listening stations. In 1917 he went to America as member of an Italian mission, and in 1919 was a delegate to the Paris peace conference, signing treaties with Austria and Bulgaria.

While experimenting with short waves in 1924, he invented the beam system for long-range transmission which eventually was adopted for the British post office radio telegraphy services to Canada, S. Africa, India, and Australia. In 1934 he introduced an ultra-short wave device to enable ships to enter and clear port in dense fog.

Until the advent of fascism, Marconi took little interest in politics, but in 1923 he joined the fascist party and, becoming a close friend of Mussolini, was appointed a member of the grand council and in 1929 a marquis. During the Abyssinian war he was an ardent propagandist. In 1905 he had married Beatrice O'Brien, daughter of Lord Inchiquin; the union was dissolved in 1927, when he married Countess Bezi-Scali. Marconi's numerous scientific honours included a share of the Nobel prize for physics in 1909, the Albert medal of the Royal Society, and the Kelvin medal. He was made honorary G.C.V.O. in 1914 and an Italian senator in 1915. Consult M., Master of Space, B. L. Jacob and D. N. B. Collier, 1935; M., The Man and his Wireless, O. E. Dunlop, 1937.

**Marconi Inquiry.** Political incident of 1913. It arose from the British government's proposed contract with the Marconi Co. for

the building of a chain of Empire wireless stations. Rumours spread that members of the government were financially interested in the company. Sir Rufus Isaacs (later Lord Reading), attorney-general, and Herbert (later Lord) Samuel, p.m.g., brought a libel action against a Paris newspaper, which withdrew its charges when it was shown that these ministers had dealt only in shares in the American Marconi Co. A select committee was appointed by the govt. and by parliament to inquire into the matter. The Marconi Co. withdrew from the contract in which, however, the committee could find nothing reflecting against the government's integrity. But a minority report criticized the conduct not only of the attorney-general and the p.m.g., but of the chancellor of the exchequer (D. Lloyd George) and the government chief whip (the Master of Elibank), who had also dealt in the American company's shares. After a debate the house accepted expressions of regret from the ministers.

**Marcus Aurelius (121-180).** Roman emperor 161-180. Marcus Annius Verus, who, as the adopted son of the emperor Antoninus Pius, bore the name of Marcus Aurelius Antoninus, is regarded as representing the perfect ideal of the highest pro-Christian conception of character. Drawn from the study of Stoic philosophy to discharge the functions of the Platonic philosopher-king as ruler of the civilized world, he loyally exerted himself to the uttermost.

Marcus Aurelius,  
Roman emperor  
*from a bust*

Unlike Antoninus Pius, he was not to enjoy peace. In the East the Parthians fell upon his borders. Thither in 161 he sent his young colleague Verus. The Parthians were beaten, not by the incapable Verus, but by Avidius Cassius. Across the Rhine and the Danube, Germans and Dacians rose in revolt, and Italy itself was smitten with pestilence. To appease the gods, offended by the decay of religion, Marcus enacted solemn purificatory rites and intercessions. His hand fell heavily upon the Christians, to whose doctrines the wrath of Heaven was in part attributed. Then in 168, though he had no experience in war, he as a matter of duty placed himself with Verus at the head of the

legions. Without apparent reason the tribes of the upper Danube made their submission, without striking a blow. But the submission had been only temporary. From this time, on one frontier or another, Marcus, whose colleague died in 169, was summoned to suppress barbarian risings, and even a rebellion raised in 175 by Avidius Cassius in the east.

The emperor's campaigns were conducted conscientiously and successfully, though without any remarkable display of military talent; the most notable event was a famous battle in which his legions were saved from destruction by an extraordinary storm which created a panic among the opposing forces—a storm variously attributed to the prayers of a Christian legion, and to the virtues of the emperor. In victory Marcus displayed an unflinching magnanimity; but his victories were won at the cost of concessions, which permitted large numbers of barbarians to settle in Roman territory, and greatly hastened the tendency to multiply the barbarian contingents in Roman armies. His weakness found unfortunate expression in his blindness to the vices of his son and successor, Commodus, and possibly of his wife Faustina, though her character has been variously judged. Marcus died on March 17, 180, at the close of a successful, but by no means conclusive, campaign in the regions of the upper Danube. Apart from his great and uncongential work as emperor and the nobility of his public life, Marcus won a permanent place in the affection of all pious and contemplative souls by placing on record his *Meditations*, the noble thoughts of a spirit pure and sincere. *Consult* Lives, E. Renan, Eng. trans. W. Hutchinson, 1904; C. C. Dove, 1930; F. H. Hayward, 1935.

### Mar del Plata.

The Brighton of Argentina, in the prov. of Buenos Aires. Near Cape Corrientes, and 230 m. S.E. of Buenos Aires, it is visited in the summer season by 500,000 people. It has many fine hotels, and other attractions include the casino, fishing, golf, polo, and horse racing. Pop. est. 85,000.

**Mardi Gras.** Festival held on Shrove Tuesday in Paris. The festival, which has been long established, derives its name from the fat ox which is led in procession through the streets of Paris on that day, followed by the triumphal car of a child, nicknamed the king of butchers. A similar festival is held in Italy, and in New Orleans, U.S.A. See Carnival; Lent.

**Mardonius** (d. 479 B.C.). Persian general and son-in-law of Darius the Great, king of Persia. He commanded the first expedition against Greece, but his land forces suffered heavily at the hands of the Thracians, while his fleet was almost wholly lost in a storm. In the second Persian expedition under Xerxes, Mardonius acted as lieutenant to the king, and was left behind after the defeat at Salamis with an army of 300,000 men. He was defeated and slain at Plataea in 479 B.C.

**Marduk.** City god of Babylon. After Hammurabi established Babylon's supremacy, about 2,250 B.C., Marduk appropriated the prerogatives of older Sumerian gods, especially Enlil, with their title Bel, their legends, creation epics, and hymns. The Biblical Bel and Merodach (Isaiah, Jeremiah), and the god of Nebuchadnezzar (Daniel 9), his worship was centred in the Esagila temple at Babylon. Originally the vernal sun, he became lord of life, light, war, and healing. See Babylonia.

### Mare Clausum

(Lat., closed sea). Name of a book written by John Selden in 1636. In 1609 Grotius had written his *Mare Liberum*

(free sea), in which he attempted to show that all men have the right to use the seas freely. To this Selden replied that the English nation had special rights in the narrow seas that engirdle the British Isles. The latter doctrine has been abandoned, and territorial waters are now restricted to a three-mile limit from the shore.

**Maree.** Loch or lake of Scotland. In the county of Ross and Cromarty, it is about 21 m. W. of Kingwall. Fringed for much of its circuit with lofty mountains, it forms one of the most magnificent pieces of scenery in Scotland. The lake is 13½ m. long, has a breadth varying from ¼ m. to 2 m., and covers 11 sq. m.

**Maremma.** Former marsh land of Tuscany, Italy. A coastal tract on the Tyrrhenian Sea, it extends from Piombino to Orbetello and penetrates inland to a depth of from 15 m. to 20 m. Well drained in ancient times, it was prosperous until the underground canals fell into disrepair, and in spite of recent attempts at reclamation, it long remained a malarious forsaken district, until under the fascist régime it was drained once more.

**Marengo.** Village of N. Italy. It lies S. of the Po, 5 m. E. of Alessandria. It is famous for the battle, one of Napoleon's greatest victories, fought between the French and the Austrians, June 14, 1800.

The Austrian army in N. Italy, in the spring of 1800, was about 100,000 strong, but it was divided, only a portion watching for a French advance. Napoleon assembled his army of 40,000 men in Switzerland, led it secretly across the S. Bernard, and on June 2 entered Milan, thus cutting off the Austrians from their homeland. His next move was to find the enemy, but his information was not very accurate, and a good part of his force was scattered in search

Maree, Scotland. View of the loch and islands, from near Talladale

Marduk destroying the monster Tiamat or Chaos. From a Babylonian bas-relief in the British Museum

when the Austrians, under Count Melas, advanced from Alessandria to Marengo, where was the main French army.

The French, outnumbered, put up a stout fight when the Austrians advanced across the Bormida. They were forced, however, to retreat, and were falling back rapidly when at 11 a.m. Napoleon arrived. The rearward movement was continued, on the whole in good order, and the Austrians about 3 p.m. regarded the battle as won. But suddenly came a change. Recalled by Napoleon, Desaix and his division reached the field and an attack was organized. All the available guns were brought into action. Desaix advanced from Marengo, while the cavalry charged on the right flank of the enemy. The Austrians soon broke and fled. The French lost about 4,000 men, including Desaix; the Austrians about 9,000; the main consequence of the victory was the cession of N. Italy to France. See Napoleon.

**Mare Nostrum** (Lat. our sea). Term used by the Romans for the Mediterranean Sea when they were masters of the countries bordering it. Before the Second Great War Mussolini in his propagandist speeches expressed his intention of making the Mediterranean an Italian lake, or *mare nostrum*, assuring the people that no enemy force would be allowed to exist there or to traverse it in the event of war.

**Mare's-tail** (*Hippuris vulgaris*). Aquatic perennial herb of the family Haloragaceae. It is a native of temperate and cold regions of the N. hemisphere. It has a stout rootstock which creeps in lakes and ponds, sending up slender, many-jointed stems, closely invested with whorls of slender leaves. The minute flowers are green, with red anthers but no petals.

Mares' tails is a term popularly applied to high cirrus cloud when it appears in tufts. See Cloud.

**Mareth Line.** System of defences some 20 m. long constructed in Tunisia by the French between the First and Second Great Wars as a defence against possible Italian attack from the E., Tunisia being one of the French possessions vociferously claimed by Mussolini. It took its name from the town of Mareth through which it passed.

The line occupied a series of wadi (watercourse, usually dry) edges and hillocks across the plain from the coast near Zarat to the Matmata hills, among which it ended. After the defeat of France in June, 1940, the Italians took possession of it, and altered it as far as possible to make it defensible against attack from the W. When the Germans and Italians were retreating before the British 8th army in 1942-43, a good deal of work was put into strengthening it. The strongest part of the line ended some 10 m. from the coast, from which point to the sea the natural difficulties of the country had simply been strengthened by occasional pillboxes, barbed wire, and minefields.

After the capture of Medenine, Feb. 20, 1943, Montgomery paused until the middle of March to build up his forces. Rommel had gone back sick to Germany, and the German-Italian army, now occupying the Mareth line, was under the command of the Italian general Giovanni Messe, who, determined as he told his troops to show "those German swine who retreat that we can fight better than they," put up a stubborn defence. The enemy was, however, driven from his outposts on the S. of the wadi Zigzau, which formed a natural anti-tank ditch before the line, during the nights of March 16 and 17. The main attack began on March 20. The wadi was conquered, but there the advance was held. In the meantime Gen. Freyberg (*q.v.*) was leading a column of British and French armour, New Zealand and Greek infantry, round the Axis right flank through the desert to the W. of the Matmata hills. Moving with great speed, this column reached El Hamma, some 35 m. N.W. of Mareth, 20 m. W. of Gabes, on March 27, capturing it after violent fighting two days later.

To escape encirclement Messe abandoned the Mareth line on March 28 and retreated rapidly beyond Gabes to the wadi Akarit. See North Africa Campaigns.

**Marett, ROBERT RANULPH** (1866-1943). British anthropologist. A Jerseyman, born June 13, 1866, he was educated in the island at Victoria College, and at Balliol, Oxford. In 1891 Exeter College, Oxford, elected him fellow and

lecturer in philosophy; and he was its rector from 1928 until his death, Feb. 18, 1943. He held a readership in social anthropology, and during 1913-18 was president of the Folklore Society. Marett's province was anthropology in relation to philosophy, and he showed their connexion in *The Birth of Religion*, 1909; *Psychology and Folklore*, 1920; *The Diffusion of Culture*, 1927. An engaging autobiography, *A Jerseyman at Oxford*, appeared in 1941.

**Margam.** Urban district of Glamorganshire, Wales. It is near the coast 4 m. S.E. of Aberavon, and is a coal mining centre. Near the town is Margam Abbey, long the residence of the Talbot family. Until a sale in 1921, it contained some magnificent works of art. In the park is a conservatory over 300 ft. long, containing a splendid collection of orange, lemon, and other trees. It stands near the ruins of a Cistercian abbey, founded in 1147. Margam church, dedicated to the Virgin Mary and restored in the 19th century, was originally the abbey church. Margam Hill is about 800 ft. high.

**Margaret.** Feminine Christian name. It is derived through the Greek from a Persian word meaning a pearl. Very popular in most European countries, it has many variants, among them Margarita, Marguerite, and the many forms of Margery or Marjorie.

Margaret was long a popular name for princesses in England, Scotland, and France. In addition to those noticed separately, mention may be made of Henry III's daughter Margaret (1240-75), who married Alexander III of Scotland, Dec. 26, 1251, and through her daughter, another Margaret, was the grandmother of the Maid of Norway; of Edward I's second wife, Margaret (c. 1282-1318), daughter of Philip III of France; of James I of Scotland's daughter Margaret (c. 1425-1445), who married Louis XI of France, in 1436, both being children; she is the princess who is said to have kissed the sleeping poet, Alain Chartier; and of James III of Scotland's wife Margaret (d. 1486), daughter of Christian I, king of Denmark. Another was the countess of Richmond and Derby, and the mother of Henry VII. The daughter of the duke of Somerset, she was the benefactress who is immortalised at Oxford and Cambridge as Lady Margaret.

**Margaret.** (c. 1045-93). Saint and Scottish queen. The daughter of Edward, a son of the English

Mare's-tail. Stems and leaves of this aquatic plant

king, Edmund Ironside, she was born in exile, probably in Hungary. Her father died young, and the princess, having returned to England with her brother Edgar Atheling, took refuge with the king of Scots. About 1067 she was married at Dunfermline to King Malcolm III. In Nov., 1093, her husband and eldest son were killed in battle with the English, and on the 17th the queen died in Edinburgh. Three of her sons, Edgar, Alexander I, and David I, became kings of Scotland. Margaret won a great reputation among the Scots by her charity and piety. She was canonised in 1250, and her festival is July 20.

**Margaret (1430-82).** Queen of Henry VI of England, known as Margaret of Anjou. Born March 23, 1430, the daughter of René of Anjou, duke of Lorraine and titular king of Sicily and Jerusalem, she was married to Henry at Titchfield Abbey in April, 1445. Her friendship with the De la Poles made her many enemies, and she made her position more difficult by interference in politics and her association with Somerset against Richard of York. In 1453 her son Edward was born, and during the fit of madness which attacked her husband, 1453-55, Margaret did her utmost to thwart York. The Wars of the Roses broke out, and after a series of defeats and victories, ending in the second battle of St. Albans, 1461, she retired to France. Allied to Warwick, she returned to England, and after her defeat of Tewkesbury, 1471, was made prisoner. Liberated after five years, she returned to France, and died April 25, 1482. *See* Henry VI; *Roses*. Wars of the; *consult* Life, M. A. Hookham, 1872.

**Margaret (1283-90).** Queen of Scotland, called the Maid of Norway. The daughter of Eric II of Norway, and Margaret, daughter of Alexander III of Scotland, she was declared heir to the Scottish throne in 1284. In 1286 her grandfather was killed and she became nominally queen. She remained in Norway until 1290, when, a marriage having been arranged between her and the future English king, Edward II, she was sent to Scotland, but died on arriving at Orkney in Sept.

**Margaret (1489-1541).** Queen of Scotland. Eldest daughter of Henry VII of England, she was born Nov. 29, 1489. In Aug., 1503, after protracted discussions about policy and dowry, she was married to James IV of Scotland, this being

Margaret, younger daughter of King George VI and Queen Elizabeth

the alliance which led to the union of England and Scotland under James VI. In 1513 her husband was killed at the battle of Flodden, and Margaret became regent for her child James V. In 1514 she married Archibald Douglas, earl of Angus. The regency was taken from the queen, who sought refuge in England. For a time she remained there, now trying to get a divorce from her husband, but soon she was again in Scotland, active in the interests of her son. The divorce obtained, in 1527 she married Henry Stewart, who was made Lord Methven. She died at Methven Castle, Oct. 18, 1541.

**Margaret (1353-1412).** Queen of Denmark, Norway and Sweden. The daughter of Valdemar IV of Denmark, she was married at the age of ten to Haakon VI of Norway. On his death, 1380, she became queen of that country and on the death of her son Olaf, 1387, became queen of Denmark as well. Shortly after she was invited by some of the Swedish nobles to accept their crown, this she did, her army defeating the Swedes under King Albert in 1389. By the union arranged at Kalmar, the three Scandinavian kingdoms were brought under one rule, which Margaret continued to exercise until her death, Oct. 28, 1412. *Consult* Margaret of Denmark, M. Hill, 1898.

**Margaret (1553-1615).** Queen of France, known as Marguerite of Valois. The daughter of Henry II and Catherine de Medici, she was born May 14, 1553. In 1572 she was married to Henry of Navarre, afterwards Henry IV, the ceremony being marked by the massacre of St. Bartholomew. She was divorced in 1599 and died in Paris,

March 27, 1615. Cultured and beautiful, yet licentious and extravagant, Margaret had several lovers. She wrote poems and some Memoirs (English translation, Violet Fane, 1892). She is *La Reine Margot* of romance.

**Margaret (b. 1930).** British princess. The second daughter of King George VI and Queen Elizabeth, she was born at Glamis Castle, Aug. 21, 1930, and christened Margaret Rose. She is next in the line of succession to King George VI after her elder sister Princess Elizabeth and the latter's issue.

**Margaret (1492-1549).** French princess. The daughter of Charles of Orleans and the elder sister of Francis I, she is generally known as Margaret of Angoulême. Born at Angoulême, April 11, 1492, she married in 1509 Charles, duke of Alençon, and after his death, Henry, king of Navarre. She died Sept. 21, 1549, leaving a daughter, Jeanne, who became the mother of Henry IV. Margaret is best known for her interest in literature. Her court was the resort of poets and she herself wrote poems. Her best-known work is the *Heptameron*, stories on the lines of Boccaccio's masterpiece. Her niece another Marguerite (1523-74), daughter of Francis I, was also known for her interest in literature. She married Emmanuel Philibert, duke of Savoy. *See* Women and Men of the French Renaissance, E. Sichel, 1901.

Margaret of Angoulême

**Margaret (1446-1503).** Duchess of Burgundy. The daughter of Richard, duke of York, and the sister of Edward IV, she was born at Fotheringay, May 3, 1446. On July 3, 1468, she was married at Damme to Charles, afterwards duke of Burgundy. In the Netherlands Margaret was a staunch friend to her brother and his cause, and during her long widowhood (1477-1503) her interest in English affairs was continuous. She aided Edward to recover his throne in 1470, and after the succession of Henry VII never ceased in her attempts to overthrow him.

**Margaret (1522-86).** Duchess of Parma, and regent of the Netherlands. A natural daughter of the emperor Charles V, in 1533 she married Alessandro de' Medici, duke of Florence and after his death, Ottavio Farnese, duke of

Parma. A capable and fearless woman, when Philip II gave her the regency of the Netherlands, in 1559, she showed herself a strong and intelligent ruler, but she was unable to cope with the revolt which broke out in 1566, and in 1567 she retired to Italy.

**Margarine** (Gr. *margaron*, pearl). Name of an edible fatty food, defined by the Butter and Margarine Act, 1907, as "any article of food, whether mixed with butter or not, which resembles butter and is not milk-blended butter." Other enactments limit the proportion of butter in margarine to 10 p.c., and the water to 16 p.c. To comply with the requirements of the Food and Drugs Act, 1938, and the Emergency Laws (Transitional Provisions) Act, 1946, margarine when exposed for sale must be labelled with the name, and the outside wrapper must show the word margarine in letters as large as any others. Margarine for table use is usually enriched in vitamins up to 450-550 I.U.s vitamin A and 90 I.U.s vitamin D per oz. (See Irradiation; Irradiation of Foodstuffs.)

The margarine industry owes its origin to a prize offered in 1867 by Napoleon III for an artificial butter substitute which should conform as closely as possible physically and chemically with butter, but which would be cheaper and

hard (hydrogenated) fats and soft oils made possible by hydrogenisation, whereby liquid oils can be hardened to a solid white fat by the action of hydrogen. Thus a hard white fat is obtained from whale oil.

Relative proportions of animal and vegetable fats used depend upon the quality and texture desired, and upon the price, animal fats being generally more expensive. The vegetable fats undergo a purification which renders them tasteless, odourless, and colourless. The milk used is either fresh-skimmed or separated; it is introduced to impart the butter flavour and to emulsify the fats. Powdered milk is sometimes used instead of liquid milk. Flavour is enhanced by the addition of butyric and other cultures. In Great Britain a small quantity of colouring matter is added, but in some countries this is prohibited, and margarine is white. To its original colour it is sometimes stated that it owes its name.

Manufacture begins in an emulsifying machine known as the margarine churn, in which the milk, melted fats, and vitamin A and D concentrates are agitated at a strictly controlled temperature until an emulsion is formed. This must then be chilled, crystallised, kneaded, blended, and automatically weighed and wrapped.

coast of Venezuela, is about 19 m. across. Margarita was discovered by Christopher Columbus in 1498 Pop. 70,000. It is famous for its pearl fisheries and hand-made straw hats. It also exports fruit, and tobacco.

**Margate**. Mun. borough, watering-place, and seaport of Kent. In the isle of Thanet, it is 15 m. N.E.

Margate arm

from Canterbury and 74 from London, with three rly. stations. It is also connected with London by regular steam-boat and road coach services. It is a member of the Cinque port of Dover, but is chiefly known as a pleasure resort, the air being remarkably bracing. It has a jetty, a pier, a theatre, winter gardens, good sands, and a fine esplanade. The chief church is S. John the Baptist, of which some of the original Norman work remains. The tower of the Holy Trinity church, a noted landmark, still stands, although the church itself was destroyed during an air raid in the Second Great War. Dane Park is a public pleasure ground. The borough includes the townships of Westgate-on-Sea and Birchington. The E. end of the town is known as Cliftonville, and the central area as Westbrook.

The town has an internal transport system, organized by the E. Kent Road Car Co., which maintains bus connexions with Broadstairs, Ramsgate, and other places of interest in Thanet and E. Kent. Margate was originally a fishing village and a small port. Towards 1800 it became a watering-place; in 1857 it was made a borough. Pop. 40,000.

**Margaux**. Town of France, in the dept. of Gironde. It is 16 m. N. of Bordeaux, with which it is connected by rly. On the W. shore of the Gironde estuary, it is noted for its Médoc wines. Pop. 2,000.

**Margesson**, HENRY DAVID REGINALD MARGESSON, 1st Viscount (b. 1890). British politician. Educated at Harrow and Magdalene College, Cambridge, he was elected Unionist M.P. for Upton division of West Ham, 1922, and for Rugby, 1924. A junior lord of the treasury, 1926-29 and 1931, he was made parliamentary secretary to the treasury and government chief whip in 1931. The strictness of his disciplinary practice in the latter capacity aroused some resentment and criticism, and was occasionally the object of scorn

Margate, Kent. Harbour, pier, and promenade of this bracing S.E.-coast watering-place, a popular holiday resort

keep better. The prizewinner in 1869, a French chemist, Mège-Mouriès, worked out a manufacturing process in which fresh beef fat was digested with a weak alkaline solution in the presence of pepsin. The resulting mixture, cooled, churned with milk, and pressed, was sold in Paris as oleo-margarine.

After 1910 vegetable oils and fats, e.g. those derived from coconut, palm kernel, ground-nut, cottonseed, soya bean, kapok, maize, and sunflower, gradually replaced the exclusive use of animal fats.

A more recent development is the blending in correct proportions of

In Great Britain the margarine industry is principally centred in the Thames and Mersey districts.

**Margarita**. Island in the Caribbean Sea, belonging to Venezuela. It lies off the N.E. coast of Venezuela, and with several adjacent islands forms the state of Nueva Esparta. Its length is 44 m. and its breadth varies from 5 m. to 20 m. Composed of two mountainous portions connected by a low isthmus, its highest point is over 4,000 ft. in alt. The capital is Asunción (g.v.), and the chief port is Pampatar, with a fair harbour. The strait of Margarita, which separates the island from the

among the opposition. Created a privy councillor in 1933, Margesson was secretary of state for war 1940-42. He was created viscount in 1942, the heir being his son, Francis Vere Hampden Margesson.

**Marghilan.** Town of Uzbek S.S.R. in the former province of Ferghana. It is 30 m. E. of Khokand. The chief industries are the manufacture of silk and woollen goods. It is the traditional burial-place of Alexander the Great. Pop. est. 40,000.

**Marginal Theory.** In economics, the theory that the individual's ideas concerning value and hence the desirability of economic action are determined by the margin or the next increment. The marginal utility of a commodity at any time to a person, that is, the subjective value of it to him, depends on his ideas concerning an additional increment; the marginal demand price is the amount that he is just willing to pay to obtain an additional increment; the marginal production of any commodity is that which is just profitable to certain producers at a stated price; the business man tries to ensure that the marginal revenue from extra business shall exceed the marginal costs. The higher the price for a commodity, the lower the margin of production; on the other hand, a higher price raises the marginal demand, that is, excludes those who were previously just willing to buy. The importance of marginal factors in the study of production, consumption, investment, employment, etc., was stressed by Alfred Marshall (Principles of Economics). J. M. Keynes (The General Theory of Employment, Interest and Money) emphasised other elements, such as the marginal propensity to consume, the marginal efficiency of capital, and the marginal multiplier. See Economics.

**Margrave.** (Ger. *Markgraf*). German title meaning count of the march, or border, corresponding to marquess. It was at first applied to governors of frontier districts under Charlemagne. The word soon lost its original meaning, but was long used as a secondary title by German sovereign princes. The feminine form is margravine.

**Marguerite.** Name applied

by florists to several plants of the family Compositae. Originally belonging to the daisy (*Bellis perennis*), and sometimes used for the ox-eye daisy (*Chrysanthemum leucanthemum*), it is more generally applied in gardens to *C. frutescens*.

**Marguerite, PAUL** (1860-1918). French novelist. He was born in Algeria. In 1884, when a clerk in the ministry of instruction, he published his first book, *Mon Père*, embodying his father's letters. His first novel, *Tous Quatre*, 1885, was followed by *Amants*, 1889, and *Ma Grande*, 1891. Then, in 1896, began the collaboration with his brother Victor (b. 1866). Beginning with *Le Pariétaire*, 1896, and *Le Carnaval de Nice*, 1897, they produced *Une Époque*, consisting of four volumes of striking stories of the Franco-Prussian War, as well as many other novels, mainly historical in subject. After 1907 each continued to write alone. Paul died Dec. 30, 1918.

**Mari.** This autonomous republic of the R.S.F.S.R. is described under its alternative name of Cheremisa.

**Maria Christina.** Name of two queens of Spain more generally known as Christina (*q.v.*)

**Marriage Forcé, Le (The Forced Marriage).** Comedy-ballet by Molière. Was produced at The Louvre, Paris, Jan. 29, 1664. In the character of Pancrace, a philosopher who has one ear for French and another for scientific and foreign languages, and who regards it as scandalous to refer to the form (instead of the figure) of a hat, Molière makes fun of the fanatical Aristotelians of his time.

**Mariamnē** (d. 28 B.C.). Wife of Herod I, the Great, and grand daughter of Hyrcanus II. She was put to death by Herod in a fit of jealousy. Her pathetic story formed the subject of several tragedies, including one by Alexandre Hardy, 1610, and others by Tristan l'Hermite, 1637, and Voltaire, 1724. The name is a Greek form of Heb Miriam. See Herod the Great.

**Marianne Islands.** Archipelago of the N.W. Pacific Ocean also called Marianas or the Ladrões. They lie N. of the Carolines and about 1,500 m. E. of the Philippines. The group to the N. are mountainous and uninhabited;

those to the S. are flat and low-lying, the chief being Guam (*q.v.*), which was ceded by Spain to the U.S.A. in 1898, Saipan, Tinian, and Rota. The climate is warm and moist, and the islands produce rice, maize, cotton, sugar, tobacco, and coffee. They were discovered by Magellan in 1521, and were called 'Thieves' (Sp. *ladrones*) Islands. Spain sold them (except Guam) to Germany in 1899 for £840,000. After the First Great War, Japan was appointed mandatory over them, and they were actively fortified. During the Second Great War, Guam was captured by the Japanese on December 9, 1941. On Feb. 22, 1944, the U.S. Pacific fleet struck Saipan and Tinian, the attack being repeated June 10-13, when Japanese bases on Tinian and Guam were shelled and bombed, and on June 15 U.S. Marines landed on Saipan. Garapan, the capital of Saipan, was captured on July 3; organized resistance ceased July 9. U.S. casualties were heavy: 2,359 killed, 11,481 wounded, 1,218 missing; most of the Japanese garrison of 19,000 perished.

Bombardment of Guam from sea and air continued meanwhile until on July 20 amphibious forces landed. Japanese opposition was stubborn here also; organized defence ceased Aug. 10, but isolated groups continued to hold out until mid-Nov. The conquests of Tinian, 2½ m. S.W. of Saipan, was assisted by artillery fire from that island. It took from July 23 to Aug. 7. Japanese troops remaining in Rota I. were left helpless by the U.S. conquest of the other islands; they surrendered Sept. 2, 1945.

The U.N. trusteeship of the Marianne Is. was given to the U.S.A. in 1947.

**Marianske Lazne.** This inland watering-place of Czechoslovakia is better known as Marienbad (*q.v.*).

**Maria Theresa** (1717-80). Ruler of the Holy Roman Empire. Born in Vienna, May 13, 1717, a daughter of the emperor Charles VI, in 1736 she married Francis of Lorraine, grand-duke of Tuscany. In 1740, Charles VI died leaving neither sons nor nephews. By the pragmatic sanction he left as his heiress his daughter, Maria Theresa, who claimed the whole of the Hapsburg inheritance, Bohemia, Hungary, and the German territories, while it was sought to secure the imperial succession for her husband. There were, however, other claimants the chief being Charles

Paul Marguerite,  
French novelist

Marguerite. Flowers  
of the dog daisy

Albert of Bavaria, who procured his own election as emperor. Frederick the Great on his own account seized the province of Silesia, and Europe was plunged in the war of the Austrian Succession. A striking incident was the manner in which the Hungarians, whose loyalty to the Hapsburgs had been extremely doubtful, rallied in support of their courageous young queen. Before the war was ended in 1748 by the peace of Aix-la-Chapelle, Charles Albert died, and Francis of Lorraine was elected emperor as Francis I. At the peace, Maria Theresa had to submit to the loss of Silesia.

The recovery of Silesia and the punishment of Frederick of Prussia now became the great objects of her life. During the ensuing years her minister, Kaunitz, reconstructed the system of European alliances in order to crush Frederick, who anticipated the attack and opened the Seven Years' War by invading Saxony in 1757 and Bohemia in 1758. When the war ended in 1763, Frederick retained his conquests; Maria Theresa did not recover Silesia. In 1765 her son Joseph II succeeded his father as emperor, and was associated with his mother in the government of her dominions. Under pressure from Joseph and with great reluctance, she was accessory to the first partition of Poland in 1772. She died Nov. 29, 1780. Among her other children were the emperor Leopold II and Marie Antoinette, the queen of Louis XVI of France. A woman of great force of character, she fostered the re-

sources of her dominions, and greatly raised the prestige of the empire. *See Austrian Succession, War of; Frederick the Great; Pragmatic Sanction; Seven Years' War; consult also Lives, J. F. Bright, 1910; M. Moffatt, 1911; M. Goldsmith, 1936; C. L. Morris, 1938.*

**Maria Theresa, ORDER OF.** Austrian military order. It was instituted in 1757 by the empress

Maria Theresa.  
Badge and ribbon  
of the order

Theresa, instituted in 1750 and remodelled by Maria Theresa in 1771, which has a black ribbon.

**Maria Theresa Dollar.** Coin current in parts of Africa and Arabia. Dated 1780 and about the size of British crowns, the coins are minted in London, and are in use in the colony of Aden, Abyssinia, parts of the Anglo-Egyptian Sudan, and Arab territories bordering the Red Sea. On one side is the head of the empress Maria Theresa, and on the other the arms of the Austrian empire with the date. The coins have a silver content of 83½ p.c.

**Mariazell.** Town of Austria, in N. Styria. It is 56 m. S.W. of Vienna and is reached by a branch rly. from St. Pölten. Thousands of pilgrims annually visit the wonder-working statue of the Virgin that stands on a silver altar in the 14th century chapel incorporated in the 17th century church. Iron is worked here and at Donauwitz.

**Maribor (Ger. Marburg).** Town of Yugoslavia. It stands on both banks of the Drave, in Slovenia, 55 m. N.N.W. of Zagreb. It has a 16th cent. cathedral with a lofty tower, a castle, and a town hall of the 17th cent. It is the seat of the bishop of Lavant, who has a palace here. The town has a trade in wine and agricultural produce; other industries are the manufacture of railway stock, boots and shoes, etc. There was a settlement here in Roman times. The town is now a summer resort. Pop. 33,131.

**Marico.** Tributary of the Limpopo river, South Africa. It rises in the W. Witwatersrand, and forms part of the boundary between Transvaal and Bechuanaland. The valley contains good irrigable land and is rich in lead and silver. Zeerust is the principal town.

**Marie (1875-1938).** Queen of Rumania. Daughter of the duke of Edinburgh and granddaughter of Queen Victoria,

she was born at Eastwell, Kent, Oct. 29, 1875, and christened Marie Alexandra Victoria. On Jan. 10, 1893, she was married at Sigmaringen to Ferdinand, crown prince of Rumania, who succeeded to the throne in 1914, though he was not crowned until 1922. The queen won admiration for her courage and assistance during the cholera epidemic of 1913. After the First Great War she worked tirelessly for the cause of Greater Rumania, finally established by the peace treaties. After King Ferdinand's death in 1927 she lived mainly in England and the U.S.A., devoting herself to charitable works and to writing, in which she had already enjoyed success. Her books in English include *My Country*, 1916; *Ilderim*, 1925; and her autobiography in three volumes, 1934-35. She died July 18, 1938. Among her children were ex-king Carol of Rumania; Elizabeth, who married George II of the Hellenes, and Marie, queen of Yugoslavia.

Rumania

**Marie Antoinette (1755-93).** Queen of France. Daughter of the empress Maria Theresa and Fran-

Maria Theresa  
After the portrait  
at Versailles by  
J. M. Nattier

Marie Antoinette,  
Queen of France  
After Greuze

cis I, she was born in Vienna, Nov. 2, 1755. No pains were taken over her education, and she was barely 14 when she was betrothed to the dauphin, afterwards Louis XVI, marrying him May 16, 1770. Her rather boisterous humour and total disregard of etiquette immediately made her position at court difficult, and when her husband succeeded to the throne in 1774 the grossest libels were circulated about her. Receiving the ad-

dressess of Count Fersen and others, Marie Antoinette was soon an object of general hatred, and the affair of the Diamond Necklace (*q.v.*) only increased the odium in which she was held, and further besmirched her character.

Though the queen's worst fault was lack of understanding, she soon realized the weakness of her husband, and her influence was continually used against reform. The people attributed every national disaster to her, and when the financial situation of France grew desperate she was nicknamed *Madame Deficit*. When the Revolution came it was she rather than the king who was blamed for the misgovernment of centuries. Mirabeau could and would have saved her but she hated him and refused his aid. The abortive flight to Varennes only seemed to show more clearly that she was seeking foreign aid and inviting invasion. The Tuileries was invaded by the mob, June 20, 1792; Louis, wearing the cap of liberty, was treated with contempt, but upon Marie Antoinette the crowd heaped such hideous abuse that her hair turned white in the night.

On Aug. 10, the Tuileries was again stormed, her Swiss guards were killed at their posts, and the royal couple were sent as prisoners to the Temple. Marie Antoinette was separated from Louis in Dec., to see him again only on the morning of his execution, Jan. 21, 1793, and for ten months longer she lay in prison. Her son was taken from her in July. Two attempts were made to rescue her, and in Aug. she was moved to the Conciergerie. She appeared before the revolutionary tribunal on Oct. 14, and was accused of treason. She maintained her calm to the last, repudiating the unnameable charges Hébert levelled against her with a dignity which

impressed even her callous judges. The trial lasted two days, sentence of death was passed at 4.30 a.m. on Oct. 16, and at 11 she ascended the scaffold. *See Conciergerie*; *Effigy* illus.; *French Revolution*; *Louis XVI*.

**Marie de' Medici** (1573-1642). Queen regent of France. A daughter of Francesco de' Medici,

Marie de' Medici,  
Queen of France  
From a medal

grand duke of Tuscany, she was born at Florence, April 26, 1573, and in 1600 married Henry IV of France. Henry was murdered in 1610 and Marie became regent to their son, Louis XIII. An ambitious and unscrupulous woman, she was influenced by Concini and his wife, Italians whom she had brought with her from Florence. In 1617 Louis asserted his authority, was privy to the murder of Concini, and exiled his mother to Blois, where she remained until 1619. She was then liberated, but her attempts to regain power were futile. She made an enemy of her former counsellor Richelieu, and in 1631 fled the country, dying at Cologne, July 3, 1642.

**Marie Galante.** French island in the West Indies, a dependency of Guadeloupe. It yields sugar and tropical fruits, and has rocky shores and no good harbour. The chief town is Grand Bourg. Area, 60 sq. m. Pop. 14,927.

**Marie Leszczynska** (1703-68). Queen of France. She was the daughter of Stanislas Leszczynski, king of Poland, and was born at Breslau, June 23, 1703. At 22 she was married to Louis XV of France, then 15. Homely, practical, and affectionate, she endured much from the insolence of her husband's favourites, and led a semi-retired life, engrossed in works of charity and religion. She had two sons and eight daughters. She died at Versailles, June 24, 1768.

**Marie Louise** (1791-1847). Empress of the French. A daughter of the emperor Francis I, she was born Dec. 12, 1791. She was 18 when Napoleon divorced his wife Josephine and arranged a marriage with this Austrian princess. The wedding was celebrated by proxy at Vienna, March 11, 1810, the civil and religious rites proper being celebrated in Paris on April 2. A son, styled the king of Rome, was born in 1811. Marie Louise acted as regent during Napoleon's absence in 1814, but proved utterly incapable. When the allies were approaching Paris, she left the city on the express instructions of Napoleon and joined his brothers at Blois. After his abdication she returned to Austria under the escort of the Count von Neipperg, refusing to reside with her husband at Elba. At the congress of Vienna the duchies of Parma, Guastalla, and Piacenza were settled upon her. In Parma she came under the influence of Neipperg, to whom she bore several children, and whom she married in 1822. After her departure from France she never beheld her son until he lay on his deathbed in 1832, and her whole aim seems to have been to forget her association with Napoleon. She died in Vienna, Dec. 18, 1847. The diaries of Marie Louise were edited by F. Masson, 1922. *See Napoleon*.

Marie Louise  
After Prudhon

**Mariénbad.** German and better-known name of the Czech inland watering-place also called Mariánské Lázně. This is in Bohemia, 19½ m. by rly. S.E. of Cheb (Eger), in a picturesque valley amid pine-clad hills. The ten springs are cold and contain

Mariénbad. General view of the Czech watering-place, beautifully situated among the pine-covered hills of Bohemia, at a height of over 2,000 ft.

Glauber's salt. Besides drinking water there are provided chalybeate, saline, peat, and mud baths. There are English, Russian, and Protestant churches.

**Marienberg.** Town of Saxony, E. Germany. It is 32 m. S.S.E. of Chemnitz, near the Bohemian frontier of the Erzgebirge. S. Mary's church and the town hall both date from the 16th century. There are textile and toy factories. Pop. 7,891.

**Marienburg** (Pol., Malbork). Town of Masuria, Poland, formerly in E. Prussia. It is on the right bank of the navigable Nogat, which from 1920 formed the frontier with the Danzig free state. Marienburg is famous as the residence of the grand masters of the Teutonic Knights, whose colossal castle, severely damaged in the Russian advance of 1945, still stands. This castle, covering with its annexes nearly 10 acres, was begun in 1276 and considered the greatest secular building of the Middle Ages; it was completed in 1398, taken by the Poles in 1457, and fell to Prussia in 1772. Between 1817 and 1914 all the buildings were repaired. Herewas held the plebiscite in 1920 which turned against Poland. Before the Second great War Marienburg had chemical, soap, cigar, and furniture industries and was a rly. junction. Its pop. of about 25,000, being German, was expelled when the Poles took over administration in 1945.

**Marietta.** City of Ohio, on the Ohio R., at the mouth of the Muskingum, 95 m. S.E. of Columbus. It is the co. seat of Washington co., the oldest settlement in the state, and the oldest town W. of the Alleghenies, founded in 1788 by a group of Revolutionary officers from New England. The name honoured Marie Antoinette. Civic rights date from 1852. Among memorials and landmarks are a sculptured group of six heroic figures by Borglum; the Campus Martius memorial museum; and the Mound cemetery, which includes an ancient Indian burial mound and the graves of 24 Revolutionary officers. In Marietta College library is a notable collection of Americana. The "elm city" has the largest elm in the U.S.A., shady streets, and Colonial, Tudor, and Gothic houses. It is served by rly.,

steamers, and airport. Situated in a gas and oil field, it manufactures castings, gas engines, safes, furniture, concrete products, chemicals and paints. Pop. 14,543.

**Mariette, FRANÇOIS AUGUSTE FERDINAND** (1821-81). French Egyptologist. Born at Boulogne,

Feb. 11, 1821, he graduated at Douai, 1841, became professor at Boulogne, studied Egyptology, and entered the Louvre, Paris, 1849. During an Egyptian visit he discovered the Serapeum (*q.v.*), 1851; and the so-called temple of the Sphinx, Gizeh, 1853. He returned to Cairo, 1858, as conservator of monuments and first director of the national museum, and directed excavations on 37 sites, including Dendera, Edfu, Karnak, Abydos, and Tanis (see *Mastaba*). There are Eng. trans. of his *Monuments*

F. A. F. Mariette, French Egyptologist

Marienburg, Poland. The castle of the Teutonic Knights, seen (pre-war) from across the Nogat

of Upper Egypt. 1877, and *Outlines of Ancient Egyptian History*, 2nd ed. 1892. He was made pasha, 1879, and died at Bulak, Jan. 19, 1881.

**Marigold** (*Calendula officinalis*). Annual herb of the family Compositae, native of S. Europe. It has oblong leaves, and large orange-rayed flowers, which are produced plentifully from spring to autumn. This is the marigold of the poets, and was used for making marigold vinegar, a domestic remedy, and for flavouring soups. The marigolds of florists are natives of Mexico, called African marigold (*Tagetes erecta*) and French marigold (*T. patula*). See *Marsh Marigold*.

**Mariinsk.** Town of the W. Siberian region of the R.S.F.S.R. It is 110 m. E. of Tomsk, on the Trans-Siberian rly. and the river Kiia. There are tanneries, brickworks, and soap factories. Mariinsk should not be confounded

with Mariisk, a variant spelling of Mari in the form Cheremisa-Mari republic (see *Cheremisa*); or with Marinsk, the name of two towns, one in the extreme N.W. of Kazakh S.S.R., the other on the Amur, 110 m. S. of Nikolaevsk, in the Far Eastern region.

**Marijuana.** American name for a narcotic also known as bhang (*q.v.*).

**Marinduque.** One of the Philippine Islands. Formerly a separate prov. and now a div. of the prov. of Tabayas, it lies S. of Luzon and covers an area of 352 sq. m. Its well wooded surface rises to 2,500 ft., in San Antonio and other peaks, and among the chief products are rice, hemp, coconuts, and copra. Tobacco has been cultivated with success since 1799, and the existence of petroleum is reported. Boac is the chief town.

#### Marine Biological Research.

Investigations aimed at increasing knowledge of the animal and plant life of the seas. Up to the time of the celebrated voyage of H.M.S. Challenger such investigations had been the concern of naturalists accompanying surveying vessels, or making individual efforts on a smaller scale. At about the time of the Challenger Expedition (*q.v.*) it became apparent to maritime powers that fisheries regulations were necessary; and the need for accurate knowledge of the biology of marine organisms of use to man, before regulations could be formulated, was recognized.

The advancement of marine biology (one aspect of oceanography) has been helped principally by the organization of further long-range, deep-sea expeditions, the establishment of marine biological stations at suitable places along the coasts, and fisheries investigations. Of many expeditions from Scandinavia among the more notable have been those of the Michael Sars (Norwegian) and the Dana (Danish). The Tiefsee, Plankton, and Meteor expeditions from Germany were outstanding. Prince Albert I of Monaco fitted out and personally headed several smaller expeditions, besides founding his famous museum of oceanography. Important expeditions have also been made by Dutch scientists. As a result of voyages of ships of the British Discovery Investigations, with the primary object of studying conditions relevant to the Antarctic whaling industry, more is known about the life of the southern ocean than of any other large sea-area.

Marine Biological Research. Plymouth Laboratory of the Marine Biological Association of the United Kingdom

In the U.S.A., since the pioneering days of Louis and Alexander Agassiz and the fisheries steamer *Albatross*, several expeditions, including the voyages of the *Atantis*, have been organized.

At M.B. stations students and research workers from the universities and other scientists can study marine organisms under good lab. conditions, with facilities for work on living material. The first great M.B. station was founded on an international basis at Naples by Anton Dohrn, in the same year (1872) that the *Challenger* sailed; most maritime countries now have several. In Great Britain the leading such station is the Plymouth lab. of the M.B. association of the U.K. The govt. fisheries lab. at Lowestoft was an early offshoot from Plymouth. Other important stations are at Port Erin, I. of Man, and at Millport, Gt. Cumbrae I., connected respectively with Liverpool and Glasgow universities. The small Gatty marine lab. at St. Andrews, recently reopened, was first in the field (1883). In the U.S.A. the most important stations are at Woods Hole and La Jolla.

Many universities, especially in the U.S.A., have oceanographical depts. where marine biology is studied. In the U.K., Liverpool and Hull have specialised in oceanography.

Marine biology concerns knowledge of the cycle of life in the sea as well as of the distribution, seasonal variations, and migrations of marine animals. Detailed morphological and biological work is also carried out on individual species. The life-histories, growth-rates, etc., of the fishes, and their environment, animate and inanimate, are studied, e.g. other

organisms inhabiting the same sea area in the light of their potentialities as food for the fish, or as enemies preying on the fish, and physical factors such as currents and temperature.

Practical applications of marine biology, other than those affecting fisheries, include methods of using seaweeds, and of dealing with

organisms which attach themselves to and foul ships' bottoms or damage under-water structures by boring.

The international council for the exploration of the sea, with H.Q. in Copenhagen, has fostered marine biology, and the science owes much to the cooperation of practical fishermen, whalers, and seamen generally. See Oceanography. Consult also *The Depths of the Ocean*, John Murray, J. Hjort, and others, 1912; *Founders of Oceanography*, W. Herdman, 1923; *The Seas*, F. S. Russell and C. M. Yonge, 1928; *Science of the Sea*, E. J. Allen, 3rd ed., 1928; *The Oceans*, Sverdrup, Johnson, and Fleming, 1942; *The Fish Gate*, M. Graham, 1943.

**Marine Corps, U.S.** Branch of the U.S. armed forces. Formed by the first Continental Congress in 1775 as a part of the naval establishment for duty at sea or on shore, it is the oldest force in the military or naval service

of the U.S. The corps furnishes detachments aboard battleships, cruisers, and aircraft carriers; maintains amphibious striking forces with the navy; and provides garrisons at naval shore stations. The organization includes infantry, artillery, paratroopers, armoured and supply units. There is also a Marine Corps air force. The strength in peacetime is 100,000; but during the Second Great War it was of the order of 500,000. The headquarters is at Washington, D.C. In both the First and Second Great Wars a Marine Corps women's reserve was formed; in the First for clerical duties only, and in the Second for administrative duties, to serve as ground crews of the air force, and to maintain vehicles and supply depots.

Considered a corps d'élite, units of the Corps especially distinguished themselves during the Second Great War in the defence of Wake Is., Dec., 1941; in the Philippines; in New Guinea; and in the capture or recapture of Guadalcanal, Guam, Saipan, Tarawa, Iwo Jima, and Okinawa.

**Marine Placers.** A type of mineral deposit formed by gravity concentration on sea-shores. When a rock forming a cliff or bluff is eroded by wave action, the heavy minerals tend to be concentrated in streaks and lenses on the beach—the concentration being effected by the movement of the water and differences in specific gravity between the light and heavy minerals. The beach at Nome, Alaska, was phenomenally rich in gold. See Placer Deposits.

**Mariner's Compass.** Type of navigating instrument used to indicate the direction in which a ship is moving. See Compass.

**Marines.** Name given in Great Britain to soldiers raised and trained for service on board ship. See Royal Marines.

**Marine Sedimentation.** Process by which solid materials are deposited on the sea floor. Marine sediments were first systematically investigated by Murray of the *Challenger* Expedition (q.v.), 1872–1876. Study of marine sedimentation involves research into, e.g., the origin of sediments, the way they are transported to the ocean floor, the formative chemical changes taking place, and the distribution and vertical stratification of the structures formed by the accumulation of this material. Many of the rocks at present above sea level are

Marine Biological Research. The 44-metre plankton net being shot from R.R.S. *Discovery II*

sedimentary deposits laid down under former seas.

Some of this sedimentary material, e.g. quartz, mica, feldspar, is derived from the weathering of rocks and is carried by streams in solution into the sea. Volcanic activity also contributes lava fragments, pumice, volcanic glass, etc. Of particular importance and interest are the skeletal remains of planktonic organisms, the foraminifera and pteropoda giving rise to calcareous deposits and the diatoms and radiolaria to siliceous deposits. Fragments of benthic organisms such as corals also contribute appreciable quantities of calcareous material. Inorganic substances precipitated out of sea water, especially calcium carbonate and probably dolomite, can form part of the sedimentary covering; even meteorites have been dredged from the sea floor.

Marine sediments fall into two groups, pelagic and terrigenous. Pelagic deposits are found in the deep ocean basins and extend across 75 p.c. of the total area of the ocean floor. Inorganic pelagic sediments (defined as those containing less than 30 p.c. of organic material) are known as red clay, while the organic pelagic sediments (containing more than 30 p.c. of organic material) are called ooze, e.g. globigerina ooze, pteropod ooze, diatom ooze, radiolaria ooze. Red clay and globigerina ooze are the most widely distributed, but of particular note is the almost continuous belt of diatom ooze around Antarctica, whose seas support a rich growth of diatoms. Radiolarian ooze is typical of the equatorial regions of the Pacific ocean, while pteropod ooze occurs in substantial quantities only in the Atlantic.

Terrigenous deposits form a zone near the shores, usually containing at least some coarse material derived from the land. Here are sands, silts, and muds, usually classified according to the size of the constituent particles. The remains of planktonic organisms may form part of these deposits, but in addition the calcareous skeletons of organisms which live on the sea floor (benthos) are particularly abundant in terrigenous sediments of low latitudes, in contrast to those of high latitudes which are chiefly composed of mineral fragments.

Dredges and snappers are used to collect samples of bottom deposits. For investigation of the vertical layering, long metal tubes are driven into the sediments

either by their own momentum or by an explosive charge, and when pulled out contain a sedimentary core. Cores up to five yards long are thus secured; they yield much valuable data on the past history of the oceans.

N. B. Marshall

**Marine Store Dealer.** Person dealing in anchors, cables, sails, old junk, old iron, or other marine stores. He must have his name and the words "Dealer in Marine Stores" painted in letters 6 ins. long on every warehouse belonging to him. He must keep proper books showing when each article was bought and the name, address, and description of the person from whom he bought it. He must not buy from persons under 16.

**Marinette.** City of Wisconsin, U.S.A., the co. seat of Marinette co. It stands on Green Bay, an arm of Lake Michigan, at the mouth of the Menominee, 161 m. N. of Milwaukee, and is served by rlys. and lake steamers. Connected with Menominee and Michigan across the river by bridge and car ferry, it is a port of entry. A trading post in 1795, it became, by virtue of its good harbour, a fur trading and lumber shipping centre, specialising in white pine until 1900. This activity has declined, but Marinette has paper and pulp mills and granite works. It was settled in 1830, and became a city in 1887. Pop. 14,183.

**Marinetti, FILIPPO TOMMASO** (1876-1944). Italian writer. Born at Alexandria, Dec. 22, 1876, he was educated at the Sorbonne, and was awarded a prize for his poem, *Les Vieux Marins*. Initiator of the futurist movement in arts and politics, he issued his first manifesto in 1909, writing and lecturing extensively and advocating principles which were to reach their logical development under fascism. After the First Great War he founded the *Fasci Politici Futuristi* in an attempt to associate his ideas more closely with those of Mussolini. Apostle of the doctrine that war brings out a nation's highest qualities, he fought in the Abyssinian campaign of 1935-36, and died Dec. 2, 1944. His chief works include *La Conquête des Étoiles*, 1902; *Futurismo e Fascismo*, 1922.

**Marini, GIAMBATTISTA** (1569-1625). Italian poet. He was born at Naples, Oct. 18, 1569, and lived successively at the courts of Rome and Turin before passing on to the patronage of Marie de Medici at Paris. Here he wrote his most

famous work, *Adone*, 1623, an epic romance on the loves of Venus and Adonis. His verse, sonnets, eclogues, canzoni, etc., all

G. Marini,  
Italian poet

enjoyed wide popularity, and long enjoyed wide popularity, Naples, March 25, 1625.

**Marino.** Town of Italy, in the prov. of Rome. Picturesquely placed at an alt. of about 1,200 ft. on the Alban Hills, it is 15 m. by rly. S.E. of Rome. It was the stronghold of the Orsini from 1266 to about 1420, when it passed to the Colonna family. The town is noted for its wine.

**Mariolatry.** Popular but incorrect name applied to the veneration or worship of the Blessed Virgin Mary, as practised by the R.C. Church. The term is incorrect, inasmuch as the supreme worship (*latreia*) has never been accorded to the B.V.M., but is restricted to God alone. R.C. theologians ascribe to her only the highest veneration (*hyperdulia*), while a lesser reverence (*dulia*) is paid to the saints generally. In the liturgical prayers of the missal and breviary are to be found only petitions that the faithful may be aided by her intercession with God. But the popular devotions go much farther, as is shown by such expressions as Gate of Heaven, Co-Redemptrix, our only Hope of Salvation.

Anything like direct invocation of the B.V.M. was unknown in the first centuries of the Christian Church, but in the 4th century the Collyridian heretics were charged with worshipping her. The oldest form of devotion to the B.V.M. is the Hail Mary, the first half of which—taken from the angel's salutation in the Gospel—was first used in the 7th century. The second half of it, which alone contains a direct prayer, is not known to have been used till the 15th century. In the 12th century the Crown of the Virgin, which consisted of 63 recitations of the Hail Mary (first half), came into use; while the Rosary (*q.v.*) dates from the 13th century, being commonly said to have been devised by S. Dominic in 1210. The practice of saying the Angelus—consisting of three Hail

Marys, a collect, and some versicles—morning, noon, and night, at the sound of the church bell, dates from the 14th century. At the Reformation, the invocation of the B.V.M. was abandoned by Protestants as unwarranted by Holy Scripture. See Angelus; Ave Maria; Mary; Rosary.

**Marion.** City of Indiana, U.S.A., the co. seat of Grant co. It stands on the Mississinewa, 70 m. N.E. of Indianapolis, and is served by rlys. and an airport. It was known as "queen city of the gas belt" when natural gas and then oil were discovered in the 1880s and '90s, but supplies of both were soon exhausted and the city turned to other industries, e.g. manufacture of glass, insulated wires and cables, electric stoves and lanterns, footwear, food products, flour, and paper. Settled about 1825, it became a city in 1889. Pop. 26,767.

**Marion.** County seat of Marion co., Ohio, U.S.A. The city is 45 m. N.W. of Columbus, and is served by rlys. and an airport. Centre of a farming district, it has limestone quarries, rly. yards and shops, and turns out steam, gas, electric and Diesel shovels, dredges and conveying equipment, tractors, and agricultural machinery. Founded in 1821, it became a city in 1880. President Harding (q.v.) was associated with Marion from 1884 until his death in 1923, publishing *The Marion Star* before he entered politics; he is buried here, and his memorial is a mile to the S. Pop. 30,817.

**Marion Island.** One of a group of islands in the Indian Ocean. Situated in lat. 46° 27' S., and long. 52° 14' E., it is 1,200 m. S.E. off the coast of S. Africa. Marion is 12 m. long and 7 m. wide. It consists of a narrow shelf sloping steeply upwards to a snow-covered mountain 4,200 ft. high. The island is bleak and desolate, its level parts boggy and covered in lichen. Marion was discovered in 1772 by the French explorer Marion du Fresne, who erroneously believed it to be part of the Antarctic continent. It was visited in 1776 by Cook, who named it Prince Edward Island, after Queen Victoria's father, and claimed it for the British crown. Uninhabited until Dec. 30, 1947, it was then officially annexed by the Union of S. Africa. A weather forecasting station was set up, and the island has become strategically important as a base for air patrols over the Indian Ocean.

**Marionette.** One of the many types of dramatic figure included in the general term puppets. Marionettes are full length figures, in contrast to the bodiless sleeve or glove puppets of the Punch and Judy type. They are made of wood, metal, or plastic material, and are articulated in various ways so that they can perform the special movements required by their manipulator. They are controlled from above the stage on which they act by means of wires or strings, whereas glove and rod puppets are operated from below the stage level.

The origin of the name marionette is obscure, but marionettes are certainly of great antiquity. It is probably a diminutive of Mary, since small images of the Virgin, jointed and manipulated

like the present-day marionette, were known in the 16th century. There are records of marionette performances in ancient Greece as early as 420 B.C. China, Japan, India, Burma, and Java each has its traditional dramas. France, Germany, Italy, Sicily, Belgium,

Marionette. Boys of Beckenham and Penge County School rehearsing their puppet under-water ballet. Top, marionette show at the Grafton Theatre, London from the operator's view-point

and Russia have long been homes of the marionette. Each country has its own distinctive types and its own traditional plays and sets of characters, with their own peculiarities of dress and methods of manipulation.

In England marionettes were known in early times as motions. Shakespeare makes mention of them in several of his plays, and Ben Jonson in his *Bartholomew Fair* lays a riotous scene in a puppet booth. Cervantes in *Don Quixote* gives an almost similar scene in a marionette theatre. They were very popular also in

the 18th century. Powell, one of the most famous of English showmen, established his puppet theatre in the vicinity of S. Paul's, Covent Garden. There were also a number of famous English troupes in the 19th century. See *Puppet*; consult also *Histoire des Marionnettes*, C. Magnin; *A Book of Marionettes*, H. H. Joseph, 1920; *Everybody's Marionette Book*, Whanslaw, 1935.

**Mariotte, EDMÉ** (c. 1620–84). French physicist. Born in Burgundy, he became one of the original members of the Academy of Sciences in 1666. He carried out experiments to determine the height of the barometer, the motion of water through pipes, and other problems in hydraulics, and the composition of air, on which he published a book containing a statement of Boyle's law, which Mariotte discovered independently, and which is known in France as Mariotte's law. He died in Paris, May 12, 1684. See *Boyle*; *Gas*.

**Mariposa Grove.** Tract of land in Mariposa co., California, U.S.A. About 4 sq. m. in extent, it contains two groves of the *Sequoia gigantea*, or redwood, the largest tree having a circumference of 94 ft., and its main trunk a height of 200 ft. The road through the grove passes through an opening 9½ ft. wide, piercing the base of one of the trees. The tallest is 272 ft. high. The area is reserved as a national park. Mariposa is Spanish for butterfly.

**Maris, JACOB** (1837–99). Dutch painter. Born at The Hague, he studied first at The Hague Academy, and afterwards in Antwerp and in Paris under Hébert. At Paris he came under the influence of the Barbizon school (*q.v.*), and exhibited at the Salon, 1862–72. Returning to The Hague, he painted Dutch landscape, river scenes, and coast scenery, and

Jacob Maris,  
Dutch painter

Marionette. Reproductions from a Japanese print illustrating a head with the mechanism for moving eyes and mouth; arms and hands, with contrivance for working the fan; complete figure with movable head and limbs

By courtesy of The Marionette, Florence

died at Karlsbad, Aug. 17, 1899. His work is remarkable for its delicate rendering of atmospheric effects and its strong sense of design. The Drawbridge is in the National Gallery, London.

**Maris, MATTHEW** (1835–1917). A Dutch painter. Born at The Hague, he studied at the local art school, and later under Van Hove at Antwerp and Hébert at Paris. He developed a style and vision of his own, mystic, emotional, and irresistibly attractive. Montmartre, in the National Gallery, London, and *The Spinner* may be cited among his works. Several years he lived as a recluse in London, where he died Aug. 22, 1917.

**Maris, WILLEM** (1844–1910). A Dutch painter. Born at The Hague, he studied mainly under his elder brothers, Jacob and Matthew Maris. He is represented in the National Gallery, London, by a picture of Ducks, but most of his paintings are pastoral landscapes, executed with the freshness and vigour of the Dutch open-air school of the 19th century. He died in London in 1910.

Willem Maris,  
Dutch painter

**Marischal, EARL.** In Scotland, a high officer of state with duties similar to those of the earl marshal in England. Sir Robert Keith (d. 1346) was described as marischal to John Baliol in 1294, and about 1309 received a charter of the office of marischal of Scotland. The post became hereditary in the family of Keith, which in 1458 was raised to the peerage with the title of earl marischal. The office itself ceased to exist after the attainer in 1716 of George Keith, the 10th earl. See *Earl Marshal*.

**Marischal, GEORGE KEITH, 10TH EARL** (c. 1693–1778). Scottish soldier and politician. He succeeded his father in 1712, served under Marlborough, and on the death of Queen Anne was with difficulty restrained from proclaiming a military revolution in favour of the Pretender. He was dismissed, or retired, and, returning to Scotland, engaged in a Jacobite conspiracy, and fought at Sheriffmuir in 1715. He sheltered Prince James Edward in his house at Fetteresso, and after the rebellion escaped to the Continent, whereupon he was attainted and his estates forfeited. In 1719 he headed an abortive Spanish attempt to invade Scotland, and was defeated at Glenshiel. He made his way to the Hebrides, where he continued to intrigue against the government, but took no part in the rebellion of 1745.

Settling in Prussia with his brother, Marshal Keith he gained the friendship of Frederick the Great, who appointed him his ambassador in Paris. In 1759 he was pardoned by George II and returned to Scotland, but at the urgent request of Frederick returned to Prussia, where he became intimate with Voltaire, Rousseau, and other celebrities. He died May 28, 1778.

George Keith,  
10th Earl Marischal  
After P. Costanzi

**Marischal College.** One of the two colleges forming Aberdeen university. It was founded in 1593 by George Keith, 5th earl marischal, and, with the exception of a brief union with King's College in 1841, existed as an independent university until 1860, when it was united with King's College to form the present university of Aberdeen. The original college was rebuilt, greatly enlarged and improved in 1837–41.

and a still more important enlargement was carried out, 1895-1906, the new building being inaugurated by Edward VII in 1906, on the occasion of the celebration of the quatercentenary of King's College. Of the early marischal's original building hardly a fragment remains except the famous stone preserved in the vestibule, inscribed "They haif said; quhat say thay; lat thame say." The college, in Broad Street, occupies the site of the grounds and conventual buildings of the Grey Friars or Franciscan Monastery. See Aberdeen; Aberdeen University.

**Marissa.** Ancient city of S. Palestine, the modern Merash. It is near Tell Sandahannah, 15 m. N.E. of Lachish. The Biblical Mareshah (Josh. 15), its capture by Ptolemy I, 312 B.C., made it for three centuries a Hellenistic city, until finally destroyed by the Parthians. Apollophanes and other princes adorned their cave-tombs with unique painted friezes of animals and flowers. Macalister's excavations, 1900, yielded house-foundations and other archaeological remains.

**Marists** (from the name Mary). Roman Catholic congregation of priests and laymen devoted to parochial missions and retreats, and to educational and missionary work. The Congregation of Marist Fathers was founded at Belley, France, in 1816, and the Brothers were organized the following year.

The Marist Sisters received the formal approval of the pope in 1834. They undertake the care of the sick in hospitals and infirmaries, and conduct schools and orphanages.

**Maritain, JACQUES** (b. 1882). A French philosopher. Born Nov. 18, 1882, he was educated at Paris university, lectured at Toronto and Chicago universities, and was appointed to the chair of philosophy at the Institut Catholique, Paris. During the Second Great War he lived in the U.S.A., being appointed visiting professor of philosophy at Columbia university, 1940-41. He later returned to France, and became ambassador to the Holy See, 1945.

A leading exponent of the philosophical school of R.C. mystics, he occupied a high place in contemporary French literature. Of his many works, the best-known included *La Philosophie Bergsonienne*, 1914; *Art et Scolastique*, 1920; *Réflexions sur l'Intelligence*, 1923; *Religion et Culture*, 1931; *Les Degrés du*

Savoir, 1932; *Questions du Conscience*, 1938. *True Humanism*, 1938, was written in collaboration with Raïssa Maritain, herself the author of several volumes which were translated into English, e.g. *De la vie d'Oraison*, 1925; *Le Prince de ce Monde*, 1932; *L'Ange de l'École*, 1934.

**Maritime Alps.** Portion of the Western Alpine system extending N.W. from the Ligurian to the Cottian Alps. They lie on the borders of France and Italy, and include the passes of Col du Tenda and the Col della Maddalena, besides several other carriage roads. Their spurs reach the shores of the Mediterranean. The chief peaks are Cima dei Gelas (10,127 ft.) and Mont Monnier (9,245 ft.). For the French department of this name, see *Alpes-Maritimes*.

**Maritime Museum, NATIONAL.** Public institution at Greenwich. Opened in April, 1937, it occupies the Queen's House, originally built by Inigo Jones for Anne of Denmark, wife of James I, but not completed until the reign of Charles I. It contains a collection of paintings of naval interest, by such masters as Van der Velde, Gainsborough, Reynolds, Romney, Kneller, Lely, and Hogarth; models of famous British ships; and the personal relics of famous seamen. Other important exhibits are a Mercator globe, made 30 years before the geographer showed the world on a flat plane; and the "Silver Map of the World," a medallion illustrating Drake's voyage round the world. From 1821 to 1933 the building was occupied by the Royal Naval School.

**Maritime Provinces.** Name given to the three E. provinces of the dominion of Canada: Nova Scotia (*q.v.*), New Brunswick (*q.v.*), and Prince Edward Island (*q.v.*).

**Maritime Regiment.** Former unit of the British army, raised to operate A.A. defences of merchant shipping during the Second Great War. The first gun crews were trained in 1940, and the regiment established in 1941. Soon there were four regiments, officially part of the Royal Artillery, about 12,000 strong, mostly volunteers from the army. They wore an Admiralty badge, a red anchor with the letters A.A., but were paid by the army. At first they operated in home waters, but later went all over the world, and were disbanded in 1945. Maritime regiments of the 17th century were the forerunners of the Royal Marines (*q.v.*).

**Maritza.** River of the Balkans, the ancient Hebrus. It rises in the Rhodope Mts., in Bulgaria, flows E. past Philippopolis (Plovdiv), then S.E. to Adrianople (Edirne), where it receives its chief tributary, the Tunja (*q.v.*). Turning S., it forms the boundary between Greece and Turkey, to fall into the Aegean near Enos. It is 300 m. long, and is navigable for small boats to Adrianople.

**Mariupol.** A seaport of the Ukraine S.S.R. It is in the Stalino region, on the N. shore of the Sea of Azov, 65 m. W. by S. of Taganrog in the R.S.F.S.R., and is a rly. terminus. Iron and steel works are the chief manufactures of the city, which developed enormously before the Second Great War to support an est. pop. of 222,000. On October 14, 1941, Russian troops had to evacuate Mariupol after fierce fighting. It remained in German hands until it was recaptured, Sept. 10, 1943, after ten hours' bitter street fighting in which Don Cossacks played an important part.

**Marius, GAIUS** (157-86 B.C.). Roman general and statesman. Born at Cereatae, near Arpinum,

Gaius Marius,  
Roman general  
From a bust

of humble parents, he achieved the unique distinction of being elected consul seven times. His first military service was as a private soldier, and he showed conspicuous

bravery under Scipio Africanus in Spain, but not until 119 B.C. was he elected tribune, identifying himself with the popular party.

His next military service was against Jugurtha in Africa, as legate of the consul Metellus. Coming home while the campaign was in progress, he was elected consul, and returned to Africa in chief command, finishing the war with the capture of Jugurtha in 106. Meanwhile, grave danger menaced Rome from the N., vast hordes of Cimbri and Teutones having defeated the Roman armies sent to oppose their threatened invasion. All eyes turned to Marius as the one man who could save the city, and from 104 to 101 he was elected consul each year. The Teutones were completely defeated near Aquae Sextiae, and the Cimbri near Vercellae.

To further his political interests and obtain his sixth consulship,

Marius found it convenient to ally himself with two demagogues, Saturninus and Glaucia, but when they had proceeded too far with their revolutionary designs, he was forced into a position of hostility to them, and had to crush the insurrection they had provoked. The next 10 years proved comparatively quiet, but in the Social War (90-88) Marius rendered further services to the state. When war broke out with Mithradates, he was desirous of obtaining the chief command, but was passed over in favour of the patrician Sulla, who had a military force behind him. Marius was obliged to flee, and after several hair-breadth escapes he reached Africa.

Cinna had taken advantage of the departure of Sulla for the East to take up arms against the senatorial party, and Marius returned to Italy. Cutting off the food supply from Rome, Marius and Cinna entered the city, and the former was elected consul again. Their triumph, however, was stained by a terrible massacre of their opponents. Marius was to enjoy his consulship only for 18 days, dying Jan. 13, 86. Though scarcely a general of genius, Marius proved a most skilful leader. He was also a great army reformer, converting the old militia into a professional army, and introducing changes in equipment and organization. See Sulla; consult The Gracchi, Marius and Sulla, A. H. Beesly, 4th ed. 1884.

**Mariut**, **MAREUTS**, **MARYÛT**, or **MAREIA**. Lagoon in Egypt, separated from the Mediterranean by a narrow tongue of land on which Alexandria is built. It was navigable during the Middle Ages, but subsequently almost dried up. In 1801 the British cut the sand dunes at Aboukir, and the area was flooded.

**Marivaux**, **PIERRE CARLET DE CHAMBLAIN DE** (1688-1763). French author. Born in Paris, Feb.

4, 1688, he had little education, but showed literary capacity as a boy. His comedies, e.g. *Le Jeu de L'Amour et du Hazard*, 1730, are marked by a great deve-

lopment of emotional interest, and by an over-refinement of thought and style which came to be called "marivaudage." His novels, *Marianne*, 1731-42, and the unfinished *Le Paysan Parvenu*, give him a place in French fiction roughly analogous to that of Richardson in English. He died Feb. 12, 1763. Consult *Complete Works*, 12 vols., 1781; *Marivaudage*, A. Tilley, 1930.

**Marjoram** (*Origanum*). Genus of perennial plants of the family Labiatae. Several species are used as sweet and pot herbs. One is native to Great Britain, another was introduced from Crete in 1551. The shoots and stems of the sweet or knotted marjoram are gathered and dried, and used for flavouring purposes in cookery. *O. dictamnus*, otherwise known as dittany of Crete, is a rather tender species grown under glass.

Marjoram. Flower-head of *Origanum vulgare*

**Mark**. System of serial numbers used to denote differing types of the same article, especially in the armed forces. When a weapon or article of equipment is first brought into general use, it receives a serial number and the designation of Mark I. Modified types are allotted serial numbers and the designation Mark II, III, etc. The Lee-Enfield rifle, used by the British army before the No. IV was introduced, was Mark IV; tanks of the First Great War were Marks I, II, III, and IV; and aircraft were allotted mark numbers. German tanks were differentiated by marks.

**Mark**. Unit of German currency. Originally it was a silver bar of approximately  $\frac{1}{2}$  lb. weight that was marked, i.e. assayed. Current in Germany since the 9th century, it spread to Holland, France, Great Britain, and later to Spain, Portugal, Latin America, and Finland. Its name was given in 1871 to the new basic coin of the German empire, about the equivalent of the British shilling, subdivided into 100 pfennigs and minted in gold coins of 20, 10, and 5 marks, and smaller silver coins. The gold pieces were withdrawn during the First Great War. After the inflation of 1923-24, the depreciated currency was replaced by the Reichsmark (Rm) of officially identical value. For details of the new issue of marks, after the occupation of Germany in 1945, see N.V.

**Mark** (Lat. *Marcus*). Jewish convert to Christianity in the Apostolic age and writer of the second Gospel.

S. Mark, the evangelist From a statue by Donatello

If, as is probable, all the N.T. references allude to the same man, he bore the Hebrew name of John, was apparently a Levite of Cyprus, cousin to Barnabas, and son of a certain Mary who was prominent in the early Church at Jerusalem. He attended on S. Paul and S. Barnabas on their first missionary journey, but turned back at Perga, to the

displeasure of S. Paul, who, however, mentions him with affection in his epistles. Afterwards associated at Rome with S. Peter, who calls him his son, he is said to have acted as his interpreter, and to have received from him the facts embodied in the Gospel which bears his name. He is said to have died in Egypt. His festival is April 25, and his symbol is a winged lion.

**Mark**, **THE GOSPEL OF**. Earliest of the three synoptic gospels and the main source of the other two. The tradition that it was written by Mark goes back to very early times. Papias (c. 135) says, "Mark having become the interpreter of Peter wrote down accurately—but not, however, in chronological order—all that he remembered of the things which were said or done by Christ," and there is no reason to doubt the substantial truth of this assertion.

Mark is much shorter than the other two synoptists and omits much of the teaching of Jesus. It lays the emphasis on the works rather than on the preaching of Jesus. Hence many of the miracles are related at greater length and with more vivid detail than in the other Gospels. "In substance and style and treatment," says Westcott, "the Gospel of Mark is essentially a transcript from life. The course and issue of the facts are imaged in it with the clearest outline." It is generally held, on the strength of the testimony of Clement of Alexandria and Eusebius, that the Gospel was written at Rome. This hypothesis is supported by the presence of some

Pierre de Marivaux, French author

Latin words and idioms in the text. The date at which Mark was written cannot be determined with absolute accuracy. It is generally placed in the period 64-70, but it may have been composed about a decade earlier. Many modern scholars hold that the present Gospel was preceded by an earlier and briefer edition, and that the last 12 verses replace the original ending, now lost. See *Gospels, The Four*.

**Mark Antony.** The Roman soldier and statesman often known by this name is noticed as an historical person under Antonius, Marcus. As the hero of Shakespeare's tragedy Antony and Cleopatra, he will be found under that head. In Julius Caesar, however, he is called Mark Antony, and has the chief oratorical part in the play, delivering over Caesar's dead body the famous speech which opens, "Friends, Romans, countrymen, lend me your ears."

**Markesh, HESHVAN OR HESVAN.** Eighth month of the Jewish sacred year, and second month of the Jewish civil year. See *Calendar*.

**Market** (Lat. *mercatus*, trade). Place where goods are sold. In the Middle Ages the right to hold a market was one of the most valuable privileges that a king or lord could grant to a body of his subjects. Not only in England, but elsewhere in Europe, the growing towns secured by charter this right, which was jealously guarded, for the holding of a market was a source of considerable wealth to a town, while the king or lord received an income therefrom. In time every town of importance had its market, held on certain days and under certain conditions; hence the common phrase market town. Medieval markets were held in an open square in the centre of the town, therefore called the market place, and the chief buildings were put up around it. There on stated days vendors brought their wares and purchasers flocked to buy, a scene associated today rather with the word fair. The 11th century and onwards was perhaps the great age of the market, but in a sense it is almost as old as the human race, and ancient literature contains many references to markets.

Markets are still held, in the main on the days and in the places fixed in the past. They form an important source of revenue, sometimes to individuals, but more usually to municipalities, and large sums have been paid for them, as when the corporation of Manchester purchased the market rights from

the family of Mosley. In London there are a number of markets, certain classes of goods having their own, e.g. Covent Garden for fruit, and Billingsgate for fish, and the same principle prevails in other large cities. Most markets in Great Britain are now controlled by the municipalities, the power to establish them or buy them having been conferred on town councils and other bodies by an Act of 1875.

A more modern use of the word is for the whole of the transactions in a certain class of goods, e.g. the wool market, or the cotton market, refers to all dealings in those commodities, whether in London, New York, or elsewhere, and implies that there is only one price for the same article. Likewise the phrase money market covers all transactions in instruments of credit. Bankers, discount houses, and financial houses are said to form the money market. See *Billingsgate*; *Covent Garden*; *Credit*; *Fair*; *Leadenhall Market*.

**Market Bosworth.** Market town of Leicestershire, England. It is 12m. W. of Leicester and has a rly. station. The church of S. Peter is a Perpendicular building, and there is a grammar school, at which Dr. Johnson was an usher. In 1920 a sanatorium for the National Society of Operative Printers was erected near Wellsborough. Bosworth Field, 2 m. S., was the scene of the battle in which Richard III was killed, thus ending the Wars of the Roses, 1485. Pop. 1,100. See *Bosworth, Battle of*.

**Market Cross.** Stone structure surmounted by a cross, standing in a market place. It was originally a plain cross-shaft upon a stepped pedestal, used for sermons and proclamations, as at Taunton and Royat in Puy-de-Dôme, shelter for wayfarers being afterwards provided by a roofed edifice with a central finial. Sometimes a tiled gable-roof upon four plain pillars, as at Castle Combe, it developed into a polygonal structure with arched openings, groined vaulting, niched statuary, and other enrichments. Many cruciform finials were destroyed during the Commonwealth. Typical examples are at Salisbury, Chichester, Shepton Mallet, Malmesbury, Winchester, Cheddar, Leighton Buzzard, and North Walsham. The Edinburgh cross, removed in 1617, was replaced by another, whereof only the shaft remains. See *Cross illus*.

**Market Deeping.** A town of Lincolnshire, England. It stands on the Welland, 8 m. N.W. of Peterborough. The nearest station

is at Deeping St. James, 3 m. E. In the fen country, it is surrounded by reclaimed land under good cultivation. S. Guthlac's church is an old foundation. Pop. 876.

**Market Drayton.** Market town of Shropshire, England, known also as Drayton-on-Hales. It stands on the Tern, 18 m. N.E. of Shrewsbury, and is a rly. junction. S. Mary's church dates in part from the 12th century, and at the 16th century grammar school Robert Clive was educated. The town is an agricultural centre; ironfounding is another industry. It is thought to have been a British settlement. Near is Blore Heath, the scene of the battle of 1459. Market day, Wed. Pop. 5,100.

**Market Gardening.** Production of flowers, vegetables, and salads for commercial purposes, including their grading, packing, distribution, and marketing. Consideration of soil, aspect, and district is vital before establishing a market garden. The ideal soil is one which is easily worked and well drained, and has been enriched with sufficient organic matter. A market garden should be on land in good heart, and the subsoil as well as the surface should be regularly cultivated.

Mechanisation is increasing in market gardening, as in other forms of working of the land. Ploughing, disking, hoeing are often done by tractor, planting by machinery, watering by mechanical means, the produce is washed by an electrical washer, the soil is heated by electricity, etc.

A relatively small area of the surface of Great Britain is devoted to market gardening, yet the total sales of horticultural produce per annum exceed those from agriculture. Compared, however, with the market gardeners of some of the countries of the Continent, many of those in Great Britain do not pay sufficient heed to washing, cleaning, grading, and packing. A national advisory service of the ministry of Agriculture exists to assist the market gardener to improve both his crops and his methods of picking, packing, and grading. In some Continental countries, e.g. Belgium and the Netherlands, market gardeners have developed a high degree of cooperation in the production of clean, well grown, well packed produce which has given them great advantages in international, as well as their own, markets.

Presentation is very important, and the best market gardeners everywhere grade and pack their

produce perfectly. They also have their own coloured labels, or brands, or makes, so that their goods come to be asked for by name. Cooperative packing stations market goods under the brand-mark of the company.

A market garden is an agricultural holding for the purpose of the Agricultural Holdings Act if it is cultivated wholly or mainly for the purpose of the trade or business of market gardening. Further the tenant has in general the rights of the tenant of such a holding (see Agricultural Holdings). If it has been agreed in writing after Jan. 1, 1896, that the holding shall be let or treated as a market garden a tenant may obtain compensation for certain improvements to the holding and has at the end of his tenancy the same right to remove fixtures (if erected after Dec. 31, 1900) as a tenant of any other agricultural holding. He may also remove all fruit trees and bushes not permanently set out. The improvements referred to are: planting of fruit trees or fruit bushes, permanently set out; of strawberry plants, or asparagus, rhubarb, or other vegetable crops which continue productive for two or more years; and erection or enlargement of buildings. When a landlord will not agree that the holding shall be treated as a market garden, the local agricultural committee may direct that the tenant shall nevertheless be entitled

to compensation for such improvements. Market gardens, like other agricultural land, are exempt from the general rate.

A person who disposes only of surplus produce from his kitchen garden cannot class his holding as a market garden.

In Great Britain one customary method of marketing produce is to consign the goods to a commission salesman in a town or city market, who lends containers at an agreed charge. But before the Second Great War the best growers marketed most of their produce in non-returnable containers, which gave them complete freedom as to choice of the salesman and market for their goods. Sales can be made (a) direct to local customers; (b) by van deliveries in a nearby town; (c) to local shops, hotels, or res-

taurants, and (d) to a town or county wholesaler, who does not sell on commission, but gives a definite price. See Allotment; Kitchen Garden, etc., and under the names of various vegetable crops. Consult also Vegetable Culture, H. C. Davidson, 1939; Vegetable Growing Business, R. L. & G. S. Watts, 1939; Market Gardening as a Career, J. O. Baker, 1946.

**Market Harborough.** Market town and urban dist. of Leicestershire. It stands on the Welland, 16 m. S.E. of Leicester and 81 by rly. from London. It is also served by the Union canal. The church of S. Dionysius is a fine medieval building with a Decorated spire, and there is a 17th century grammar school. The old grammar school, on the market place, is an interesting survival. There are manufactures of patent foods, type, rubber goods, boots

Market Harborough arms

Market Harborough, Leicestershire. Market place and old schoolhouse, restored in 1883

and shoes, batteries, corsets, etc., and the town is a centre for the Fernie, Pytchley, and Woodland Pytchley hunts. Market day, Tues. Pop. 10,830.

**Marketing Board.** In Great Britain, a government organization for cooperative marketing. Marketing boards are set up either for a given commodity, e.g. the milk marketing board, or for a certain group of producers, e.g. the empire marketing board. Their objects are to rationalise supply and distribution, to set a standard of quality, and to obtain fair prices for producers. They undertake research on behalf of their members, and advertise their produce. To remove anomalies in distribution, they sometimes, as in the case of the milk marketing board, establish a pool to which all produce is

sold and from which distributors are supplied. The empire marketing board was established in 1926 on the recommendation of the imperial economic committee to develop trade between Great Britain and the empire, by carrying out market research in the mother country and popularising empire products through publicity campaigns; it was responsible for the national mark scheme for grading eggs, flour, malt products, home-killed beef, and certain fruits.

**Market Overt** OR **OPEN MARKET.** English legal phrase. As a rule, if a chattel is taken from its true owner, the latter still remains the owner, even as against a purchaser who has given full value for it in good faith. The exception is in the case of a sale in market overt, if the sale is according to the custom of the market. It must not be by night; nor in a room or place to which the public have not free access; it must be for valuable consideration; and the buyer must not know of the defect in the seller's title.

**Market Rasen.** Market town and urban dist. of Lincolnshire, England. It stands on the Rasen, 16 m. N.E. of Lincoln, with a rly. station. There is an old church dedicated to S. Thomas. Race meetings are held five times yearly. Market day, Tues. Pop. 2,048.

**Market Weighton.** Market town of the E. Riding of Yorkshire. It is 19 m. by rly. from York. It is connected with the Humber by a canal, and is an agricultural centre. Market day, Wed. Pop. 1,735.

**Markham, CHARLES EDWIN** (1852-1940). American poet. Born in Oregon, April 23, 1852, he passed his boyhood on a farm in California, became a school superintendent, and devoted much time to the study of literature and Christian sociology. In addition to his most notable volumes of verse, *The Man With the Hoe* and *Other Poems*, 1899, and *Lincoln and Other Poems*, 1901, he wrote *The Children in Bondage*, 1909, dealing with child labour, and *California the Wonderful*, 1914. A collected edition of his poems appeared 1927. Markham died March 7, 1940.

**Markham, SIR CLEMENTS ROBERT** (1830-1916). A British traveller and geographer. Born at Stillingfleet, July 20, 1830, he was educated at Westminster, and entered the navy in 1844. Promoted lieutenant in 1850, he went with the expedition for the relief of Franklin. In 1852 he left the navy and undertook a journey to Peru.

Observations in that country led him to introduce into India the cultivation of quinine-yielding cinchona trees, 1859-62. Appointed to the geographical department of the India office, 1867-77, he accompanied the expedition to Abyssinia, 1867-68. He was secretary to the Royal Geographical Society, 1863-88, and president 1893-1905; he held similar positions in the Hakluyt Society, 1857-87. Knighted in 1896, he died Jan. 30, 1916. Amongst his works are *Franklin's Footsteps*, 1852; *Travels in Peru and India*, 1862; *Richard Hakluyt*, 1896; *The Lands of Silence*, 1921.

**Markham, GERVASE** (c. 1568-1637). English author. Born at Cottam, Notts, he was a member of an old county family, and seems to have received a good education. He became a soldier, seeing service in the Netherlands and in Ireland, but afterwards passed his time in writing. Little else is known save that he died early in 1637 and was buried in S. Giles's, Cripplegate, London. He wrote poems and dramas, also books on horses and agriculture, including *A Discourse of Horsemanship*.

**Markham, Mrs. (1780-1837)**. Pseudonym of Elizabeth Penrose, British writer. She was born on Aug. 3, 1780, at Goadby-Marwood, Leicestershire, the second daughter of the Rev. Edmund Cartwright, inventor of the powerloom; and she married the Rev. John Penrose in 1814. Her *History of England*, begun in the first instance for her own children and published in 1812, attracted little notice at first, but eventually became the leading school history for a period of some 40 years. Her *School History of France*, 1828, likewise achieved remarkable success. She died Jan. 24, 1837.

**Markham, VIOLET ROSA** (b. 1872). A British social worker. Daughter of a Derbyshire coal-owner, she was born Oct. 3, 1872. She took an active part in the women's trade union movement, and her experience in the organization of women workers, and wide knowledge of industrial law, led to her appointment as deputy director of the women's section of the national service department in

1917. Made C. H., 1917, she was mayor of Chesterfield, Derby, 1927. Member of the industrial court from 1920, and of the assistance board from 1934 (deputy chairman from 1937), she retired 1946. She presided over the committee on welfare and amenities of serving women in the Second Great War, and reported on domestic employment, 1945. Her early books were about South Africa, and in 1929 she published *Romanesque France*. She married in 1915 J. Carruthers.

**Markhor** (*Capra falconeri*). Species of wild goat, found in Kashmir and Afghanistan. It is

Markhor. Specimen of the wild goat found in Afghanistan  
W. S. Berridge, F.Z.S.

readily distinguished from all other goats by its massive horns, which are twisted either closely like a screw, or open like a cork-screw. A fine specimen stands about 3½ ft. high at the withers, the chin-beard often reaches nearly to the knees, and the colour varies from greyish brown to nearly white. Markhors are found among the mountains at varying elevations, and their wary habits render them difficult to approach.

**Markievicz, CONSTANCE GEORGINA, COUNTESS** (1868-1927). Irish politician. Born Feb. 14, 1868, she was the eldest child of Sir Henry Gore-Booth, bart., of Lissadill, co. Sligo, and sister of the poet Eva Gore-Booth (1870-1926). She studied painting at the Slade and in Paris, where she met Count Casimir Dunin de Markievicz (d. Dec. 2, 1932), a Pole, whom she married in 1900. They eventually settled in Dublin, where she became prominent among the extremists of Irish politics. For her part in the Easter rising, 1916, she received sentence of death, commuted to penal servitude for life. Released 1917, she was again arrested 1918 in connexion with an alleged German plot. Returned

as Sinn Féin M.P. for S. Patrick's, Dublin, 1918-21 (first woman elected to the British house of commons), she never took her seat. An ardent republican, she opposed the treaty of 1921. From 1921 until her death, July 15, 1927, she represented Dublin City in the Éire parliament.

**Markinch.** A police burgh and parish of Fife, Scotland. It is 33 m. due N. of Edinburgh, and has a main line rly. station. Industries include paper making, bleaching, blanket weaving, and whisky blending. Pop. est. 2,500.

**Marking Nut Tree** (*Semecarpus anacardium*). Evergreen tree member of the family Anacardiaceae. A native of the East Indies, it is also called the kidney bean of Malacca. It has alternate, oblong, leathery leaves, and small, greenish-white flowers in terminal clusters. The nut or bean is enclosed in a hard shell, attached to a pear-shaped, fleshy, yellow receptacle, which is roasted and eaten. The unripe fruit yields a kind of ink, and the corrosive juice of the shell is used as an external remedy for rheumatism and as a wart cure. Mixed with quicklime, the juice forms an indelible stain used for marking ink.

**Markino, YOSHIO** (b. 1874). Japanese artist and author. Born Dec. 25, 1874, at Koromo, he settled in the U.S.A. in 1893. In 1897 he came to London, where he rapidly achieved a reputation for clever drawings and writings illustrative of British life. He published *A Japanese Artist* in London, 1910; *My Recollections and Reflections*, 1913; *My Forty Years in England*, 1940; and illustrated in colour a series of travel books.

**Markirch.** A town of Haut-Rhin dept., Alsace, France. It is 36 m. S.W. of Strasbourg, standing on both sides of the Leber, and is a manufacturing centre, various kinds of textiles being woven and prepared here. In the Middle Ages and until about 1800 rich mines of silver, copper, and lead were worked here, hence the other name of the town, St. Marie aux Mines.

**Markland** (Norse, wood land). Name given in 1003 by the Norse explorer, Thorfinn Karlsefai, to a forested land with great stretches of white sand, which he found in North America. The identity of Markland has been much discussed, but it may have been Newfoundland. The discovery is related in the Icelandic *Flatey Book*, trans. in *The Discovery of N. America* by the Northmen, N. L. Beamish, 1841.

Violet Markham.  
British social worker

ledge of industrial law, led to her appointment as deputy director of the women's section of the national service department in

Markova. British dancer who won international fame in ballet

**Mark Lane.** London thoroughfare. It runs from Fenchurch Street to Great Tower Street, E.C., and contains the two Corn Exchanges, the older dating from 1828, and the newer from 1881. A market was held here in the Middle Ages. In the Second Great War the W. side of the lane was mostly destroyed by German bombs. The station on the Metropolitan rly. was renamed Tower Hill in 1946.

**Mark Masonry.** Side degree of Freemasonry. To this degree, excluded from craft masonry by the act of union of 1813, admittance is still limited to master masons, although the organization is quite independent of United Grand Lodge. The Grand Lodge of Mark Master Masons was founded in 1856, and also controls the degree of Royal Ark Mariner, membership of which is limited to mark master masons. The office of the Grand Lodge of Mark Master Masons is in Great Queen Street, London, W.C. See Freemasonry.

**Markova, ALICIA** (b. 1910). British dancer. Born Alice Marks of Jewish parents in London, Dec. 1, 1910, she studied under Asta Neva, joined the Diaghilev company in 1924, and appeared in miniature ballets at the Ballet Club. With the Vic-Wells company, 1933-35, she became famous for her interpretations of the title-

part in Giselle and Odette in Swan Lake. She later founded a company in partnership with Anton Dolin (q.v.), and in 1938 appeared with the Ballet Russe de Monte Carlo. In the Second Great War she went to the U.S.A., dancing at the Metropolitan Opera House, New York, 1943-45.

**Marks, HENRY STACY** (1829-98). British artist. Born in London, Sept. 13, 1829, the son of a solicitor who turned coachbuilder, he was educated there, afterwards studying art in Paris. He first exhibited at the R.A. in 1853, becoming A.R.A. in 1871 and R.A. in 1878. He died Jan. 9, 1898. In early life Marks painted genre subjects, but later became well known as a painter of birds and pictures in which birds and human figures were strikingly associated.

**Mark System.** Name given to a system of landholding by which the land was held and cultivated in common by freemen, who managed their own affairs, and lived in self-governing communities. It was believed at one time that this was the usual method throughout Germany in the early centuries of the Christian era, and that it was brought to England by the Anglo-Saxons. This opinion is not now held widely. Some such system was very likely in existence in Germany and elsewhere, but not in the universal and rigid way that its advocates believe. The word is

shells of mollusca, contains 40 to 50 p.c. of carbonate of lime, and a small percentage of potash and phosphoric acid. Eocene or chalky marl may contain up to 95 p.c. of the carbonate, while Cretaceous marls are valuable for their high proportion of potash and phosphoric acid, though low in their percentage of lime. Marls are used as fertilisers and as improvers of peaty and acid soils. Marlstone is the name given to the argillaceous limestone of the Middle Lias. See Limestone.

**Marlborough.** Mun. bor. and market town of Wiltshire, England. It stands on the Kennet, 11

Marlborough arms

m. S. by E. of Swindon and 76 m. W. of London, and is served by rly. The church of S. Peter is a Perpendicular building. The Castle Inn is one of the most famous of the old coaching inns, for the main road from London to the W. ran through Marlborough, as does now the A4 road to Bath. There are a town hall and a 16th century grammar school. Marlborough College (q.v.) is a public school.

Marlborough was a settlement of the Britons and probably of the Romans. The Norman kings built a castle here, and their successors, especially Henry II, lived here occasionally, because it was convenient for the hunting in Savernake Forest. It became a borough in the Middle Ages, and was separately represented in parliament from 1295 to 1885. Market day, Sat. Pop. 4,600.

Marlborough, Wiltshire. The wide High Street of this ancient town, looking towards the Market Hall

derived from mark or march, a border district, one which the freemen are supposed to have cleared of forest and occupied. See Manor; Village Community.

**Marl.** In geology, sedimentary deposit which is a mixture of calcium carbonate, clays, and sands. The word is loosely applied to a large number of friable clays of widely differing composition, and though most contain calcium carbonate, many so-called marls are almost entirely deficient in it. Blue or shell marl, consisting largely of

Marlborough Downs is the name given to a range of chalk hills lying to the W. of the town. There are remains of British camps. Below the Downs lies Avebury (q.v.).

**Marlborough.** N.E. district of S. Island, New Zealand. Its area is 4,220 sq. m. It contains the two Kaikouras ranges, the highest peak being 9,462 ft., is well timbered and fertile, and the Wairau is its only navigable river. It exports wool, timber, hides, and tallow. Blenheim and Picton are its chief ports. Pop. 20,737.

**Marlborough, DUKE OF.** British title borne since 1702 by the family of Churchill. From 1626 to 1679 there was an earldom of Marlborough held by the family of Ley, John Ley being the lord chief justice and lord treasurer. When the 4th earl died, in 1679, the title became extinct. In 1689, however, it was revived for John Churchill, who, in 1702, was made a duke. He left no sons, and by arrangement his titles passed to his eldest daughter, Henrietta, wife of the 2nd earl of Godolphin, and on her death to Charles Spencer, 5th earl of Sunderland, the son of Marlborough's second daughter. From him the later dukes are descended, and to him they owe the name of Spencer. George, the 4th duke, as

Charles, 9th Duke of Marlborough  
*Elliot & Fry*

he is ranked, died in 1817, and his son, the 5th duke, in 1840. A younger son of the duke was made a baron in 1815. In 1902 the 3rd baron was made Viscount Churchill.

John Churchill, the 7th duke, a Conservative politician and the father of Lord Randolph Churchill, was lord-lieutenant of Ireland 1876-80. George, the 8th duke, was succeeded in 1892 by Charles, the 9th duke (b. 1871). He was under-secretary for the colonies, 1903-05, and parl. secretary to the board of agriculture, 1917-18. Dying June 30, 1934, he was succeeded by his son, John Albert Edward William (born Sept. 18, 1897), as 10th duke. The duke's eldest son is called the marquess of Blandford. *See* Blenheim.

**Marlborough, JOHN CHURCHILL, 1st DUKE OF.** English soldier. He was born probably June 24, 1650, of a good Dorset family, at Ashe, near Axminster. He entered the household of James, duke of York, as a page, became an ensign in the Guards, saw service at Tangier at the age of 16, won a colonelcy as the reward of courage and skill displayed under Turenne in the Netherlands, and then in 1678 married Sarah Jennings.

He held high command in the army of James II, but deserted him when William of Orange landed Nov. 5, 1688. William, on accepting the English crown, created Lord Churchill, as he already was, earl of Marlborough, and after the battle of the Boyne, June 30, 1690, left to him the conduct of a brief campaign in Ireland. The earl, however, now lost favour. Like most

other men of position, he was known by William to be intriguing with the exiled James II. The death of Queen Mary, however, Dec. 28, 1694, ensured Marlborough's loyalty, since it was entirely to his interest that the princess Anne should succeed to the throne. Accordingly he was reinstated in the favour of the king.

At the beginning of 1702, when war was on the point of breaking out, William selected Marlborough as the man who in his own absence should command the British and Dutch forces. William's death, March 8, 1702, placed Anne on the throne, and her accession confirmed the appointment of Marlborough. Hampered at every turn by the Dutch civilian commissioners whose assent was required to his military operations, and by perpetual intrigues at home, Marlborough nevertheless succeeded in manoeuvring the French out of one position after another, until he found his great opportunity in 1704.

Marlborough concerted his plans with Prince Eugene, arranged what was ostensibly to be a campaign on the Moselle, and then, before anyone suspected his intentions, swooped from the Rhine to the Danube, throwing himself between

*Marlborough*  
After Sir Godfrey Kneller

the French and Vienna, and won the overwhelming victory of Blenheim, Aug. 13, 1704.

But the duke—his earldom had been raised to a dukedom in 1702—was still prevented as before from reaping the full fruits of his victory. It was not until 1706 that his hands were freed and he was able at Ramillies, on May 23, to strike another crushing blow, the result of which was that within four months

the French were cleared out of Brabant and Flanders. In the next year, 1707, he had to leave war for diplomacy, wherein he proved himself no less a master by averting the threatened intervention of Charles XII of Sweden. In 1708 the Spanish Netherlands revolted against the Dutch domination which had resulted from the victory of Ramillies, and again the situation was saved by Marlborough's brilliant victory over the French at Oudenarde, July 11.

So extreme were the demands made by the Allies upon Louis XIV that France refused the terms of peace. A sanguinary victory was won over the French at Malplaquet, Sept. 11, 1709. But the French defeat was not a rout, and Malplaquet was the last of Marlborough's triumphs.

Marlborough was paralysed for action by the turn taken by political events in England, and in 1711 a direct attack was made upon him for misappropriating public moneys. But for partyspite his defence would have been conclusive; but in fact the issue of the attack was that he was deprived of all his offices and retired abroad. He was recalled on the accession of George I, Aug. 1, 1714; but his powers of mind and body were broken by a stroke of apoplexy in 1716, and he played no more part in public affairs. On June 16, 1722, he died, and was buried in Westminster Abbey.

Marlborough's name stands amongst those of the greatest of masters of the art of war known to history; the British army owes him an eternal debt of gratitude for his determined insistence on proper care and treatment for the men who were fighting the country's battles. As a diplomatist he was hardly less supreme than as a soldier. That he was grasping and avaricious, that he was perfectly capable of playing the traitor, even that he was guilty of treasonable acts, it is hardly possible to dispute. But the heaviest charges brought against him were never proved, and the presumptions are in his favour even when they were not definitely disproved. There is no Englishman who more decisively commands our admiration, no great Englishman for whom it is so difficult to feel a confident esteem. His character has been painted in the most unattractive colours by Macaulay. *See* Blenheim; Malplaquet; Oudenarde; Ramillies.

A. D. Innes

**Bibliography.** Letters and Dispatches, ed. Sir G. Murray, 5 vols., 1845; Life and Times, W. S. Churchill, new ed. 1939; Lives, G. E. B. Sainsbury, 1885; Viscount Wolsely, 1894; E. Thomas, 1915.

**Marlborough, SARAH CHURCHILL, DUCHESS OF (1660-1744).** Daughter of Richard Jennings, of Sandridge, Hertfordshire,

Sarah Churchill,  
Duchess of Marl-  
borough  
After Lely

she was born on June 5, 1660. As maid-in-waiting to the duchess of York, she became intimate with the young princess Anne, a friendship which had important political consequences. In 1678 she married John Churchill, afterwards 1st duke of Marlborough, and the princess's adherence to the husband of her friend in his political misfortunes brought a quarrel with her mother. On Anne's accession the duchess of Marlborough received high favours and exerted great influence. Her adoption of Whig principles, her uncontrollable temper, and the increasing influence, used against Marlborough, of Mrs. Abigail Hill, led, however, to a breach between "Mrs. Morley" and "Mrs. Freeman," as the queen and duchess respectively called each other in private. Despite a temporary reconciliation, the duchess was finally dismissed from the court in 1710. She used her biting wit against Anne and the Tories, and in later life wrote a vindication of her husband and her own conduct. To the end she retained her vigorous and forceful personality, dying, Oct. 18, 1744. *Consult* Lives, A. T. Thomson, 1839; O. Colville, 1904; K. Campbell, 1932; F. Chancellor, 1932.

**Marlborough College.** English public school. Founded in 1843 for the sons of the clergy, it stands in large grounds in Marlborough. In 1853 it was thrown open to the sons of laymen. It is arranged partly on the hostel system and partly on that of boarding-houses. In college, on the former system, are about 430 boys, divided among eight houses, while outside are houses accommodating about 230 boys. There are scholarships to the school and the universities. The school is divided into lower, middle, and upper; there is also an army department.

**Marlborough House.** London royal residence. Standing in a garden of four acres, between the S.W. end of Pall Mall and the Mall, it is of red brick, and was built by Wren in 1709-10 for the first duke of Marlborough, who died here in 1722, as did his

duchess in 1744. It was the residence, after his marriage to Princess Charlotte, of Prince Leopold, 1817-31; Queen Adelaide, widow of William IV, 1837-49; Edward VII, when prince of Wales, 1863-1901; George V, when prince of Wales, 1901-10; and Queen Mary, after the death of George V in 1936. It was the residence of Queen Alexandra in her later years. Marlborough House chapel, once connected with St. James's Palace, was built by Charles I. A memorial to Queen Alexandra, carried out in bronze by Sir Alfred Gilbert, occupies a site on the W. wall of the grounds.

**Marlinspike.** Pointed iron instrument used by sailors in knotting and splicing ropes. From 8 to 12 ins. in length, it enables knots that have jammed to be unfastened, the strands of a rope to be opened, etc. It often has an eye in the thick end for a lanyard.

**Marlow OR GREAT MARLOW.** Market town and urban district of Bucks, England. It stands on the N. bank of the Thames, 32 m. by railway W. of London. It has some manufactures, including paper, beer, and chairs, and is a boating centre. The church of All Saints is a modern building, and there is a 17th century grammar school founded by Sir W. Borlase. A suspension bridge crosses the river here. The royal military college, now at Sandhurst, was here until 1812. A tablet marks the house in which Shelley lived and wrote. Marlow was a borough in the 13th century. It was separately represented in parliament until 1885, and had markets and fairs in the Middle Ages. Pop. 5,087. Little Marlow is a village on the river, 2 m. away.

**Marlowe, CHRISTOPHER (1564-93).** English poet and dramatist. Born at Canterbury, son of a shoemaker and parish clerk, he was educated at the King's School in the cathedral city, and Benet (Corpus Christi) College, Cambridge, graduating M.A. in 1587.

Marlborough House, London, one of the royal residences. The main front, overlooking the Mall

Adopting free thought in religion, he abandoned the idea of a Church career to write for the stage in London. Here he was attached as playwright to the lord admiral's company. Shortly after a warrant had been issued for his arrest on some unknown charge, he was killed by Francis Archer, a serving-man, in a brawl near Greenwich, at the end of May, 1593, and was buried in the churchyard of St. Nicholas, Deptford.

His first tragedy, *Tamburlaine the Great*, a play in two parts, each of five acts, produced by Alleyn's company about 1588, introduced a pliant, rhetorical, passionate, and resonant form of blank verse ("Marlowe's mighty line," Jonson called it), which gave a permanent stamp and lasting impetus to English romantic drama. The *Tragical History of Doctor Faustus*, containing some of the finest poetry in the language, was produced a year later, being followed by *The Jew of Malta*, in which Alleyn appeared as Barabas; *Edward the Second*, which best exhibits its author's skill as a playwright and was the first Elizabethan historical drama; *The Massacre at Paris*; and the unfinished *Tragedy of Dido*, completed by Nashe. Marlowe's dramatic construction is faulty, and he created no heroine. His principal heroes are men of humble origin and exemplars of the superman: *Tamburlaine* typifies the will to conquer by physical force, and proved tremendously popular with an audience stirred by the defeat of the Spanish Armada; *Faustus* symbolises the lust of knowledge.

Marlowe, Shakespeare's chief creditor in the dramatic craft, may have collaborated with him in *Henry VI* and *Titus Andronicus*. His exquisite paraphrase of part of Musaeus's *Hero and Leander* was completed by Chapman and quoted by Shakespeare ("Who ever loved, who loved not at first sight?" in *As You Like It* (V, iii, 81-82)). As a poet Marlowe also lives in his pastoral lyric, *Come, live with me and be my love*. He translated Ovid's *Amores*, and the first book of Lucan's *Pharsalia*. No portrait of him exists, and no original edition of his plays (which display the work of no other hands) except that of Edward the Second. A memorial, by Onslow Ford, was unveiled at Canterbury by Irving in 1891.

**Bibliography.** Works, ed. C. F. Tucker Brooke, 1910; M. and His Associates, J. H. Ingram, 1904; Life, C. F. Tucker Brooke, 1930; M., a Conspectus, J. M. Robertson, 1931; C. M. in London, M. Eccles, 1934; And Morning in His Eyes, P. Henderson, 1937; Tragical History of C. M., J. Bakeless, 1943; C. M., P. H. Kocher, 1947; The Muses' Darling, C. Darling, 1948.

**Marmalade** (Port. *marmelo*, quince). Name commonly given to a preserve of Seville oranges. Originally a kind of quince jam, it is sometimes particularly designated orange marmalade, especially as other citrus fruits, e.g. lemon, lime, grapefruit, are now similarly preserved. See Jam.

**Marmalade Box** (*Genipa americana*). Popular name for the ever-green genipap (*q.v.*).

**Marmalade Tree** (*Lucuma mammosa*). Tree of the family Sapotaceae, native of S. America.

Marmalade Tree. Leaves and flowers. Inset, left, single flower; right, section of fruit

It has large leathery leaves of ob-long shape, 1-2 ft. in length, and small, solitary, whitish flowers. The fruit is more or less oval, 4-5 ins. long, with a rough, rusty brown skin, and a single seed embedded in a luscious, edible pulp, with a flavour akin to that of quince marmalade.

**Marmande.** Town of France, in the dept. of Lot-et-Garonne. It is 49 m. by rly. S.E. of Bordeaux on the right bank of the Garonne. It contains a fine Gothic 13th century church, and makes brandy and liqueurs, linens, and woollens. Pop. 12,101.

**Marmara** or **MARMORA**, SEA OF. The ancient Propontis, separating S.E. Europe from Asia Minor. It is connected with the Black Sea by the Bosphorus, and with the Aegean by the Dardanelles. With an area of 4,500 sq. m., it is 175 m. in length, and at its broadest is about 50 m. wide. It derives its name from its largest island, which is famous for marble quarries. Among its other islands is the

group called Princes' Islands. The strict control over the two passages to the Sea of Marmara imposed by the treaty of Sèvres in 1920 was relaxed in favour of Turkey by the Straits treaty signed in 1923 at Lausanne, and by the Montreux convention (*q.v.*). See Dardanelles, Attack on; Gallipoli; Turkey.

**Marmion**: A TALE OF FLODDEN FIELD. Second of Scott's metrical romances, published 1808. The poem is in six cantos, each prefaced by an epistle to a friend. Its story is that of the Scots war against Henry VIII which ended in the death of James IV and the destruction of his nobility at Flodden, Sept. 9, 1513.

**Marmolata.** Highest mountain of the Dolomites (*q.v.*). It lies in the Italian prov. of Belluno, 6 m. W. of Caprile. The N. slope is gradual, while the S. side descends precipitously. Of its peaks, Punta di Penia reaches over 11,000 ft., and Punta di Rocca 10,855 ft.

**Marmont**, AUGUSTE FRÉDÉRIC LOUIS VIESSE DE (1774-1852). French soldier. Born at Châtillon-sur-Seine, July 20, 1774, the son of a soldier, he entered the revolutionary army in 1791. Known to Napoleon as a fellow student, he became his aide-de-camp, served in Italy and Egypt, and was made a general. He held commands at Marengo and Ulm, after which, 1805-09, he was governor of Dalmatia and drove the Russians from Ragusa. In 1810 he took command in Spain, where, after capturing Ciudad Rodrigo, he was beaten at Salamanca. He appeared next in Napoleon's lost battles of 1814, after which he surrendered with 20,000 men under conditions that seemed treasonable. He was honoured by the restored Bourbons, whom he served after 1814, and in whose cause he became an exile in 1820. He lived in Vienna and elsewhere until his death at Venice, March 22, 1852. Marmont, who was made a marshal and duke of Ragusa by Napoleon,

Marmot. Specimen of the Alpine species, *Arctomys marmotta*  
W S Berridge, F Z S

wrote some volumes of Memoirs, published in 1856.

**Marmoset** (*Hapalidae*). Family of very small monkeys, found only in Central and S. America. They are

Marmoset. A pair of the lion variety from Brazil

placed at the foot of the sub-order which includes the monkeys, apes, and man; and in general form nearly approach the lemurs. They are somewhat squirrel-like in general appearance and size, are covered with thick fur, and have non-prehensile tails which are often bushy. The face resembles that of a miniature monkey, and many species have tufts or fringes on the ears. The feet and hands of the marmoset differ considerably from those of the monkeys proper, the toes and fingers being provided with claws instead of nails, except for the great toes. There are no cheek pouches and no bare callosities on the buttocks. In dentition also they differ from the rest of the monkeys. They live in the trees and climb about like squirrels. They are usually found in small companies, and their food consists of insects and fruit. In disposition marmosets are gentle and timid; they rarely live long in captivity.

**Marmot** (*Arctomys*). Genus of rodents, placed by zoologists in the same family as the squirrels. They are found in the N. portions of both hemispheres, and include numerous species. Very stoutly built, somewhat resembling rabbits, but without the characteristic ears and long hind legs, they range from 14 to 24 ins. in length. Their coarse fur is yellowish brown, and usually darker along the middle line of the back. Europe possesses two species, the Alpine marmot, now occurring in the Alps, Pyrenees, and Carpathians, but formerly of much wider range, and another

species, commonly known as the bobac, smaller in size, ranging from Germany and Poland across S. Russia into W. Siberia. Other species occur in Central Asia, and N. America has several, of which the woodchuck is perhaps best known. All marmots live upon seeds, roots, and leaves, move about in the daytime, and live in burrows, usually occupied by large colonies. Many species hibernate. See Woodchuck.

**Marne.** River of France. It rises in the Langres plateau and flows, in general, N.W. through Champagne to join the Seine at Charenton, a S. suburb of Paris. Its tributaries are the Ourcq, Saulx, and Ornain, on the right, and the Grand Morin and Petit Morin on the left. Over 200 of its 326 m. are navigable, and it forms part of the Marne-Rhine canal navigation, while the Haute Marne canal joins it to the Saône. The main stream and the tributaries in the neighbourhood of Meaux flow in trenches carved below the general level of the E. side of the Paris basin.

The battles of the Marne in 1914 and 1918 are described in a separate article. During the brief campaign of 1940, the Germans reached the Marne near Chateau-Thierry on June 11, and established bridgeheads on the S. bank next day. The French, faced with vastly superior mechanised forces,

were compelled to retreat from the line of the river. On Aug. 27, 1944, U.S. armoured forces reached the Marne near Lagny, meeting little opposition; next day formations crossed the river at Meaux and near Chateau-Thierry.

**Marne.** Dept. of France, formerly part of the prov. of Champagne. It lies contiguous with the depts. of Ardennes, Meuse, Haute-Marne, Aube, Seine-et-Marne, and Aisne. To the N. of the dept. are the wooded hills of the Reims district, but the chief physical feature is the bare, chalky tract known as the Champagne Pouilleuse. The Marne flows in a N.W. direction through the dept., other rivers including stretches of the Aisne and Aube, and numerous small tributaries of the Marne. The Aisne-Marne and Marne-Rhine canals are notable.

The principal product is champagne wine, but miscellaneous agriculture and fruit growing are also carried on; the industries include woollen manufactures, dyeing, chalk and marble quarrying, foundries, etc. The capital is Châlons-sur-Marne, and among other towns are Reims, Épernay, Ste. Menehould, and Vitry-le François. The dept. suffered severely in the First Great War, especially in the tract from Reims across the Camp de Châlons to Suippes. Area, 3,167 sq. m. Population 386,926.

On Sept. 4, Joffre ordered the Allied armies to assume the offensive on Sept. 6, to profit by the "adventurous" position of the German 1st army, and to concentrate against it the efforts of the Allied armies on the left. He called on his troops, if they found it impossible to advance, to "stand their ground at all cost and die rather than give way."

#### The Opening Phase

On Sept. 5, the artillery of the French 6th army opened fire on the Allied left, the German artillery replied, and artillery fighting continued all that afternoon. On the next day, a Sunday, the main battle began. During the night Kluck had ordered two of his four corps S.E. of Paris to march to the aid of his corps opposite the French 6th army, and during the day he also recalled the other two, thus leaving an enormous gap between his 1st army and Bülow's 2nd army, apparently in the belief that the British facing him were incapable of any action. The French 6th army meanwhile attacked northward from Meaux with great energy and gained ground in the face of deadly artillery fire. On their right the British advanced slowly across the forest of Crécy to the Grand Morin. The French 5th army forced the German 2nd army northwards across the Marne in prolonged fighting, bending in Bülow's right flank and threatening his whole position. The French 9th army could do no more than barely hold its position against great German attempts to break through, the 4th army was forced back slightly, while the 3rd army held the attacks of the German 5th generally in check, though losing ground S. of the Argonne.

#### Gap in German Front

On Sept. 7, Kluck's movement of his whole 1st army to the Ourcq imperilled the French 6th army. It was at this moment that Gen. Gallieni, recognizing the danger, hurried aid to that army in the requisitioned taxicabs of Paris. Meanwhile the concentration on the Ourcq of Kluck's entire force created that gap in the German front which proved fatal to their plans. The British, delayed by a German cavalry screen and by machine guns, thrust into the gap, reaching the Petit Morin after seizing Coulommiers. The 5th army pushed back Bülow's right some 6 m., and was also able to detach a corps to aid the 9th army, still violently attacked and

## MARNE: BATTLES OF 1914 AND 1918

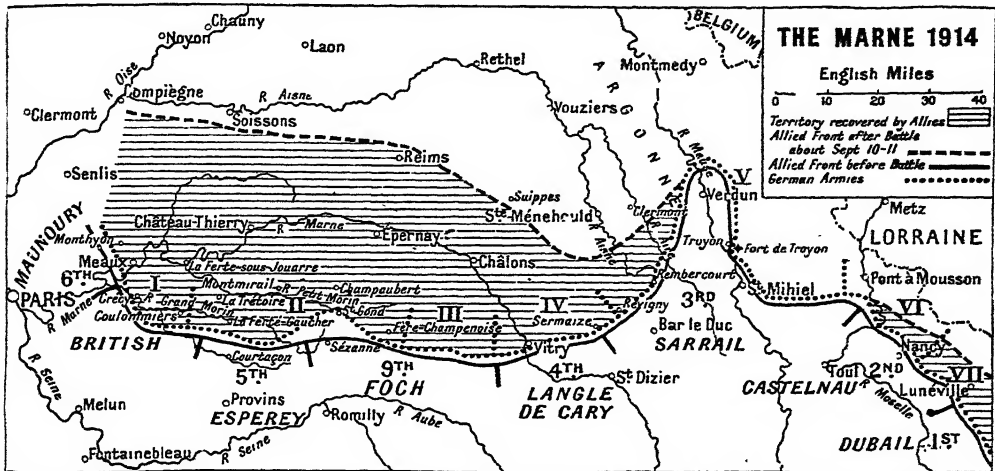

*Major battles of both the First and the Second Great Wars are described in detail in this Encyclopedia (see Aisne; Jutland; Somme; Ypres, etc.). This article deals with that battle which first arrested the German advance in 1914, and with two decisive and almost simultaneous Allied victories of 1918, one defensive, the other offensive. See First Great War*

The first battle of the Marne, fought Sept. 6-10, 1914, was one of the decisive battles of the First Great War, indeed of history. It marked the first check of the German forces after the initial impetus of their advance into France, and was their first decided defeat. This turning of the tide appeared at the time so inexplicable as to be almost miraculous.

Joffre, French C-in-C., had learned from airmen's reports that the German 1st army, under von Kluck, was marching from N.E. of Paris to a point E. of Paris to support the German 2nd army, under Bülow, in crushing the French 5th army. The German right flank was thus left exposed. The German 1st army commander, von Kluck, believed the British army demoralised, and did not

know of the new French 6th army assembling on his right flank nor of the new French 9th army in the Allied centre. The opposing forces from W. to E. were, on the Allied side, the French 6th army, the British army, and the French 5th, 9th, 4th, and 3rd armies, a total of 51 divisions; on the German side, the 1st, 2nd, 3rd, and 5th armies, totalling 40 divisions. Altogether, about 450,000 Germans faced about 600,000 Allied men at the outset of the battle. The Germans retained immense superiority in heavy artillery, aircraft, and equipment. But their communications were faulty; the Belgian resistance had dislocated their plan of campaign; and the unexpected vigour of the Russian attack in the E. had led them to divert two corps to that front.

Marne. Map showing how the German advance was arrested by the French and British armies, and the line forced back beyond Reims after the 1st battle

hard pressed, but holding its ground. The 4th army also held on, though its connexion with the 3rd was imperilled. The 3rd army was engaged fiercely, for the fall of Maubeuge that day set free a German corps and vital railways at a moment when German supplies and ammunition were low.

On Sept. 8 each of the opposing armies attempted to outflank the other; the British continued their advance, crossing the Petit Morin and violently shelling the Marne bridges; and the 5th army, crossing the Petit Morin, captured Montmirail, and widened the gap in the German front. The 9th and 4th armies were again violently attacked, yet held their ground, the 3rd even advancing slightly.

On Sept. 9 fresh German troops of Kluck's army continued to assail the French 6th, but Kluck was now in imminent danger of being enveloped on both flanks. At the critical moment the German staff lost heart, and ordered a general retreat to the Aisne. The retirement began that afternoon. It was accentuated all along the line on the following day, when Kluck's army was placed under Bülow. The Allies were soon in pursuit, in pouring rain. By Sept. 12 the Allies had advanced rapidly to the Aisne; the 9th army reached Épernay and Châlons, and on Sept. 13 occupied Reims; the 4th army seized Vitry-le-François; the 3rd army pushed up to the railway line from Verdun to Ste. Ménehould. The Germans were approaching or had actually reached the line which, after the ensuing 1st battle of the Aisne they were to fortify and

hold, with little change, until 1916. (See Aisne Battles.)

The net result of the battle was that the French armies, after a fortnight of defeat and retreat, had (with the British) taken the initiative, driven back the Germans 35 miles, and thus saved Paris and probably France. Certainly it put an end to German hopes of a speedy and victorious end to the war. French generalship was of a high order, particularly that of Gallieni. The British were criticised for the slowness of their movements, and Gallieni himself held that French cavalry should have exploited the victory more completely. German critics blamed both Moltke and the Kaiser for their defeat, first for withdrawing troops for the east; secondly for leaving a large force in Belgium; thirdly for attempting to break through at Nancy without a sufficiently large force for such an operation. The French claimed 38,000 prisoners, but no exact total of French casualties was given, as the figure of 300,000 published after the war included losses in the retreat and in the Lorraine battles of the same month.

#### Second Marne Battle

The second battle of the Marne was fought July 15-17, 1918, and began with a German offensive, following the earlier great German attacks which had been brought to a standstill on other parts of the front. The object of Ludendorff's attack was the capture of Reims, to be followed by a fresh offensive in Flanders which he hoped would end the war. The German force consisted (W. to E.) of the 7th, 1st, and 3rd armies (50 divisions). De-

fending the section were the 10th, 6th, 5th, and 4th armies, with strong U.S. forces intercalated on the French line.

Pétain, commanding the French, was well informed of the German plans, and withdrew the bulk of Allied troops from advanced positions on his 4th army front, leaving only strong, detached points which were to be held to the last. The attack, postponed for three days through bad weather, was planned by the Germans to open suddenly with artillery fire at 1.10 a.m. on July 15, the infantry beginning their storm at 4.30 a.m. But these plans were discovered by the French, who surprised the Germans by opening their own bombardment first, on the evening of the 14th. When the 7th German army crossed the Marne during the early morning, they were already weakened by heavy losses from shells and machine-gun fire. Only 3 m. S. of the river they struck the main French positions, meeting French and U.S. troops. The resistance of the U.S. 3rd div. disorganized the attack, and the advance here was checked, with enormous German losses. S.W. of Reims the assailants gained some important ground, but were unable to push on, as intended, to Épernay. On the French 4th army front the German bombardment wasted its shells on the advanced French positions. Reims itself was heavily bombarded, but French troops there, sheltered in vast wine cellars, suffered little.

Next day the French counter-attacked with great success, and at noon the German 1st and 3rd armies were ordered to suspend

studied art in Paris, where his Young Girl playing with a Dog, 1829, attracted some attention. He executed the relief of the battle of Jemappes on the Arc de Triomphe, made some successful statues, that of Emmanuel Philibert at Turin, 1833, being one of the best, and after the revolution of 1848 came to London, where he enjoyed a certain vogue. Two of his best known works in England are the statue of Richard Coeur de Lion at Westminster, and the Inkerman memorial in S. Paul's. He died at Passy, Paris, June 4, 1868.

**Marolles** OR **MAROLLES**. One of the square cheeses of France, with a brownish skin. It is small and heavy, made of whole milk and fermented, with a strong taste and smell, and semi-hard. It is made at Maroilles, in French Flanders, also in other places in N. and E. France, during winter and spring.

**Maronites**. A tribe of Syrian Christians, living mainly in the vicinity of Damascus. Converted to Christianity in the 8th century by a monk, John Maro, who became their bishop, they held the Monothelite heresy until 1182, when they joined the Church of Rome, only to leave it 200 years later. In 1445 they were reconciled to the pope. They are largely independent, elect their own patriarch, and retain their own liturgical usages. They have about nine bishops, and have been much persecuted by the Druses.

**Maroon** (Fr. *marron*, chestnut). Device used for producing a loud report. It is a cylindrical box of pasteboard filled with gunpowder, strongly bound with twine, and primed with quickmatch. Maroons were fired in London during the First Great War to give warning of imminent enemy air raids, and until 1938 marked on Armistice Day the beginning and end of the two minutes' silence. Traditionally they precede public displays of fireworks.

**Maroons**. Name given to certain negro inhabitants of Jamaica. It is an adaptation of the Span. *cimarron*, applied by the Spaniards to runaway slaves who escaped to the mountains (*cima*, mountain-top). On the expulsion of the Spaniards from Jamaica in 1658 their slaves took to the hilly interior, and were long a source of trouble to the British, who abbreviated the Spanish word into maroon. See Jamaica.

**Maros** OR **MURESUL**. River of Rumania. It rises in the Carpathians in the E. of Transylvania

and describes a great curve to the N. until, just above Deva, it flows W. to join the Tisza (Theiss) near Szeged. Below Nagylak it passes through Hungary. Its chief tributaries are the Aranyos (Auraru) and the Great and Little Küküllő (Tarnava). The chief towns on its banks are Arad, Deva, Karlsburg (Alba Julia), and Maros Vásárhely (Osorrei). It is navigable for small craft for half its length of 500 m., and its valley provides one of the two easy routes from the Alföld to the Transylvanian plateau.

**Marot**, **CLÉMENT** (1496-1544).

A French poet. He was born at Cahors, the son of a man of letters, and at the university of Paris studied law. He gave time to verse making, and was soon a member of the court circle. Francis I took a fancy to him, as did his sister, Margaret, duchess of Angoulême, and Marot was taken prisoner at Pavia when in the king's train. In 1526 he was arrested for heresy, and later his liberal ideas got him into trouble. In 1535 he took refuge in Italy, but soon abjured his heretical opinions and returned. He was again an exile, however, when he died at Turin. A popular translation of the Psalms, condemned by the Sorbonne, was one reason for his flight. As a poet Marot tried many styles, but excelled in the lighter and more familiar forms, his *chansons* being characterised by natural ease and courtly grace. His influence on French literature was considerable, for he was one of the first to break away from conventional poetic forms. His complete works were edited by P. Jannet, 1873-76.

**Marozia**. Italian princess of the 10th century. Daughter of Theodora and the consul Theophylact, she married successively Alberic, duke of Spoleto, in 906, Guido of Tuscany, and Hugo of Provence, king of Italy. Ambitious and unscrupulous, she deposed and put to death Pope John X in 928, and three years later installed her bastard son as pope. Calling herself Senatrix of the Romans, she maintained her rule until 932, when she was imprisoned by Alberic, her son by her first husband, and disappeared from history.

**Marple**. Urban dist. of Cheshire, England. It stands on the river

Goyt, on the borders of Derbyshire, and is also served by a canal and is a rly. junction, 12 m. S.E. of Manchester, of which it is practically a residential suburb. The chief industry is cotton manufacture. Market day, Fri. Population 12,270.

**Marpelate Controversy**. A literary dispute between the Puritans and the Established Church of England in 1588-90. It was started by a series of seven secretly printed tracts, signed Martin Marpelate, Gentleman; Martin Junior; and Martin Senior. The first appeared about Oct., 1588, and, with its fellows, was followed by replies in kind written by Thomas Cooper, bishop of Winchester, Thomas Nashe, John Lyly, and others. Martin appears to have been a scholar of Oxford, a theologian, and a man of means—possibly Job Throckmorton. The tracts employed satire, wit, railery, and racy gossip in attacking abuses in Church and state and the character of certain bishops. Archbishop Whitgift proceeded mercilessly against all suspected of complicity in their production and circulation, John Penry, the printer, being hanged in 1593. The secret press was carried on at East Molesey, Fawsley, Coventry, and Manchester, where it was seized in Aug., 1589.

**Marquand**, **JOHN PHILLIPS** (b. 1893). American novelist. He was born Nov. 10, 1893, and educated at Harvard. He published *Unspeakable Gentlemen* in 1922, and became known as a stylist with *Four of a Kind*, 1923, and later novels. The series of adventures of a semi-Oriental amateur detective, Mr. Moto, began in 1936 with *Thank you, Mr. Moto*; this character was a success on the screen when interpreted by Peter Lorre. Marquand's *The Late George Apley*, and H. M. Pulham, Esq., studies of Bostonian social types, were also filmed.

**Marquesas**. Group of French volcanic islands in the Pacific Ocean. They are 900 m. N.E. of Tahiti, N. of the Low Archipelago. Nukahiva and Hivaoa are the largest of the 13 islands, seven of which are inhabited; Resolution Bay, on Tahuata, and Port Jarvis, on Roapoa, are the chief harbours. The interiors are hilly and the cliff coasts render access difficult. Copra and pearl shells are the chief products. The S. islands were discovered by Mendaña in 1595, those to the N. in 1791 by Ingraham, who named them the Washington

Clément Marot,  
French poet

Marquesas. Natives of the islands

Islands. They have been French since 1842; and the French commissioner has his seat at Atuona on Hivaoa. Area, 480 sq. m. Pop. 2,699.

**Marquess** or **MARQUIS**. Title of nobility. Etymologically the same as *margrave*, count of the march (border), the word was not used in this sense in Great Britain, except occasionally for the guardians of the Scottish and Welsh marches. In the British peerage the title ranks between duke and earl; it was introduced in 1385 by Richard II, who made his favourite, Robert de Vere, marquess of Dublin.

**Marquetry** (Fr. *marqueter*, to inlay). Mosaic of ornamental woods, metals, or ivory, inlaid in furniture and smaller articles. In Venice, in the 15th century, caskets were inlaid with geometrical shapes of wood and ivory, and the Italian "intarsia" work of the 16th century was at first geometrical, and later developed into pictorial design. By the end of the 17th century marquetry in a number of intricate designs was being applied to Continental furniture. The English furniture makers of the 18th century employed it freely. Earlier marquetry was executed with woods of natural hues. Later, stained woods were employed, particularly after the discovery by a Frenchman named Boucherie of a process whereby wood could be stained to a considerable depth. See *Furniture*; *Inlaying*; *Mosaic*.

**Marquette, Jacques** (1637-75). French explorer. Born at Laon, he joined the Jesuits, and in 1666 was sent out to Canada. There he engaged in missionary work among the Indians who lived around the Great Lakes until, in 1673, he and Louis Joliet set out to explore

the Mississippi. Marquette died on a missionary journey, May 18, 1675.

**Marrakesh**. City of Morocco, the S. capital of the country. It is situated on the N. end of a fertile plain, about 4 m. S. of the river Tensift. It is surrounded by a wall, and contains many ancient but dilapidated buildings and several notable mosques, including the Kutubia or mosque of the scribes.

The sultan's palace stands outside the walls and covers about 200 acres. Standing within easy reach of the Atlas Mts. and commanding the trade routes to the S., its commerce was important, and it is still the centre of a large trade. Pop. 241,000.

**Marram Grass** (*Ammophila arenaria*). Perennial grass of the family Gramineae. Marram is a native of the sea-shores of Europe and N. Africa. It has a long, branching rootstock which creeps under the blown sand, and its numerous rigid stems, 3 or 4 ft. high, bear long, stiff leaves which are rolled up from the side. The flowers are grouped in a long, rounded panicle. This grass is most valuable on account of its work in binding the dry, shifting sands and forming the dunes, making them sufficiently stable for other sand-plants to cooperate in preventing the loose sand from blowing far inland.

Marram Grass. Leaves and flowers of this perennial grass. Right, flower panicle and single flower

**Marriage** (Lat. *maritus*, husband). Union of man and woman sanctioned by the community. This social institution has the two-fold purpose of regulating sexual relations for the common weal, and establishing the status of the offspring. It serves to define the rights and obligations of the parties and their children, and to determine descent and succession to property and rank. In all stages of culture disregard of the procedure

imposed by custom is visited with social reprobation and attended by disabilities. When, in advanced

societies, it is regarded as a contract, and as such is formally sanctioned by the church or state, wedlock is not terminable at will but only by the mechanism of the accepted legal proceedings.

Marrakesh. Lower picture, Kasba gate in the city walls. Upper picture, Kutubia mosque

Monogamous union appears to have been the primeval foundation of the human family. Westermarck's minimum definition of marriage as a union lasting till after the birth of the offspring recognizes it as something more than mere mating. It involves living together for mutual helpfulness and protection, and the rearing of the family. The social instinct, no less than the parental, is rooted in the psychological life, and in its noblest aspect marriage is held to be a spiritual union.

The intercourse of near relatives is, almost without exception, regarded by mankind with abhorrence. Hence have arisen tables of affinity of varying extension within which marriage is prohibited. Aversion from the union of persons brought up together from infancy is innate, but is sometimes over-ridden by caste pride, as in the royal families of ancient Egypt and Peru. Even then the recorded cases of brother-and-sister marriage are mostly concerned with half-brothers and half-sisters.

Physical aversion or social disapproval tends to inhibit some unions which would be unattended by legal disabilities, such as those which offend against the law of

similarity. Among these may be classed those, marked by wide disparity of race, class, age, or religion, which are held to lack the essentials of domestic sympathy. Child-marriage, distinguishable from infant betrothal, may, as in orthodox Hindu circles, involve the deplorable sequel of perpetual widowhood.

The phenomena of courtship are observable among all peoples. Except in special circumstances the man is the wooer, and much freedom of choice occurs in the lowest as in the highest levels of culture.

#### Forms of Polygamy

Marriage is either monogamous or polygamous. Monogamy consists in the union of one man with one woman. Polygamy, which denotes plurality of husbands or plurality of wives, comprises three forms: polygyny, the marriage of one man with more than one woman; polyandry, that of one woman with more than one man; and the hypothetical communal or group-marriage, the sanctioned union of more than one man with more than one woman. Polygyny is widespread in human society, but where it occurs is usually practised only by men of power or means. The wives may be of co-ordinate rank, whether living together or in separate establishments; when a special status is accorded to the chief wife and her offspring, that of the other wives tends to pass into one of legal concubinage. Polyandry, of diminishing extent, survives in Tibet and among the Nayars of S. India.

**MARRIAGE CUSTOMS.** The manner in which the institution of matrimony reached the level of formal contract is best observed by reference to the customs which attend it. Various considerations led to an early stage to the formulation of rules binding men to find their wives either within their own social group, hence called endogamous, or outside it, thus giving rise to the principle of exogamy. An early form of exogamy was the forcible seizure of extratribal women, either singly, as with Persephone, or in the mass, like the rape of the Sabines. The tribe of Benjamin practised it both in battle and at village feasts (Judges 21). Marriage by capture may also be intertribal, often denoting an attack upon prescriptive clan-right. In some Australian tribes the captive is stunned; she may be abducted on horseback with pretended pursuit, as among the Yakut; there may be realistic fights among the relatives, as in the New Hebrides.

Marriage by purchase (*cf.* Ruth 4) is a widespread recognition of clan-right or family-right; the bride-price is a compensation for economic loss. It is based upon the local measure of value: mares in central Asia, reindeer among the Samoyeds, cattle in Bantu Africa, pigs in the New Hebrides, bead-money on the lower Congo, arrows among the Pygmies, shell-money in California. Marriage by service, as with Jacob and Laban, is a well-established variant. The servitude may precede marriage, as with the Chukchi, or follow it, as in aboriginal N. America. The latter is usually indistinguishable from *beena* marriage, the matrilocal custom of residence by the husband with the wife's people.

The dowry, as the converse of the bride-price, arises under social conditions that relieve the wife of the duty of economic labour. It is often given in kind, such as a cow among the Yugoslavs, or mats in Polynesia. In some communities it is indistinguishable from husband-purchase. It is normal in Aryan India and in modern Europe. *See* Betrothal Customs; Concubinage; Dowry; Family; Kinship; Society.

E. G. HARMER

**Bibliography.** Marriage Customs in Many Lands, H. N. Hutchinson, 1897; History of Human Marriage, E. A. Westermarck, 3rd ed. 1901; History of Matrimonial Institutions, G. E. Howard, 1904; Marriage and the Family, R. E. Baber, 1939.

**Marriage Law.** Marriage is "the voluntary union for life of one man with one woman to the exclusion of all others." In England the law was consolidated in the Marriage Act, 1949. Before two persons can marry they must be at least 16 years of age; of sufficient mental capacity to understand the nature of the contract they are entering into; not within the prohibited degrees of relationship; physically capable of consummating the marriage, and not validly married to any other person. A marriage may take place (1) according to the rites of the Church of England; (2) in a nonconformist or R.C. church or other registered building; (3) in a superintendent registrar's office; (4) according to the rites of the Society of Friends or the Jewish faith. The necessary formalities differ in each case.

A special licence can be obtained from the archbishop of Canterbury which makes it legal for the marriage to be solemnised according to the rites of the Church of England without publication of banns, at any convenient

time and place, and not necessarily in a church. Special licences are, however, granted very rarely and usually only for the marriage of persons of public importance, the licences which are in common speech sometimes referred to as "special" licences being in fact not special licences but licences granted by a superintendent registrar (*see* below).

#### Church of England Marriage

Except where a special licence has been obtained, marriage according to the rites of the Church of England must be celebrated in a church of the Church of England either after publication of banns or on a common licence from the bishop dispensing with banns or on a certificate obtained from a superintendent registrar. If the marriage is by banns, these must be published on the three previous Sundays in the parish church of the parish or parishes where the parties live. They may be married in some other church of the Church of England which is the usual place of worship of one of them if the banns are also published there. Instead of banns, the parties may in exceptional cases obtain a common licence from the bishop of the diocese or a certificate from the superintendent registrar. To obtain a certificate 21 days' notice must be given to the superintendent registrar of the district or districts in which the parties must have resided for seven days. A marriage may be solemnised in a church with a certificate instead of banns only if the clergyman consents. A clergyman must not without just cause refuse to marry a parishioner; but he may, so long as the former spouse is alive, refuse to remarry a person whose previous marriage has been dissolved, whether the person to be married again was the guilty party or not, nor need he allow the use of his church for such a marriage. He may also refuse to marry a man and his deceased wife's sister, a man and his deceased brother's wife, or persons who are related as nephews or nieces by marriage; he must, however, in such cases allow his church to be used by another qualified clergyman if required.

A marriage in a church of the Church of England must be solemnised by a priest or deacon. There must be two witnesses. The use of the words of the marriage service is not essential, nor is the putting of a ring on the bride's finger. On the joining of the hands of the parties and the

pronouncement by the clergyman that they are man and wife, the marriage is complete so long as they understand that as a result of these acts they become married to one another, and to one another only, until death parts them. Marriages, other than those with a special licence, or according to the usages of the Society of Friends, or of the Jews, must take place between 8 a.m. and 6 p.m.

Marriages in nonconformist and R.C. churches and other buildings registered for the solemnisation of marriages may be performed on a superintendent registrar's certificate, or on a superintendent registrar's certificate with licence. A certificate with licence can be obtained one whole day after the notice of marriage has been given; 15 days' prior residence by one of the parties is necessary. The registrar of marriages may be required to attend the ceremony. Two witnesses must be present, and the marriage must be solemnised with open doors between 8 a.m. and 6 p.m. Any religious ceremonies may be used, but each party must state that he or she knows of no impediment to the marriage and must say to the other: "I call upon these persons here present to witness that I, A.B., do take thee, C.D., to be my lawful wedded wife [or husband]," or "I, A.B., do take thee, C.D., to be my wedded wife [or husband]."

#### Marriage at Registrar's Office

Marriage may also take place at the office of the superintendent registrar on a superintendent registrar's certificate or certificate with licence. Two witnesses and open doors are required, the same words as those necessary at a marriage in a nonconformist church are used, and the ceremony must take place between 8 a.m. and 6 p.m. No religious service may take place at the superintendent registrar's office, but the minister of a nonconformist church or other religious body to which the parties belong may, if it is so desired, later celebrate a marriage service at his church. Such a service, however, is not a necessary part of a civil marriage ceremony.

During the Second Great War, some of the above rules as to notice and place were relaxed for the benefit of members of the armed forces who were frequently moved at short notice from one part of the country to another.

Where a person is under 21 and is not a widow or widower, the consent of the parents or guardian

is required to the marriage. If such consent is refused an application for consent can be made to the court, usually the magistrate's court. Failure to obtain consent of parents, guardian, or magistrate may make the parties liable to prosecution, but does not invalidate the marriage.

Where one of the parties is a Friend or where both are of Jewish faith the marriage may be solemnised according to the rites of these bodies on a superintendent registrar's certificate with or without a licence. The rules of English law as to open doors, the presence of witnesses, and the permitted hours do not apply.

#### Scotland and the U.S.A.

In Scotland marriages are either regular or, now in very rare cases, irregular. The irregular marriages (which were fully valid), made whether at Gretna Green or elsewhere in Scotland by mere declaration without notice or ceremony, were abolished in 1939. A regular marriage is one celebrated by a minister after banns or publication of a notice in the registry. Marriage may also take place on a sheriff's licence or after notice before a registrar. The consent of parents is not required for persons under 21.

U.S.A. Marriage laws in the U.S.A. differ from state to state. The age for marriage with consent of parents or guardian ranges from 14 for males and 12 for females in Idaho, Maine, Michigan, Mississippi, and New Jersey, in which states common law prevails, to 18 for males and females in West Virginia; age without consent varies from 18 to 21 for men and for women. Blood tests for the male only are required in Alabama, Louisiana, and Texas, for both parties in California, New York, Pennsylvania, Virginia, and 28 other states. There is no period of waiting before or after the issue of a licence in most states; five days is the longest term of waiting imposed. Common law marriages, without licence or ceremony, if they have lasted a year or more, are validated in most states. In the South, and some of the other states, marriage between whites and negroes is unlawful; and in some marriage between whites and Indians. See Divorce.

**Married Woman's Property Acts.** English laws for the protection of married women, which began with the Married Woman's Property Act of 1882. By common law a husband on marriage before that date became entitled to all the

personal property which the wife then had or later acquired, and had also extensive rights over her other property. His rights extended even to her earnings. Apart from a few exceptional cases, a married woman could not validly enter into any contract. The ingenuity of conveyancers had done something to mitigate the hardship of the rules relating to property, but this Act, which came into force on Jan. 1, 1883, stated that a woman married after that date should be entitled to hold as her separate property any real or personal property. She was also given the power to make contracts. In 1935 it was provided that a married woman should hold property in the same manner as an unmarried woman, and restrictions on anticipation were abolished in 1935 and 1949. The Act of 1882 left a husband liable for his wife's ante-nuptial debts to the extent of any property he acquired through her, and also for any tort committed by her; these liabilities were not removed until 1935.

**Marriott, Sir John Arthur Ransome (1859-1945).** British historian. From Repton he went to New College, Oxford, where he was appointed to a lectureship in 1884. Secretary of the university extension delegacy, 1895-1920, he became a fellow of Worcester College in 1914. He was Conservative M.P. for Oxford City, 1917-22, and for York, 1923-29, serving on several financial committees. His special studies were the Eastern question in modern diplomacy, 19th cent. European history, and the growth of the British Empire. His publications include *The Mechanism of the Modern State*, 1927; *A History of Europe from 1815 to 1923*, 1931; *Commonwealth or Anarchy*, 1937; *The Evolution of the British Empire*, 1939; *Anglo-Russian Relations*, 1944. Marriott died June 6, 1945, and his *Memoirs of Fourscore Years* appeared in 1948.

Sir John Marriott,  
British historian

**Marrow.** Soft tissue found in bone. Red marrow occupies that part of the bone which is made up of spongy tissue. It is very vascular, and contains certain cells, known as erythroblasts, from which the red corpuscles of the blood are developed. Yellow marrow consists chiefly of fat cells, and

fills the medullary cavity in the centre of the shaft of long bones.

**Marrow.** Plant of the family Cucurbitaceae, better known as Vegetable Marrow (*q.v.*).

**Marrow Controversy.** Dispute in the Church of Scotland. Arising in 1718, it led finally to the formation of the Secession Church. It was named after The Marrow of Modern Divinity, 1644, by Edward Fisher, an English Calvinist, and was caused by the republication of this work in 1718, with a commendatory preface, by the Rev. James Hog of Carnock, the book being attacked and condemned as antinomian. *See* Presbyterianism; Church of Scotland.

**Marrucini.** Tribe of ancient Italy. They lived on the E. coast and came into notice in 315 B.C. as a member of an alliance formed to fight against the Romans. They then became allies of Rome, but soon disappeared from history.

**Marryat, FREDERICK** (1792-1848). British novelist and sailor. Born at Westminster, July 10, 1792, he was the son of Joseph Marryat, who had interests in the W. Indies. In 1806 he entered the navy and was at first under Lord Cochrane, afterwards earl of Dundonald, who appears in Peter Simple as Captain Savage. He saw service in European and American waters, before the peace of 1815. He held a command during the Burmese War of 1824-25, and retired in 1830. Made F.R.S. for his work in improving signalling, he is credited with several rescues of life. He died at Langham, Norfolk, Aug. 9, 1848.

Marryat turned his experiences to good account in his numerous stories of nautical life. He began with Frank Mildmay, 1829; and went on with Newton Forster, 1832; Peter Simple, 1834; Jacob Faithful, 1834; Mr. Midshipman Easy, 1836; and Snarley Yow, or The Dog Fiend, 1837. Some of these attained remarkable popularity, especially among boys. Several appeared first in The Metropolitan Magazine, which Marryat edited 1832-35. His later books include Masterman Ready, 1841; The Settlers in Canada, 1844; and The Children of the New Forest, 1847. His daughter Florence (1838-99), herself author of some 70 novels, published his Life and Letters, 1872.

Captain Marryat,  
British novelist

**Mars.** In classical mythology, the Italian god of war and agriculture, whom the Romans subsequently identified with the Greek Arēs. He was extensively worshipped by the Romans, who claimed him as the father of their founder Romulus. He was the god of the year, March being his special month. The Campus Martius or field of Mars, where stood an altar to the god, was the recognized place of exercise for the youth of Rome. He was also known as Gradivus and Quirinus. *See* Arēs.

**Mars.** First of the superior planets. Its mean distance from the sun is 141,710,000 m., and its

Mars. Telescopic photograph of the planet taken at the Mount Wilson Observatory, Pasadena, California

orbit is extremely eccentric. The mean diameter of the planet is 4,213 m.; its year 1·88 of our years, or 687 days; and the Martian day 24 hours, 37 mins., 23 secs. The mass of Mars is little more than one-tenth that of the earth (0·108), and its mean density as compared with the earth is 0·70. The tilt of Mars, or the angle between the plane of the planet's equator and the plane of its orbit, is 25° 12', and it has an analogous division of seasons to the earth's, though they are longer. Mars has two moons, Deimos and Phobos, the discovery of which in 1877 was predicted by Swift in Gulliver's Travels. They are very small, Phobos perhaps 10 m. in diameter, Deimos 5, and they revolve about Mars in 7 hours, 39 mins., and in 30 hours, 18 mins. respectively.

The determination of the elements relating to the orbit and mass of the Martian system has been exact enough to leave few loopholes for inquiry, but speculation has been busy about the constitution of Mars. Its ruddy colour, which fades to yellow and reddish brown in the telescope, was formerly thought to be due to the great density of its atmosphere, but is now believed to be due to oxidation of the surface rocks.

Modern observation and mathematical theory show that the planet's atmosphere is in quantity much less than that of the earth. It has clouds, which, according to observations by Pickering at the opposition of 1916, always lie over the so-called desert regions. Their existence was first noted by Lockyer in 1862, but for many years this was denied on the ground that there was no proof of the existence of water vapour on Mars. The spectroscope shows that the amount of water vapour to be found is not 1 p.c. of that on the earth.

In 1877 Schiaparelli discovered what he called channels, but described more usually by others as canals, extending from the darker patches on Mars over the lighter ones. This discovery gave rise to the conjecture that these channels were actual irrigation canals, by which the melting of the polar snows on Mars, of which there is visual evidence, might be made available for watering the desert regions.

This theory was supported by Lowell, whose drawings show the planet covered with a complex geometrical network of canals, meeting at so-called oases. Other equally good observers have failed to see the canals, and it is generally believed that, though much fine detail exists, the appearance of geometrical precision is suggested by factors that are subjective. Photography cannot yet decide the point, for even with the biggest telescopes exposure times running into seconds have to be used, during which atmospheric tremor can obliterate fine detail even in good observing conditions. Possibly some low form of vegetation could live in the dry atmosphere and cold nights (−110° F.) of Mars, but the existence of animal life is dubious. *See* Astronomy; Lowell, P.; Planet; Solar System.

**Bibliography.** La Planète Mars, C. Flammarion, 1892; Mars and Its Canals, P. Lowell, 1906; Mars as the Abode of Life, P. Lowell, 1908; Life in Other Worlds, H. S. Jones, 1940; Earth, Moon and Planets, F. Whipple, 1941.

**Marsala.** Wine produced in the neighbourhood of, and exported from, Marsala, Sicily. An old and flourishing industry is based on the product of extensive vineyards in W. Sicily. A white, sweet, strong wine, Marsala resembles Madeira, but has a distinctive, pleasing flavour and golden colour, with a high percentage (average 22) of alcohol.

**Marsala.** A seaport of Sicily, Italy, in the prov. of Trapani. The most westerly point, 19 m. by rly. S. of Trapani, it is the centre of a wine producing district, and exports quantities of Marsala wine. It is built on the site of the ancient Lilybæum, a Carthaginian stronghold, which fell to Rome, 241 B.C. Garibaldi landed here from Genoa, May 11, 1860. During Allied operations in Sicily in the Second Great War troops of the U.S. 7th army took the town from the Italians on July 23, 1943. The civic museum was almost completely destroyed. Pop. 31,000.

**Marschall von Bieberstein, ADOLF HERMANN, BARON (1842-1912).** German statesman. Born at Karlsruhe, Oct. 12, 1842, he became a lawyer and was public prosecutor at Mannheim, 1865-75. Then he was elected to the Baden chamber of deputies, becoming a member of the Reichstag in 1878. On forming his cabinet in 1890 Caprivi made Marschall secretary for foreign affairs, in which capacity he exercised skill in dealing with the Kaiser's interference in state affairs. In 1897 he was appointed ambassador to Constantinople, and largely owing to the influence he acquired over Abdul Hamid Germany gained prestige in Turkey and the concession to build the Bagdad rly. Marschall died at Badenweiler, Sept. 24.

**Marschner, HEINRICH AUGUST (1795-1861).** German conductor and composer. Born at Zittau, Aug. 16, 1795, he studied law, but having a gift for music, soon turned to it professionally. He became acquainted with Beethoven, at whose suggestion he wrote his first opera. In 1823 he became a conductor at Dresden, and later was director of music there, and at Leipzig and Hanover, where he died Dec. 14, 1861. Marschner's greatest opera is *Hans Heiling*.

**Marsden Square.** Term applied to a map-making system devised by Marsden in 1831. A Mercator chart of the world is proportioned into squares of 10° latitude by 10° longitude, and numbered accordingly. Each area is further subdivided into 100 smaller squares 1° by 1°. The latter are allotted numbers from 00 to 99, so that the first figure, in conjunction with the main square, represents latitude and the second longitude. This system is used in charting meteorological data over ocean areas.

**Marseillaise, La.** The national hymn of France since the period of the Revolution. It was written in

1792 at Strasbourg by a young officer of engineers, C. J. Rouget de Lisle, and received its name after having been sung by a party of revolutionaries from Marseilles on their entry into Paris, and again during the attack on the Tuileries. It was prohibited under the Bourbon and Bonaparte régimes, owing to its inflammatory effect on the people, who had adopted it as their rallying cry. The original version, in which the source of several modern variants can be traced, ran thus:

### LA MARSEILLAISE

Rouget de Lisle

Al - lons en fan - ta - si - e, Le jour de gloire est ar - ri - vé. Con - tre nous de la ty - ran - ni - e Lé - ten - dards sang - lant est le - vé, l'é - ten - dard sang - lant est le - vé. En ten - dez vous dans ces cam - pa - gnes Mu - gir ces fé - ro - ces sol - data. Ils vien - nent jus - que dans vos bras E - gor - ger vos fils, vos com - pa - gnes! Aux ar - mes, ci - to - yens! for - mez vos ba - tail - lons. Mar - chez, mar - chez, qu'un sang im - pur A - breu - ve nos ail - lons.

*La Marseillaise.* Original version of the French national hymn, reproduced from an old score. It varies slightly from the version now in use.

**Marseilles** (Fr. Marseille). The second city and greatest seaport of France, and also of the whole Mediterranean. Capital of the dept. Bouches-du-Rhône, Marseilles is situated on the most favoured spot of the Mediterranean coast, in a huge bay surrounded by hills and protected by a range of small, rocky islands. Far enough from the delta of the Rhône river not to have its basins silted up, near enough to exploit the natural trading road of the Rhône valley, Marseilles covers a huge territory—larger than the area of Paris—along the coast. It was one of the world's most picturesque cities until, in January, 1943, its famous old port and the surrounding quarter—mostly huge,

Marseilles arms

*bouillabaisse*, was the principal dish offered.

From the old port the principal street of Marseilles, the impressive Cannebière, started up a gentle slope. A few yards away were the slums, thieves' dens, and brothels of a big harbour town. Before the Second Great War, the population included 125,000 Italians, 22,000 Spaniards, 22,000 Armenians, Turks, Lebanese, Greeks, Russians, Swiss, and numerous coloured citizens of French colonies, all registered as French. Fully half the Marseilles population at that time hailed from other countries, a fact which contributed to its rapid growth (1801, 90,500; 1872, 313,000; 1926, 652,600; 1932, 803,230). The new port, begun in 1844, had 11 basins, one, Madrague, connected with the Marseilles-Rhône canal, and was used annually by 8,000-9,000 vessels of

Marseilles. 1. Quai des Belges with Notre Dame de la Garde on the hill in the background. 2. Fort St. Jean at the entrance to the old port. 3. Aerial view of the docks showing the National and La Pinade basins

a total tonnage of some 15 million tons: goods handled weighed 7-10 million tons.

Rlys., connected with the port partly by tunnels, linked France, Germany, Switzerland, etc., with Italy and Spain; a great airport for land- and seaplanes on the lake of Marignane, 12 m. N.W. of Marseilles, and a service of bus lines, especially along the Riviera coast, further enhanced the dominating position of the city. As a fortress, and the seat of the medical and science faculties of the Aix-Marseilles university, of legal, colonial, etc. schools, of an observatory, zoological and botanical gardens, libraries (one of which held 112,000 vols., 145 incunabulae, and 1,689 manuscripts), Marseilles plays a rôle in France's intellectual and public life; its industries, especially its famous soap, but also chemical, glass, ship-building, and engineering works, are important, though less so than its trade.

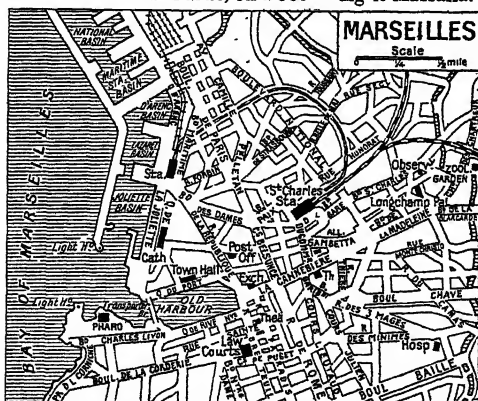

One of Europe's oldest cities, Marseilles is nevertheless essentially modern. Its most impressive buildings—the palais de Longchamp, containing several museums; the Byzantine cathedral near the old port; and the church of Notre Dame de la Garde, on a 300-

ft. hill, with a 150-ft. tower carrying a 30-ft. gilded statue of the Virgin visible from far out to sea—all date from the middle of the 19th cent. Among ancient buildings, the church of St. Victor, 10th to 13th, Notre Dame du Mont Carmel, 13th, the town hall, 17th, and the Grand Théâtre, 18th cent., are the most important. The beautiful promenade de la Corniche, along Marseilles's hilly promontory, the fashionable avenue du Prado and several boulevards, with their colourful life, are among the city's attractions. Pop. (1946) 635,939. The history of Marseilles goes back to about 600 B.C. when Ionian Greeks settled here, calling it Massalia. It was an aristocratic republic, mother of such towns as Antibes, Nice, Monaco, and Arles; later allied with Rome, it was annexed, 49 B.C., by Caesar, and called Massilia. Though long remaining a centre of Greek civilization, it was successively taken by Visigoths, Ostrogoths, and Franks between the 5th and the 9th cents., was attached to Lower

Burgundy—Arelat—in A.D. 879, and regained independence 1212-16. It fell to Charles of Anjou 1246, to France 1481, but refused recognition of the crown until 1596. Its last privileges were abolished by Louis XIV in 1660. During the French Revolution it sided with the Girondists against the Jacobite terror, but was subdued. It regained its importance in consequence of France's conquest of N. Africa and the opening of the Suez canal. Traces of its ancient history, from Phoenician, Egyptian, Greek, Roman, and its early Christian days—it was a bishopric from A.D. 420—to the Middle Ages, are carefully preserved in its archaeological museum.

During the Second Great War Marseilles lay in the unoccupied zone of France from June, 1940, to Nov., 1942, when that zone also was occupied by the Germans following the Allied landings in French North Africa. When the Allies landed in the south of France, Aug. 15, 1944, French forces under Gen. de Lattre de Tassigny advanced on Marseilles, which fell on Aug. 23, unorganized German resistance continuing, however, until the 28th. The city had not suffered seriously in the fighting.

**Marseilles-Rhône Canal.** An artificial waterway making navigation possible between Geneva and Lyons and the Mediterranean Sea, by means of a canalised Rhône and a canal to the harbour at Marseilles.

Marseilles. Plan of the old town and principal docks of the French Mediterranean port

Its two main features are a lock at Génissiat near the Swiss frontier and the use of a specially constructed tunnel near Marseilles. The tunnel is  $4\frac{1}{2}$  m. long, 72 ft. wide, with a depth of 10 ft. of water, contains two waterways, and was cut 1911-16; the canal between the river and Marseilles, which was opened to shipping in 1926, is 48 m. in length.

**Marshal** (old High Ger. *mara*, war horse; *scale*, servant). Title of various high military and civil officers. Originally meaning a groom or farrier, it was applied to the Frankish master of the horse. In England and Scotland the marshal had important duties and became a great officer of state. In France the marshal, associated with the constable, originally had high military command, and the office was revived temporarily by Napoleon. The title of marshal of France, which had been in abeyance since 1871, was revived in 1916, when it was bestowed on Joffre, and later on Foch, Pétain, Lyantey, and others. Marshal is a high military title in the U.S.S.R.

The term was also used for a kind of guardian of etiquette; in the British royal household there is an official in the lord chamberlain's department called the marshal of the ceremonies. The marshal of the king's bench was judge of the Marshalsea court, which tried disputes between royal servants. The city marshal, an officer of the corporation of London, rides before the lord mayor. At Oxford university the marshal is the proctor's chief attendant, and at Cambridge the vice-chancellor has two marshals. A judge of the high court when on circuit

is accompanied by a marshal, usually a young barrister, who acts as his secretary. His duties included the swearing in of the grand jury until these juries were abolished by the Administration of Justice Act, 1933. See Air Marshal; Earl Marshal; Field-marshal; Marschal; Marshal of the R.A.F.

**Marshall, ALFRED (1842-1924).** British economist. Born July 26, 1842, he was educated at Merchant

Alfred Marshall,  
British economist

Taylor's and S. John's College, Cambridge. In 1865 he was second wrangler, and he became a fellow of S. John's. In 1877 he was made principal of University College, Bristol, and in 1883 fellow and lecturer of Balliol College, Oxford. He was at Cambridge from 1885 to 1908 as professor of political economy, on which subject he had made himself a foremost authority, adapting the ideas of Ricardo and Mill to altered conditions. His classic work is *Principles of Economics*, 1890; he wrote *Industry and Trade*, 1919. Died July 13, 1924.

**Marshall, GEORGE CATLETT (b. 1880).** U.S. soldier and administrator. Born at Uniontown, Pennsylvania, on Dec. 31, 1880, he was educated at Virginia military institute, Lexington, being commissioned in the infantry Feb. 2, 1901. He served with the American expeditionary force in France in 1917, was A.D.C. to Gen. Pershing, 1919-24, and served in China, 1924-27. Back in the U.S.A., he held various posts, then in 1938 was made chief

of the war plans dept. of the general staff, becoming chief of staff with promotion to general, Sept. 1, 1939, the day Germany invaded Poland.

An advocate of conscription, he directed and coordinated with admirable tact and efficiency the expansion of the U.S. army after

George C. Marshall,  
U.S. soldier and  
administrator

enactment of the Selective Service bill. When the U.S.A. found herself in the Second Great War on Dec. 7, 1941, the army consisted of 1,500,000 men; by July, 1944, it had grown to 7,700,000, with more than 4,000,000 serving overseas in Europe, the Pacific, and Asia. It was Marshall who chose Eisenhower to command the Allied armies for the invasion of Europe on June 6, 1944. With Roosevelt, Marshall attended the conferences at Casablanca, Quebec, Cairo, and Teheran in 1943, at Quebec in 1944, and at Yalta in the Crimea, 1945. He was one of four made general of the army when that rank was created in Dec., 1944.

After the war he advocated a strong citizen army, and unification of the armed forces; but he relinquished his post as chief of staff on Nov. 20 before bringing any of these ideas to fruition, in order to become ambassador to China in an attempt to bring peace to that divided land. After 13 months, back in Washington he blamed extremists of both the Communists and Chiang Kai-shek's govt. for the failure of his

Marshalling yard. Whitemoor marshalling yard (formerly L.N.E.R.), Cambridgeshire. Incoming trains are split up by

mission. On Jan. 8, 1947, he succeeded James Byrnes as secretary of state, dropping his military title. He attended the abortive meetings of the council of foreign ministers in Moscow, March 10-April 24, and London, Nov. 25-Dec. 15. Speaking at Harvard university on June 5, he made suggestions whereby all Europe, acting in concert, might be helped by American aid to economic recovery. For the results of this speech and the implications of what became known in Europe as the "Marshall plan," see European Recovery Programme in N.V. Marshall resigned for health reasons Jan. 7, 1949.

**Marshall, JOHN** (1755-1835). American lawyer. Born in Virginia, Sept. 24, 1755, he fought through the War of Independence. Admitted to the bar in 1781 and 1782 elected member of the Virginia legislature, in 1798 he was elected to congress. In 1801 he became chief justice of the supreme court, and his judgements have become classics in American jurisprudence. He died July 6, 1835. A study by Lord Craigmyle appeared in 1933.

**Marshall-Hall, SIR EDWARD** (1858-1927). British lawyer. Born at Brighton, Sept. 16, 1858, and educated at Rugby and St. John's College, Cambridge, he became a barrister in 1883, and began to practise on the south-eastern circuit. He made a particular reputation in criminal cases, and from about 1900 he was the foremost advocate of this kind at the bar, appearing in outstanding trials, such as those of G. J. Smith, Seddon, Thompson, and Bywaters. In 1898 he took silk, and in 1917 he was knighted. In 1900 Marshall-Hall entered parliament as Union-

ist M.P. for Southport. He lost his seat in 1906, but in 1910 found one at East Toxteth, which he retained until 1916. Died Feb. 24, 1927. *Consul Life, E. Marjoribanks, 1929.*

**Marshalling.** In heraldry, the art of grouping and blending insignia so as to form an heraldic record. Thus a man who marries an heiress, or who acquires, or claims the rights to, territorial possession or hereditary offices, places the arms of his wife, the arms or other insignia of the feudal estate, territory, or office, in a small shield, called a shield of pretence, or a surtout, in the middle of his own arms. His successors usually quarter the arms of the heiress with their own, according to modern practice placing the paternal arms in the first and fourth quarters, and that of the heiress in the second and third. But in mediæval days those who acquired a fief or feudal estate superior to their own either abandoned their paternal arms for the more valuable insignia, or gave the latter precedence.

With sovereign territorial rights, or the acquisition of hereditary offices, the successors might retain the insignia in the shield of pretence, or quarter them. A husband and the holder of certain important offices, such as a bishop or a herald, impales his paternal arms with those of his wife or his office; in the former case placing his on the dexter, and in the latter on the

Sir E. Marshall-Hall,  
British lawyer

sinister, side of the shield. Or the two coats of arms may be retained in separate shields, which are placed together. See Heraldry.

**Marshalling.** Term used in the law of equity. A testator leaves two funds from which claims on his estate can be paid. Marshalling the assets means arranging them so that a person who has the right to have his legacy or debt discharged from both funds shall not do so to the detriment of another who can only come upon one fund. Thus A, who is entitled to receive £1,000 from either fund, cannot have it all out of fund A, which totals only £1,000 in all, as in that case he will be depriving of his rights B, whose £500 is payable only from this fund.

**Marshalling Yard.** Network of rails spreading out fanwise from a central track to enable trains of loaded freight wagons coming from different directions to be split up and formed into trains which will distribute them to their final destination. Stated simply, a marshalling yard accepts wagons from N., S., E., and W., and sorts them so that all wagons going S. form one train, and so on.

In a flat marshalling yard, the incoming wagons enter direct upon one of the sidings, where a shunting engine pushes them in "cuts" of one or more wagons according to their destination, into the lines upon which trains are being made up. Where large numbers of wagons have to be sorted and made up into trains, the hump system is employed. The wagons of each incoming train are uncoupled according to destination and then pushed slowly over an artificial hump, on the far side of

running over the hump (18) on to the radiating tracks (22). Outgoing wagons are shunted on to other tracks (24)

which is a steep slope with sorting sidings radiating. As each wagon draws away from the rest of the train it drops down by gravity on to the sidings. Sufficient time is allowed for switches, giving access to the fan of sidings, to be moved between one wagon and the next, so that each may run into the appropriate track.

Train sorting in the largest marshalling yards is now completely mechanised. Before a train is pushed up the hump, the wagons are uncoupled and a list of their destinations compiled by the shunter and posted by pneumatic tube to a control tower. From these lists the entire movements necessary to make up a train are set on a control machine which automatically arranges the points leading to the final sorting track. As each wagon runs down the hump it trips a lever which automatically resets the points behind it. Points immediately beyond the track leading from the hump are operated electrically from the control tower. To prevent wagons running off the hump too rapidly, rail-brakes, controlled from the tower, are fitted in the tracks.

One of the largest marshalling yards in Great Britain working on the mechanised hump system is at Whitemoor, near March, Cambs. It has 40 sorting sidings radiating from the hump and can deal with over 4,000 wagons daily. Train movements are controlled by radio telephony. The most famous marshalling yard in Europe is at Hamm, Germany; this was repeatedly bombed by Allied aircraft during the Second Great War.

**Marshall Islands.** Two chains of islands in the N. Pacific ocean. They lie E. of the Carolines, and are composed of the Ratak group of 13 islands and the Ralik group of 11. They are shallow-soiled, but yield crops of coconuts and bread fruit. Phosphate and copra are exported. The chief island and administrative centre is Jaluit. They were occupied by German traders in 1888 and taken over by the German colonial authorities in 1906. Seized by the Japanese early in the First Great War, they were afterwards administered as a Japanese mandate. During the Second Great War the islands were frequently attacked by U.S. aircraft and by the U.S. Pacific Fleet.

On Jan. 29, 1944, after raids on 20 consecutive days, U.S. forces began a concentrated attack—the largest undertaken to that date—by carrier and shore-based planes and by bombardment from cruisers on the chief islands of the group. The small undefended atoll of Majuro was taken on Jan. 31, and next day U.S. marines landed on

Roi, Namur, and Kwajalein. By Feb. 22 control of the Marshalls had passed to the U.S.A. The Japanese

garrisons of those atolls not invaded, left helpless by the Allied advance in the Pacific, surrendered formally Sept. 2, 1945.

The U.N. trusteeship of the group was given to the U.S.A. in 1947.

In the same year Eniwetok (*q.v.*) atoll was developed as a testing ground for atomic weapons.

**Marshall Pass.** Pass in Colorado, U.S.A., in Saguache co. It is named after William Louis Marshall, who served in the Civil War. It has an elevation of 10,841 ft., and is used as a rly. route across the Rocky mountains.

**Marshall Plan.** Name popularly given to proposals put forward by G. C. Marshall (*q.v.*), as U.S. secretary of state, in a speech at Harvard university on June 5, 1947, for economic cooperation

among European countries in their own post-war recovery, with assistance from the U.S.A. See under European Recovery Programme in *Novissima Verba*, at the end of this Encyclopedia.

**Marshal of the Royal Air Force.** Highest rank in the R.A.F. corresponding to admiral of the fleet and field marshal. Until the outbreak of the Second Great War, it had been granted to only three officers, apart from the reigning sovereign, the first being Sir Hugh (later Viscount) Trenchard, in 1927. The insignia of rank are one broad and four narrow rings on the tunic sleeves or coat epaulettes.

**Marshalsea.** Former London prison. Originally the prison of the court of the knights marshal for settlement of disputes among royal servants, and punishment of offenders within the jurisdiction of the king's court, it stood opposite Maypole Alley, in Borough High Street, Southwark. Mentioned in the 14th century, it suffered at the hands of the rebels under Wat Tyler. In Elizabethan times the second of the London prisons, it became in the 18th century the county gaol for felons, an admiralty gaol for pirates, and a debtors' prison. Notable prisoners included Bishop Bonner, who died here, George Wither, and John Udall.

It was pulled down about 1780, and rebuilt in 1811, on ground adjoining S. George's Churchyard, and this structure, which John Wesley in 1753 described as a picture of hell upon earth, was the one made famous by Dickens in *Little Dorrit*, and the one in which his father was imprisoned. It remained in use until the court was abolished in 1849, and was demolished in 1887, with the exception of a turret. See *illus. below*.

**Marsh Cypress** (*Taxodium distichum*). Tall coniferous tree of the family Pinaceae. A native of N. America, it is also known as the bald or black cypress. The leaves are very slender and yellow-like, and are shed in autumn; the cones globular, of thick, shield-shaped scales. It grows in swamps, and, like the white mangrove (*q.v.*), its roots send up "kneeroots" for the purpose of supplying the roots with oxygen. In the marsh cypress these growths, which are hollow, may be more than 3 ft. in height. Correlated with these "kneeroots," the base

Marshall Islands.  
Types of natives

Marshalsea. Part of the north side of the old London prison. Left, buildings of the original prison; right, the court house, which was a later addition  
From a print of 1773

Marsh Cypress, showing the knee-roots sent up to obtain oxygen

of the trunk has a hollow space, into which the oxygen is conducted.

**Marsh Gas.** Alternative name for fire-damp, methyl hydride, or methane (*q.v.*).

**Marsh Mallow** (*Althaea officinalis*). Perennial herb of the family Malvaceae. Indigenous to Europe, Asia, and N. Africa, it has roundish or oval thick leaves with toothed edges, and large rosy flowers. The whole plant is 'downy'. It grows in marshes near the sea. The hollyhock (*A. rosea*) is a Chinese species of the genus.

**Marsh Marigold** (*Caltha palustris*).

Perennial herb of the family Ranunculaceae. A native of Europe, Asia, and N. America, it is also known as kingcup. It has a stout, creeping rootstock, and large, kidney-shaped leaves. The flowers are exaggerated buttercups of golden yellow sepals, the petals being absent. The unopened buds are pickled and eaten as a substitute for capers. See Botany.

Marsh Mallow. A plant that thrives near the sea

Marsh Marigold or Kingcup. Flowers and leaves

These hardy mountaineers came over the Alpine passes, and absorbed the primitive aboriginal

hunters of Mediterranean stock. They shared in the Social or Marsic War (90-88 B.C.), which gained for them and other provincial tribes the Roman franchise. See Paeligni.

**Marsileaceae.** A family of Pteridophytes (fern-plants) containing the genera *Marsilea* and *Pilularia*. They are marsh or aquatic plants, and have creeping rootstocks, sending up fronds at intervals. These are rolled from the top, as in the true ferns. The spore-capsules spring from the base of the frond. The development of the spore into a spore-bearing plant is somewhat similar to that in other Pteridophytes. See Pillwort.

**Mars-la-Tour.** A village of France, in the dept. of Meurthe-et-Moselle, 9 m. W. of Metz. It was the scene on Aug. 16, 1870, of a severe cavalry fight in the Franco-Prussian War. The 2nd Dragoons of the Prussian Guard were sent in to rescue the 38th (Westphalian) infantry brigade from General de Ladmirault's men. Ladmirault sent six regiments of horse to attack them, but these were again met by von Barby's cavalry brigade, and a great hand-to-hand struggle terminated in favour of the Prussians.

**Marsovan, MERZIVAN, OR MERSIFUN.** Town of Asiatic Turkey, in the vilayet of Amasya. It is 24 m. W.N.W. of the town of Amasya, on the edge of Marsovan Plain. Silver is mined in the locality.

**Marston, JOHN** (c. 1575-1634). English dramatist. His father was English and his mother Italian. Educated at Coventry and at Brasenose College, Oxford, he wrote a number of satires, several tragedies and comedies, and became involved in the famous stage quarrel with Jonson and Dekker. Marston's first work, an amatory poem, *The Metamorphosis of Pigmalion's Image*, and his series of satires, *The Scourge of Villanie*, both published 1598, were burnt by order of Archbishop Whitgift. His earlier dramatic work, particularly the tragedies *Antonio and Mellida*, *Antonio's Revenge*, and *Sophonisba*, are vigorous but turgid and unreal. Marston collaborated with Jonson and Chapman in *Eastward Hoe*! His plays were edited by A. H. Bullen in 1887.

**Marston, JOHN WESTLAND** (1819-90). British dramatist and critic. Born at Boston, Lincolnshire, Jan. 30,

Westland Marston, British dramatist After E. Morn

1819, he early gave up the law for literature, and wrote about a dozen plays, chiefly poetical dramas, of which the most successful were *The Patrician's*

*Daughter*, 1841, *Strathmore*, Philip of France, and, in prose, *A Hard Struggle*. He died Jan. 5, 1890.

**Marston, PHILIP BOUKE** (1850-87). British poet. He was born in London, a son of John Westland Marston (*v.s.*), Aug. 13, 1850, and became almost blind at the age of three; lost by death within a few years his fiancée, his two sisters, and his friends Oliver

Philip B. Marston, British poet

Madox Brown and James Thomson. His poems, often exquisite if somewhat monotonous, were pub. as *Song Tide*. All in All, *Wind Voices*. He died Feb. 13, 1887.

**Marston Moor, BATTLE OF.** Fought July 2, 1644, during the English Civil War (*q.v.*). The Scottish army, as promised in the Solemn League and Covenant, had entered England and united with the parliamentary force in the north. In the face of this menace Newcastle, the king's general, fell back on York, and that city was besieged. A royalist force under Rupert was sent to its relief. Rupert's army crossed into Yorkshire on June 28.

The Scots and their allies awaited the enemy on Marston Moor, between York and Knaresborough. Rupert, however, avoided them, and, entering York, urged Newcastle to fight. The parliamentarians were already in retreat, but when pursued they turned and stood on this moor, between Long-marston and Tockwith. The parliamentary army had infantry, Scots and English, in the centre, and cavalry on the wings. Cromwell with his Ironsides and David Leslie with some Scottish horse were on the left. The royalists were in similar formation. The royalists, not expecting the action until the morrow, were hardly

ready for the opening of the battle, when the parliamentarians, at 7 p.m. on July 2, attacked in full force.

On the left, Cromwell and Leslie drove Rupert's horsemen from the field, but on the right Fairfax was routed, and in the centre the royalists also had the advantage. A breach was made in the parliamentary line and many were soon in flight. But Cromwell, keeping his men well in hand, swung them round and fell upon the victorious royalist horsemen of the other wing, who were quickly routed. The infantry of the eastern counties, who had stood firm, did their part, and soon a great attack was delivered on the unbroken line of the royalist foot. These fought valiantly, but by the end of the day all were either dead, prisoners, or fugitives. The victors at once entered York. It is computed that the parliamentarians numbered about 25,000 and the royalists about 18,000. Of the latter about 3,000 were slain.

**Marsupial** (Lat. *marsupium*, a pouch). Sub-class of mammals. They are provided with pouches in which the later stages of the development of the young take place. Except for the monotremes (*q.v.*) they form the most primitive living group of mammals, and are distinguished by the details of their embryology. The young are born after a very short gestation, in a very small and rudimentary condition.

The young of the kangaroo, for example, is only about an inch long at birth. The mother takes up the newly-born young, apparently with her lips, and places them in the abdominal pouch, which contains the teats. Here they are attached to the teats by their lips, which at this stage resemble a

cylindrical sucker, and the milk is injected into their throats by muscular contractions on the part of the mother. To avoid the danger of choking, the upper portion of the windpipe in the young is at this stage prolonged into a tube which fits into the back of the nasal cavity, so that air is drawn directly from the nostrils into the lungs, while the milk passes outside and around this tube into the gullet, and so to the stomach. In a very few species the pouch is absent, the young being concealed by the long hair as they cling to the teats.

Marsupials are found both in Australasia and S. America. These regions are characterised by their isolation and the comparative absence of animals of the placental type. The marsupials would probably have become extinct if it were not for this fact, for they cannot compete with the placental mammals. Formerly their range was much wider, occurring in most parts of Europe; and fossil remains have been found in Great Britain. The earliest known fossils occur in the Cretaceous rocks of Canada, and are generally regarded as nearly, if not quite, the most primitive form of mammalian life.

The existing marsupials are divided into two sub-orders, chiefly differentiated by their dentition. The first are mainly carnivorous and the second mainly herbivorous, although insectivorous examples occur in both. The former includes the Tasmanian wolf, the dasyure or native cat of Australia, the bandicoots, the banded anteater, and American opossum. The herbivorous marsupials include the kangaroo and wallaby, the phalanger, the kangaroo rat, the wombat, and the koala or native bear. In size they vary from the grey kangaroo, which is often 5 ft. high, to species no larger than a mouse. See under names of marsupials quoted.

**Marsupial Mole** (*Notoryctes typhlops*). Small marsupial mammal, found in the deserts of S. Australia. It is molelike in general appearance and habits, is about 5 ins. long, and its soft fur is golden-red in colour. The forepaws are powerful digging implements, paddle-shaped, and armed with strong and stout claws. The abdomen is provided with a pouch in which the young are suckled. There are no external eyes or ears, and the animal seems to make its way about by its sense of touch. Also called the pouched mole, it is

Marsupial Mole. Specimen of the small Australian desert mammal

found a few inches below the surface of the sand.

**Marsyas**. In Greek mythology, a Phrygian peasant, or, according to other accounts, a satyr. Proud of his skill on the flute, he challenged Apollo to a contest. The contest took place on the understanding that the victor should do what he willed to the other. The Muses, who were the umpires, awarded the decision to Apollo, who punished Marsyas for his presumption by binding him to a tree and flaying him alive.

**Martaban**, GULF OF. Broad inlet of the Bay of Bengal in Burma. The Sittang flows into the head of the gulf; W. is the Irawadi delta, E. the mouth of the Salween. Rangoon, Moulmein, Pegu, and Amherst all lie on or close to the shore. The city of Martaban, which was for several centuries the capital of the kingdom of Pegu, is now only a village.

**Martel**, SIR GIFFARD LE QUESNE (b. 1889). British soldier. Martel was born Oct. 10, 1889, and educated at Wellington College. He served in France during the First Great War, and was an instructor at the staff college, Quetta, 1930-34. Martel became an authority on mechanisation and the employment of tanks, on which he contributes the article in this Encyclopedia—also those on British Expeditionary Force; North Africa Campaigns; Strategy. Deputy director of mechanisation at the war office, 1938-39, promoted major-general in 1939, he commanded the 50th division in France in 1940 and was head of the British military mission in Moscow in 1943. He retired in 1944 with the rank of lieutenant-general, and was created a K.C.B. in the same year. He published military books, *e.g.* *Our Armoured Forces*, 1945.

**Martel de Janville**, SYBILLE GABRIELLE MARIE ANTOINETTE DE RIQUET DE MIRABEAU, COMTESSE DE (1849-1932). French novelist, well known by her literary pseudonym of Gyp. A great-grand-niece of Mirabeau, she was born in Morbihan, Brittany, August 15,

Marsupial. Bennett's Wallaby, a typical marsupial carrying her young in the pouch characteristic of the order  
Gambier Bolton, F.Z.S.

1849, and was educated at the convent of the Sacré Coeur. She became the author of a long series of novels and sketches, famous for their gaiety, vivacity, and wit. They range from *La Vertu de la Baronne*, 1882, down to the First Great War satire of *Les Profitards*. She was also a painter of some talent, and made a reputation, under the name of Bob, as a caricaturist. In politics she was connected successively with the Boulangist, anti-Semite, and nationalist movements. She died June 29, 1932.

**Martello Tower.** A type of building erected for coast defence. Named after a tower on Cape Mortella, Corsica, which a British squadron, when succouring the Corsican insurgents in 1794, found almost impregnable against their attacks, this type was used in the defences built round the S. and E. coasts of England in preparation for Napoleon's threatened landing. About 40 ft. high and frequently surrounded by a moat, martello towers are of solid masonry and contain rooms for a garrison of about 30. The only entrance is some 20 ft. above the ground, reached by a ladder or drawbridge. A platform on the top served for the guns, which were protected by a parapet. Although erected at enormous cost, the towers were never used, and being defenceless against 20th cent. weapons they are now mostly deserted. A few have been converted into private residences and coastguard stations.

**Marten** (*Martes*). Genus of carnivorous mammals belonging to the weasel family. They differ from the weasels, stoats, and polecats in their larger size, longer limbs, tree-climbing habits, and in details of dentition. They have fine and valuable fur of reddish-brown colour, and a long and bushy tail. There are several species, of which only the pine marten occurs in Great Britain. This species has chocolate-brown fur, with orange chest and throat, and the edges of the ears are white. A fine specimen will mea-

sure 20 ins. in length. It was formerly fairly common in the British Islands, but persecution has now made it rare, and it is only found in secluded localities. It occurs in pine woods in N. Wales, the Lake District, the Scottish Highlands, and in the N. of Ireland, and ravages the covert and the poultry yard. On the W. coast of Scotland it feeds to some extent on shellfish, and it will often eat fruit. Savage in disposition, it will fight furiously with dogs if surprised at a distance from trees. The beech marten, which has white underparts, is common in Central and S. Europe. See Sable.

**Marten, MARIA.** Victim of a notorious murder. William Corder, of Polstead, Suffolk, formed an attachment with Maria Marten

of the same village, but, becoming tired of the girl, he lured her to a lonely building, called the Red Barn, where he murdered her, burying the body. The girl's stepmother, who was aware of the meeting at the barn, eventually became suspicious and per-

suaded her husband to dig up the floor of the building, where the corpse was discovered. Corder was arrested and found guilty at the assizes which opened at Bury St. Edmunds on Aug. 4, 1828. He was hanged a week later. Shortly afterwards a play entitled *The Red Barn*, or *The Mysterious Murder*, was produced at the Royal Pavilion Theatre, Mile End, London, and has since been revived on numerous occasions.

**Martens, ADOLF** (1850-1914). German engineer. Born at Beckendorf, March 5, 1850, he worked in a factory at Güstrow, 1867-68, and then studied at the industrial academy at Berlin, being afterwards employed in railway bridge construction. In 1879 he was appointed to a chair in the Berlin technical university, and in 1884 became director of the institute for mechanical experiments. He acquired a considerable reputation by his researches

on the resistance of metals for technical purposes, and contributed largely to the science of metallurgy, giving his name to martensite (*v.i.*). He died July 24, 1914.

**Martensite.** The hardest constituent commonly found in steels. It has a Brinell Hardness of up to 800. Martensite is the first decomposition product obtained on cooling a steel. If a steel is heated above the upper critical point, which is about 900° C. for pure iron, but varies with the carbon content of the steel, all the carbon in the steel goes into homogeneous solid solution. This is quite soft. But in an ordinary carbon steel it is impossible to retain its face-centred cubic lattice structure at room temperatures however quickly the steel is cooled. By very rapid quenching it is possible to prevent the steel from reaching its normal equilibrium structure of pearlite with varying amounts of cementite or ferrite and to produce the intermediate structure of martensite. This is either body-centred tetragonal or body-centred cubic and, furthermore, being alpha iron it will not dissolve carbon. The result is that bulky molecules of iron carbide form inside the lattice structure and so peg it that the atoms cannot easily slide over each other. For this reason the martensite is extremely hard and brittle, having the appearance of a number of fine, white needles when seen under the microscope. See Austenite; Iron; Metallography; Pearlite; Steel.

**Martha.** New Testament character. In Luke 10 and John 11-12 she is represented as the sister of Lazarus and Mary, at whose house Jesus stayed when in Bethany. Martha serves as an example of the virtue of hospitality, but is gently reproved for her somewhat over-anxious, bustling spirit, which led her to pay more attention to the bodily comfort of her Guest than to His teaching.

**Martha's Vineyard.** Island off the S. coast of Massachusetts, U.S.A., forming, with the Elizabeth Is., Dukes co. Situated 5 m. from Cape Cod, its greatest length is 21 m., greatest width 10 m.; its area is 108.7 sq. m. It has a level surface, relieved in the W. by a hill ridge reaching 308 ft. Once a whaling and trading centre, it has fisheries and small farms today, but is noted chiefly as a summer resort. Edgartown, the co. seat, has a pop. 1,370. The island was discovered 1602; Great Harbour (near Edgartown) was settled 1642. Pop. (Dukes co.) 5,669.

Marten. Specimen of the pine marten, *M. martes*

**Martial** (c. 43-c. 104). Roman epigrammatist. Marcus Valerius Martialis was born at Bilbilis in Spain, and came to Rome in 66. The early part of his life in Rome was a rather sordid struggle, but the latter years, when he became possessed of a small country house in the Sabine hills, were passed in comparative comfort. His life was that of a parasite, as is evidenced by his fulsome flattery of his patrons, especially of the sinister emperor Domitian. The great majority of his writings are epigrams, which afford valuable information on every aspect of the life of the period. Many of the epigrams are grossly indecent, but are the work of a brilliant literary genius, with an extraordinarily flexible style, polished wit, a keen sense of the ridiculous, a tolerant, kindly temperament, and a genuine love of nature and the homely pleasures of a country life. Weary of Rome, he retired in 98 to his birthplace, where he died.

Martial, Roman epigrammatist  
From a bust

**Martial Law.** Term somewhat loosely employed to indicate the suspension of the administration of normal civil law and its replacement by military authority, when such a change is rendered desirable by special circumstances, of which war and rebellion are the most usual examples.

The term martial law does not signify a law in the usually accepted sense, but essentially the enforcement of the authority and power of the military commander of the district affected, who becomes responsible for taking whatever measures he considers advisable for ensuring the safety of the state and its loyal subjects. Before a district is placed under martial law, a proclamation is published by the executive, notifying the public generally that ordinary law is insufficient to cope with the situation, after which the military authority specifies what, if any, special regulations will be applied, and issues orders regarding such restriction of personal and public liberty as is thought necessary to the public safety.

The advantage of martial law in times of emergency is that exceptional means of arrest and punishment may be taken against persons who resist the government or aid

the enemy, and that it is readily possible to define as punishable offences any conduct which a rapidly changing military situation shows to be inimical to the success of the government forces. Under martial law, the ordinary civil courts may be maintained coexistent with, or entirely replaced by, military tribunals. Minor offences are dealt with by duly authorised officers, and the more serious by military courts which have unlimited powers of punishment. In British practice, the military tribunals are usually constituted as courts-martial (*q.v.*), and the procedure followed is that of military law, the sentences being confirmed in accordance with the provisions of the Army and Air Force Act (*q.v.*).

Under the Petition of Right, which is reproduced in the preamble to the Army Act, martial law is illegal in Great Britain in times of peace, but it is legalised by various Acts which provide for it to be employed, whether the ordinary courts are open or not, in times of emergency. Naturally, its enforcement involves suspension of the privilege of Habeas Corpus. After the suspension of martial law an Act of indemnity is always passed to protect any person responsible for its administration, who has exceeded his powers in good faith. Martial law cannot be made retrospective, and can only be enforced in the districts within which it has been proclaimed. But under special circumstances a person arrested outside such a district may be brought within it and tried by the military tribunal.

Martial law has been enforced but rarely in Great Britain. During the Second Great War, in expectation of invasion, provision was made for setting up war-zone courts to try criminal cases in places in which, because of enemy action, it might be impossible for ordinary law to function. These courts would not have been military courts, as it was provided that the president must be a judge of the supreme court. Fortunately, it never became necessary to make use of these provisions. Martial law was enforced in the war area during the South African War, in parts of Ireland in 1920 and 1921, and frequently in India and Palestine. Martial law must not be confused with military law which applies to sailors, soldiers, and airmen for the purpose of enforcing discipline. Military law is to be found in the Naval Discipline Act and the Army and Air Force Acts. See Court Martial.

**Martigny.** Town formed from three villages in canton Valais, Switzerland. It stands on the river Drance, 41 m. by rail S.E. of Lausanne. The Roman Octodurus, it is on the historic route over the Great St. Bernard to Aosta. On the Simplon rly. to Italy, the starting-place of the electric rlys. to Chamonix, and of the route to the Val de Bagnes, it is a busy place in the tourist season.

**Martigues.** Harbour of S. France, in the dept. of Bouches du Rhône. It is built on three islands, connected by bridges, on the S. side of the Étang de Berre near its outlet to the Gulf of the Lion, and is connected with Marseilles by rly. Pop. 11,295.

**Martin.** Name given to various members of the swallow tribe. Two species occur in Great Britain, the house martin and the sand martin. The former (*Delichon urbica*) is a familiar summer visitant, arriving in April and May and migrating to Africa about the middle of Oct. The plumage of the upper parts is black with violet reflections, and of the lower parts pure white. It is slightly smaller than the swallow, with shorter wings and a less forked tail. Its nest is fixed to a wall, generally under the eaves of a house, and is formed of mud strengthened with hair and fibres, and lined with feathers. Two broods are reared.

The sand martin (*Riparia riparia*) arrives in spring before the house martin, and leaves early in

Sand Martin at the entrance to its nest  
W S Berridge, F.Z.S.

Sept., and is fairly common in many parts of Great Britain, except in the extreme N. It is mouse coloured above with white below, and has a rather short tail. It nests in burrows in sand pits and banks of clay, usually three or four ft. deep and sloping upward to the breeding-chamber, where a nest of hay and feathers is constructed. The same burrow is used each year.

**Martin** (c. 316-c. 400). Saint and bishop. A native of Pannonia, he was educated at Pavia, and became an officer in the army under Constantine and Julian. Leaving the army, he placed himself under S. Hilary of Poitiers, and after labouring as a missionary in Pannonia he founded a monastery near Poitiers, about 360, and there he remained till he was appointed

bishop of Tours in 371. His only known literary work is his Confession of Faith in the Holy Trinity.

**Martin.** Name of five popes, of whom three are noticed separately. Martin II and III are more accurately named Marinus I and II respectively, Marinus having been written Martinus in error. The former was pope from 882 to 884, the latter 942-46. The former, who had attended the council of Constantinople in 869 as the representative of western Christendom, was intimate with Alfred the Great.

**Martin I** (d. 655). Pope from 649 to 654. He was born at Todi on the Tiber, and on his election to the papacy he at once pronounced against the monothelite heresy, then maintained by the emperor Constans II and by Paul, patriarch of Constantinople. In 653 the emperor, instigated by Paul, sent an exarch to Rome, demanding the surrender of the pope. Martin yielded to avoid bloodshed, and after being imprisoned near Constantinople was exiled to Cherson, where he died Sept. 16, 655. He is honoured as a saint in the Eastern and Latin churches, his festival being Nov. 12 in the latter communion. *Consull Lives of the Popes in the Middle Ages*, H. K. Mann, 1902.

**Martin IV** (c. 1210-85). Pope 1281-85. A Frenchman, born in Touraine and named Simon de

Brie, he was chancellor of France under Louis IX, 1260, cardinal, 1261, and papal legate in France for over 20 years. After his election to the papacy he was the instrument of Charles of Anjou, upon whom he depended for protection. After the massacre known as the Sicilian Vespers, Martin still tried to keep Sicily for France, and even ordered a crusade against the king of Aragon, whom the Sicilians had chosen for their ruler. He died at Perugia, March 28, 1285.

**Martin V** (1368-1431). Pope 1417-31. Otto di Colonna was one of the cardinals who deserted Gregory XII and took part in the council of Pisa, 1409, and the

election of the anti-popes Alexander V and John XXIII. On his election as undisputed pope at the council of Constance by the representatives of the five nations—German, French, Italian, Spanish, and English—which put an end to the Great Schism, he took the name of Martin. The

chief activity of his pontificate was the re-establishment of the temporal affairs of the papacy, entirely disorganized as a result of the Schism, together with the restoration of the city of Rome itself and the Papal States. In all these schemes his chief assistants were members of his own family of the house of Colonna, on whom he lavished in return important ecclesiastical and secular offices. In accordance with the decree of Constance summoning a council within five years, he convened the council which opened at Pavia in 1423, but dissolved it on Feb. 26, 1424. He died Feb. 20, 1431.

**Martin, (BASIL) KINGSLEY** (b. 1897). British journalist. Born July 28, 1897, he was educated at Mill Hill and Magdalene College, Cambridge, and was a lecturer at the London School of Economics, 1923-27. Next with the Manchester Guardian, in 1931 he became editor of the New Statesman and Nation. He wrote *The Triumph of Palmerston*, 1924; *French Liberal Thought in the 18th Cent.*, 1929; *The Magic of Monarchy*, 1937; *Propaganda's Harvest*, 1942.

**Martin, SIR GEORGE** (1764-1847). British sailor. He went to

sea in 1776 and saw service in the W. Indies, 1779-80. Two years later he was given his first command. At the battle of Cape St. Vincent, 1797, he commanded the *Irresistible*,

in which Nelson hoisted his flag when the Captain was disabled. Martin was appointed to the Northumberland, 1798, blockaded Malta and reduced Valletta in 1800, and after a brief period in Egypt returned to the Channel fleet, where, in command of the *Barfleur*, he fought in the battle of

Cape Finisterre, 1805. In 1807 he blockaded Cadiz. Vice-admiral in 1810, he was knighted in 1814, became admiral in 1821, and commander-in-chief at Portsmouth in 1824. He died July 28, 1847.

**Martin, SIR GEORGE CLEMENT** (1844-1916). British organist and composer. Born at Lambourn, Berks, Sept. 11, 1844, he studied under Stainer and took his musical degree at Oxford in 1868. He was appointed master of song at the choir school of S. Paul's cathedral in 1874, and on the retirement of Stainer in 1888 became organist to the cathedral. Elected teacher of the organ at the R.C.M. in 1883, he was appointed to a similar post at the R.A.M., 1895, and knighted in 1897, on the occasion of the diamond jubilee of Victoria, for which he composed a special Te Deum. Martin wrote *The Art of Training Choir Boys*. Died Feb. 23, 1916.

**Martin, GLENN L.** (b. 1886). American aircraft manufacturer, born at Macksburg, Iowa, Jan. 17, 1886. He was educated at Kansas Wesleyan university. He began to build gliders in 1907 and aeroplanes next year, establishing the first aircraft factory in the U.S.A. in 1909. He was founder, president, and general manager of the firm of Glenn L. Martin Co. (now centred in the Baltimore area), which produced such well-known aircraft as the Baltimore (*q.v.*), *Marauder* (*q.v.*), Maryland, and the *Mariner* and *Mars* flying-boats.

**Martin, HENRI** (1810-83). French historian. Born at St. Quentin, Feb. 20, 1810, and baptized Bon

Louis Henri, Martin was educated for the law, but devoted his life to historical research, although he was for a few years a member of the chamber of

Henri Martin,  
French historian

deputies. He died in Paris, Dec. 14, 1883. Martin's fame rests entirely on his *Histoire de France*, which, despite Guizot's condemnation as "bad history, bad philosophy, and bad literature," for long ranked as the standard history of France. A first and prizewinning edition in 15 vols., 1833-36, was followed by others, one being largely rewritten, and another abridged. A continuation in 6 vols. made it the most complete work of its kind.

**Martin, HENRI JEAN GUILAUME** (b. 1860). French painter. Born at Toulouse, he was a pupil of

Martin V,  
Pope, 1417-31  
From a coin

Martin I, Pope, 649-54  
From a medal

Martin IV,  
Pope, 1281-85  
From a coin

Sir George Martin,  
British sailor  
After Lawrence

J. P. Laurens. In 1883 he received a medal for his picture Paolo and Francesca, in the Carcassonne museum. Inspiration, 1895, painted as part of a decorative scheme for the hôtel de ville, Toulouse, was bought for the Luxembourg, and Apparition of Clémence Isaure to the Troubadours, 1898, is in the hôtel de ville at Toulouse. He painted L'Étude for the Sorbonne, 1908; Le Travail, for the palais de justice, 1914; and was elected to the Académie des Beaux-Arts in 1917.

**Martin, JOHN** (1789-1854). British painter. Born near Hexham, July 19, 1789, he was apprenticed to a coach painter in Newcastle, and proceeded to London in 1806, where he earned his living for a time by painting china. In 1812 he painted his first picture, Sadak in Search of the Waters of Oblivion. A regular exhibitor at the R.A., 1812-52, he also showed work at the British Institution, where in 1817 his picture Joshua Commanding the Sun to Stand Still, was awarded a premium of £100, and in 1821 his Belshazzar's Feast gained a prize of 200 guineas. He took part in founding the Society of British Artists. He exhibited The Fall of Nineveh, at Brussels, 1833. He died at Douglas, Isle of Man, Feb. 17, 1854. Martin, whose work is very melodramatic, and shows a wild imagination, painted mainly in oils, but also in water-colour, chiefly landscapes and river scenes. He also illustrated the Bible and Paradise Lost. Among his chief works are Adam's First Sight of Eve, 1813; Clytie, 1814; The Fall of Babylon, 1819; and The Destruction of Herculaneum, 1822, in the National Gallery. *Consult* Life, T. Balston, 1948.

**Martin, SIR THEODORE** (1816-1909). British writer. Born at Edinburgh, Sept. 16, 1816, and educated at Edinburgh university, he became a solicitor, first in Edinburgh, and from 1846 in London. Literature was the occupation of his leisure hours throughout the whole of his long life.

Martin's fame, however, rests chiefly on his translations of Horace, 1882, his rendering of the odes being on the whole the most acceptable in the English language. He also translated

Catullus, Heine, and Dante. In 1866, at the request of Queen Victoria, he undertook the biography of the Prince Consort, which was published in five volumes from 1875 to 1880, in which year he was made K.C.B. Martin married the well-known actress Helen Faucit in 1851, and died at his home near Llangollen, Aug. 18, 1909.

**Martin Chuzzlewit.** Charles Dickens's fifth novel, originally published in monthly parts, Jan., 1843-July, 1844, with illustrations by Phiz, and in book form in 1844. Its avowed theme was selfishness and the retribution it invites, selfishness being made the besetting sin of the Chuzzlewit family, of whom the Martin of the title is the youngest representative. But the central figure is the arch-hypocrite Seth Pecksniff (q.v.). He and Sairey Gamp (q.v.), another character, are two of Dickens's greatest comic creations. Other popular figures are the gawky, simple-hearted Tom Pinch (q.v.) and the persistently "jolly" Mark Tapley (q.v.). Distressed by the initial falling-off in sales, Dickens altered his plans during the serial publication and introduced a highly satirical description of America, which he had visited in 1842-43. Other scenes of the story are laid in London and in a village which has been identified with Amesbury, Wilts.

**Martindale, CYRIL CHARLES** (b. 1879). British Roman Catholic divine. He was born May 25, 1879, and educated at Harrow and Stonyhurst, and at Campion Hall, Oxford. He taught at Stonyhurst, Manresa House, Southampton, and Oxford, and

C. C. Martindale,  
British Roman  
Catholic divine

rose to be a leading figure among British Jesuits. He travelled widely, wrote many books on religious subjects, dealing especially with missionary work, and edited the series of Catholic Thought and Thinkers. He was president of the federation of Catholic societies in universities of Great Britain. Father Martindale contributes the article Jesuits to this Encyclopedia.

**Martineau, HARRIET** (1802-76). British author. A sister of James Martineau, she was born at Norwich, June 12, 1802. In 1832 she achieved literary success

when her Illustrations of Political Economy, a series of tales written to demonstrate economic truth, brought the acquaintance of many leading men. In 1834 she paid a visit to America, then greatly agitated by the question of the abolition of slavery, and as an abolitionist herself had some unpleasant experiences. On her return she published Society in America, 1837.

Harriet Martineau,  
British author

Her Forest and Game Law Tales, 1845-46, was followed in 1849 by a History of the Peace, a work embodying the views of the philosophic radicals. This was followed in 1851 by Letters on the Laws of Man's Social Nature. Originally a strict Unitarian, she now revealed herself as an agnostic, a fact which led to a breach with her brother James. A Condensation of Comte's Positive Philosophy, 1853, and an autobiography complete the list of Harriet Martineau's more important works. Other works show little originality of thought and less imagination, but she was possessed of an unusually clear and vigorous intellect, and was a talented expositor and populariser of the opinions of others. She died near Ambleside, June 27, 1876. *Consult* Lives, F. F. Miller, 1884; T. Bosanquet, 1927.

**Martineau, JAMES** (1805-1900). British theologian and philosopher. Born at Norwich, April 21, 1805, on his father's side of Huguenot descent, he received his early education at the local grammar school, and at Bristol.

*James Martineau*

Apprenticed to a civil engineer in 1821, he studied divinity at Manchester College, York, 1822-27, was ordained in 1828, served as a minister, and was professor of mental and moral philosophy and political economy at Manchester New College, 1840-57; professor of mental, moral, and religious philosophy there, 1857-69; and principal, 1869-85. With J. J. Taylor and C. Wicksteed, he edited

Sir Theodore Martin,  
British poet

The Prospective Review, 1845-54. He died Jan. 11, 1900, and was buried in Highgate Cemetery.

A prominent Unitarian, an impressive preacher, and essentially an ethical teacher, eclectic and broadminded, discerning the interdependence of all forms of speculation, he based his intuitionist philosophy (see Intuition) on conceptions of God, freedom, and immortality. Martineau insists that, while prudence is concerned with our welfare, conscience forms character, and pleasure is the fruit of right doing, not its incentive. He won the affection of all who knew him. He wrote *The Rationale of Religious Enquiry*, 1836; *Unitarianism Defended* (with J. H. Thom and H. Giles), 1839; *Studies in Christianity*, 1858; *A Study of Spinoza*, 1882; *Types of Ethical Theory*, 2 vols., 1885; *A Study of Religion*, 2 vols., 1888; and *The Seat of Authority in Religion*, 1890.

**Bibliography.** *The Ethical System of J. M.*, J. H. Hertz, 1894; *J. M., a Biography and Study*, A. W. Jackson, 1900; *Lectures on the Ethics of Green, Spencer, and M. H. Sidgwick*, 1902; *Life and Letters of J. M.*, J. Drummond and C. B. Upton, 2 vols., 1902; *Life*, J. E. Carpenter, 1905.

**Martinez de la Rosa, FRANCISCO** (1789-1862). Spanish statesman and author. Born at Granada, March 10, 1789, he entered political life in 1813, and became prime minister in 1822. He was banished after the French occupation in 1823, and lived in Paris, where he resumed his literary work. Prime minister again in 1834, he introduced the statute creating constitutional government, but was compelled to resign the same year. He was ambassador to Paris, 1847-51, and died Feb. 7, 1862. A follower of the French romantics, Martinez wrote dramas, e.g. *Padilla's Widow*, and *The Conspiracy of Venice*, the historical novel *Doña Isabel de Solis*, epigrams, lyrics, etc.

**Martinezia.** Genus of small trees of the family Palmaceae, natives of tropical America. More or less armed with long, sharp spines, they have cylindrical trunks and large leaves broken up into wedge-shaped leaflets. The globular fleshy fruits are yellow or red, and contain a hard seed.

**Martinez Sierra, GREGORIO** (1881-1947). Spanish dramatist. Born in Madrid, May 6, 1881, he was educated at the university there, and joined the Spanish art theatre founded by his master Benavente. His first success as a

dramatist was achieved with *The Cradle Song*, 1911. He wrote some 40 plays and translated or adapted

more than 50 others; many were introduced during the 1920s to British playgoers in the translations of J. G. Underhill and H. Granville-Barker, e.g. *The Kingdom of God*; *The Romantic Young Lady*. In this playwright's treatment of fools, critics discerned a touch of Cervantes. After the civil war of 1936-39 he lived in voluntary exile in Buenos Aires. Returned to Spain in 1947, he died Oct. 1.

**Martin-Harvey, SIR JOHN** (1863-1944). British actor. Born at Wivenhoe, Essex, June 22,

Sir John Martin Harvey, British actor

1863, and educated at King's College School, he first appeared on the stage at 14. In 1882 he joined Irving at the Lyceum, remaining with him for 14 years, and took plays from the Lyceum repertory to the provinces. Under his own management he produced *The Only Way* in 1899; adapted from Dickens's *Tale of Two Cities*, this piece in which Martin Harvey played Sydney Carton established his reputation. He appeared in this part for very many years. He modelled himself on Irving, and added to his repertory such romantic plays as *A Cigarette Maker's Romance*, *The Corsican Brothers*, *The Breed of the Treshams*, *The Lyons Mail*, and *The Bells*. He was for a long time better known and appreciated in the provinces than in London, possibly because of his choice of plays. But in 1912 Reinhardt produced for him *Oedipus Rex* at Covent Garden in strikingly original fashion, and towards the end of the First Great War he scored a success with *The Burgomaster of Stilemonde*. His 1916 revival of *Hamlet*, his third production of that tragedy, was also esteemed for its simple and original staging. One of his last appearances was in *The Boy David*,

G. Martinez Sierra, Spanish dramatist

1936. His wife, Helena (Nina) de Silva (1869-1949), was long his leading lady. Knighted in 1921, he took the hyphenated name of Martin-Harvey. He died May 14, 1944. Consult *Autobiography*, 1933; *The Last Romantic*, M. W. Disher, 1947.

**Martini, FRIEDRICH** (1832-97). Austro-Hungarian inventor. Born at Mehadia, Hungary, he entered the Austrian army, served in the engineers in the Italian campaign of 1859, and then settled as a civil engineer at Frauenfeld, Switzerland. Adapting his invention of a block action breech mechanism to the 7-groove, .45-in. calibre rifle of Henry, he offered the model to the British government, which adopted it in 1871 under the name of Martini-Henry rifle. See *Rifle*.

**Martini, GIAMBATTISTA** (1706-84). Italian musician. A native of Bologna he was born April 24, 1706, and having been ordained became chapel master at the church of S. Francesco there. Besides producing original compositions, he wrote two erudite musical treatises, *Storia della Musica* and *Saggio di Contrappunto*.

**Martini, SIMONE** (c. 1283-1344). Italian painter, commonly but wrongly known as Simone

Simone Martini, Italian painter

Memmi. Born at Siena, he was a pupil of Duccio. The earliest known example of his work is the fresco at Siena of *The Enthroned Virgin and Child*, painted 1315.

Then came the polyptych painted for the church of S. Caterina in Pisa, c. 1320. In 1328 he was at work in the Palazzo Pubblico at Siena on the equestrian portrait of Guidoriccio da Fogliano. His later art may be seen in the frescoes in S. Francesco, Assisi. In 1339 he went to Avignon, where he executed frescoes in the cathedral and the palace of the Popes, and where he met Petrarch and painted the portrait of Laura. He died at Avignon. Of his other works, the most notable are *The Annunciation* (Uffizi Gallery), *S. John the Baptist* (Altenburg Museum), *Christ Carrying His Cross* (Louvre), *The Crucifixion*, *Deposition*, and *Annunciation* (Antwerp Gallery). Martini is remarkable for decorative qualities of colour and line, and as showing a break with Byzantine influence.

**Martinique.** French island in the West Indies, since 1947 an overseas department of France. It is one of the largest of the Windward Islands and lies between the British islands of Dominica and Sta. Lucia. Almost wholly of volcanic origin, it has such well-known volcanic peaks as Vauclain (1,656 ft.), the Pitons de Carbet (3,955 ft.), and Mt. Pelée (*q.v.*) (4,500 ft.), the scene of a disastrous eruption on May 8, 1902. The slopes still retain much virgin forest, and sugar, cacao, coffee, tobacco, and fruit are produced in the fertile valleys. Sugar, rum, and cocoa comprise more than three-quarters of the exports. The chief harbour is Fort-de-France, and the towns are Lamentin and Gros Marne. St. Pierre was the chief town before its destruction in 1902. Discovered by the Spaniards in 1493, Martinique was settled by the French in 1635, and was British, 1794–1802 and 1809–14. The aborigines were exterminated by early settlers, and the inhabitants are chiefly blacks or creoles. The dept. is administered by a governor and council.

In May, 1942, an agreement was reached between American and French authorities concerning the immobilisation of the three Vichy warships that had been stationed at Martinique since June, 1940. The adherence of Martinique to the French committee of national liberation was announced on July 8, 1943. The three warships with twelve tankers and cargo ships in the harbour were placed at the disposal of the Allies; and gold sent to the island after the French surrender in 1940 was found intact. Area of island 385 sq. m. Pop. 246,712.

**Martinmas.** Feast of S. Martin, Nov. 11. It is a quarter day in Scotland. The festival of S. Martin, the patron of reformed drunkards, is probably a survival of the Roman vintage festival, the Vinalia. At Martinmas hiring fairs for servants are held in some parts of England and the Martinmas or

Martlemas ox, or mart, was killed to be salted for winter. In Germany, goose was a Martinmas dish. The spell of fine weather sometimes occurring around this date is called S. Martin's summer.

**Martin's Bank.** English bank, said to be the oldest in the country, now amalgamated with the Bank of Liverpool. Founded by Sir Thomas Gresham c. 1570, it first did business at the sign of the Grasshopper in Lombard Street. It belonged in the 17th cent. to Charles Duncombe, then to Richard Smith, and in 1703 was owned by Thomas Martin and Andrew Stone. After taking the name of Martin's Bank, it became a limited liability company. At the time of the amalgamation in 1918 it had a paid-up capital of £1,000,000, and its head offices were 68, Lombard Street, London, E.C., still the main London office.

**Martlesham.** Village of Suffolk, England, 6 m. E. of Ipswich. Before the Second Great War all new aircraft were officially tested at the adjacent Martlesham aerodrome. It was a U.S. bomber base during the air offensive on Germany, and later became an Air ministry experimental centre.

**Martlet.** Heraldic term for a small bird of the swallow tribe. It is shown without beak or feet, an innovation since the 15th century. In cadency it is the mark of the fourth son and his descendants. See Cadency; Heraldry.

**Martos.** Town of Spain, in the prov. of Jaén. It stands on a castle-crowned hill, 15 m. by rly.

Martos arms

S.W. of Jaén, and carries on a trade in wine, oil, fruit, etc. In the vicinity are sulphur springs and baths. Martos was the Iberian Tucci and the Colonia Augusta Gemella of the Romans. It was taken from the Moors by Ferdinand III. Pop. 19,830.

**Martyn, HENRY (1781–1812).** English missionary. He was born at Truro, Feb. 18, 1781, and edu-

Henry Martyn, English missionary

cated at Cambridge, where he came under the influence of Charles Simson. In 1805 he was appointed chaplain to the East India Company, and devoted the rest of his life to missionary work, translating the N.T. into Hindustani, Hindi, and Persian. He died at Tokat in Asia Minor, Oct. 16, 1812, while on his way back to England.

**Martyn, JOHN (1699–1768).** English botanist. Born in London, Sept. 12, 1699, he was devoted to botanical studies from early youth, and when only 21 years of age translated and elaborated Tournefort's Catalogue of Plants Growing about Paris, though he did not publish it until 1732. Some public lectures delivered by him in London led to an invitation to do similar work at Cambridge. In 1732 Martyn was elected to the chair of botany there, and held it till 1762. He published a flora of Cambridge, 1727, *Tabulae Synopticae Plantarum Officialium*, 1726, and *Historia Plantarum Rariorum*, 1728–37. He died Jan. 29, 1768.

**Martyn, THOMAS (1735–1825).** English botanist. A son of John Martyn, the botanist, he was born at Chelsea, Sept. 23, 1735, and studied at Cambridge, where he succeeded his father as professor of botany in 1762, in which year he took priest's orders. He became the most active agent in popularising the Linnaean system in England. He published *Plantae Cantabrigienses*, 1763, and a new edition of Miller's *Gardeners' Dictionary*—in reality a new work based upon Miller. He was F.R.S., and vice-president of the Linnaean Society. He died June 3, 1825, at Pertonhall, Beds, where he had been rector since 1804.

Thomas Martyn, English botanist

**Martynia.** Genus of herbs of the family Martyniaceae. They are natives of the warmer parts of America, especially Mexico. They have long-stalked, heart-shaped leaves, and tubular yellow, pink, or purplish flowers. The fruit is a

Martos, Spain. View showing the ancient Moorish castle crowning the hill on which the city stands

**Martynia.** The woody hooked capsule of the Mexican plant

large, woody capsule ending in two long curved hooks which catch in the fur or tails of quadrupeds, by which means the seeds are widely distributed. *M. fragrans*, with large red-purple fragrant flowers, is often grown in European gardens.

**Martyr** (Gr., a witness). Person, especially a Christian, who suffers death in testimony to his faith. One who suffers but does not lose his life is usually known as a confessor. The first Christian martyr was Stephen the Deacon, called the Protomartyr.

Apparently martyrs only were at first regarded as saints. Their tombs were held in high honour. When it became possible to erect special buildings for Christian worship, they were usually built over the tombs of martyrs, and the actual tomb was often converted into an altar, or the remains of the martyr were reinterred under the altar. This practice is alluded to in Rev. 6, v. 9; and a survival of it is seen in the placing of relics in the altars of R.C. churches at their consecration. Articles which had belonged to martyrs were regarded as precious relics, and the possession of the body, or part of the body, of a famous martyr at once gave eminence to a church, and later gave rise to pilgrimages. In this way a cultus grew up, which later developed into a general cultus of saints. A town or district in which a martyr had lived or suffered, or which possessed his relics, took him as its patron saint and often adopted his name, as St. Albans and Bury St. Edmunds.

At an early date it became necessary to check the genuineness of alleged cases of martyrdom, and this was known as the vindication of martyrs, which later developed into the official canonisation of saints generally. Rules were laid down restricting the use of the term.

**Martyrology.** In the R.C. Church, a list of martyrs, with notices of their life and death, designed for devotional uses. In monastic institutions such a list is

read from at prime after the prayer, *Deus, qui ad principium*, and followed by the versicle. Precious in the sight of the Lord is the death of His Saints, and a prayer of intercession addressed to the heavenly court. After prime or tierce it was a monastic custom to adjourn to the chapter and to read the martyrology and say prayers that now form part of prime.

All western martyrologies are based upon that attributed to Jerome, which may have been derived from a work used in S. Gregory's time in Rome; that discovered at Ravenna about 850 and known as the Lesser Roman Martyrology; and that attributed to Bede. The standard Roman Martyrology, largely the work of Usuard (c. 875), a French monk, and first printed in 1486, was revised by Baronius in the 16th century, and under Urban VIII in the 17th century. A Cistercian martyrology was issued at Rome in 1733-48. The Menologium of the Eastern Church was compiled in 886 and edited by Cardinal Urbino in 1727. A Syrian martyrology, written about 412, was discovered by W. Wright, and published 1866. Jean Crespin's *Histoire de Martyrs* celebrates the Protestant martyrs of the 16th century; the best known English work of a similar character is the *History of the Acts and Monuments of the Church*, John Foxe, 1563.

**Marvell, ANDREW** (1621-78). English poet, satirist, and politician. Son of Andrew Marvell,

**Andrew Marvell,** English poet

rector of Winestead, in Holderness, Yorkshire, he was born March 31, 1621, and educated at Hull Grammar School and Trinity College, Cambridge. He became in turn tutor, at Nun Appleton, the scene of his lyrical poems, to Mary, daughter of Lord Fairfax and afterwards duchess of Buckingham, and to William Dutton, a nephew of Cromwell, at Windsor. In 1657 he was appointed Milton's colleague in the Latin secretarieship. From Jan., 1669, until his death, he was M.P. for Hull. He died in London, Aug. 16, 1678, and was buried in the old church of S. Giles-in-the-Fields.

Known in his lifetime chiefly as a Cromwellian, as a friend and colleague of Milton, as an M.P., a pamphleteer and a satirist, his

fame as a poet came later. His widow published a collection of his miscellaneous poems in 1681, and an edition including the political satires was issued in 1726. The complete works did not appear until 1776. His poems, especially those on gardens and country life, display an exquisite feeling for nature and language. Those by which he is chiefly remembered are the Horatian Ode to Cromwell, On Appleton House, To His Coy Mistress, Thoughts in a Garden, and The Nymph Regretting the Loss of her Fawn. In his satires he tended to distinguish between Charles I and his advisers; he attacked Clarendon and the court party, and, in Hodge's Vision, bitterly assailed Charles II. He finally condemned the house of Stuart, despaired of Parliament, and favoured a republicanism after the model of Rome and Venice.

The site of the cottage at Highgate in which Marvell lived is marked by a tablet in Waterlow Park. Consult Lives, J. Dove, 1832; A. Birrell, 1905; Works, A. B. Grosart, 4 vols., 1872-75; Poems and Satires, ed. G. A. Aitken, 1892.

**Marwick Head.** Headland of Mainland, one of the Orkney Islands. It is also the name of a hamlet in Lewis, 8 m. from Stornaway.

**Marx, HEINRICH KARL** (1818-83). German economist and the founder of international revolutionary socialism.

Born at Trèves, May 5, 1818, of Jewish origin, he was educated at the universities of Bonn and Berlin, where he studied history and philosophy. Giving up his first idea of an academic life, he became in 1842 editor of the *Rhenish Gazette*, a journal whose advanced views led to its suppression by the authorities. In 1843-45 he was in Paris, engaged in literary work, and formed his lifelong friendship with Engels (q.v.). Expelled from Paris as a dangerous person, he settled at Brussels, where with Engels he drew up, in 1847, the manifesto of the Communist Party which may be regarded as the foundation of modern socialism.

In 1848 Marx returned to Germany to take part in the revolutionary outbreaks of that year in the Rhine country, but all the movements ended in failure, and in 1849 Marx migrated to London,

**Karl Marx,** German economist

where he spent the rest of his life, and where he took an active part in founding and directing the affairs of the International Working Men's Association, which came to an end in 1873. In 1867 appeared the first volume of Marx's work, *Capital*, and two further volumes appeared after his death, which took place in London, March 14, 1883.

Marx was a leading exponent of what is known as the materialist conception of history, i.e. he believed that the basis of historical development is to be found above all in economic considerations. On the purely economic side he held the theory, not generally accepted, that the value of any article or product depends upon the amount of labour expended on it, as measured by time. Labour, he further taught, produced far more than it consumed, and this surplus value, as he termed it, was inevitably appropriated by the capitalist, who allowed to the labourer in wages only enough to provide for a bare subsistence and enable him to reproduce his kind. From this it followed that there could be nothing in common between the employers and the employed, or proletariat. The latter must recognize this by developing a class-consciousness which, when sufficiently developed, would result in a class war, in which the whole capitalist system would be overthrown.

Many socialists claim that Marx was the first to remove socialism from a humanitarian and place it on a scientific basis. His views form the basis of Marxist Communism, as established in the U.S.S.R. See *Capital*; *Communism*; *International, The*; *Socialism*. Consult *Lives*, E. H. Carr, 1938; C. J. S. Sprigge, 1938; I. Berlin, 1939; *What Marx Really Meant*, G. D. H. Cole, 1934; *The Red Prussian*, L. Schwarzschild, 1948.

**Marx, Wilhelm** (1863-1946). German statesman. He was born at Cologne, Jan. 15, 1863, studied law at Bonn, 1881-84, became a deputy judge in 1888, a county judge in 1894, and, in 1921, president of a senate of the Kammergericht, Prussia's highest court, in Berlin. A member of the Roman Catholic party, and of the Prussian diet from 1899 to 1918, of the Reichstag from 1910 to 1918, and again from 1919 until 1933, Marx was appointed Reich chancellor, with a cabinet of the moderate bourgeois parties, for the first time in Nov., 1923. He resigned in Jan., 1925; was re-appointed in May, 1926, and again resigned in June, 1928. In the interval he had stood

for the Reich presidency, as candidate of the left, in the spring of 1925, but had been defeated by Hindenburg. In 1926 Marx was Reich minister of justice, and in 1928 he resigned the chairmanship of the Centre party. In 1933, after the abolition of his party by Hitler, he retired from public life, in which he had been known as an honest mediator, but never as an innovator. He died in 1946 near his native town.

**Marx Brothers.** Name of a Jewish-American family of film comedians. Arthur (Harpo) born Nov. 21, 1893, Julius (Groucho) born Oct. 2, 1895, Leonard (Chico) born May 22, 1891, and Herbert (Zeppo) born February 25, 1901, formed a troupe and became famous as the Four Marx Brothers, though their number was later reduced to three by the retirement of Zeppo, whose last film was *Duck Soup*. Their reputation was based upon their unusual form of wit, the essence of which was a serious treatment of illogical situations accompanied by clowning, verbal sallies, and musical interludes. Their first film *Coconuts*, which appeared in 1929, was succeeded by *Animal Crackers*, 1931; *Horse Feathers*, 1933; *Duck Soup*, 1934; *A Night at the Opera*, 1936; *A Day at the Races*, 1937; *The Big Store*, 1941; *A Night in Casablanca*, 1946.

**Mary.** A feminine Christian name. Its meaning is somewhat doubtful, but its origin is the Hebrew Miriam, generally taken to mean bitterness, though some trace it to the Egyptian Mer Amon, beloved of (the god) Amon. Owing to its having been the name of the Virgin Mother, it has always been, in Christian communities, the most popular feminine Christian name, while in R.C. countries it is often given to men. The Greek and Latin form is Maria. The French is Marie.

**Mary** (Heb., Miriam). Saint and virgin, the mother of Jesus Christ, usually called the Blessed Virgin Mary. Sister of Mary, wife of Alphaeus, she was espoused to Joseph, a carpenter, of Nazareth. Being told by the angel Gabriel that she should become the virgin mother of the Son of God, and greeted with the words, Hail, thou art highly favoured, she replied with submission: Behold the handmaid of the Lord; be it unto me according to thy word. To her kinswoman, Elizabeth, mother of John the Baptist, recalling the song of Hannah (1 Sam. 2), she expressed her joy in the words of

the Magnificat (*q.v.*). She went with Joseph to Bethlehem, and there gave birth to Christ.

At Jerusalem, when Jesus was 12 years old, on the occasion of the Passover, Mary and Joseph found Him in the Temple, hearing and asking questions of the doctors. Mary was present at the marriage feast at Cana; at Capernaum; on Calvary, where Jesus committed her to the care of S. John, and with the disciples at prayer after the Ascension (Matt. 1 and 2; Luke 1 and 2; Mark 3; John 19; Acts 1). According to tradition Mary died at Jerusalem. Her tomb, it is said, was found vacant; hence the R.C. feast of the Assumption.

Since ancient times much discussion has surrounded the problem whether Mary had other children besides Jesus (see Matt. 12 and 13; Mark 3 and 6; Luke 1 and 2; John 2 and 7; Acts 1; 1 Cor. 15). Of three main views, the Hieronymian, held by Jerome, regards the "brethren" as cousins, sons of Mary, wife of Alphaeus or Clopas; that of Epiphanius, held by the Eastern Church, and the most ancient, that they were sons of Joseph by a former wife; and that held by Helvidius, that they were born to Mary and Joseph after Jesus. Much depends on the interpretation of the word "brethren." The title *Theotokos*, Mother of God, has been applied to Mary since the council of Ephesus, 431. See *Annunciation*; *Assumption*; *Immaculate Conception*; *Incarnation*; *Jesus*; *Madonna*; *Mariolatry*.

**Mary I** (1516-58). Queen of England. The daughter of Henry VIII and Catherine of Aragon, she was born at Greenwich, Feb. 18, 1516. Brought up as heir to the throne, she was harshly treated by her father after his divorce of Catherine, and was even forced to sign a declaration acknowledging the union of her parents to have been illegal, and renouncing the authority of the pope. She remained faithful, however, to the R.C. religion, living in retirement chiefly at Hunsdon and Kenninghall, until the death of Edward VI on July 6, 1553. Despite the efforts of the duke of Northumberland to secure the succession for Lady Jane Grey (*q.v.*), Mary had popular support, gathered a force from E. Anglia, and was proclaimed queen in London, July 19.

She behaved at first with leniency. Her reign was inaugurated by Acts of parliament declaring her legitimacy, restoring the Latin Mass and the celibacy of the clergy,

and abolishing the title of supreme head of the Church which Henry had assumed. New bishops were consecrated, and by Dec., 1554, the reconciliation with Rome was virtually complete. In the face of strong popular opposition, Mary married Philip II of Spain, July, 1554. The rebellion of Sir Thomas Wyatt (*q.v.*) had led to the execution of Lady Jane Grey in Feb.

A stern persecution of Protestants began in 1555. The queen, embittered perhaps by her early life, the failure of her marriage, ill-health, and childlessness must bear some responsibility for the persecutions which brought some 300 persons to the stake during the last three years of her reign, notably the bishops Hooper, Latimer, Cranmer, and Ridley; but they were not so much personal victims of "Bloody Mary" as victims of the abrupt and ill-adjusted return to the old laws against heresy. Without the worldly wisdom of her half-sister Elizabeth, Mary had far deeper convictions. The final blow in an unhappy life was the loss of Calais to the French. Shortly afterwards Mary died, Nov. 17, 1558. See England: History.

**Bibliography.** Privy Purse Expenses of the Princess Mary, with Memoir by Sir F. Madden, 1831; History of Mary I, J. M. Stone, 1901; Philip and Mary, J. B. Mullinger, Cambridge Modern History, vol. ii, 1904; Two English Queens and Philip, M. A. S. Hume, 1908; The Reign of Mary Tudor, J. A. Froude, 1910; Mary Tudor, B. White, 1935.

**Mary II** (1662-94). Queen of England. The elder daughter of James, duke of York, afterwards

Mary I,  
Queen of England  
After Holbein

then of Scotland. Crowned April 11, Mary was sovereign equally with her husband. The dignity of her private life and her staunch Protestantism made her respected, while her conduct of affairs while William was abroad showed spirit and shrewdness. On Dec. 28, 1694, Mary died of smallpox, and was buried in Westminster Abbey. She was childless. Consult The Third Mary Stuart, M. Bowen, 1929.

**Mary** (1542-87). Queen of Scots. Born at Linlithgow, Dec. 8, 1542, six days before the death of her father, James V, she then became queen of Scotland. In 1547 Somerset sought to compel the Scots to give their infant queen in marriage to Edward VI of England. To escape this Mary was shipped off to France, where she was brought up at the court under the charge of the Guises, the kinsfolk of her mother, Mary of Lorraine, who remained in Scotland and ruled on the child's behalf. In 1558 Mary was married to the dauphin Francis, who succeeded to the French throne in 1559, but died next year.

In 1561 Mary returned from France to a Scotland dominated by John Knox, in whose eyes she was a subject not for sympathy but for discipline, by reason especially of her loyalty to the R.C. religion, in which she had been brought up. Mary was left to fight her own battles and to select a husband from a crowd of suitors. She chose her cousin Henry Stuart, Lord Darnley, whom she married July 29, 1565.

Finding Darnley a broken reed, she gave all her confidence to her secretary, David Rizzio. The nobles, led by Morton, made ready use of Darnley's jealousy; and on March 9, 1566, conspirators murdered the secretary in the queen's presence in Holyrood Palace. Mary never forgave her husband, although there was a formal reconciliation after the birth on June 19 of her child, who afterwards became James VI. On Feb. 10, 1567, when Darnley was lying ill at a house called Kirk o' Field, near Edinburgh, and Mary was absent attending marriage festivities at Holyrood Palace, the house was blown up and the prince murdered. It has never been conclusively

proved that Mary had a hand in framing the murder plot; but that she knew that murder was afoot, and that Bothwell was the arch-conspirator, there is little question.

Bothwell was merely subjected to a mock trial, and acquitted. On April 24, he captured the queen herself after a barely formal show of resistance, and on May 15, after he had divorced his wife, Mary married him. The nobles rose in arms. At Carberry Hill, June 15, Bothwell escaped and fled the country, while Mary surrendered to the lords, by whom she was imprisoned in Loch Leven castle and compelled to abdicate in favour of James VI on July 24. On May 2, 1568, Mary escaped from Loch Leven, but only a few devoted loyalists gathered to her standard. They were defeated at Langside on May 13 by the regent Moray, and Mary escaped to England.

Elizabeth was guided by policy, not by generosity, and Mary was held in custody. A commission sat at York, nominally to hear the defence of the Scots lords for their rebellion, actually in order that their charges against Mary might be published. The commission was closed without giving her any opportunity of rebutting the evidence, and then for 18 years Elizabeth kept her a prisoner; while Roman Catholics formed plot after plot to liberate her and set her on the throne of England.

From a portrait

Scots at Hardwicke  
Hall

MARY II  
After Wissing

difficult position by the events of 1688, she appears to have sympathised with her husband rather than with her father; at all events she followed William to England in 1689, and the pair were proclaimed king and queen of England and

to which, if the marriage of Anne Boleyn (*q.v.*) to Henry VIII was really invalid, she had an irrefutable claim on the score of descent.

Each plot was detected, but without investigation of Mary's complicity; since neither her acquittal nor her condemnation would have suited Elizabeth's plans. But when war with Spain had actually been declared in 1586, Elizabeth's secretary, Walsingham, was given a free hand. The strict supervision of Mary's correspondence was ostensibly withdrawn, but really maintained more closely than ever. The plot of Anthony Babington (*q.v.*) was revealed. At the trial, letters of Mary's were produced which, if genuine, were absolutely damning; but whether the damning parts of them were genuine or forged no man will ever know. Mary was found guilty on Oct. 25, and parliament demanded her execution. Elizabeth, after efforts at evasion, sealed the death warrant, Feb. 1, 1587. The council, without giving her time to recall it, put it in execution, and on Feb. 8 Mary was beheaded at Fotheringhay. Her beauty has become legendary, and of her courage there is ample evidence; but a passionate nature led her to commit such blunders that the interest in her career now belongs as much to romance as to constitutional history. See Bothwell; Casket Letters; Darnley; Holyrood; Knox. J.; Scotland.

**Bibliography.** The career of Mary has been used in stories, poems, and dramas. Among the last may be mentioned Schiller's *Maria Stuart*; Swinburne's trilogy, *Chastelard*, *Bothwell*, and *Mary Stuart*; Drinkwater's *Mary Stuart*; Gordon Daviot's *Queen of Scots*. Lives and studies include those by D. Hay Fleming, 1897; E. Linklater, 1933; M. Bowen, 1934; M. P. Willcocks, 1939. Consult also *The Casket Letters* and M. Q. of S., T. F. Henderson, 2nd ed. 1890; *Love Affairs*, M. A. S. Hume, 1903; *The Mystery of M. Q. of S.*, A. Lang, new ed. 1904; *Trial*, ed. A. F. Steuart, 1923; *Persecution of M. S.*, Sir E. A. Parry, 1931; *In My End Is My Beginning*, M. Baring, 1931.

**Mary (1658-1718).** Queen of James II of Great Britain, known as Mary of Modena. Born at Modena, Oct. 5, 1658, she was the only daughter of the duke of Modena, a member of the Este

family, and was baptized Mary Beatrice Anne Margaret Isabel. Largely owing to the efforts of Louis XIV, she became by proxy in Sept., 1673, the second wife of James, duke of York. She went at once to England, where she lived until 1688, being regarded as a papal agent, and being certainly a strong and not very discreet Roman Catholic. In 1688 she fled to France. After the death of her husband, Sept. 6, 1701, Mary entered a convent, where she died May 7, 1718. Her surviving children were James Edward, the old pretender, and a daughter, Louisa.

**Mary (b. 1867).** Queen consort of George V of Great Britain, Ireland, and the British Dominions

*Mary II*

Overseas, and Empress of India. Eldest child and only daughter of the duke of Teck and his wife, Mary (daughter of the 1st duke of Cambridge, and granddaughter of George III), she was born at Kensington Palace, May 26, 1867, and baptized Victoria Mary Augusta Louise Olga Pauline Claudine Agnes. She was known in the family circle as May.

During her girlhood she lived mostly at Kensington until 1883, then, after a sojourn in Florence, the family moved to White Lodge, Richmond Park. In 1891 she was betrothed to the duke of Clarence, the heir (after his father, the prince of Wales) to the British throne. He died, Jan. 14, 1892; and on May 3, 1893 the engagement of the princess to his brother, the duke of York, was announced. The marriage was celebrated July 6, 1893, in the chapel of St. James's Palace. The duke and duchess lived at York House, London and York Cottage, Sandringham. On his father's accession as Edward

VII, 1901, the duke of York became duke of Cornwall, and, in Nov., prince of Wales.

The princess of Wales, now residing at Marlborough House, became widely known to the country by her performance of many public duties. With her husband she made a tour of the Empire, 1901, visiting Australia, 1906-07, and Canada, 1908. Crowned as queen consort in Westminster Abbey, June 22, 1911, she was crowned empress of India at Delhi in Dec. the same year.

During the First Great War, Queen Mary performed invaluable work for the women's organizations, e.g. the Queen's Work for Women Fund, 1914, Queen Mary's Needlework Guild (founded in the same year); and throughout that arduous period, 1914-18, she maintained her practical philanthropy, and her sympathy was shown on innumerable occasions. During the king's illness of 1928-29 she presided over the council of regency. In 1934 she named and launched the liner named in her honour, and in 1935 shared with the king the many engagements connected with the Silver Jubilee of the king's reign. After his death in 1936, when she returned to Marlborough House, she continued to appear at public ceremonies and, relieved of prime responsibilities, became a frequent visitor to theatres and concerts, and also spent much time in the company of her grandchildren. In the abdication crisis of Dec. 1936, she took no public part.

During the Second Great War she lived at Badminton, Glos., home of the duke and duchess of Beaufort, returning to Marlborough House in 1945.

One of the most beloved of British queen consorts, she endeared herself to her subjects by her many charitable acts and sense of duty to the country's welfare during periods of the greatest crises in its history. Her consistently regal appearance and deportment never failed to arouse admiring comment. An authority on *objets d'art*, she was a great collector of furniture and china. A needlewoman of skill, she presented to the prime minister in 1950 a carpet in gros point, on which she had been working since 1941, to be sold for dollars. Thousands of people saw it when it was exhibited in the U.K., the U.S.A., and Canada before it was sold. See *Dolls' House*; George V. Consult *Lives*, C. Cavendish, 1930; Sir G. Arthur, 1935.

**Mary of Modena, Queen of England**

**Mary** (1515-60). Queen of James V of Scotland, and known as Mary of Guise and Mary of Lorraine. A daughter of Claude, duke

Mary of Guise,  
Queen of Scotland  
After Jameson

of Guise, she was born at Bar-le-Duc, Nov. 22, 1515. In 1534 she married Louis, duke of Orleans, who died three years later. Henry VIII sued for her hand, but in 1538 she became the wife of James V, to whom she bore two sons, who died in infancy, and a daughter, Mary. James died in 1542, and their daughter became queen, with Cardinal Beaton as regent. Beaton fell, and Mary and her daughter escaped to Stirling, where the child was crowned.

Mary of Guise now played a prominent part in Scottish politics, and formed a close alliance with France. Her chief obstacle was James, earl of Arran, now regent, who looked to England for support. In 1554 he resigned and Mary became regent. Able and honest, she was not popular, and had a bitter enemy in Knox. In 1559 she attempted to break the Protestant party by placing a garrison in Perth, but her action was ill-timed; she was forced to flee to Dunbar, and at Edinburgh was declared deposed, Oct. 21. Mary died in Edinburgh, June 11, 1560.

**Mary** (b. 1897). British princess, known as the Princess Royal, countess of Harewood. Only daughter of King George V and Queen Mary, she was born at York Cottage, Sandringham, April 25, 1897, and christened Victoria Alexandra Alice Mary. Her education was supervised by Mlle. Dussau, and during the First Great War she trained as a nurse at the Great Ormond St. hospital for children. She later became president of the girl guides. On Feb. 28, 1922, she married Viscount Lascelles, who in 1929 became 6th earl of Harewood (q.v.). Two sons were born to them: George Henry Hubert, 7th earl (b. Feb. 7, 1923), and Gerald David (b. Aug. 21, 1924). On the death of Princess Louise she was created Princess Royal, Jan. 1, 1932. She later became controller-commandant of the A.T.S. (maj.-gen. of W.R.A.C.). During the visit of George VI to N. Africa in the Second Great War she was a councillor of state. She resided mostly at Harewood House.

**Mary Barton.** Novel of Lancashire life by Elizabeth Cleghorn Gaskell, first published in 1848. It is a sympathetically told story of working-class life in Manchester during a period of distress. This was Mrs. Gaskell's first novel, written as a distraction after the death of an infant son.

**Maryborough.** English name of the town in Laoighis co. called by the Irish Port Laoighise (q.v.).

**Maryborough.** Town of Victoria, Australia, in Talbot co. It is situated in the Loddon valley, 118 m. by rly. N.W. of Melbourne, at an alt. of 1,787 ft. There are rly. workshops and iron-foundries. Gold is mined locally. Pop. 5,900.

**Maryborough.** Port in Queensland, Australia. It is 20 m. from the mouth of the Mary river, 167 m. N. of Brisbane, and on the coastal rly. linking Brisbane to Rockhampton. It is the outlet of the Gympie gold and Burrum coal fields, and has the biggest iron and steel foundries in Queensland. Timber is exported. Pop. 14,500.

**Mary Celeste.** A vessel concerned in a mystery of the sea. On Dec. 5, 1872, the brig *Dei Gratia*, commanded by Captain Morehouse, sighted the brigantine *Mary Celeste* about 130 m. off the coast of Portugal. Morehouse was a friend of Capt. Briggs, master of the *Mary Celeste*, and seeing no one at the wheel, he boarded the vessel. No one was on board, and there was no sign of disorder. The last entry in the log book was dated Nov. 24; but a slate in the captain's cabin recorded that on the 25th the *Mary Celeste* was passing N. of the island of Santa Maria in the Azores. During ten days she had to all appearances held her course for 750 m. unsteered.

Mary,  
Princess Royal  
Countess of  
Harewood

Morehouse took the ship in tow and continued his voyage to Gibraltar. A cutlass was found, with what might have been bloodstains, and on the deck some marks which looked like spots of blood, while there were curious cuts on the bows. Briggs had been accompanied by his wife and daughter, and the ship carried a crew of seven. It was stated that the ship's boat was hanging on the davits when she was found.

Many explanations were advanced to account for the mystery. The cuts on the bows were shown to have no significance, and the stains on the cutlass were proved not to be blood. In 1929 Laurence Keating published a solution, *The Great Mary Celeste Hoax*, which was based on documentary evidence. According to his account Morehouse lent Briggs three of his crew at New York, the others in the *Mary Celeste* being a rough lot. One of the crew, Venholdt, soon got into a fight with the mate Hullock, who seems to have taken command of the vessel. Mrs. Briggs was accidentally killed by a piano falling upon her, and was buried at sea by the mate, contrary to the captain's wishes. Briggs began to drink heavily and disappeared one night after fighting with the mate. Hullock and Venholdt again came into conflict, and the latter went overboard and was never seen again. At Santa Maria the mate and two others deserted, taking the log containing Briggs's complaints, and when the *Dei Gratia* arrived at Santa Maria the *Mary Celeste* was in charge of the three members lent by Morehouse and the English cook Pemberton. Morehouse invented the story of finding a deserted vessel to avoid inquiries.

In 1885 the *Mary Celeste* was wrecked off Cienfuegos, Cuba, in suspicious circumstances.

**Maryhill.** Suburb of Glasgow, Scotland. Lying N. of the Kelvin, it is an industrial and working-class residential district, being distinguished by its long streets of "closes" or tenements. Here is Maryhill barracks, the depot of the Highland Light Infantry. Maryhill gives its name to a borough constituency of Glasgow including Ruchill.

**Maryland.** A twin-engined bomber designed by Glenn Martin (U.S.A.) for service in the Second Great War. It achieved particular success in the early Mediterranean campaigns of the R.A.F., proving superior in performance to current Italian fighters. Powered by two

Pratt and Whitney Twin Wasp radial engines of 1,050 h.p., the Maryland carried a crew of three and 1,250 lb. of bombs at a maximum speed of 304 m.p.h. Wing span was 61 ft. 4 ins., length 46 ft. 8 ins.

**Maryland.** Alternative name given in the U.S.A. to the old German tune to which the song *Der Tannenbaum* was traditionally sung around the family Christmas tree. The tune was used for a song, Maryland, my Maryland, written by J. R. Randall, of Baltimore, in 1861, and was later popular as a hymn-tune. The same tune was adopted in the U.K. for the Socialist song *The Red Flag*. See *Red Flag*, *The*.

**Maryland.** State of the U.S.A., one of the thirteen original states of the Union. The area is 10,577 sq. m., and it is divided into two parts by Chesapeake Bay. In the S. it has a coast-line on the Atlantic, but farther N. Delaware divides it from the sea. Another boundary is the estuary of the Potomac. In the E. the surface is low and marshy, but to the W. it is hilly, being crossed by ridges of the Alleghenies, and having some peaks over 3,000 ft. high. Agriculturally, Maryland is known as the "special crop" state, many farmers experimenting in diversified crops. It is famous for strawberries, tomatoes, spinach, and tobacco. The capital is Annapolis, but Baltimore is much the largest place. Other cities are Cumberland, Hagerstown, and Frederick. The government is carried on by a governor and a general assembly, consisting of a senate and a house of delegates. Two senators and six representatives are sent to Congress. An inter-racial commission, appointed by the governor and consisting of white and coloured members, provides for the welfare of negroes, who form about one-fifteenth of the total pop. of 1,821,244.

Maryland was settled by R.C.s in Charles I's reign and remains a centre of American Roman Catholicism, the first American cardinal, James Gibbons, having been born in Baltimore. In the first U.S. census, 1790, 93 per cent were of British stock. In the 1930 census only 977 were registered as foreign-born. Two famous Maryland writers are H. L. Mencken and Upton Sinclair. The walls of Johns Hopkins University, Baltimore, have murals representing various beautiful Maryland women, the gift of an anonymous donor.

**Marylebone.** London place-name. Popularly used for a metropolitan bor. of London, the title being officially St. Marylebone (q.v.), Marylebone has given its name to a rly. terminus (originally of the Great Central rly., later of the L.N.E.R.). Marylebone Road is a main thoroughfare from Edgware Rd. to Gt. Portland St. Marylebone Park was the former name of Regent's Park, which is entirely within the bor. *Pron.* Marri-lebun.

**Marylebone Cricket Club.** English cricket club, regarded as the governing body of the game in England, and known as the M.C.C. It dates from 1787, when some members of the White Conduit club began to play on Lord's ground in Dorset Square, and called themselves the Marylebone club. In 1788 the rules of cricket were revised by the club, and since then it has been generally accepted as the controlling body. All alterations in, and additions to, the laws of the game must be accepted by a two-thirds majority of the members present at an annual meeting of the M.C.C. The club, which owns Lord's cricket ground, is governed by a president, treasurer, and committee of sixteen. The M.C.C. is responsible for the selection of representative English teams. Presidents have included Lord Hawke and Sir Pelham Warner. See *Cricket*; *Lord's*.

**Mary Magdalene.** Name of the woman mentioned with others in the N.T. as being healed of evil spirits and ministering to Christ of her substance. She was present at the Crucifixion, and it was to her that Jesus is said to have first appeared after the Resurrection. The name is generally understood as indicating that she was a native of Magdala, the modern El Mejdal, on the W. shore of the Sea of Galilee. Tradition identified Mary of Magdala with the unnamed penitent of S. Luke who anointed Christ with the spikenard. Gregory the Great decided that the two women were identical; on his authority the feast of S. Mary Magdalene was arranged, but the identity is rejected by the majority of modern critics. David Smith, however, in his book, *In the Days of His Flesh*, identifies Mary of Magdala with the unnamed penitent and with Mary of Bethany, sister of Martha and Lazarus.

**Maryport.** Seaport, market town, and urban dist. of Cumberland. It stands at the mouth of the river Ellen, 28 m. by rly. from Carlisle. The principal buildings

include the churches of S. Mary and Christ Church. The chief industries are food canning, coal mining, the manufacture of buttons, children's wear, surgical instruments, furniture, and electrical equipment. Originally known as Ellenfoot, the town was renamed Maryport in 1750 because Mary Queen of Scots landed here in 1568. In 1750 also the building of the harbour was begun, and docks were added to it in the 19th century. Near was a Roman station, in which many remains have been found. Market day, Fri. Pop. 11,820.

**Mary Rose.** Fantasy in 3 acts by J. M. Barrie. This imaginative piece with its "fey" atmosphere is a notable example of Barrie's art. The heroine "disappears" into the realms of enchantment during a visit to a Scottish island (The Island which Likes to be Visited), and on her return home many years later is represented as untouched by age or experience. Produced at the Haymarket Theatre, London, April 22, 1920, with incidental music by Norman O'Neill, it ran for 399 performances. Fay Compton played Mary Rose, and Robert Lorraine the double part of her husband and soldier son. It was revived in 1926 and 1929.

**Mary Ward Settlement.** Social welfare institute in Tavistock Place, St. Pancras, London. Until 1920 it was known as the Passmore Edwards Settlement, the name being changed to commemorate Mrs. Humphry Ward (q.v.), through whom John Passmore Edwards (q.v.) founded the settlement in 1897. It now comprises schools for defective children, evening play centres, boys' and girls' clubs, a free legal advice centre, lectures, recreational gatherings, and an evening institute. See *Settlement*.

**Mazipan** (Ger.). Sweetmeat made of ground almonds and sugar in about equal proportions, bound with eggs and flavoured with lemon juice, rose water, or orange flower water. It is used as an icing for cakes and as a sweetmeat, and is often called almond paste. Marchpane is the older English name.

**Masaccio** (1401-c. 1428). Florentine painter. Born at Castel San Giovanni di Valdarno, Dec. 21, 1401, he was named Tommaso Guidi, but is invariably known by his nickname Masaccio, meaning loutish Tom. In 1417, commissioned to decorate a chapel for Cardinal San Clemente, he painted a Crucifixion and scenes from the lives of SS. Catherine and Clement.

Between 1423 and 1428 he painted 12 frescoes in the Brancacci Chapel in the Carmine, representing scenes from the Bible. He died in Rome about 1428. His Madonna and Child with Angels was acquired for the National Gallery, London, 1916.

**Masai.** People of Nilotic negro stock in E. equatorial Africa. A sinewy, round-headed, thin-lipped people, with Caucasoid nose, they derive their predatory temperament and pastoral habit from Hamitic contact. The warriors, wearing skin shoulder-flaps and ostrich-feather aureoles, are armed with thrusting spears, knobkerries, and oval shields. The village stockades resemble Kafir kraals. Marriage is deferred until after the warrior age. Immigrant from the Bari-Latuka region, they ranged from Mt. Kenya to beyond Kilimanjaro, where some still remain in Tanganyika territory. They frequently attacked caravans and expeditions, and those in the colony of Kenya have been removed from the Leikipia plain to a reservation between Nairobi and the S. boundary. The region inhabited by them is known as Masailand. See Africa, colour plate; consult The Masai, their Language and Folklore, A. C. Hollis, 1905.

**Masaniello** (1622-47). Name given to the Neapolitan patriot, Tommaso Aniello. A fisherman of Amalfi, he became leader of the populace when they rose against the Spanish tyranny in Naples, July 7, 1647. Count d'Arcos, the viceroy, was driven to Castelnovo, and for six days Masaniello was ruler of the city. He tried to moderate the fury of the mob and restrain their excesses. On July 13, d'Arcos agreed to the demands of the insurgents, and three days later Masaniello was murdered and mutilated by his old adherents. His story forms the theme of Auber's opera, *La Muette de Portici*.

**Masaryk, JAN GARRIGUE** (1886-1948). The son of Thomas Masaryk, he entered the Czechoslovak foreign service in 1918, and served in the London and Washington embassies before becoming ambassador to Great Britain in 1925. In 1939 he resigned,

and in 1940 became foreign minister in the provisional Czechoslovak government which was set up in London. He was deputy prime

minister, 1941-45, during which time he became widely known to British listeners by his broadcasts in the B.B.C. Brains Trust. With the re-establishment of the Czechoslovak republic he became foreign minister, and led his country's delegations to the San Francisco conference of 1945 and to the Paris peace conference; he was retained in his post in the government formed after the Communist *coup d'état*, Feb., 1948. He committed suicide (to all appearances) by throwing himself from a window, March 10.

**Masaryk, THOMAS GARRIGUE** (1850-1937). Man of letters and first president of the republic of

T. G. Masaryk,  
President of  
Czechoslovakia

Czech school at Czejkovice and the German school at Hustopech, and worked as a locksmith in Vienna and a blacksmith in Moravia. In 1865 he was able to resume his studies, first at Brno, and later at Vienna, where he graduated, and Leipzig. In 1882 he became a professor at Prague university.

He was elected to the Austrian Reichsrath in 1891, but resigned two years later. Re-elected in 1907, he denounced the conduct of Serbo-Croat affairs by the Austrians, especially with regard to Bosnia and Herzegovina. When the First Great War broke out he escaped from Austria to campaign for a free Czechoslovakia, founding with Dr. Benes and General Stefanik the Czechoslovak National Council which in 1918 was recognized as the country's provisional government. In 1915 he took up an appointment at King's College, London, and his writings proved so dangerous to the Austrians that he was condemned to death in his absence, and his property confiscated. He was elected president of the newly-formed Czechoslovak republic, Nov. 14, 1918, and re-elected in 1920, 1927, and 1934. but in Dec., 1935, his failing health induced him to resign. He died Sept. 14, 1937. The whole period of his country's independence drew inspiration from him. He encouraged his compatriots to make their country an observatory from which

to watch developments in all parts of the world. His writings, in Czech and German, include Blaise Pascal, 1883; *Slavic Studies*, 1889; *Russia and Europe*, 1913; *The World Revolution*, 1925. His war memoirs appeared in 1925. See Czechoslovakia. Consult President Masaryk Tells His Story, recounted by Karel Capek, 1933; *Lives*, D. A. Lowrie, 1930. E. Ludwig, Eng. trans. J. Murphy, 1936; R. J. Kemer, 1938; V. Cohen, 1941; P. Selver, 1941.

**Masaya.** Town of Nicaragua, capital of the dept. of Masaya. At an alt. of about 3,000 ft., near Lake Masaya, it is 16 m. by rly. S.E. of Managua. The surrounding districts produce tobacco, sugar, coffee, and rice. Pop. 30,372.

**Masbate.** One of the Philippine Islands. Situated W. of Samar and S. of Luzon, it forms, with the adjacent islands, the province of Masbate, which has an area of 1,260 sq. m. With hills rising to 2,500 ft., it has large forest tracts, producing excellent timber. Agriculture is undeveloped, and stock-raising and fishing are the chief industries. Manufactures include mats and sugar sacking, and a fairly large export trade is carried on from Masbate, the capital, and several other good harbours. It was occupied by the Japanese in April, 1942, and liberated when Japanese opposition in the Philippines ceased early in 1945. Pop. of province, 108,800.

**Mascagni, PIETRO** (1863-1945). Italian composer. Born at Leghorn, Dec. 7, 1863, the son of a baker, he

Pietro Mascagni,  
Italian composer

studied music there and at Milan. In 1890, Mascagni leapt suddenly into fame by the production at Rome of the one-act opera *Cavalleria Rusticana*. This won for him worldwide popularity. In 1895 he was made director of the Conservatoire at Pesaro, and after a tour in the U.S.A. as operatic conductor he became a teacher in Rome. His other operas include *L'Amico Fritz*, 1891; *Iris*, 1898. *Parisina*, 1913; and *Nero*, 1935. He died Aug. 2, 1945.

**Mascara.** Town of Algeria. At an alt. of 1,834 ft., 93 m. by rly. S.E. of Oran, it has a large trade in wine, oil, and cereals. Mascara was the residence of Abd-el-Kader who, in 1837, preached the holy war of extermination against the Chris-

tians. It was taken by the French under Bugeaud on May 30, 1841. Pop. 31,842. The name mascara is given to eyelash cosmetic.

**Mascarene.** Collective name for three islands E. of Madagascar, in the Indian Ocean, Mauritius, Réunion, and Rodriguez. Réunion was discovered by the Portuguese Mascarenhas in 1545.

**Mas d'Azil.** A French hamlet near the Pyrenees, remarkable for the discovery by Édouard Piette in 1887 of mesolithic remains. It has a natural limestone tunnel 450 yds. long. See Azilian.

**Masdevallia.** Large genus of epiphytal plants of the family Orchidaceae. They are natives of the mountain regions of tropical America. The leaves are long and leathery, and the very striking flowers are borne singly or in pairs at the summit of long, leafless stalks. Sepals form the showy part, the small petals being concealed.

**Masefield, JOHN EDWARD** (b. 1878). English poet laureate. He was born at Ledbury, June 1,

John Masefield,  
English poet laureate

1878, and spent his early years wandering, as a sailor before the mast, and in varied employment in the U.S.A., gaining the hard experience he was later to write about.

Salt-water Ballads were published in 1902, *A Mainsail Haul*, 1905, his edition of *Dampier's Voyages* in 1906, and thenceforward he pursued literary work. In the First Great War he served with the Red Cross in France and at the Dardanelles.

Many pieces in the volumes of 1902-05 and in *Ballads and Poems*, 1910, were marked by the bold rhythms of the Kipling school. In 1911 reputation came with the first of his long narrative poems, *The Everlasting Mercy*, recounting in rough-and-ready but original and memorable rhyme the story of a village drunkard's conversion. It was followed by similar works, unequal but vivid in style: *The Widow in the Bye-Street*, *The Daffodil Fields*, and *Dauber*.

*Biography*, a less known but truly subjective poem, shows Masefield concerned with that ceaseless striving after an ideal beauty which forms the subject of the series of grave and beautiful sonnets in *Lollingdon Downs*,

1917. With Reynard the Fox, 1919, and *Right Royal*, 1920, vigorous pictures of sport in the English shires, Masefield resumed his narrative genre. Nearly all the volumes to this date have much about ships and the sea. But in the Second Great War no subject inspired him so much as the women's land army. Collected Poems appeared in 1932.

Masdevallia abbreviata. Leaves and flowers of this Peruvian plant

His plays include *The Tragedy of Nan* (in dialect), 1909; *Pompey the Great*, 1910; *Philip the King*, 1914; *Good Friday*, 1916; *The Trial of Jesus*, 1925; *Tristan and Isolt*, 1927. Among novels and adventure stories are *Captain Margaret*, 1908; *Lost Endeavour*, 1910; *Sard Harker*, 1924; *Odtaa*, 1926; *The Bird of Dawning*, 1933; *Dead Ned*, 1938; *New Chum*, 1944. In 1911 came a modest study of Shakespeare. Masefield succeeded *Bridges* as poet laureate in 1930 and was awarded the O.M. in 1935.

Alan Phillips

**Maseru.** District and capital town of Basutoland, S. Africa. The town has a mission station, with industrial school and hospital. Situated near the Caledon river, it is the terminus of a branch rly. to Marseilles, and is 80 m. E. by S. of Bloemfontein.

**Masham.** An urban dist. and market town of the N. Riding of Yorkshire, England. It stands on the Ure, 8 m. N.W. of Ripon, and has a rly. station. The church of S. Mary the Virgin is partly Norman. There is a grammar school founded in the 18th century, and the chief industries are a trade in agricultural produce, and brewing. Market day, Wed. Pop. 1,995.

**Masham, SAMUEL CUNLIFFE-LISTER, 1st BARON** (1815-1906). British inventor and manufacturer. The son of a Yorkshire squire, Ellis Cunliffe, afterwards Cunliffe-Lister-Kay, he was born at Calverley Hall, near Bradford, Jan. 1, 1815. He began business in Liverpool, afterwards setting up a worsted mill at Manningham with his brother, and later was

associated with Isaac Holden. He perfected a compressed air brake for rlys., a silk-combing machine, a velvet loom, and a method of utilising silk waste. In 1891 he was made a baron, and he died Feb. 2, 1906. At one time possessed of great wealth, he bought Swinton Park, Jervaulx Abbey, and extensive estates in the West Riding. He was a strong tariff reformer. *Pron.* Mass-ham.

**Masham, ABIGAIL** (d. 1734). English courtier. The daughter of Francis Hill, a London merchant, she was appointed woman of the bedchamber to Queen Anne, through the influence of her cousin, the duchess of Marlborough. In 1707 she privately married Samuel Masham, who was then in attendance on Prince George of Denmark, and was raised to the peerage in 1712 as Baron Masham. The duchess soon found that her cousin was supplanting her in the queen's favour and was assisting her enemy Harley. In the quarrel that ensued Mrs. Masham was victorious, and her power increased. She was driven into retirement with her husband by Anne's death in 1714. She died Dec. 6, 1734.

**Mashie.** Golfer's iron club, intermediate in length of shaft and loft of face between the iron and niblick. Its main purpose is for comparatively short approaches, so played that the ball will stop on the green near the pin. See *Golf*.

**Mashonaland.** District of S. Africa, now part of Rhodesia. It is named after the Mashonas. Lying to the N.E. of Matabeleland, it is a mountainous area, but is rich in minerals, gold having been mined here in ancient times, and contains excellent pasture land. Salisbury is the chief town; others are Hartley, Gatooma, Umtali, and Victoria. Mashonaland was included in the grant made in 1889 to the British South Africa Co., and in 1890 a force was sent to take possession of it. In 1893 the inroads of the warlike Matabele, long the enemies of the more peaceful Mashonas, led to the Matabele War. In 1896 the Mashonas rebelled, and for over a year the rising continued, but in the end it was put down, and Mashonaland became soon an integral part of Rhodesia. See *British S. Africa Co.*; *Matabeleland*; *Rhodesia*.

**Masinissa** (c. 238-148 B.C.). Numidian king. Son of the king of the Massylians, or E. Numidians, he was educated at Carthage, and

in the second Punic war at first fought for the Carthaginians, but after their defeat deserted to the Romans. He was hard pressed both by the Carthaginians and by another Numidian king, Syphax, but the arrival of Scipio in Africa in 204 B.C. brought relief, and Masinissa was able to play an important part in the battle of Zama, 202, in which the Carthaginians were completely defeated. As a reward for his services to the Roman cause, he received the territory of Syphax, and thus became king of all Numidia. See *Sophonisba*.

**Mask** (Fr. *masque*, vizor). A covering for the face, assumed either to conceal the features or to represent a character. The hideous masks ceremonially used by many savage peoples are intended to ward off demons, to express totemistic ideas, and to terrify enemies. The faces of the dead were masked by the ancient Egyptians, Mycenaean Greeks, Mexicans, and Peruvians, to preserve them from molestation by evil spirits. In the presentation of the Greek drama every actor wore a mask suited to the character he personified. They were made of bronze or copper, enamelled or painted, and designed to add power to the voice so that the actor could be heard at the farthest limit of the vast theatre. This was effected by fastening the mask to the head with a kind of perwig, which covered the head and left only a circular passage for the voice to sound through, whence was derived the Latin word for a mask, *persona* (*personare*, to sound through).

On the modern stage masks have been discarded by actors with speaking parts, the smaller stage requiring the use of facial expression and of vocal asides, which would have been lost in the immense auditorium of a classic Greek theatre. But masks, especially of grotesque design and representing heads of animals, still figure prominently in pantomime. In Shakespeare's time ladies commonly wore black masks to conceal their identity in public, perhaps always did this in the theatre. Hence, as Nares points out, if a theatrical company had no male actor physically well adapted to impersonate a woman, he could don a mask and yet not be absurdly out of the picture. Thus, in *A Midsummer Night's Dream*, when Flute begs not to play a woman since he has a beard coming, Quince retorts "That's all one: you shall play it in a mask, and you may speak as small as you will."

Masks 1 and 2, Japanese theatrical masks of carved wood. 3, North American Indian mask used in ceremonial dances (Puget Sound, Washington co.)  
1 and 2, Victoria and Albert Museum

In sculpture the word mask is used in several connexions, such as a representation of the human face, whether noble or grotesque, in gargoyles, on tiles fixed at the ends of cornices and eaves, or on the keystone of an arch, and as a cast of a face taken after death. technically a death-mask.

For protective purposes masks have been developed into various forms, e.g. the inhalers used by firemen, miners, and divers when working in smoke or vitiated air or under water, and the gas respirators worn by troops assailed with poisonous fumes. The word mask is also applied by military engineers to a screen provided for a battery, and to earthworks thrown up to protect men when constructing a battery. See *illus. to Actor; Comedy; Harlequin; Masque; Masquerade; Respirator*.

**Mask.** Lough or lake of Eire. It forms part of the boundary between counties Galway and Mayo, and contains about 20 islands. Its length is 12 m., while its breadth varies from 2 to 4 m. Salmon and trout are caught. On the S.E. shore are the ruins of a castle, built in the 13th century and restored by Sir Thomas Bourke in the 17th.

**Maskell, DANIEL** (b. 1908). British lawn-tennis player. He was born in London, April 11, 1908, and on leaving school was attached as a professional to Queen's Club, London. In 1926 he won the British professional lawn-tennis championship, and between that year and 1949 won that title 15 times. In 1927 he won the open professional world championship. For many years he was the official coach to the British Davis and Wightman cup teams.

**Maskelyne, JOHN NEVIL** (1839-1917). British entertainer and illusionist. Born at Cheltenham, Dec. 22, 1839, he was apprenticed to a

watchmaker, but studied conjuring and began entertaining at the age of 16. In 1865 he entered into partnership with one Cooke, exposed the mysteries of the Davenport spiritualistic quacks, and in 1873 moved to London. The partnership, later Maskelyne and Devant, took the Egyptian Hall, Piccadilly, and The Hall of Magic was the scene of ingenious illusions until they moved to St. George's Hall in 1905. Maskelyne died May 18, 1917. An unwavering opponent of frauds perpetrated under the guise of spiritualism, he was never deceived by any pretended medium, whilst the secrets of many of his tricks remain undiscovered.

**Maskelyne, NEVIL** (1732-1811).

British astronomer. Born Oct. 6, 1732, he was educated at Westminster and Cambridge. In 1761 he observed the transit of Venus from St. Helena on behalf of the Royal Society. He was appointed the astronomer royal, 1765, and founded the Nautical Almanac the following year. During his long tenure at Greenwich he also compiled a valuable catalogue of fundamental stars, and introduced systematic publication of results noted at the observatory. He died Feb. 9, 1811.

Nevil Maskelyne, British astronomer After Vanderburgh

**Masks and Faces.** Comedy by Charles Reade and Tom Taylor, founded on the former's novel *Peg Woffington*. Produced Nov. 20, 1852, at The Haymarket, it had a successful run, Mrs. Stirling playing Peg Woffington, Leigh Murray Sir Charles Pomander, and Benjamin Webster Triplet.

**Masochism.** Term in psychology used to denote the converse of sadism (*q.v.*). The word derives from Leopold von Sacher-Masoch, an Austrian novelist, who described the condition.

**Mason.** Worker in building stone. The term is usually applied to artificers who dress or hew blocks of stone into sizes and shapes suitable for building, but it includes those who place the stones in position and erect the buildings. From earliest times the mason's was one of the most important and exclusive crafts. In the Middle Ages expert masons travelled from town to town over Europe. The term is also used for freemason. See *Freemasonry*.

**Mason, ALFRED EDWARD WOODLEY** (1865-1943). British novelist. Born May 7, 1865, he

A. E. W. Mason,  
English novelist

was educated at Dulwich and Trinity College, Oxford. During 1906-10 he was Liberal M.P. for Coventry. His first literary success was *The Courtship of Morrice Buckler*, 1896; it was

followed by a series of books which showed the power to impart movement to a story. This enabled him to achieve success in a series of crime novels, featuring a French detective, Hanaud. Outstanding among his writings were *The Four Feathers*, 1902; *The Broken Road*, 1907; *At The Villa Rose*, 1910; *The Turnstile*, 1912; *The House of the Arrow*, 1924; *The Sapphire*, 1933; *Fire over England*, 1936; *Konigsmark*, 1938. Several of these were dramatised and filmed, and Mason also wrote original plays, including *The Witness for the Defence*, 1911; *Running Water*, 1922; and a film script, *The Drum*, 1937. In 1941 appeared an idealised life of Drake. Mason died Nov. 22, 1948.

**Mason, GEORGE HEMING** (1818-72). British painter. Born at Stoke-upon-Trent, March 11, 1818, he was articled to a surgeon in Birmingham. In 1845 he settled in Rome, where he painted portraits. Many of his pictures are of scenes in the Campagna, such as *Ploughing in the Campagna*, and *In the Salt Marshes*, 1856. In 1858 he returned to England. Of his English period, the chief pictures, which show great beauty of design and poetic sentiment, are *Wind on the Wold*, *The Cast Shoe* (both in the Tate Gallery), *The End of the Day*, and *The Harvest Moon*. He exhibited at the R.A., 1857-72, was elected A.R.A., 1869, and died Oct. 22, 1872.

**Mason, JAMES** (b. 1909). British film actor. Born at Huddersfield, May 15, 1909, he was educated at Marlborough and Peterhouse College, Cambridge. After practising as an architect in Manchester, he joined a repertory company, and in 1933 appeared in *Gallows Glorious* at the Shaftesbury Theatre, London. He entered films in *Late Extra*, 1935, but made no outstanding reputation until 1939 in *I Met a Murderer*. On the strength of saturnine performances in *Thunder Rock*, *The Man in Grey*, *Fanny by Gaslight*,

and *The Seventh Veil*, he was voted the most popular British film actor in the Daily Mail poll of 1945. *The Wicked Lady*, *Odd Man Out*, and *The Upturned Glass* confirmed his position in 1946-47. He married Pamela Kellino, 1940, and went to the U.S.A., 1946.

**Mason, SIR JOSIAH** (1795-1881). British manufacturer and philanthropist, born Feb. 23, 1795 at Kidderminster. In 1825, having gained some experience in a Birmingham factory, he bought a small business and became a manufacturer of hardware, soon devoting himself mainly to making pens, in which he built up a large business. The pens bore the name of James Perry, the London stationer who placed them on the market. Mason became interested

Sir J. Mason, British  
philanthropist

in other industries in Birmingham, especially electroplating. In 1872 he was knighted, and he died June 16, 1881. He founded Mason College, Birmingham, and an orphanage at Erdington. See *Birmingham University: consult* Life, J. T. Bunce, 1882.

**Mason and Dixon Line.** The boundary between the states of Pennsylvania and Maryland, U.S.A. Thus it was virtually part of the dividing line between the free and slave states before the Civil War. It was drawn 1763-67 by two English astronomers, Charles Mason and Jeremiah Dixon, to settle a dispute between the Lords Baltimore and the Penn family. The line was originally marked by stones, every fifth mile bearing on one side the arms of Lord Baltimore and on the other those of Penn. See *Dixie*.

**Mason City.** In Iowa, U.S.A., the co. seat of Cerro Gordo co. It stands on a small stream, 70 m. N.E. of Fort Dodge, and is a rly. junction. Settled in 1853, it was incorporated in 1870 and made a city in 1881. It produces 5 p.c. of the nation's cement, has brick and tile works, makes clay ware, and has meat processing plants, also a small trade in agricultural produce. Pop. 27,080.

**Masonry.** The art of shaping or building in stone and similar materials. It is an ancient craft and method of construction, stone being one of the first materials used for building purposes. It is not possible to give the date of the

first masonry structure, but it is quite easy to believe that prehistoric cave-dwellers adjusted the positions of loose blocks at the entrances to their homes to give added protection against the weather, their enemies, and the animals they had dispossessed.

Some of the finest examples of the masons' art in existence today are the work of the Greeks. The earlier works of the Egyptians were of a very high quality, too, but it is the magnitude of the tasks they undertook rather than the quality of their actual craftsmanship that is impressive. The building of the pyramids, which are constructed of large blocks of granite faced on the outside with slabs of polished alabaster, was a task which today would be considered to require the aid of modern transport, high grade steel cutting tools, and carborundum and diamond saws.

Masonry in the British Isles had not got far beyond the cave-dwelling stage before the coming of the Romans, and although these early invaders are chiefly famed for their road building, they were responsible also for many structures and founded a number of British towns. After their departure in A.D. 410, the buildings suffered during the troubled times that followed. The work of the Anglo-Saxon masons, though crude, showed the influence of the Romans, and in many cases materials from Roman buildings which had been destroyed or had gone into decay were used again.

The Normans brought with them in the 11th cent. new ideas from the Continent, their own craftsmen, and in some cases their own materials. Several English cathedrals contain Norman work constructed in stone from the quarries of Caen in Normandy.

From the 12th to the 15th cent. the development of masonry and of English architecture are synonymous and can be most easily traced through ecclesiastical buildings. Changing conditions in the mode of life are reflected in these old buildings; new ideas, new tools, and, with them, new methods of construction were handed on and determined a style of architecture. Historic events also influenced the work of the mason.

Norman masonry can be divided into two almost distinct periods. The earlier examples retain much of the crudeness of Saxon work, wide joints between blocks, shallow mouldings, typical

of the work of the axe and not the chisel. The use of the chisel brought about an almost sudden change in the quality of craftsmanship, and some examples, *e.g.* at Canterbury and Winchester, show a line of demarcation so clear that the period of the work can be traced almost to a stone.

The Early English period, approx. the 13th cent., shows a steady development of craft skill both in the finishing of the blocks themselves and in construction. Deeply cut mouldings, clustered columns surmounted by carved foliated capitals, thinner walls with larger and more scientifically de-

Masonry in the Perpendicular style is more subdued, considered to be a reflection on the Black Death which terminated the Decorated period. Mouldings were shallow, mullions were carried vertically through the tracery of the windows and the geometrical patterns became simple sub-division of the bars.

Many great masonry structures have been erected since the end of the Gothic period, *e.g.* works by Wren, Nash, Barry, and Pugin. Liverpool cathedral is an example of 20th cent. masonry; started in 1904, this great building was still far from complete when work on it was interrupted by the Second Great War.

Masonry tends to become a series of specialised trades, each with its own specialised crafts-

The design and required shape of the stone is transferred to zinc moulds from which the banker mason shapes the block with the aid of chisels and a mallet. Plain blocks and straight lengths of moulding can be worked entirely by machine. Each block is carefully checked for size and numbered before it is fixed, the term used for the actual setting of the stone in the wall.

T. B. Nichols

**Masons' Company.** London city livery company. Its first by-laws were drawn up in 1356, and its initial charter was granted in 1677. The site of the company's old hall in Basinghall Street was later covered by **Masons' Hall Tavern**. The offices are at 9, New **Masons' Company arms** Square, Lincoln's Inn, London, W.C. *Consult* Records of the Craft and Fellowship of Masonry, E. Conder, 1894.

**Masons' Marks.** Figures scratched or cut into the stones of ancient buildings in various parts of the world. Attention was first formally directed to them by George Godwin, in a communication to the Archaeological Association in 1841. Masons' marks assume innumerable forms, which may be roughly classed as geometrical, symbolical, heraldic, pictorial, and alphabetical. Some of these are of universal occurrence, *e.g.* the fylfot, or Thor's hammer, which is found in India and at Alnwick Castle, while a symbol in a chamber of the Great Pyramid is identical with one cut in a wall at S. Mary's, Leicester.

In attempting to account for the marks, opinion is sharply divided. Some see in them secret signs of mystic brotherhoods, or guilds of travelling masons, such as the Comacines, or masonic fraternity of Como; others take the view that they were tally marks to associate the mason with his work, and thus fix responsibility for quantity and quality. Masons'

signed buttresses are typical. Ribbed vaulting was introduced and developed, tracery in windows, which began as simple piercings, became ultimately separations of the mullions.

The growth of the Decorated style, which covers approx. the 14th cent., was gradual. This period includes the most perfect and complete examples of Gothic masonry. The mouldings consisted chiefly of rounds and hollows separated by fillets, many of the members being decorated by the familiar bell flower. Much of the tracery of the windows, an outstanding feature of the period, was geometrical in construction and varied considerably in design.

men. It can be divided according to the material—granite masonry, marble, hardstone, softstone, etc., and also according to the type of construction, *e.g.* rubble masonry, where the blocks are unwrought and are laid and bonded in the natural state just as they were obtained from the quarry; wrought or dressed masonry, where the blocks are accurately cut and dressed to a specific shape and size; monumental masonry, the working and erection of monuments.

The processes necessary to convert a piece of stone into a portion of a masonry structure vary according to the type of stone and structure. Generally the material is either wedged or blasted from its quarry bed and transported in blocks to the mason's yard. The rough blocks are cut to approx. sizes either by diamond-studded or carborundum-rimmed circular saws, or by the older method of abrasion with swinging steel blades fed with sand, steel shot, and water.

Masons' Marks. Examples from the cathedral of Pierrefonds, France, 14th century

marks, sometimes called bankers' marks, a mason who worked at a bench or bank being therefore a banker, are especially prevalent in medieval buildings, and it appears from the records of the Brechin Lodge of Masons that each member was assigned his own particular symbol, such symbols passing from father to son.

**Maspero**, GASTON CAMILLE CHARLES (1846-1916). A French Egyptologist. Born in Paris, June 23, 1846, he became professor of Egyptology there, 1873, and succeeded A. Mariette as director-general of excavations in Egypt, 1881-86, signalling this appointment by recovering the royal mummies at Deir el-Bahri, 1881. Returning to Paris, he was recalled to his former post in Egypt, 1899, and retired, 1914. His translated works include *Egyptian Archaeology*, 5th ed. 1902; *The Ancient Peoples of the Classic East*, 1894-1900, comprising *The Dawn of Civilization*, *The Struggle of the Nations*, and *The Passing of the Empires*; *Art in Egypt*, 1912; *Popular Stories of Ancient Egypt*, 1915. He died in Paris, June 30, 1916.

**Masque** (Fr., mask). Theatrical entertainment of an allegorical nature, usually written for a particular occasion, and distinguished chiefly by the splendour of the spectacular effects provided by machinist, scene painter, and costumer, to embellish the poetical conceits of the author. In the prologue to his own masque *The World Tost at Tennis*, Thomas Middleton defines the form, not calling the device a play, because it breaks the stage's laws of acts and scenes; it lays claim neither to comedy nor tragedy, nor yet to history, though presenting something of all; "it was intended for a royal night: there's one hour's words, the rest in songs and dances."

As a fashionable amusement in England the masque, introduced, it is said, from Italy in 1512, had its greatest vogue in the time of James I and Charles I. Ben Jonson was the author of many masques, pageants, and court entertainments, and reveals his poetic genius at its best in the delicacy of the craftsmanship and the light playfulness of the lyrics. The most beautiful example is *Milton's Comus*, presented at Ludlow Castle on Michaelmas night, 1634.

The Inns of Court provided many poets with opportunity to give their fancy rein in this direction, and lavished money upon the magnificent production of

masques. One by Chapman, for which Inigo Jones provided the machinery, cost the society of Lincoln's Inn £1,086 8s. 11d. to present before King James and his consort on the occasion of the marriage of the Princess Elizabeth to the Elector Palatine of the Rhine. For the same occasion Beaumont wrote a masque presented by the Inner Temple and Gray's Inn before the king and queen in the banqueting house, Whitehall. In the opinion of some judges the finest composition of the kind, with the exception of *Comus*, was *The Inner Temple Masque* of William Browne (1590-1645), author of *Britannia's Pastorals*. Others that may be mentioned are the *Microcosmus* of Thomas Nabbes, *The Triumph of Time*, a moral masque forming the last part of a curious composition called *Four Plays in One* by Beaumont and Fletcher, and *The Mountebank's Masque*, produced at court in 1618, included in John Marston's works by A. H. Bullen.

The composers of the 17th cent. contributed a good deal to this form of dramatic entertainment. Among them were Alfonso Ferrabosco, who wrote the music for Ben Jonson's *The Masque of Blackness*, *Hymenaei*, *The Masque of Beauty*, and *The Masque of Queens*. Thomas Campion wrote several masques, including *The Masque of Flowers*, for Gray's Inn; and sundry songs in other masques. The song *Rule Britannia* appeared in its original form in the masque of Alfred, 1740, by Thomson and Mallet, with music by T. A. Arne. Consult *English Masques*, ed. H. A. Evans, 1897; *List of Masques, Pageants, etc.*, W. W. Greg, 1902.

**Masquerade**. Form of revel in which the company wear masks. In the 13th century the masquerade was a highly popular amusement in England, not only among the lower classes, for whom the mummers provided crude fun at seasons of mirth and jollity, but also among the feudal lords and at the court. Edward III was particularly fond of this sort of entertainment, and an extant list of the masks and "visers" used at his Christmas revels in 1347, the year before the Black Death, mentions lions' and elephants' heads, men's heads with bats' wings, satyrs, and virgins. Both Pepys and Evelyn mention a masquerade held at Whitehall, Feb. 2, 1665, and at the beginning of the 18th century this form of

revel became such a craze in London that it was denounced by moralists and satirists, and by the clergy from the pulpits. They survive in the festivities of carnival (*q.v.*), and, in a less riotous form, in the fancy dress ball.

**Mass**. Property of matter. Two bodies are said to possess the same mass if they are equally accelerated when subjected to the same force. Until the latter part of the 19th century the truth of the laws of conservation of mass and of energy was undisputed. It was shown by experiment, for instance, that the masses of reacting substances in a chemical reaction were just equal to those of all the products formed, and that any heat, *i.e.* energy, development was a constant and independent of the manner in which the change took place. These laws of mass and energy remained unquestioned until the discovery of radio-activity and Einstein's special theory of relativity. This theory indicated that an increase in the energy of a physical system is associated with an increase of its mass, and a system of mass  $m$  is supposed to contain energy  $E = mc^2$ , where  $c$  is the velocity of light. Einstein (and Lorentz before him but by classical dynamics) deduced the

relation  $m = \frac{m_0}{\sqrt{1 - \frac{v^2}{c^2}}}$  for the

mass of an electron moving with velocity  $v$  where  $m_0$  is to be regarded as its rest mass. The kinetic energy of this electron will therefore be given by

$m_0 c^2 \left( \frac{1}{\sqrt{1 - \frac{v^2}{c^2}}} - 1 \right)$  approaching

the Newtonian classical value of  $\frac{1}{2} m_0 v^2$  at low velocities. Mass and energy thus appear to be interconvertible and the law of conservation of mass for an individual body gives way to that of conservation of energy. The increase in mass is only about  $1$  in  $3 \times 10^{12}$  even at the high speed of a jet plane, but viewed from the other angle, *i.e.* conversion of mass into energy, large amounts of energy might be readily available. The conversion into energy of 1 milligram would release over 20,000 kWh of energy. For the mass of such a system to alter, the energy developed must be removed from the system.

**Mass** (Lat. *missa*, dismissed). Roman Catholic name for the Eucharist. The origin of the word

is much disputed, but Mass appears to have been used in its present sense from the 6th century, the "dismissal" being first that of the catechumens after the sermon, and then that of the baptized at the close of the service. The word was sometimes used for services other than that of the Eucharist. The term was retained in the first vernacular liturgy of the Church of England, 1549, where the title ran, The Supper of the Lord, and the Holy Communion, commonly called the Mass, but was omitted in the revised book of 1552.

The Roman Catholic Mass is based on the belief that Christ died once for all as a victim for man's sins and can die no more, though He stands for ever before the throne of heaven as "a lamb as it had been slain" (Rev. 5, v. 6). In the Mass by Transubstantiation (*q.v.*) the heavenly victim is believed to be present on the altar and is offered, by the ministry of the priest, as a sacrifice of adoration, praise, thanksgiving, and propitiation. The efficacy of the Mass derives from Christ's one sacrifice and adds nothing to its fruits, though it can distribute them. The Church benefits in the fruits of every Mass, but a special share goes to those present, to those whose intention the priest celebrates, and to the priest himself. High Mass (*Missa solemnis*) is celebrated with the assistance of deacon and subdeacon, and is sung. Low Mass (*Missa bassa* or *lecta*) is recited by the priest without music and with one server. The Mass for the dead is called a Requiem, from the opening word of the Introit.

See Communion, Holy; Eucharist; Last Supper; Requiem; Vestments.

**Bibliography.** L'Explication de la Messe, P. Le Brun, 1777-78; Hierurgia, D. Rock, 1903-4; De Sacrificio Missae, Benedict XIV, new ed. 1839-46; The Service of the Mass in the Greek and Roman Churches, C. H. H. Wright, 1898; De Sacrificio Missae Tractatus Asceticus, J. Bona, new ed. 1903; The Mass, A. Fortescue, 1912; Holy Mass, H. Lucas, 1914; Mysterium Fidei, J. de la Taille, 1928; The Mass and the Redemption, M. C. D'Arcy.

**MASS, MUSIC OF THE.** From earliest centuries in the history of the Christian Church some form of singing has been employed varying from monotone with slight inflections, through inflected monotone of a more elaborate type, to the polyphonic music of the 15th and later centuries. The portions of the Mass chiefly chosen for

musical treatment were the Kyrie, Gloria, Credo, Sanctus, Benedictus, and Agnus Dei.

In these polyphonic settings a plainsong melody was chosen and other voice parts were woven around it, in number from 2 to 12, and even more; sometimes the melody was a secular one, and this led to levity when irreverent chorismen substituted the original words of a love song or drinking song for the Latin words of the Mass. Occasionally a composer provided his own *canto fermo*, and treated it in the same way by the addition of cleverly interwoven vocal parts. Composers of the polyphonic Mass, whose names may be used as links for further reference, include Dufay, Dunstable, Binchois, Morales, Van Rore, Goudimel, Willaert, Palestrina, Vittoria, Gabrieli, Orlando Lassus, William Byrd, and Gregorio Allegri, with whom the polyphonic school practically died out in the middle of the 17th century.

In the 18th and early 19th centuries we have as musical landmarks the Masses of Bach, and the beautiful but not strictly ecclesiastical compositions of the Italian and Viennese schools, including Haydn, Mozart, and Schubert. Beethoven's Mass in D, 1823, may be reckoned the culmination of this type. During the later part of the 19th century and continuing into the 20th, there was a steady revival of interest in polyphonic music, and reprints of the finest examples have been made, helping to redeem the cult of this music from the antiquarian atmosphere which had hitherto surrounded it.

**Massa.** City of Italy, joint capital with Carrara of the prov. of Massa e Carrara. It stands near the Gulf of Genoa, 20 m. by rly. S.E. of Spezia, with a light rly. to its port, Marina di Massa, or San Giuseppe, whence is shipped the famous white marble. The fine ducal palace, built in 1701, and now the prefecture, was a residence of Napoleon's sister, the duchess of Lucca. Manufactures include tobacco, oil, paper, silk and cotton. Pop. est. 39,000.

**Massachusetts.** State of the U.S.A. In New England, it is one of the 13 original states of the Union. Its area is 8,266 sq. m., in which is included the islands of Nantucket and Martha's Vineyard. It has an irregular coastline, which, broken by Cape Cod, Massachusetts, and Buzzard's Bays, and lesser openings, including Plymouth Bay, is 300 m. long. The Cape Cod peninsula is a curiously

shaped extension. The surface rises from the low coastal plain to heights of over 3,500 ft. The chief rivers are the Merrimack, Connecticut, Housatonic, Hoosac, Concord, and Charles, and the state has a number of lakes, its water area being 220 sq. m. The soil is in parts unfertile; hay, potatoes, and maize are the chief crops. Tobacco is grown, and much land is under fruit. Fishing is an important industry. Boston is the capital. Other large towns are Worcester, Fall River, Lowell, Cambridge, New Bedford, Lynn, Springfield, Lawrence, and Somerville. Gloucester is a fishing centre. Harvard is in the state, as are many places associated with New England's early days. It sends two senators and 16 representatives to Congress. Its local affairs are managed by a general court of two houses.

The Commonwealth of Massachusetts, as it is still called, owes its origin to the Pilgrim Fathers who landed near Cape Cod in 1620. In 1629 they secured possession of the land around their first home from the king of England, and, known as Plymouth colony, other settlements were made in it. About this time, another band of settlers, led by John Endicott, having obtained a grant of land, arrived and formed a settlement N. of Plymouth, the two being quite independent. This was known as the governor and company of the Massachusetts Bay, and had a constitution defined by charter. Both colonies were strengthened by the arrival of Puritans from England during the reign of Charles I.

The Massachusetts Bay colony was the parent of Rhode Island and Connecticut, which broke from it owing to differences of opinion about ecclesiastical matters. Compensation was found, however, by taking possession of New Hampshire and Maine. In the time of Charles II there was trouble between the colonists and the crown, and in 1684 the charter was taken away. A new charter was given in 1692, the two colonies, Massachusetts and Plymouth, being united, and Maine being also included in the enlarged colony. The richest and most populous of the New England colonies, Massachusetts took a leading part in the wars of the 18th century against France, as her citizens did in the struggle for independence, although even here there were many loyalists. Its present boundary dates from 1820, when Maine be-

came a separate state. New Hampshire having been cut away before the declaration of independence.

In the modern state the struggle for political power lies between voters of Anglo-Saxon origin, usually Republicans, and descendants of Irish immigrants, usually Democrats. There was a large Irish influx in the 19th cent., and in 1948 Boston voters were 75 per cent. R.C. Puritan tradition is still strong, however, in small towns and rural areas. The Congregational church was not disestablished until 1830. Administration is decentralised to an unusual extent: there are 40 separate municipalities within 15 m. of Boston. Harvard university has made proposals to correct this decentralisation. Pop. 4,316,721.

**Massachusetts Bay.** Broad inlet of Massachusetts, U.S.A. On the E. coast and roughly triangular in shape, its shores are marked by many small openings and fringed by several islands. It extends inland for some 50 m.

**Massachusetts Bay Colony.** One of the earliest English settlements in N. America. In 1623 a company of merchants from Dorchester obtained from the council of New England a patent for a strip of land along the coast from 3 m. S. of the Charles River to 3 m. N. of the Merrimac, and extending from the Atlantic westward "to the South Sea." In 1629 a royal charter was granted incorporating the governor and company of Massachusetts Bay. By this charter a group of traders was turned into a political organization. The administration was entrusted to a governor, deputy governor, and 18 assistants, all elected by the whole body of freemen, who, together with these officers, were to meet four times a year in a general court.

Dissatisfaction with the repressive religious policy of the English government was not the least powerful motive of the successive migrations which established the settlement, notably those led by John Endicott and John Winthrop. In 1631 the general court enacted that none but a member of the Church should have the

right of voting, thus realizing the theocratic ideal. The founders of this colony were puritans of the Church of England, unlike those of the Plymouth colony, founded nine years earlier, who were independent separatists. Later, Congregationalism became the religion of the colony. The original charter was forfeited in 1684, but a second was granted in 1691.

**Massachusetts Institute of Technology.** American institution for technical education. Situated in Cambridge, Mass., it was founded in 1861, and has more

Massachusetts Institute of Technology. The buildings in Cambridge, Mass., to which the institute was moved from Boston in 1915

than 300 professors and instructors, and an average student body of about 3,000. The library contains over 250,000 volumes. The institute moved from Boston to its present 80-acre site in 1915.

**Massacre of the Innocents.** Name given to the killing, by order of King Herod, of all children of the age of two and under in Bethlehem and the surrounding country. Herod hoped by this measure to ensure the death of the child born to be king of the Jews, of whom he had been told by the wise men from the east. Warned by an angel in a dream, Joseph saved the life of Jesus by taking Him and His Mother into Egypt (Matthew 2, vv. 16-18). See Innocents' Day.

**Massa e Carrara.** Province of N.W. Italy, in Tuscany. It has a short coastline on the gulf of Genoa, and a ridge of the Apennines in the N.E. Mostly hilly, its chief product is its famous marble. Area 688 sq. m.

**Massage.** For details of this method of dealing with various bodily conditions, see Physiotherapy.

**Massa Marittima.** City of Italy, in the prov. of Grosseto. It stands on a hill at an alt. of 1,445 ft., 16 m. by rly. N.E. of Follonica.

It has a 13th century cathedral, a museum of antiquities, and a library. In the vicinity there are mines of iron, lead, copper, zinc, and lignite, and mineral springs. The town suffered only slight damage in the Second Great War, although the Germans in the neighbourhood put up a strong resistance to the advance of the Allied 5th army. There was a night tank battle near by, June 24-25.

**Massawa, MASSOWAH, OR MASSAUA.** Town on a small coral island in the Red Sea. It is off the coast of the former Italian colony of Eritrea, of which it forms the chief port, and is joined to the coast by a causeway nearly a mile long. Massawa was occupied by Italy in 1885. It is the centre of a pearl-fishing industry and of a trade in palm-nuts. The rly. to Asmara (q.v.) links it with Abyssinia. Massawa is one of the hottest inhabited places in the world, mean temperature in May reaching nearly 100° F.

In the East Africa campaign, 1940-41, Massawa was captured by British Imperial forces on April 8, 1941, the Italians thereby losing their last port on the Red Sea. Pop. 17,169.

**Massawippi.** Lake and river of Quebec, Canada. The lake is situated 75 m. E.S.E. of Montreal, measures 9 m. by 3 m., and is a tourist resort. The river joins the lake with the St. Francis river at Lennoxville.

**Masséna, ANDRÉ (1758-1817).** A French soldier. Born at Nice, May 6, 1758, he served first in the Sardinian army. Joining the forces of the French Republic, he gained rapid promotion and became a general in Dec., 1793. He made a reputation in Italy, especially at Rivoli,

(Masséna)

Jan. 14, 1797, by his defeat of Korsakow at Zürich, Sept. 26, 1799, and by his defence of Genoa in 1800. Appointed a marshal in 1804, he rendered brilliant services in the Wagram campaign of 1809, and was created duke of Rivoli and prince of Essling by Napoleon.

In 1810 he was given the command against Wellington in the Peninsular War. The British general, after checking him at Busaco, Sept. 27, fell back upon Torres Vedras, and all Masséna's efforts to pierce the entrenchments

were in vain. After five months he began, in March, 1811, a skilfully conducted retirement, but on May 5 he was defeated by Wellington at Fuentes d'Onoro, and with this his military career practically terminated, since Napoleon, attributing his failure to mismanagement, superseded him. On Napoleon's abdication, April, 1814, Masséna gave his adherence to the restored Bourbon dynasty and refused to join Napoleon on his reappearance in 1815. He died April 4, 1817. *Consult* *Histoire Militaire de Masséna*, E. Gachot, 4 vols., 1901-13.

**Massenet, JULES ÉMILE FRÉDÉRIC** (1842-1912). French composer. Born May 12, 1842, he

studied at the Paris Conservatoire, where he had a distinguished career and became professor of composition, his talents winning for him also membership of the

J. E. F. Massenet,  
French composer

Academy and the Legion of Honour. His first opera was produced in 1867, and for the next forty years he turned out a succession of operas, oratorios, overtures, orchestral suites, etc. The most successful of his operas are *Le Cid*, *Manon*, *Thaïs*, and *Le Roi de Lahore*. He died Aug. 14, 1912.

**Massey, GERALD** (1828-1907). British poet and mystic. Born near Tring, Hertfordshire, May 28, 1828,

the son of a bargee, he began work in a mill at the age of eight, and at 15 was working in London as an errand boy. Devoting his leisure to study, at 21 he was editing a

Gerald Massey,  
British poet  
*Elliott & Fry*

Chartist journal, and fell under the influence of F. D. Maurice. Among his best efforts are *The Ballad of Babe Christabel*, *Sir Richard Grenville's Last Fight*, and *Ten Kings*. In the latter part of his life Massey's interest was chiefly absorbed by spiritualism and Egyptology; he wrote *Concerning Spiritualism*, 1871, and similar books, and lectured in America on mysticism. His *Ancient Egypt*, *The Light of the World*, 1907, is his most notable work as an

Egyptologist. He also published a fantastic interpretation of Shakespeare's sonnets, under the title *The Secret Drama of Shakespeare's Sonnets*, 1888. Died Oct. 29, 1907.

**Massey, RAYMOND** (b. 1896). Canadian-born U.S. actor and producer. Born at Toronto, Aug. 30,

Raymond Massey,  
Canadian-born actor

1896, he was educated at the university there, and at Balliol College, Oxford. After serving in the First Great War, he made his début on the London stage at the Everyman Theatre, 1922, and later produced and acted in many well-known plays, e.g. *The White Château*, 1927; *The Man in Possession*, 1930; *The Rats of Norway*, 1933; *The Shining Hour*, 1934; *Idiot's Delight*, 1938. He made his first appearance on the New York stage in 1931, when he appeared as Hamlet, and his later Broadway successes included *Abe Lincoln in Illinois*, 1938; *Lovers and Friends*, 1943. He became a U.S. citizen in 1944.

**Massey, VINCENT** (b. 1887). A Canadian administrator. Elder brother of Raymond Massey, he

was born at Toronto, Feb. 20, 1887, and educated at St. Andrew's School, and the university there. After graduating at Balliol College, Oxford, he became lecturer in

Vincent Massey,  
Canadian administrator

modern history at Toronto university (of which he later became governor and, in 1947, chancellor). After serving as president of the Massey-Harris co., 1921-25, he entered politics, and was minister without portfolio in the Dominion cabinet, 1925, attending the Imperial conference in London the following year. Canadian minister to the U.S.A., 1926-30, he was high commissioner for Canada in Great Britain from 1935 to 1946. Some of his wartime speeches were published as *The Sword of Lionheart* in 1943.

**Massey, WILLIAM FERGUSON** (1856-1925). New Zealand statesman. Born at Limavady, co. Derry, Ireland, March 26, 1856, and educated at Londonderry, he

went in 1870 to New Zealand, where he took up farming. He was elected to parliament in 1894.

becoming chief of opposition whip the following year, and leader of the opposition in 1903. In 1912 he became prime minister and minister of lands and labour. He was a member of the Imperial war cabinet, 1917-18, represented New Zealand at the peace conference in Paris, 1919, and attended the Imperial conference held in London, 1922. He died May 10, 1925.

**Massicot.** A form of the monoxide of lead (PbO). It occurs in nature as the mineral sometimes called lead ochre, which is brownish yellow in colour. It is now prepared by oxidising lead as the first stage in the production of red lead. The lead is melted in a reverberatory furnace, the temperature being kept above the melting point of lead and below that of the oxide which is continuously removed as it forms on the surface. So produced the massicot is a bright yellow pigment of coarse texture. If the temperature is allowed to rise above the melting point of the oxide the form known as litharge is produced. Massicot can also be produced by the careful oxidation of white lead. On further heating and oxidation the monoxide (litharge or massicot) is converted to red lead (Pb<sub>3</sub>O<sub>4</sub>). *See* *Lead*; *Pigments*.

**Massillon, JEAN BAPTISTE** (1663-1742). French prelate. Born at Hyères, June 24, 1663, the son

of a notary, he became an Oratorian in 1681. He was bishop of Clermont from 1717 until his death, Sept. 18, 1742, when d'Alembert pronounced his eulogy in the French academy, to which he was elected in 1719. He was regarded as the greatest preacher of France, whose pulpit oratory was distinguished by its purity and elegance of style.

Unpopular at court, he pronounced the funeral oration over Louis XIV, and preached 10 Lenten

W. F. Massey,  
New Zealand statesman  
*Elliott & Fry*

J. B. Massillon,  
French prelate

sermons (Le Petit Carême) before Louis XV in 1718, urging upon him the need of morality and just government. His one sermon before Louis XIV drew from the last named the famous epigram to the effect that while other preachers made him contented with them, Massillon made him discontented with himself.

**Massine, LEONIDE** (b. 1896). Russian dancer and choreographer. Born at Moscow, Aug. 9, 1896, he was educated at the imperial ballet school there, and succeeded Fokine and Nijinsky as leading male dancer and choreographer of the Diaghilev company. His finest part

Leonide Massine,  
Russian dancer

was generally considered to be the Miller in *The Three-Cornered Hat*. He introduced an angular and "earthy" element into the curves and elevation of classical ballet. In 1932 he joined the de Basil company, and his productions included *Jeux d'Enfants*, *Le Beau Danube*, *Union Pacific*, *Scuola di Ballo*, *Le Bal*, *Gaieté Parisienne*. One of the most famous dancers of his age, he created ballets based on famous classical symphonies. He danced at the Metropolitan, New York, 1940-43, and reappeared at Covent Garden in 1947, when his *Mamzelle Angot* was produced. See *Ballet*.

**Massinger, PHILIP** (1583-1640). English dramatist. Born at Salisbury in Nov., 1583, and educated at St. Alban Hall, Oxford, he lived by his pen in London from 1606 till his death, March, 1640. He was buried in S. Saviour's, Southwark.

A voluminous writer, he is now known to have been part author of plays usually attributed to Beaumont and Fletcher. Fifteen of the plays which he wrote independently are extant. A master of plot and also of construction, his plays held the stage till the final quarter of the 19th century. Of his works, *The Bondman*, *The Maid of Honour*, *The Emperor of the East*, and *Believe As You List* (the last not printed till 1848) are still sometimes read. His masterpiece is *A New Way to Pay Old Debts*.

**Massingham, HAROLD JOHN** (b. 1888). British writer. Son of H. W. Massingham (v.i.), he was born March 25, 1888, and educated at Westminster and Queen's College, Oxford. A weekly contributor to *The Nation* and *Athenaeum*, 1916-24, and to *The Field* from 1938, he became noted for books on the English countryside, e.g. *In Praise of England*, 1924; *English Downland*, 1936; *Cotswold Country*, 1937; *A Countryman's Journal*, 1939; *Chiltern Country*, 1940; *The Wisdom of the Fields*, 1945; *Where Man Belongs*, 1946. He revered rustic crafts, Shakespeare, and naturalists, and hated new builders, whether in the reign of Henry VIII or in his own days.

**Massingham, HENRY WILLIAM** (1860-1924). British journalist. Born at Old Catton, Norwich, and educated at Norwich grammar school, he entered journalism on the *Norfolk News*. In London he was successively editor of the *National Press Agency*, the *Star* (where he succeeded T. P. O'Connor), and the *Daily Chronicle*. Later he was for two years London editor of the *Manchester Guardian*, special parliamentary representative of the *Daily News* (1901-07) and then editor of the *Nation* until 1923. He died Aug. 27, 1924. A keen and incisive writer, of advanced radical views, he was also well-known for his wide acquaintance with French politics and literature.

**Mass Number.** Term used in physics. It is in the main used in connexion with atoms which exist in isotopic forms. Isotopic masses are essentially nuclear masses since practically the whole of the atomic mass is concentrated in the nucleus. From inspection of atomic weights and nuclear charges it appears that all nuclei except hydrogen must contain both protons and neutrons, the neutron being uncharged but possessing almost the same mass as the proton. If a proton be added to a given nucleus then the electric charge is thereby increased, producing a rise in atomic number and the creation of an atom in the next place in the periodic table. If a neutron is added to a nucleus the atomic number is unaffected, but an isotope is created since an increase of mass occurs.

Prout originally stated over 100 years ago that all the heavier atoms were built up of hydrogen, i.e. of protons and electrons; in the light of modern experience, however, his rule may be restated

as the whole-number rule: the masses of all atoms are nearly whole numbers with respect to 16 for the neutral oxygen atom. Hydrogen, however, does not fit into the scheme and actually Aston's more precise measurements made with the mass spectrograph (*q.v.*) showed slight deviations in nearly every case. The difficulty was surmounted by assuming that a part at least of the masses of the electron and proton were electromagnetic, so that the mass of a highly condensed structure was smaller than the sum of the component units, i.e. than of these if widely dispersed. Hence in the formation of a heavy nucleus energy must be released before a stable packing state is attained. The deviation of the mass of a nucleus from the whole number is termed the mass defect ( $\delta$ ). If  $N$  be the mass number of an isotope its mass in general will be  $N-\delta$  and the ratio  $\delta/N$  is a measure of the amount of packing of its constituent particles, i.e. of the stability of its nucleus.

**Masson, ANTOINE** (1636-1700). French engraver. Born at Louvry, near Orléans, he at first engraved ornaments on steel. Settling in Paris, he devoted himself to painting portraits, but became famous for his line engravings. In 1679 he was elected to the Academy in Paris, where he died, 1700.

**Masson, DAVID** (1822-1907). Scottish essayist and biographer. Born at Aberdeen, Dec. 2, 1822,

and educated at Marischal College and Edinburgh university, he was professor of English literature, University College, London, 1852-65, and held the chair of rhetoric and English literature at Edinburgh university, 1865-95. He became editor of the privy council register of Scotland in 1878, and historiographer royal for Scotland in 1893. He died at Edinburgh, Oct. 6, 1907.

His numerous works include a monumental *Life of John Milton*, 6 vols., 1859-80; *British Novelists and Their Styles*, 1859; *Life of Drummond of Hawthornden*, 1873; *Life of De Quincey*, 1878; and *Edinburgh Sketches and Memories*, 1892. He was the first editor of *Macmillan's Magazine*, 1859-67, and a man of solid learning, keen intellect, and abounding energy.

David Masson  
Elliott & Fry

Married in 1853 to Emily Rosaline Orme, he left three daughters and one son, Sir David Orme Masson (1858-1937), for 37 years professor of chemistry at Melbourne.

**Masson, Frédéric** (1847-1923). French historian. He was born at Asnières, and early devoted himself to a close study of Napoleon and his family. The result was a series of valuable volumes, which included *Napoléon et les Femmes*, 1893, Eng. trans. *Napoleon and the Fair Sex*, 1894; *Napoléon Inconnu*, 1895; *Joséphine, Impératrice et Reine*, 1898; *Napoléon et sa Famille*, 9 vols., 1897-1913; *Napoléon et son Fils*, 1904. He was elected a member of the Academy in 1903, and died Feb. 19, 1923.

**Massorah.** Rabbinical term for tradition. It has special reference to the text of the Hebrew Bible, and the efforts made to preserve it uncorrupted. Rules to this end were handed down orally from one generation to another, until the text was finally settled. There are two forms, the eastern and western, or Babylonian and Palestinian, which differ in vowels, accents, and system of punctuation. Those who have made the subject one of special study are called Massoretes. The standard Massorah text is that of Ginsburg. See *Mishna*; *Talmud*; consult also *The Massorah ha-Massoreth* of Elias Levita, 1867, 1880-1905; *The Massorah* compiled from MSS., 4 vols., C. D. Ginsburg, 1906.

**Mass Observation.** British organization for sociological research. Founded in 1937 by Tom Harrison and Charles Madge, it studies the habits, attitudes, and opinions of the British people, and disseminates the ascertained facts. It employs full-time field-workers assisted by a nation-wide panel of voluntary observers. Stressing the specialised questionnaire, it carries out surveys of public opinion on behalf of government departments, commercial organizations, religious and political groups, etc. *Mass Observation* reports published in book form include *Britain, 1939*; *War Begins at Home*, 1940; *Clothes Rationing*, 1941; *People in Production*, 1942; *Britain and Her Birth Rate*, 1945; *Peace and Public*, 1947; *Puzzled People*, 1947. The head office is at 7, Kensington Church Court, London, W.8.

**Mass Production.** Term implying the manufacture in bulk of any article. The principle is to split manufacture into a multitude of simple operations which can easily be taught to the workers. Each

worker has to carry out one comparatively simple operation, the article gradually being assembled or completed as it passes from one operative to another on a conveyor. Little is left to the initiative of the employee, and tools and machinery play an increasingly large part. The great disadvantage is the deadly monotony of work, though in well managed factories this may be mitigated by frequent changes of task.

The motor industry is usually given the credit of developing mass production beyond the experimental stage, and the Ford Company of America is regarded as having carried out the biggest development of the method under a single management and for a single purpose. Ford was able by mass production not only to pay his ordinary workers the highest wages, but also to sell his product at the lowest price and still make an enormous profit. By 1926 2,000,000 Ford cars a year were made and placed on the market. In Europe one who nearly approached the American ideal was Thomas Bata, shoe manufacturer, of Zlín, Czecho-Slovakia. Like Ford, he paid good wages; sold his shoes for the lowest price in the world; tried to limit his production to a small number of models; and introduced a profit-sharing scheme for his employees.

Mass production methods have been introduced into nearly every industry in which machinery can replace human labour, e.g. clothing, prefabricated houses, bicycles, wireless sets, and certain branches of food production. During the Second Great War the method was adopted in all highly industrialised countries for munitions, aircraft, and shipping. To overcome the serious shortage of shipping amongst the Allies, Henry J. Kaiser (*q.v.*) revolutionised shipbuilding by making sections of vessels in factories and assembling them at his shipyards. He next turned his attention to aircraft, and by 1944 one of his factories could turn out 150 fighters a month. See *Bedaux*, C. E.

**Mass Spectrograph.** Instrument used in physics. It was a development of the discovery of "positive rays" (originally termed "canal rays") by Goldstein in 1886. These rays consist of atoms or groups of atoms, which, by collision, have lost one or more electrons in the intense electric field between the electrodes of a low pressure discharge tube. They may be detected as an emerging

beam in the space behind the cathode if the latter is suitably perforated. J. J. Thomson made the first determination of the ratio of the charge  $E$  to the mass  $M$  of these positive particles by applying parallel electric and magnetic fields to the beam and observing the resultant deflections. Considerable attention has to be paid to the maintenance of a low gas pressure in the observation vessel. If  $x$  and  $y$  be the electrostatic and magnetic deflections respectively it follows that  $y^2/x = k.E/M$ , in which  $k$  is a constant depending upon the values of the electric and magnetic fields.

By means of this positive-ray analysis Thomson showed that the gas neon consisted of two isotopes, which was later more accurately confirmed by Aston's apparatus which he called the mass spectrograph. This overcame the loss of intensity of the positive-ray beam, by bringing to the same focus all positive ions with the same  $E/M$  of any velocity.

With later instruments Aston obtained an accuracy of 1 in 10,000 and was able to show that most of the elements were complex, having in some cases as many as ten isotopes. He was also able to obtain fairly accurate measurements of the relative proportions of the various isotopes. These measurements are now usually made by a simpler type of instrument than that of Aston, e.g. the mass spectrometers of Dempster, Bainbridge, etc., which sort out all ions having a particular velocity, and pass them through a uniform magnetic field.

**Massys, Quinten.** A Flemish painter, otherwise known as Matsys and so described in this *Encyclopedia*.

**Mast.** In sailing vessels, the spar, set upright from the keel-plate, on which sail is set. Built-up masts comprise two or more sections, the upper of which may be lowered when reducing the amount of sail. From the deck upwards the sections are termed the lowermast, topmast, topgallant mast, and royal mast. Pole masts are usually constructed in a single piece. Metal masts, often used on racing yachts, are frequently hollow, internal bracing being provided to give the necessary strength. Where a ship has more than one mast a distinctive name is given to each, e.g. foremast, mainmast, and mizzen or mizzenmast. The word is also used for any more or less vertical pole or narrow built-up structure

for supporting, e.g. the antenna of a wireless telegraphy station, or the overhead trolley of an electrically propelled vehicle. There are also mooring-masts for airships. See Ship.

**Mastaba** (Arab., bench). Early form of Egyptian tomb. The term was adopted by Mariette. Rectangular and flat-roofed, with sloping sides, it was faced at first with sun-dried brick, and afterwards with limestone. Representing the earliest elaboration under the Old Kingdom of the pre-dynastic pit-tomb, mastabas are best preserved at Dahshur and Sakkara, whose "step-pyramid" is transitional to the fully developed pyramid. At Gizeh they were arranged in regular streets about the great pyramids. There was a "false door" (stela) on the river face for the use of the departed; a chamber of offerings, often sculptured; a secret niche (serdab) for the sculptured "double"; and an aperture through which it received the offerings and incense. The tomb-chamber was beneath. See Dolmen; Sakkara.

**Master** (Lat. *magister*, master). Term for a man exercising control, authority, or headship, especially one empowered to direct or teach. The word has many applications. Formerly used in England as a title for the male head of a household, or for any man, it is now replaced in this sense by the modified form Mr., *pron.* mister. The eldest son of a Scottish viscount or baron is known as master, e.g. the master of Stair. In popular usage a boy may be addressed or written to as Master Harry Smith.

The British royal household has its master of the household, of the horse, of ceremonies, and of the king's musick. The master of the revels was originally supervisor of royal entertainments, and gradually developed into a stage censor. The heads of most colleges in Cambridge, and of some in Oxford, are called master. The chief official of a hunt is called the master. The incumbent of the Temple Church in London is called the Master of the Temple, a title originally borne by the grand master of the Knights Templars. In freemasonry a master mason is any mason who has passed the third degree, and is not to be confused with the master of a lodge.

The commander of a merchant ship is the master, originally master-mariner or sailing-master, by courtesy called captain. The term old masters is applied to

the great painters from the 13th to the 17th centuries approximately, and also to their works. Master is the title of a university degree in the faculty of arts, originally conferring a licence to teach in the university. In some British universities it is used for the degrees in science and surgery. (See Degree.) As a title of respect it is sometimes used by those in artistic professions in addressing an acknowledged superior (cf. Ital. *Maestro*).

**MASTER AND SERVANT.** This legal relation is created where one person hires the services of another, either generally or for a fixed period, in such a way that the servant is bound to obey all reasonable commands of the master; and, moreover, can be told not only what work to do, but how to do it. He is to be distinguished from a sub-contractor, who agrees to do certain work at a price, but does it, within limits, in his own way, and may himself hire servants to help him. He is also to be distinguished from an agent who acts for the principal within the limits of his authority, and for strictly defined purposes.

Such questions as wages and notice depend primarily on agreement. In the absence of any agreement a servant's engagement is for a year, and from year to year, but subject to being determined by notice which is fixed by general or local custom. As a rule, the more important the situation the longer is the notice required. By long custom a menial (i.e. an indoor) servant gives or takes a month's notice. In other cases, apart from special custom, it is for a jury to say what is a reasonable notice. Workmen, i.e. trade servants, are usually entitled to a week. A master or mistress is under no compulsion, as in Germany, to give a servant a character; but, if one is given, it must not be a false one, or the giver of it is guilty of a crime.

If a character is given to a prospective employer who applies for it, it is privileged, however derogatory to the servant, unless express malice can be proved. Misconduct, or disobedience to reasonable orders, or insubordination, are grounds for dismissal without notice. A hiring or contract of service for more than a year should be in writing, and signed.

**Master.** Title of various legal officials in England. The master of the faculties is superintendent of the court of faculties, a tribunal belonging to the archbishop, which

does not hear pleas but grants licences or dispensations, such as licence to marry, erects monuments in a churchyard, or removes bodies after burial. Masters in lunacy are officials appointed by the lord chancellor as guardians of lunatics to hold commissions of lunacy, superintend the management of the estates of lunatics, and generally to act as directed by the rules in lunacy, or by the judge in lunacy acting thereunder.

Masters of the supreme court are officials with duties partly judicial, partly administrative. Under the Judicature Act of 1879 they replaced, in the king's bench division, the earlier sixteen masters of the common law courts, the king's coroner and attorney, the master of the crown office, the two record and writ clerks, and the three associates. There are also masters in the chancery division, that title having been substituted in 1897 for the former title of chief clerk. The masters of the supreme court hear summonses in chambers, hold inquiries as to damages, tax costs, and generally do much work requiring experience, knowledge of law, and a judicial mind. In almost every case there is a right of appeal to the judge from a master's decision. Under the Coinage Act, 1870, the chancellor of the exchequer for the time being is *ex officio* master of the mint.

**Master-at-Arms.** In the Royal Navy, the head of the police aboard a warship.

**Master Builder, THE.** English title of Bygmester Solnaes, a play in three acts by Henrik Ibsen (q.v.). One of Ibsen's most powerful studies of contemporary social life and morality, it was produced in 1892. Trans. into Eng. by William Archer and Edmund Gosse, it was produced at the Trafalgar Square Theatre, London, Feb. 20, 1893, with Elizabeth Robins and Herbert Waring in the chief parts. It has often been revived, e.g. by Donald Wolfit at the Westminster Theatre, 1943.

**Master Cutler.** Dignitary of the city of Sheffield, England. Ranking next to the lord mayor as the most important civic figure, he presides over the ancient Cutlers' Company. The company exercises jurisdiction over the metal industries in the W. Riding of Yorkshire.

**Master Gunner.** Honorary rank borne by an officer of the Royal Artillery and awarded by the king. See Gunner.

**Master Humphrey's Clock.** Title of a weekly magazine, in which Charles Dickens proposed to

publish short miscellaneous papers and occasional continued stories, introduced and connected by the machinery of a club, all material to be written by himself. The miscellany, started on April 4, 1840, ran until Nov. 27, 1841. The public was disappointed on discovering that the publication was not a continuous tale, though a fillip was given to the general scheme by the reappearance of Mr. Pickwick and the Wellers; but the numbers soon became only a vehicle for first the publication of *The Old Curiosity Shop*, then of *Barnaby Rudge*, the periodical ending with the completion of the latter story.

**Master Mariners, Honourable Company of.** Company formed in 1926 to forward the interests of the British merchant navy service. Incorporated 1927, it received a grant of livery from the City of London in 1932. The former Admiralty sloop *Wellington* (*g.v.*), moored in the Thames, is the co.'s h.q. and livery hall.

**Master of the Fleet.** Officer in the Royal Navy. He is the navigation expert on an admiral's staff and his duty is to arrange the anchorages of the ships when the fleet goes into harbour, etc. Whenever a royal review is held, a master of the fleet is appointed.

**Master of the Horse.** Officer of the sovereign's household. In the British royal household he is the third great officer of the court, and is a peer and privy councillor. He has control of the equeries, pages, grooms, and all the stable servants, and supervises the royal stables, stud, and kennels. Actually the chief or crown equerry is responsible for the stables and the stud. The pages of honour of the master of the horse carry the sovereign's train on state occasions.

In ancient Rome the master of the horse was an extraordinary magistrate, properly commander of the cavalry, but appointed on the occasion of a dictatorship as lieutenant of the dictator.

**Master of the King's Musick.** Originally the musician responsible for the English king's band. The appointment is now honorary rather than executive. There are records of bands being maintained at court as long ago as the reign of Edward IV, who had 13 minstrels with "trompets, shalmes, and small pypes"; and in 1660 Charles II instituted the "four and twenty fiddlers" in imitation of Louis XIV. The band of Victoria was reconstituted by the prince consort as a modern or-

chestra, and gave state concerts; but in Edward VII's reign these were discontinued. In charge of the activities of these musicians was a master of the musick (*Fr. musique*, a band). Among those who have held the post are John Eccles, 1700-35; William Boyce, 1755-79; Sir Walter Parratt, 1893-1924; Sir Edward Elgar, 1924-34; Sir H. Walford Davies, 1934-41. Sir Arnold Bax was appointed in 1942.

**Master of the Rolls.** Official of the English high court of justice. At first the chief clerk of the king's chancery, he obtained his present name, master or keeper of the rolls (*Lat. custos rotulorum*), before 1500, because he had charge of the rolls and records of the court, including the grants which had passed the great seal. Later he ceased to discharge this duty and became a judge of the court of chancery, acting as the vice-chancellor. He now presides over the court of appeal, and ranks after the lord chief justice. Before the Judicature Act of 1873, he was permitted to sit in the house of commons, the only judge enjoying that privilege. His salary is £6,000 a year, and he is usually made a peer. He has charge of the public records, this duty having been given back to him by an Act of 1838, and is chairman of the Historical Manuscripts Commission. Through the Law Society he controls the admission and conduct of solicitors. *See* Chancery.

**Master Pilot.** Rank in the Royal Air Force. Approved by the king in 1945, it is the senior rank for non-commissioned aircrew. The badge is the R.A.F. eagle in a laurel wreath surmounted by the royal coat-of-arms. It is worn on the lower part of the sleeve in the same position as a warrant officer's badge of rank. There are also master navigators, master signallers, master engineers, and master gunners in the R.A.F.

**Masters.** Term applied to unknown authors of pictures and engravings which have become famous. It is coupled with distinguishing allusions divided into two classes: (1) those distinguished by marks such as initials and dates, (2) those named from some salient characteristic of style or subject.

The most important Masters include: Master B. M., a pupil of Schongauer, who engraved *The Judgment of Solomon*, S. John in *Patmos*, etc. Master of the *Playing Cards*, c. 1446: he had great influence on engraving in the North, and examples of his work

are in Paris and Dresden. Master of 1446, a German engraver who engraved *The Passion*, *The Scourging of Christ*, 1446, the earliest engraving known. Master of 1423, a German who produced the earliest dated woodcut, S. Christopher, now belonging to Lord Spencer. Master E. S., 15th century, probably from Strasbourg; 323 of his plates are known, the chief of these, *The Madonna of Einsiedeln*, bearing his coat of arms and the date 1466. Master of the *Amsterdam Cabinet*, 15th cent., from Frankfort or Mainz; his 89 engravings are mostly at Amsterdam; he is also known as Master of the *Medieval House Book*. Master of the *Life of Mary* (or *Life of the Virgin*), 15th century, German, school of Cologne; he painted the *Life of Mary*, seven panels of which are in Munich, and the eighth, the *Presentation in the Temple*, in the National Gallery, London. Master of *Werden*, 15th century, German; four of his pictures, from the Abbey of Werden near Dusseldorf, are in the National Gallery, London. *See* Little Masters.

**Masters, Edgar Lee** (1869-1950). U.S. poet. Born at Garnett, Kansas, Aug. 23, 1869, he was made nationally famous by his *Spoon River Anthology*, 1915, a hundred bitterly satirical poems describing, in contrast to their eulogistic epitaphs, the real characters of the dead in a typical American cemetery. He also wrote *lives of Lincoln*, 1931, and *Mark Twain*, 1938. Died Mar. 5, 1950.

**Master-ton.** Town of North Island, New Zealand. Situated 67 m. N.E. of Wellington by rly., it is the centre of one of the finest sheep-rearing areas in the world, and produces lamb and wool for the export market. Pop. 9,535.

**Mastic.** Variety of gum resin, used in the East as a chewing gum. The resin is a product of the mastic or lentisk tree, and is obtained by cutting the bark, the liquid oozing through and hardening in yellow masses or small drops. It is extensively used in the manufacture of varnishes for map-making, and in dentistry as a tooth-stopping. The lentisk plant is indigenous to the Mediterranean coast region, and various plants yielding a similar substance are found in S. Africa, India, and S. America.

**Mastication.** The crushing or chewing of food in the mouth. This is effected by the teeth, the action of the muscles of the tongue and cheeks being to press the particles of food again and again between the teeth until they are broken up.

Mastication is an important preliminary process in digestion. See Dentistry; Food and Nutrition.

**Mastiff.** Large type of dog, now mainly kept as a watchdog. The chief breeds are the Asiatic, the

Mastiff. Champion specimen of the English breed

English, and the Bordeaux. The Asiatic mastiff, of which the Tibetan is the best known type, is figured on Assyrian monuments of c. 650 B.C. The old English breed dates back to before 55 B.C., and in medieval and early modern times was used for bear-baiting and deer-stealing.

The modern English mastiff is a large and powerful animal, possessing a keen scent, with something of the bulldog about its head, due to crossing with that breed. Its temper is variable, but it is usually docile with those whom it knows. It usually stands about 30 ins. high at the shoulder, but breeders pay more attention to points than to size. In 1949 it was said to be in danger of extinction.

**Mastitis.** Medical term for inflammation of the breast (*g.v.*). Septic material finds its way into the substance of the breast by the blood or the nipple. The breast must be slung by a wide bandage and dressed with belladonna and glycerine. Pus may have to be set free surgically. Penicillin and the sulpha group of drugs are sometimes useful in treatment.

**Mastodon** (Gr. *mastos*, breast; *odous*, tooth). Fossil elephant. The mastodon, so called from the conical tubercles or projections on its teeth, was of a more primitive type than the mammoth, and its remains are more widely scattered, fossil skeletons having been found in Egypt, Europe, N. America, and Asia. The animal lived in the Miocene age and died out during the Pleistocene. The American mastodon resembled the modern Indian elephant both in size and in shape of tusks. From remains found in 'peat bogs' it is known that

the animal fed on the leaves and bark of conifers, and was covered with a thick, woolly, brown hair much like the mammoth. See Elephant; Ice Age; Mammoth.

**Mastodonsaurus.** Fossil amphibian labyrinthodont found in rocks of the Triassic period. It was the largest known labyrinthodont batrachian, having a skull four feet in length and a body ten feet long. Its remains have been found in England, Württemberg, and India. See Labyrinthodonts.

**Mastoid.** The bony mass felt immediately behind the ear is called the mastoid process. It contains cavities of which one communicates with the middle ear and is thus liable to share any infection of the middle ear. In other days this inflammation of the mastoid often needed a severe surgical operation to save hearing or to save life. The condition usually yields to treatment with penicillin and the sulpha drugs. See Ear.

**Masulipatam** OR **BANDAR.** Port of India, in Madras. In the Kistna dist., it is situated N. of the Kistna delta, at the end of a branch rly. from Bezvada. Printed cottons, canopies, prayer cloths, etc., are manufactured, but this industry, like that of carpet weaving, is decadent. Its name means "fish-town." It was held by the rulers of Golconda in the 16th century. An English settlement was founded here in 1611, and after having been abandoned for a few years was re-established 1632. During 1686-90 it was held by the Dutch and in 1750 was given to the French by the nizam of Hyderabad. In 1758 Clive sent a force against it, and under Col. Forde it was taken in April, its capture being a brilliant feat of arms which had important results in extending the British power in India. The Church Missionary Society has a centre here, with a college affiliated to Madras university. Pop. 59,146.

**Masuria** OR **MAZOVIA.** Province of Poland. It consists of that part of the former province of East

Prussia S. of a line running W. to E. just N. of Braunsberg (Pol., Braniewo) and Goldap (Goldapia). About 10,000 sq. m in area, it had a pre-war pop. of c. 1½ millions, most of whom were expelled following the Russo-Polish treaty of Aug., 1945, settling the E. frontier of Poland.

The capital of Masuria is Olsztyn (former Allenstein), and among important towns are Malbork (Marienburg), Kwidzyn (Marienwerder), Wegobork (Angerburg), Goldapia (Goldap), Olecko (Treu-), and Gombin (Gumbinnen).

Masuria was originally the southern part of the former duchy of Prussia. Some wood, paper, glass, textile, and engineering industry existed in the towns; much of its equipment, however, was destroyed or dismantled during and immediately after the Second Great War. The country is rich in timber and contains several famous hunting preserves, of which the best known is probably the Rominten heath, favourite hunting ground of William II, and later of Goering.

In the 14th and 15th centuries Masuria merged with Poland and at the same time the Masurians started to settle in E. Prussia. In plebiscites held after the First Great War the people mostly claimed German, not Polish, nationality. The Masurians have preserved numerous habits and traditions, and a wealth of popular songs and dances; their buildings, largely of timber, have often characteristic gabled porches carried by pillars. Their religion, unlike that of other Polish tribes, is well-nigh exclusively Protestant. The Polish national dance Mazurka takes its name from the tribe. The name of Masuria is also connected with two battles of the First Great War; see Masurian Lakes. For the fighting here during the Second Great War, see Russo-German Campaigns.

**Masurian Lakes.** Network of lakes, marshes, and water courses in Masuria. In the First Great War important fighting took place in this region between the Russian and German armies. Hindenburg gave the name "battle of the Masurian lakes" to the fighting of Sept. 5-15, 1914, which followed his victory at Tannenberg, when he attempted to crush the retreating Russian army. There was further heavy fighting in Feb., 1915, when Hindenburg concentrated 300,000 men against the Russian 10th army of 120,000. In the S. the Russians made a fighting retreat to the farther side of the Niemen, inflicting great losses on the

Mastodon. Skeleton of American mastodon found in Northern Yukon  
Natural History Museum, New York

German armies. To the north they were also driven from Tilisit and other towns, and one corps were forced to retreat by rly., leaving exposed the flank of the neighbouring corps, the 20th. The Germans made a heavy thrust and dispersed the 20th corps in confusion amid the forests and swamps. The latter, however, saved it from complete destruction and enabled a large number to escape to defensive lines between the Bobr and the Niemen. Here a counter-offensive had been prepared, and the Germans were slowly forced back until they reached positions only a few miles within the Russian frontier. Thus the German offensive was a failure; on the other hand, the Russians did not win back the line of the Masurian Lakes.

**Matabele** OR **AMANDEBELE**. Bantu-negroid people in S. Africa. In 1817 Umsiligazi, one of Chaka's

Matabele warrior

indunas, fled with a following of Abazanzi Zulus over the Drakensberg into the Transvaal, and dominated the Bechuana, until driven by the Boers across the Limpopo into Matabeleland in 1838. Under Umsiligazi's son Lobengula, who assumed sway in 1870, the confederation comprised the descendants of the original Abazanzi; the Abenbla derived from Bechuana war-captives; and the Maholi slaves, recruited from Mashona, Makalaka, and other unwarlike tribes. In battle the warriors used Chaka's short stabbing assagais, knobkerries, and oval shields, and raided Korana Hottentots and other aboriginal peoples. Their dialect is spoken in S. Rhodesia. They submitted to British rule in 1893 and 1896. See Africa; Bantu; Lobengula.

**Matabeleland**. District of S. Africa, now part of Rhodesia. It is named after the Matabele. It stretches from the Transvaal to Mashonaland, includes the watershed of the Zambesi and the Limpopo, is rich in minerals and fertile land. The chief towns are Bulawayo, Gwelo, and Selukwe.

Matabeleland was included in the grant made to the British S

Africa co. in 1889, this following a treaty between the tribal king, Lobengula, and Cecil Rhodes. The first settlements made by the new company were in Mashonaland, and against them the Matabele directed their raids, the successors of those against the Mashonas. In 1893 they were particularly active, and L. S. Jameson, with about 1,000 white men, marched to Bulawayo, Lobengula's capital. Twice the Matabele attacked in great force, only to be repulsed with heavy loss, while a third victory was won by a body of allies from Bechuanaland. Bulawayo was entered and Lobengula fled, and it was while pursuing him that Allan Wilson and his small force were killed, on the Shangani river. The Matabele were crushed, and their country became in reality part of the territory under the chartered company. Settlers entered the land and there was a spell of feverish activity in developing it.

In March, 1896, the Matabele rose in rebellion, seizing the opportunity offered by the Jameson Raid. They had legitimate grievances, but their savage methods of warfare were a danger to the white community. There was much fighting, but the struggle was ended after a meeting between Rhodes and the chiefs of the tribe in the Matopopo Hills in Sept. The country then settled down as an integral part of Rhodesia. See British S. Africa Co.; Rhodes, C. J.; Rhodesia; S. Africa. Consult The Downfall of Lobengula, W. A. Wills and L. T. Collingridge, 1894; The Matabele Campaign, R. S. S. Baden-Powell, 1897; Matabele Journals of Robert Moffat, ed. J. P. R. Wallis, 1945.

**Matadi**. River port of the Belgian Congo. Situated 70 m. above the mouth, it is the highest point to which ocean steamships can ascend the Congo. It is connected with Léopoldville by a rly. of 255 m., and forms the chief exporting and importing centre of the country. The rly. has been improved, and transport on the Congo and its tributaries has been much accelerated. Matadi is in the province of Léopoldville.

**Matador** (Sp., killer). Highest rank among professional bull-fighters. He is the man who has the task of actually killing the bull. See Bull-Fighting.

**Matagalpa**. Dept. and town of Central Nicaragua. Bounded S. by the river Matagalpa, the dept. is mostly mountainous and is intersected by the Rio Grande. Sugar,

coffee, and tobacco are cultivated. Matagalpa, the capital, stands in a high mountain valley. Population (estimated) 50,000.

**Mata Hari** (1876-1916). Dutch spy. Margaret Gertrud Zelle was born at Leeuwarden, Aug. 7, 1876, and married a captain of the Dutch colonial forces named MacLeod, in 1895. She lived with him in Java until 1901, studied the ritualistic dances of the East, and on her return to Europe adopted the name Mata Hari (Eye of the Morning, Star of the Evening), cultivating a popular belief that she had been born in Java, was a half-caste, and had been a temple dancer. As a dancer at the Musée Guimet, Paris, in 1905, she was an immediate success, and went on to become a well-known courtesan. At the outbreak of the First Great War her influence over French and German military and diplomatic officials was supreme; she betrayed secrets to both sides until arrested by the French and executed as a spy, Oct. 15, 1916.

**Matamoros**. Town of Mexico in the state of Tamaulipas. It stands on the S. bank of the Rio Grande and opposite the town of Brownsville, Texas, U.S.A., being a customs port of entry to Mexico. It is 842 m. N. of Mexico City, the journey taking 33 hours by train. It is on the main inter-American highway. In the vicinity is an important cotton-growing region. Cattle, cotton, hides, and maize are also produced. Population (estimated) 18,000.

**Matanzas**. West-central prov. of Cuba. It borders the Strait of Florida and has an area of 3,256 sq. m. Hilly in the N., where the

Matador in the costume of the bull-ring

surface reaches 1,310 ft., it slopes to the S., where large expanses are swamps. Sugar, bananas, etc., are produced. Area 3,256 sq. m.; pop. 364,128.

**Matanzas**.

City of Cuba. The capital of the prov. of Matanzas and the second seaport of the island, it lies at the head of Matanzas Bay, on the N. coast, 63 m. by rly. E. of Havana, to

which it is also connected by the central highway. It has a well-sheltered but partly silted harbour and vessels lie in a roadstead and discharge by lighter. The town consists of three portions separated by the rivers San Juan and Yumuri, and among its larger buildings are the government building, theatre, casino, and lyceum. Matanzas has petroleum and sugar refineries, distilleries, rly. workshops, and manufactures of leather, boots and shoes, and cord, and its chief exports are sugar, rum, and molasses. The city dates from 1693. Pop. 72,826.

**Matapan, BATTLE OF CAPE.** Sea action of the Second Great War. The victory of Cape Matapan, March 28, 1941, so named from the point of land nearest to the scene of action, was the fruit of skilful cooperation between ships and aircraft of the Royal Navy. In 39 months of war the Italian fleet never showed any disposition to risk a battle, though in material strength it was at all times superior to the British Mediterranean fleet. To force it to fight was the constant endeavour of the British c.-in-c., Admiral Sir Andrew Cunningham; and at Matapan he did his utmost to bring about a general action.

At noon on March 27, 1941, three Italian cruisers and four destroyers were sighted by air reconnaissance almost midway between the toe of Italy and the Peloponnesus, steering in a S.E. direction. In the hope of intercepting this force, the Mediterranean fleet sailed from Alexandria at dusk the same day, when there was least chance of its movements being reported to the enemy. Four cruisers and four destroyers under the second-in-command, Vice-Admiral H. D. Pridham-Wippell, were ordered to rendezvous next morning south of Gavdhos, an islet lying to the southward of Crete.

The battle fleet, comprising the battleships *Warspite* (Cunningham's flagship), *Barham* (flagship of Rear-Admiral H. B. Rawlings), and *Valiant*, the aircraft carrier *Formidable* (flagship of Rear-Admiral D. W. Boyd), and eight destroyers, followed at the best speed of which the three battleships were capable.

One of the *Formidable's* aircraft sighted the Italian squadron soon after dawn on March 28, about 30 m. S. of Gavdhos, steering S.S.E. At 7.45 a.m. the Italians were in sight of Pridham-Wippell's ships. To draw the enemy towards the battle fleet, he turned to

Matanzas, Cuba. The Plaza, with harbour beyond

the S.E., and for over an hour they followed the bait thus held out to them, though they did not get within gun range. Just before 9 a.m. the enemy squadron reversed its course and was in turn pursued by the British. Apparently the Italians were also trying to set a trap, for just before 11 the big new battleship *Vittorio Veneto* appeared about 16 m. to the northward, and opened fire with her 15-in. guns on the British.

Almost at the same moment the *Vittorio Veneto* was sighted by Albacore torpedo aircraft from the *Formidable*, which had been ordered to attack the Italian cruisers. They turned on the new target, and inflicted a hit which reduced the *Vittorio Veneto's* speed by 50 p.c. and caused her to turn away to the westward.

As soon as the British cruisers had effected a junction with the battle fleet, at 12.30 p.m., a second air striking force flew off from the *Formidable*, and hit the Italian battleship with two more torpedoes. From this operation one of our aircraft was missing, the only loss suffered by the British fleet throughout the action. A second Italian force of five cruisers, which had been sighted in the meantime, showed no sign of wishing to come closer, but made off to the N.W. at 30 knots. Naval aircraft from Maleme, in Crete, carried out a third attack on the retreating Italian forces, and succeeded in torpedoing and disabling the 10,000-ton cruiser *Pola*. To her aid went three other cruisers and some destroyers, while the rest of the Italian ships promptly proceeded homeward.

At 10.25 p.m. these lagging cruisers were sighted by the *Warspite*. Searchlights were switched

on by the attendant destroyers, and the *Warspite* and *Valiant* simultaneously opened fire on the *Fiume*, of 10,000 tons; she at once burst into flames. A second cruiser was set on fire by the *Barham*. All three battleships then concentrated their fire on a third ship. Enemy destroyers which fired torpedoes at the British battleships were also fired upon, and two were sunk. British destroyers completed the destruction of the three sister cruisers *Fiume*, *Pola*, and *Zara*, which offered little resistance. In the *Pola* discipline appeared to be non-existent. This night battle was the first occasion on which ship-borne radar was used in a major action. See Mediterranean Campaign.

**Mataro.** Seaport of Spain. 20 m. N.E. of Barcelona and in that province. It has manufactures of linen and cotton goods, soap, and chemicals, while wine is produced in the neighbourhood. Pop. 24,700.

**Match** (Fr. *mèche*, from late Lat. *myza*, wick). Word commonly applied to a small piece of wood, waxed thread, or other material, tipped with a substance which can be ignited by friction and used to ignite other objects.

The first form of match consisted of splints tipped with potassium chlorate and sugar held together by gum. These were ignited by touching with concentrated sulphuric acid carried in a bottle. The lucifer match, invented in 1827, had a head of chlorate of potash and sulphuret of antimony, and was ignited by drawing the match head through a strip of glass-paper. That combination has been superseded by others, but all matches which can be struck on some rough surface have as their basic ingredients one substance rich in oxygen and another which easily combines with oxygen, the reaction between the two taking place with the evolution of heat on the application of friction. Potassium chlorate and phosphorus are two examples.

In the safety match, invented in the middle of the 19th century, the phosphorus was separated from the composition on the match and transferred to the friction surface on the base. In many safety matches the head of the match is a mixture of potassium chlorate and antimony sulphide and the rubbing surface on the box contains red phosphorus. The use of yellow phosphorus for matches is now everywhere prohibited; but sesquisulphide of phosphorus, which

Match. Stages in manufacture. 1. Veneering from log of wood for match splints. 2. Charging magazine with splints which are put through a machine for coating heads with composition. 3. Revolving drum for drying matches after heads have been coated. 4. Another view of drying drum. 5. Matchbox-making machine. 6. Boxes of matches coming off the machine

lights readily with a moderate amount of friction, is used on match heads that strike anywhere.

Aspen and white pine are the chief woods used in match manufacture. The wood is cut into splints when green by special machinery, the usual method consisting in slicing off a veneer of match thickness, which is afterwards cut into bands or ribbons the length of the match. These ribbons are sliced in layers into match sticks. The dried sticks are fed into dipping frames which hold several thousand, and dipped in the composition. Round matches are cut by a machine with circular hollow cutters. Many matchmaking machines will cut nearly a million matches an hour. To lessen the risk of fire from burnt matches, the sticks are dipped in a fireproofing salt, which prevents smouldering.

Book matches, a 20th century innovation, are prepared by inserting the cardboard, already cut to shape, in a frame, and dipping it first in paraffin wax, and then in a safety match composition. When the dipped cardboard is dry enough, it is stitched into a cardboard cover on which the friction surface has been mounted.

The matchmaking industry is controlled by special laws in most countries, aiming at the abolition of the use of white phosphorus, e.g. the White Matches Prohibition Act, 1908, in Great Britain.

**Match Duty.** Tax on the consumption of matches. In the United Kingdom customs and excise duties were imposed on matches by the Finance Act of 1916 at the rate of 5s. or 3s. 4d. per 10,000 matches, the former being when they were 80 or less in a box, and the latter when that number was exceeded. In addition, match manufacturers pay £1 a year for a licence. A previous attempt to introduce a tax of this kind had been made in the budget proposals for 1871-72. Robert Lowe, afterwards Lord Sherbrooke, introduced it with the jesting motto, *Ex luce lucellum* from light a little gain. The match manufacturers of London organ-

ized a procession of workers, chiefly women, to Westminster by way of protest, which caused the withdrawal of the proposed tax. In the U.S.A. the use of white phosphorus was checked by a heavy tax on matches made thereof. In France the making of matches is a state monopoly.

**Matchlock.** Hand gun in which the charge is fired by the application of a smouldering match to the touch-hole by a mechanical device actuated by moving a lever. The first hand guns, which came into use early in the 15th century, like the larger weapons, consisted of a simple iron or brass tube with a touch-hole on the top the charge being fired by the application of a piece of smouldering, loose-spun cotton, or hemp cord, which had been soaked in a strong solution of saltpetre, and was called the match. Later, the touch-hole was moved to the side of the barrel and a flash-pan provided, the latter occasionally being fitted with a pivoted cover. To speed up firing, in some of the later weapons a roll of burning slow match was carried on the barrel, at

Matchlock. Early 16th century type. A piece of smouldering match was carried on the barrel to ignite the match on the serpentine (or curved lever) when a shot was about to be fired

which the yarn in the serpentine could be ignited just before it was desired to fire a shot. The matchlock was invented about 1460. In its earliest form it consisted of a serpentine (a curved lever) pivoted in a hole in the stock, which carried the burning match, and so balanced that the match was held away from the touch-hole until the end of the lever under the stock was pressed, when the glowing match was pushed into the flashpan and the charge fired. Matchlocks are still used by various tribes in Asia and in N. Africa. See Flintlock; Gun; Musket.

**Mate.** Literally a companion or equal. The word is sometimes used for a husband or wife. It is also used colloquially by workmen for those who work with them.

In the British navy, the rank of mate was held until 1861 by officers immediately junior to lieutenants, but in that year the rank of sub-lieutenant was substituted for it. In 1913 the title was again revived. With the double object of meeting the shortage in junior officers and of encouraging merit among the younger warrant officers and the petty officers and men of the fleet, the Admiralty directed that a number—originally fixed at 100—of the best of these should be selected for appointment as mates (ranking with sub-lieutenants), who would be advanced to the rank of lieutenant after two years or longer, according to their abilities. The rank was abolished in 1922. In the merchant service a mate is relatively a much more important officer, the first mate, or first officer, of a ship, ranking next after the captain.

**Mate or PARAGUAY TEA.** Dried and powdered leaves of *Ilex paraguayensis*, infused and sweetened with sugar. It is sucked up through a special tube which strains off the leaf particles, is aromatic and somewhat bitter, and has refreshing and restorative effects. Large quantities are consumed in Argentina and Brazil. *I. paraguayensis* is a tree allied to the holly, *Ilex aquifolium*.

**Mateotti, GIACOMO** (1885–1924). Italian politician. Leader of the Socialist Unitario party in the parliament which assembled in 1924, he made a speech in the chamber charging the fascist party with terrorism and trickery in the conduct of the elections. Shortly afterwards, on June 10, he was abducted, many believed at the instigation of Mussolini, and his body, stabbed to death, was found three days later buried in a lonely

spot 12 m. from Rome. Fascist leaders were accused of complicity, and four of them—Marinelli, administrative secretary of the party; Filippelli, editor of the *Corriere Italiano*; Rossi, head of the official press bureau; and Naldi, editor of the *Nuovo Paese*—were arrested, together with others accused of the actual murder. Tried at Chieti, some of the accused were found guilty of unpremeditated accidental homicide, and sentenced to short terms of imprisonment; their associates were released. The horror caused by this political assassination threatened for a time to cause the overthrow of the fascist govt.

After the fall of the fascist regime the accused men, only four of whom were in court, the others being tried in their absence, were brought to trial a second time; and in April, 1947, Dumini, Poveromo, and the absent Viola were sentenced to 30 years' imprisonment. Rossi and Giunta, with others who were absent, were acquitted.

**Matera.** City of Italy, in the prov. of Matera. It is 42 m. E. of Potenza, and contains the cathedral of the archbishopric of Acerenza and Matera. At Monte Scaglioso, near by, are stone quarries and troglodyte caverns, still inhabited, and caves with 13th century wall paintings. Pop. 22,069.

**Materialism.** Theory that regards matter as the prime cause of everything, even of mental processes such as thought and

Maté. Gourds, for holding the liquid tea, and bombillas through which it is sipped. Top, left, the leaves of the plant

consciousness. Materialism differs from hylozoism (*q.v.*), which is essentially a kind of pantheism not incompatible with religion, in that it leads, if carried to its logical extreme, to atheism and the most selfish form of eudaemonism.

According to the materialists all knowledge has its origin in sensation, merely consisting of transformed sensations; intellectual life is nothing but the result of mechanical combinations and interactions of matter. The soul itself is only a phenomenon of the brain; when the latter perishes, the soul perishes with it. Everything in the world takes place according to certain fixed, unalterable laws. There is no room for a God as Creator, or as a supernatural being capable of arresting or altering the course of nature. On the other hand, it should be remembered that we do not really know matter as it is, but only as it appears to us in the form of external phenomena; again, materialism is not capable of explaining the origin of mental processes from matter, since the combination and interaction of material elements can produce only material, not spiritual, results. See Free-thought; Theism.

**Materia Medica.** British medical publication. Produced by the British Medical Association, it first appeared in 1852 and deals with that branch of medical science which treats of drugs, their properties, doses, and uses, and their action on the body.

**Maternity Benefit.** Name given in Great Britain to money payable by the state to the wife of an insured man, or to an insured woman, on the birth of a child. Such benefit is a usual feature of state insurance systems.

In Great Britain a maternity benefit of 30s. was introduced under the National Insurance Act of 1911 and was raised to £2 in 1926; if a man and his wife were both insured, double benefit was payable. Under the National Insurance Act, 1946, benefit from July 1, 1948, was raised to a maternity grant of £4 on the birth of a child, with in addition 36s. a week for 13 weeks to a mother gainfully occupied, provided she gave up work for that period, attendant's allowance of £1 a week for four weeks to a mother not gainfully employed, these additional payments being subject to certain qualifying conditions.

**Mathematics** (Gr. *mathēma*, learning). The science of number and space and of all their relations. Some writers distinguish between mathematics, the methods used to discover certain truths, and Mathematics, the truths or relations discovered.

Mathematics is a unity, but for convenience in presentation it is usually subdivided into pure

mathematics and applied mathematics. The former may be divided into arithmetic, algebra, geometry, trigonometry, calculus, etc.; or it may be divided into geometry, the study of space and of spatial relations, and analysis, which includes arithmetic and algebra and deals with numbers, the relations between numbers, and the operations performed. In practice, however, the distinction between geometry and analysis is not clear-cut. Applied mathematics comprises the methods adopted to solve problems of mechanics (statics and dynamics) and other aspects of natural science and, more recently, problems of social science and technology.

The range of applied mathematics is as extensive as science itself, for research into, say, the relative value of artificial fertilisers no less than research into the structure of the atom uses mathematical techniques.

#### An Ancient Science

Mathematics, like most other sciences, has developed through the operation of two causes, human wonder and curiosity and human need, the desire to find out and the desire to learn how to do something. The earliest known civilizations had some method of counting and of recording possessions. Geometry (literally, measurement of the land) seems to have begun through the need of the Egyptians to restore the boundaries of land after the Nile inundations, and in the need of accurate measurement of size and direction in the building and orientation of the pyramids. The ancient Greeks, although freely using the knowledge gained from the Egyptians, developed geometry principally as an intellectual exercise. It speaks much for their work that parts of the elements of Euclid (330–275 B.C.) remained the English schoolboy's usual introduction to geometry until the 20th century. Pythagoras (c.550–500), Eudoxus (408–355), Euclid, and Apollonius (260–200) contributed to the foundation of mathematics. Archimedes (287–212) has been ranked with Newton and Gauss for his mathematical discoveries.

The Greeks, however, lacked the advantage of the greatest mathematical invention, the use of the zero and decimal notation. This seems to be of Hindu or Arabic origin, as are the beginnings of algebra, introduced into Italy in the 13th century.

Descartes (1596–1650) considerably improved its notation and methods; but he is principally remembered as the great originator of analytical or co-ordinate geometry, which applied algebraic methods to geometrical problems, and revolutionised mathematical conceptions and processes. A century later, Isaac Newton and Leibniz shared the honour of introducing the calculus, a tool of immense power, particularly in the application of mathematics to the problems of natural science, an activity in which Newton himself excelled.

The rich territory thus opened up through analytical geometry and the calculus has since yielded an abundant harvest through the discoveries of Gauss, Lagrange, Laplace, Poncelet, Hamilton, Abel, Weierstrass, Riemann, Cantor, Einstein, and many other giants, so that mathematics has not only revealed characteristics of the universe that would otherwise have remained hidden, but has provided investigators in every field with precision instruments far beyond the wildest dreams of the great Galileo.

It is no longer possible for any individual to see the limits either of mathematics or of mathematical methods. But it is not difficult even for the mediocre mathematician to agree with Bertrand Russell, "Mathematics, rightly viewed, possesses not only truth but supreme beauty . . . capable of a stern perfection such as only the greatest art can show." See Archimedes; Gauss; Newton, etc.; Algebra; Arithmetic; Calculus; Trigonometry, etc.; consult also Introduction to Mathematics, A. N. Whitehead, 1911; Short Account of the History of Mathematics, W. W. R. Ball, 5th ed., 1912; Mathematics for the Million, L. Hogben, 1937.

H. Watson

**Mather, Cotton** (1663–1728). American Colonial divine. One of a famous Puritan family, and grandson on his mother's side of John Cotton (1585–1652), he was born at Boston, Mass., Feb. 12, 1663. At Harvard he took his B.A. degree at 15, and becoming with his father, Increase Mather, co-pastor of the North Church in 1684, remained associated with it until his death. A notable linguist, he published some 400 works, notably *Magnalia Christi*, or Ecclesiastical History of New England, 7 vols., 1702, new ed., 2 vols., 1853; and left voluminous MSS., including a treatise

on medicine and a Scripture commentary in 6 vols.

Eminent as preacher, pastor, and philanthropist, a genius of curiously complex character, partly saint and partly fanatic—he inaugurated trials for witchcraft—he was thrice married, the third time unhappily, and, suffering through the dissolute character of his son Increase, met death, Feb. 13, 1728, with the words, My last enemy is come; I would say, my best friend. *Consult* Lives, B. Wendell, 1891; A. B. Marvin, 1892.

**Mather, Increase** (1639–1723). American Colonial divine. Born at Dorchester, Mass., June 21, 1639, he was the youngest son of Richard Mather (1596–1669), who, suspended for nonconformity, left Lancashire in 1635. Educated at Harvard and Trinity College, Dublin, Increase became a preacher in Devon and Guernsey, but refusing to conform at the Restoration, went to Boston, where he was ordained pastor of the North Church, June 6, 1664. He retained this office until his death, Aug. 23, 1723, and was also president of Harvard, 1685–1701. In 1662 he married Maria, daughter of John Cotton, by whom he had three sons and seven daughters. Noted for his love of learning and Puritan zeal, he secured an enlarged charter for Massachusetts under William III.

**Mathew, Theobald** (1790–1856). Irish temperance advocate. Born at Thomastown, near Cashel,

Theobald Mathew,  
Irish temperance  
advocate

Oct. 10, 1790, he studied at Maynooth, entered the order of S. Francis, was ordained in 1814, and given charge of a little chapel in a poor part of Cork. He laboured to secure education for the poverty-stricken people, and then in 1838 began to exercise his remarkable magnetic influence in the cause of total abstinence. At one time his followers are said to have numbered nearly half the adult population of Ireland, and his activities were reflected in a fall of 40 p.c. in the revenue from Irish spirits and in a great decrease in crime. Father Mathew visited London in 1843 and America in 1849, drawing crowds of converts to total abstinence. He died at Queenstown (Cobh), Dec. 8, 1856. There is a memoir by J. F. Maguire, 1863.

**Mathews, CHARLES** (1776–1835). British comedian. Born in London, June 28, 1776, the son of a bookseller, he

Charles Mathews,  
British comedian

was educated at Merchant Taylors', and was engaged by the Theatre Royal, Dublin, in 1794, coming to London in 1803. Among the parts he played was that of Sir Fretful Plagiary in *The Critic*, a performance which Leigh Hunt regarded as perfect. Mathews's greatest success, however, was in the rôle of entertainer, in which capacity he became immensely popular on both sides of the Atlantic. He died at Plymouth, June 28, 1835.

**Mathews, SIR CHARLES** (1850–1920). British lawyer. Born in New York, Oct. 16, 1850, he was educated at Eton.

He was called to the bar at the Middle Temple, 1872, and rapidly built up a large practice in criminal cases. Eloquence and power of cross-examination in many famous cases, including the Penge mystery, the trial of Lamson for murder, and the Mignonette case, brought him into prominence. In 1885 he was made a revising barrister, and in 1888 senior counsel to the treasury at the Old Bailey, in which capacity he took part in nearly all the celebrated criminal trials for some years. In 1907 he was knighted, receiving a baronetcy ten years later, and from 1908 was director of public prosecutions until his death, June 6, 1920.

Sir C. Mathews,  
British lawyer  
Russell

**Matico.** Dried leaves of a species of pepper, *Piper angustifolium*, belonging to the family Piperaceae. Native to Brazil and Bolivia, it is used in medicine as a styptic. An infusion or tincture forms an agreeable tonic and stimulant, its astringent properties being especially useful in catarrh of the bladder in aged patients.

**Matilda** (d. 1083). Queen of William the Conqueror. A daughter of Baldwin, count of Flanders, and a descendant of Alfred the Great, she married the duke of Normandy in 1053. Pope Leo IX had previously forbidden the marriage on the ground that the parties

were related, but the exact relationship, if any, has never been decided, and many stories, mostly fictitious, have been told about the supposed impediment. Pope Nicolas II finally granted a dispensation in 1059. Matilda ruled Normandy during her husband's absence in England, and was crowned queen of England at Westminster in 1068. She spent much time in Normandy, where she died Nov. 3, 1083, and she was buried in the church she built at Caen.

**Matilda OR MAUD** (1102–67). Queen of England and empress. Daughter of Henry I of England, she married the emperor Henry V (q.v.) in 1114. On the death of her husband in 1125 she returned to England and, being the only surviving child of Henry, was proclaimed heiress to the throne. In 1128 she married Geoffrey of Anjou, a step which created discontent amongst the nobles, so that, upon her father's death in 1135, Stephen was able to seize the crown without opposition. Matilda, who had been with her husband in France, landed in England in 1139, and, assisted by Robert, earl of Gloucester, defeated Stephen at Lincoln, 1141, and was crowned in London. The country was, however, in a state of civil war, and finding it impossible to make her claim effective Matilda returned to Normandy, leaving her son, afterwards King Henry II, to establish his claim to the crown. She died Sept. 10, 1167. See Stephen.

Matilda,  
Queen of England

**Matilda** (1046–1115). Italian countess, known as the Great Countess. Daughter of Boniface II, count of Tuscany, she married in 1070 Godfrey V, duke of Lorraine, who died in 1076. On his demise Matilda joined the papal party against the emperors, and in 1077 Henry IV of Germany tendered his submission to Gregory VII at her castle of Canossa. She steadily supported the pope, and fought unaided against the emperor. In 1089 she married Welf, duke of Bavaria, at the time only 18 years of age, but this marriage was dissolved in 1095, and on her death, July 24, 1115, the whole of her vast estates, including Tuscany, Modena, Reggio, Brescia, Mantua, and Ferrara, were claimed by the Holy See in virtue of a grant made

by Matilda in 1077 and renewed in 1102. See Gregory VII.

**Matilda Tank.** An armoured vehicle used in the Second Great War by the British army. Popularly known in the army as the Waltzing Matilda, it went into service early in 1942, and was used with infantry for attacks on prepared positions. The vehicle weighed 28 tons and had a maximum speed of 16 m.p.h. It was armed with one 2-pr. and one Besa gun mounted in a turret.

**Matin, Læ** (Fr. the morning). French daily newspaper. Founded in 1884 by an American, A. C. Edwards, from 1900 it was owned by the French financier Bunlaux-Varilla. Bourgeois and nationalist in tone, it had a circulation up to 2 millions, a large network of correspondents abroad, and considerable influence. It was abolished by the Nazis in 1940, but revived under new editorial and business management after the liberation of France.

**Matins OR MATTINS** (Lat. *matutinus*, belonging to the morning). Ancient name for early morning prayers. In the English Prayer Book of 1549 the service of morning prayer was called matins; the words morning prayer were substituted in 1552, but the old word is retained in the tables of proper lessons and proper psalms. The existing service is formed from the ancient services for matins, lauds, and prime. The hour of matins has varied. Early custom favoured a time before daybreak; later, 6 or 7 a.m. was usual; and in 1714 the service was first held on Sundays in London at 11 a.m. See Canonical Hours.

**Matisse, HENRI** (b. 1869). French painter. Born at Le Cateau, Dec. 31, 1869, he went to Paris in 1892 to complete his training as a barrister, but, abandoning the law, studied at the Beaux-Arts under Moreau. After experimenting with impressionism, he became a leading member of the revolutionary Fauves, declaring that he aimed at the utmost simplification. Primarily that of a designer and decorator, his style was characterised by large, flat areas of pure colour, and his abstractions, with distortion of the person in the manner of El Greco, represent the height of his intellectual conception of form. By painting what his eye immediately saw, Matisse achieved an integral vision that had a profound effect upon contemporary artists, notably Derain (q.v.). Influenced by negro art, he painted portraits, land-

Photo, Marc Fauz

scapes, still life, and interiors. A brilliant lithographer, he illustrated Mallarmé's *Poésies*. He is represented in the leading European and American galleries; two of his best-known paintings, *Odalisque* and *Le Buffet*, are in the Luxembourg, Paris. Consult A Study, R. Fry, 1930.

**Matlock.** Name of several adjacent places in Derbyshire, England, comprising an urban district. Matlock is a market town and parish, standing on the Derwent. It is 17 m. N. of Derby, on the A6 road, and has a rly. station. Its chief industries are making and bleaching cotton, flour and colour mills, and quarrying limestone. Market days, Tues. and Fri.

Matlock Bath, a mile to the S., has been famous for its medicinal waters since 1698. Matlock Bank has hydropathic establishments. The Matlocks are famous for their beautiful surroundings, which include High Tor and other rocks along the Derwent, and stalactite caverns visited by thousands every year. Pop. est. 17,500.

**Matoppo Hills.** Range of hills in S. Rhodesia about 18 m. S.E. of Bulawayo. The district is about 100 m. long, its greatest breadth being 25

m., and covers an area of, 1,040 sq. m. It is a wild region, in parts almost inaccessible, but crossed by fertile valleys. The grave of Cecil Rhodes is situated on The World's View, in a national park which contains a small preserve for African game and the Matoppo Dam built to irrigate the surrounding country. The cemetery was consecrated by Rhodes to those who deserved well of their country, and contains the remains of Major Allan Wilson and Sir Starr Jameson.

The hills proved impregnable when held by the Matabele during the rebellion of 1896-97.

**Matriarchy** (Lat. *mater*, mother; Gr. *archê*, rule). Form of social organization under which personal rights, duties, and restrictions are determined from the maternal side. Social anthropologists tend to prefer the alternative term "mother-right." It is threefold in form—matrilineal, in which descent and inheritance are reckoned along the mother's line; matri-local, in which the wife

resides with her own people, the husband being an occasional or permanent guest; and matri-potestal, in which child control and choice of mate rest with the mother and her people, often with

her brother as head of the family. In aboriginal America mother-right in its three-fold form is present among the Seri and the Pueblo Indians at opposite ends of primitive culture. The theory of a primeval promiscuity which passed into matriarchy, and this into patriarchy, lacks support. See Family.

**Matriculation** (Lat. *matricula*, public register). Process of admittance to the membership of a university or college. In any university admittance is conditional on evidence that the student has attained prescribed standards in a number of specified subjects, either in the examination for the general certificate of education, conducted at his school, or at an examination conducted by the university. The subjects demanded comprise English and four or five other subjects, including a foreign language, and mathematics or an approved science, and at Oxford and Cambridge Latin or Greek. Until 1951 the London matriculation examination was taken by hundreds of students merely as a certification of

Matoppo Hills, Matabeleland. Grave of Cecil Rhodes; in the background is the memorial to the British who fell fighting against the Matabele, Dec. 4, 1893

general education. The matriculation examination at Oxford is called Responsions; at Cambridge the Previous examination or "little-go." See University.

**Matrimonial Causes Acts.** Acts of parliament regulating proceedings between husband and wife relating to their marriage. That of 1857 removed matrimonial causes from the jurisdiction of the ecclesiastical courts and set up a new court for divorce and matrimonial causes. For the first time it gave a court power to grant divorce, which formerly was possible only by Act of parliament. After further changes had been made in the law of divorce, the Matrimonial Causes Act of 1937 widely extended the ground for divorce and nullity. See Divorce; Marriage; Nullity.

Matlock, Derbyshire. Matlock Bath, in the wooded dale watered by the river Derwent

**Matrix** (Lat., wombl., Word used in several senses. (1) The material of a mould in which an object is shaped or formed. (2) In geology, the material in which a different substance, e.g. a fossil or diamond, is embedded. (3) In concrete, the hydraulic lime or cement, combined with water, which binds the sand, stone, etc., with which it is mixed, and which is termed the aggregate. (4) In typefoundry, a metal mould for casting type. (5) In electrotyping and stereotyping, a flong or mould, usually of papier-mâché, which contains the impression of a page of type, and from which plates are cast for printing. (6) In a linotype machine, a brass plate with an intaglio of the letter it is to produce in relief. (7) In metallography, the ground mass or last-freezing constituent in which other constituents appear embedded. (8) In powder metallurgy, that metallic constituent of a powder mixture which has the lower melting point and melts during sintering. See Electrotyping: Linotype; Printing.

**Matron** (Lat. *matrona*, married woman). Term of Roman origin, used at first for a married woman of unblemished character. This idea has persisted, but the word now refers chiefly to a mature woman, not necessarily married, who is the head of a hospital or orphanage, and to one who has charge of the domestic arrangements of a school or college. There is a matron-in-chief directing Queen Alexandra's Imperial

Military Nursing Service, who is attached to the department of the adjutant-general at the War office. Queen Alexandra's Royal Navy Nursing Service is controlled by a matron-in-chief at the Admiralty. A jury of "matrons or other discreet women" was formerly empanelled if a woman found guilty of a capital offence pleaded she was pregnant and asked for execution to be postponed on that account. These juries were abolished in 1931, and the

pregnancy of a woman in such circumstances is now decided by the jury which tried her. If found pregnant, she cannot be sentenced to death.

**Matronalia.** In ancient Rome, festival celebrated by married women in honour of Juno on March 1. Crowned with flowers, they went in procession to the temple of Juno Lucina on the Esquiline, and offered up prayers for the happiness of married life.

**Matsoth** or **Mazzoth.** Jewish unleavened bread. This Hebrew word is derived either from *matsets* or *matsah*, meaning pressed, because the bread is as though pressed together; or from an Arabic word which signifies pure and sincere, implying that the bread is made from pure flour and water with no admixture. Eaten at the Feast of the Passover with the paschal lamb, it is baked in large, very thin pieces. The word is also commonly spelt *matzos*.

**Matsue.** Town of Japan, in Honshu. It is in the S.W. of the island, near the W. coast, on a narrow strip of land between Lake Shinji-Ko and a sea lagoon, on the banks of a river which connects these sheets of water. Raw silk, ginseng, lacquer, and pottery are the chief products. Pop. 38,000.

**Matsumoto.** Town of Japan, in Honshu. It is situated on the Central rly, 115 m. W.N.W. of Tokyo, and is a tourist centre for the "Northern Alps of Japan," which lie W. of the town. There is a trade in raw silk. Pop. 36,000.

**Matsuoka, Yosuke** (1880-1946). Japanese diplomatist. He was born at Yamaguchi-ken, and educated at Oregon university, U.S.A., where he became converted to Christianity. After 15 years in the Japanese diplomatic service he was appointed secretary to the premier in 1918. Matsuoka was Japanese delegate to the League of Nations, and became foreign minister in 1940. The next year he signed a non-aggression pact with Russia and allied Japan more closely with the Rome-Berlin axis. He went out of office in July, when the Konoye cabinet was reshuffled. On Jan. 23, 1946, he was arrested in Tokyo as a war criminal, and he died in hospital on June 27.

**Matsushima.** Group of islets of Japan on the E. coast of Honshu. Matsushima Bay is a small section of Sendai Bay, from which it is separated by the archipelago. The scenic beauties of the pineclad group, which includes over 800 islands, make it one of the show places of Japan. It is reached from Tokyo by the E. coast rly. to Shiogama. Miyakojima and Sabusawa are the only inhabited islets. Matsushima village occupies almost the middle of the curved coast of the bay.

**Matsuyama.** Town of Japan, in Shikoku, connected by light rly. with Mitsu, its port, 4 m. to the N.E. on the E. coast of the Inland Sea. Pop. 48,000.

**Matsya** (Skt. fish). Name of a short-lived union of four Indian states—Alwar, Bharatpur, Dholpur, and Karauli—which was formed March 17, 1948, the maharajah of Dholpur being president. The states were integrated with Rajasthan (*q.v.*) on May 15, 1949.

**Matsys** or **Massys, Quinten** (1466-1530). Flemish painter. Born at Antwerp or at Louvain, he was a pupil

of either Albrecht Bouts or Schongauer, but the main early influence was that of Dierick Bouts. The chief pictures of his early period are *Madonna and Child* (Brussels), *S. Christopher*, and *Virgin at Prayer* (Antwerp). The painting, *Our Lady of the Seven Sorrows*, at Brussels, is assigned to Matsys, and is supposed to be the large painting made for the Hall of the Guild

Quinten Matsys, Flemish painter  
Etching by L. Girton

Matsys. A Money-changer and his Wife, painted by Quinten Matsys in 1518, and now in the Louvre, Paris

in 1505. The Crucifixion, in the National Gallery, London, is one of many Calvary pictures painted about that date. Of his later works The Magdalen and Madonna Enthroned are noteworthy. His portraits are remarkable. He painted genre pictures in a satirical vein, e.g. a Money-changer and his Wife, 1518 (Louvre). He died at Antwerp.

**Mattawa.** Town and river of Canada, in Nipissing dist., Ontario. The river is 50 m. long and flows into the Ottawa river at the town, which is on the C.P.R., and is a centre for lumberers, trappers, and sportsmen. Near the town are large deposits of mica. The river forms part of an historic trade route in Upper Ontario. Champlain in 1615 went up the Ottawa and the Mattawa to Lake Nipissing, and his route was generally followed until the advent of the rlys.

**Matte.** Term used in metallurgy to describe one of the intermediate products of smelting an ore containing sulphides. Formation of a matte implies concentrating the valuable part of the ore into a readily fusible and easily handled mass. It depends on the ability of the various sulphides to mix perfectly with iron sulphide. This intimate mixture is heavier than the slags formed, but lighter than the metal, which will therefore settle to the bottom of a furnace, leaving the matte sandwiche. Mattes dissolve gold, silver, and the platinum metals, and so not only collect the base metals, but also concentrate the precious metals away from the gangue (*q.v.*). Copper ores containing sulphides are smelted in a reverberatory furnace to produce matte, which is subsequently blown in a converter to copper sulphide, the iron being removed as slag, and then to blister copper. If much nickel is present the matte may be cast, the nickel sulphide settling to the bottom of the mould, whence it may be separated when cold and smelted separately from the copper concentrate. In the reverberatory smelting of lead, iron or copper sulphides if present form mattes which dissolve lead sulphide. See Smelting.

**Mattei, Tito** (1841-1914). An Italian pianist and composer. Born May 24, 1841, at Campobasso, near Naples, he studied music in Rome. After teaching there, he settled in London in 1863, devoting himself to conducting, piano-playing, and composing. He made tours in Europe and later returned to Italy,

where he was pianist to the king. His works include operas, Maria di Gand among them, ballets, and songs. He died March 30, 1914.

**Matter** (Lat. *materia*). In philosophy, the quality possessed by all sensible things; more particularly, the material or substance of anything as opposed to its form. Aristotle first accentuated this distinction. He regarded matter as formless, undefined, but capable of becoming everything; it is potentiality as contrasted with actuality. Everything that exists in nature is a possibility that has become an actuality. Thus, the seed is the matter, the potential tree; the tree is the form, the seed in actuality. In later philosophy, matter denotes the visible, palpable material existing in space; more definitely, the persistent, imperishable, foundation or substratum of the world, and all that is in it, as opposed to its changeable phenomena. As to its ultimate nature, according to the atomists it consists of the smallest individual elements; according to the dynamists, of simple movable points endowed with force. The relation between mind and matter is another subject of much controversy. (See Aristotle; Kant; Materialism; Mind.)

In physics, three different forms of matter are recognized, the solid, the liquid, and the gaseous. The particular state in which a substance is found is governed by the prevailing conditions of temperature and pressure, e.g. air on sufficient cooling and with a suitable applied pressure becomes a liquid or even a solid. To account for this interchange of state, it becomes necessary to invoke an atomic theory of matter. On this theory a molecule of a substance is the smallest part of it which can have a separate existence, and it is made up of a definite arrangement of the atoms of the elements which form the compound. The degree of mutual attraction between these constituent atoms is greatest in the solid state, is less strong in the liquid state, and is so weak in the gaseous state that a gas always tends to occupy the entire space of the largest container.

Rutherford's experiments showed that the structure of the

Tito Mattei,  
Italian composer  
Histed

atom itself was complex and was to be regarded as consisting of a central core, or nucleus, with an "atmosphere" of revolving electrons, the whole resembling a miniature solar system in which gravitational are superseded by electrical forces. Almost the whole mass of the atom resides in the nucleus, but it is the number of electrons which determine the chemical nature of the atom. (See Atom; Mass, etc.)

In medicine matter is sometimes used as a synonym for pus.

**Matterhorn** (Fr. *Mont Cervin*). Greatest mountain of the Alps. On the frontier of Italy and Switzerland, between Monte Rosa and Mt. Combin, it reaches 14,782 ft., rising abruptly above the range of which it is the sentinel peak. Its glaciers have their upper sources in snows. The Matterhorn was first climbed by Whymper and his party on July 14, 1865; the story of their triumphant ascent and the tragic descent involving four deaths has often been told. The first crossing of the mountain was carried out by J. Tyndall in 1868. Its ascent was later eased by a hut built at a height of 12,526 ft. The N. rock wall was partially climbed in 1934 by the German brothers Schmid, and for the first time completely by a Swiss party in 1946. On the Rosa ridge, 12,000 ft. alt., is a laboratory for studying cosmic rays. See Alps illus., p. 339. Consult also Hours of Exercise in the Alps, J. Tyndall, 1899; The Englishman in the Alps, A. Lunn, 1912; The Matterhorn. G. Rey, new ed. 1947.

**Matthay, Tobias** (1858-1945). British pianoforte teacher. Born of German stock at Clapham, Feb. 19, 1858, he studied at the R.C.M. under Sterndale Bennett and Sullivan, and was appointed professor in 1880, a post he retained until 1925. In 1900 he founded his own pianoforte school. His influence was most important on the interpretative side, and in The Art of Touch, 1903, he described his system. Among his pupils Myra Hess (*q.v.*) was outstanding. Matthay married Jessie Kennedy (d. 1937), sister of Marjory Kennedy Fraser (*q.v.*). He died at Haslemere, Dec. 14, 1945.

**Matthew.** Saint and apostle, also called Levi. A Jewish tax-collector for Herod the tetrarch, he was sitting at the receipt of custom near Capernaum when called by Jesus. The First Gospel traditionally embodies his teaching. He is said to have remained in Jerusalem for 15 years after the

Ascension, and to have suffered martyrdom at the hands of the Ethiopians (Matt. 10; Mark 2 and 3; Luke 5 and 6; Acts 1). His call is commemorated by the Anglican Church on Sept. 21, when the R.C. and Greek Churches celebrate his martyrdom.

**Matthew**, THE GOSPEL ACCORDING TO. Ascribed by tradition to Matthew the Apostle as early as Papias (c. 135), this is a compilation based on two main sources—Mark and the Logia—with some additional material, especially in the opening and closing chapters. It was evidently written for a Jewish audience. The writer never misses an opportunity of introducing an argument from prophecy to prove that Jesus was the Messiah. His quotations are very rarely taken from the Septuagint—a point which proves his acquaintance with the original Hebrew. Jewish customs and practices are often left unexplained, the author assuming that his readers would be familiar with all the national Jewish institutions.

The arrangement and order of the narrative are artificial. The writer groups similar incidents together—giving us chapters of miracles, chapters of parables, and chapters of teaching. There is a strong tradition that the gospel was originally written in Aramaic, but this hypothesis is not now generally accepted. Modern scholars are for the most part inclined to question the theory that Matthew was the author of the gospel as a whole, and to restrict his authorship to the Logia document which was used as its source. Its earliest possible date is 60–70, but many place it ten years later. See Gospels, The Four.

**Matthew of Paris** (d. 1259). English chronicler. He made his confession as a monk at St. Albans, 1217, remaining there for the rest of his life, apart from two visits to Norway about 1248. In his chief chronicle, *Chronica Maiora*, he gives a vivid picture of his times. The *Chronica* is based partly on earlier histories, but its account of the years 1235–59 is the work of Matthew. His *Historia Anglorum* was completed about 1254.

**Matthews**, FRANCIS EDWARD (1862–1929). British chemist. Born in London, Jan. 31, 1862, he was educated at University College, London, and the Royal College of Chemistry, S. Kensington. He early made a reputation in chemical mathematics, and in 1888 joined the Royal India Engineering College as assistant professor. He is best known for his experiments

in synthetic chemistry, and in 1911 published a paper first suggesting the conversion of neoprene into artificial rubber. He experimented in various polymerising actions and their application to synthetic rubber production. He also made some valuable experiments in the production of ribbon metals. Matthews died Feb. 24, 1929.

**Matthews**, JAMES BRANDER (1852–1929). American dramatic critic and dramatist. Born at New Orleans, Feb. 21, 1852, and educated at Columbia university, he was called to the bar in 1873, but adopted literature as a profession. He was professor at Columbia university from 1892 to 1924. His books include *French Dramatists of the 19th Century*, 1882; *Studies of the Stage*, 1894; *Introduction to the Study of American Literature*, 1896; *Molière: His Life and His Works*, 1910; *Shakespeare as a Playwright*, 1913; *A Book about the Theatre*, 1916; *Essays on English*, 1921. Of his plays, suited rather to the study than the stage, the best known is *Margery's Lovers*, 1884. Died March 31, 1929.

**Matthews**, JESSIE (b. 1907). British dancer and singer. Born in London, March 11, 1907, she first appeared on the London stage as a dancer in a revival of *Bluebell in Fairyland*, 1917, and in 1923 played in revue. After understudying Gertrude Lawrence in the U.S.A. she made a notable success in C. B. Cochran's *This Year of Grace*, 1928, and *Wake Up and Dream*, 1929, at the London Pavilion. Another hit was *Ever-Green* (in which she played a dual part), 1930. From 1931 she was seen mainly in films with bright music (including *Ever-Green*), and she played *Susie Dean* in a screen version of *The Good Companions*.
